THE ENCYCLOPEDIA AMERICANA

Lord (Anglo-Saxon "hlāford," for "hlāfweard," bread-keeper), English title of honor or dignity, used in different senses. In feudal times the lord was the grantor or proprietor of the land, who retained the ultimate property in it, the use only being granted to the tenant. Between the superior lord, or lord paramount, and the actual tenant, stands the lord of the manor or mesne lord. Lord is also a mere title of dignity, attached to certain official stations, which are sometimes hereditary, but sometimes only official or personal, as lord advocate, or lord mayor, a title applied to the chief magistrates of London, York, and Dublin. See also LORD CHAMBERLAIN and LORD LIEUTENANT. In its most definite sense in English it is equivalent to peer, but does not express any special rank or degree of nobility. The five orders of nobility constitute the "lords temporal" in contradistinction to the prelates of the church, or "lords spiritual," that is, such archbishops and bishops as are members of the legislature and sit in the House of Lords. The title is also applied, but only by courtesy, to the sons of dukes and marquises, and to the eldest sons of earls. In Scotland the judges of the Court of Session and Justiciary prefix the title "lord" to their surname, or to some territorial designation assumed by themselves. British judges, when on the bench, are addressed as "My lord."

Lord, James Brown, American architect: b. New York 26 April 1859; d. there 1 June 1902. He was graduated from Princeton in 1879 and after studying architecture practised his profession in his native city, where he designed the Appellate Court in Madison Square, the first of the Carnegie branch libraries, and 16 of the other 65. He was chosen as architect of the Memorial Building erected by the class of 1879 of Princeton.

Lord, John, American historian and lecturer: b. Portsmouth, N. H., 10 Sept. 1812; d. Stamford, Conn., 15 Dec. 1894. He was graduated from Dartmouth in 1833; studied theology for a time at Andover Theological Seminary, and though not ordained to the ministry occupied

Congregational pulpits in New Marlboro and Stockbridge, Mass. After 1840 he devoted himself to literary work, and lecturing. In 1843-6 he was in England, giving lectures on the Middle Ages, and on his return to the United States continued to lecture for many years in the principal towns and cities, giving over 6,000 lectures in all. From 1866-76 he was lecturer on history at Dartmouth College. His lectures were published under the title 'Beacon Lights of History' (1883); he also wrote: 'Modern History for Schools' (1850); 'The Old Roman World' (1867); and 'Ancient States and Empires' (1869).

Lord, William Frewen, English historical writer: b. Brighton, Sussex, 23 Feb. 1861. He was educated at Trinity College, Cambridge, was attached to the Bombay civil service 1881-9, and has been lecturer on and professor of modern history at the Durham College of Science, Newcastle-on-Tyne, from 1899. He has published: 'The Lost Possessions of England' (1895); 'Lost Empires of the Modern World'; 'Life of Sir Thomas Maitland' (1897); 'Development of Political Parties under Queen Anne' (1900); 'England and France in the Mediterranean' (1901).

Lord, William Paine, American soldier and diplomatist: b. Dover, Del., 1838. He was graduated at Fairfield College, N. Y., in 1860, and at the Albany Law School in 1866. In the Civil War he served as major of Delaware cavalry, and as judge-advocate on the staff of General Lew Wallace. After the war he was given a lieutenancy in the regular army, and served at Forts Alcatraz and Steilacoom and in Alaska, resigning in 1868. Since then he has practised law at Salem, Ore., was a State senator in 1878, and for 14 years sat on the Supreme bench of the State. He became governor of Oregon in 1895, and at the expiration of his term in 1899 was appointed United States minister to Argentina. This position he still (1903) continues to hold.

Lord Chamberlain, an officer in England who has control of the establishment attached to the chapels royal; of officers and servants attached to the royal chambers, except of those of

LORD HOWE ISLANDS — LORD'S PRAYER

the bedchamber; and over the medical men of the household. He appoints royal tradesmen, directs all great royal ceremonies, receives all applications to attend levées and drawing-rooms, superintends the royal wardrobe and the jewel house at the Tower, and licenses theatres and plays, his power extending to the cities of London and Westminster, and certain other parts of the metropolis, as well as to those places within which the sovereign may reside occasionally.

Lord Howe Islands, a group of small islands in the Pacific Ocean; nearly 500 miles east of Australia. They are of volcanic origin; and are nearly 3,000 feet above the sea. The group was discovered in 1788 by Lieutenant Ball, but was not colonized until 1840, when New South Wales was given charge of the government. In the surrounding waters there is an abundance of fish. The flora is beautiful and varied, banyan trees are conspicuous.

Lord Lieutenant, a British official of high rank, representing the sovereign, as: (1) The Viceroy, or Lord-lieutenant of Ireland, who is a member of the ministry, and retires from office on the resignation of the Cabinet. His power is quasi-regal; thus he can confer knighthood. In his government he is assisted by a privy council nominated by the sovereign. (2) The lord-lieutenant of a county, the principal official of a county, at whose nomination all deputy-lieutenants and justices of the peace are appointed, and first commissions in the yeomanry, militia, and volunteers are given.

Lord-Mayor's Day, the 9th of November, on which a great procession accompanying the newly elected Lord Mayor of London from Westminster to Guildhall takes place. The procession, formerly famous for its historical and allegorical devices, notably the huge wooden effigies called Gog and Magog, has now much dwindled.

Lord of the Isles, a title borne by chiefs who ruled the western islands of Scotland. They were descended from Somerled, the Lord of Argyll, on whom David I. conferred the islands of Arran and Bute after he had driven the Norwegians out. John, fourth and last Lord of the Isles, was deprived of his title and estates by the Parliament of May 1493. In 1540 the Lordship of the Isles was annexed to the Scottish crown, and from it the Prince of Wales derives one of his titles.

Lord Ormont and His Aminta, a novel, by George Meredith, published in 1894. In this tale the author's enigmatical laughter sounds louder than usual; possessing at the same time a quality which leaves the reader in doubt whether the mirth is at his expense or at the expense of the characters.

Lord's Day. See SABBATH.

Lords, House of. See PARLIAMENT.

Lord's Prayer, *The*, sometimes called "Our Father" or the "Pater Noster," from the first two words in English or in Latin; and called the "Lord's Prayer" because taught by our Lord to his disciples. The prayer is given in the Bible, in Saint Matthew vi., and in Saint Luke xi. The prayer is given as a model, and in Matthew is introduced by the words: "After this manner therefore pray ye." In Luke the introduction is: "When ye pray say," and is fol-

lowed by the words. There is a difference in the form as given in the two gospels mentioned. In Matthew the words are: "Our Father who art in heaven, hallowed be thy name; thy kingdom come; thy will be done as in heaven so upon earth. Give us to-day our daily bread; and forgive us our debts, as we also have forgiven our debtors; and lead us not into temptation; but deliver us from evil. Amen." In Luke the words are: "Father, hallowed be thy name; thy kingdom come. Give us day by day our daily bread; and forgive us our sins; for we also forgive everyone indebted to us; and lead us not into temptation."

The doxology, "For thine is the kingdom, and the power, and the glory for ever, Amen," is not found in many of the best ancient authorities, and for that reason it is omitted in Tischendorf's eighth edition of the New Testament and in the Westcott and Hort Greek New Testament.

The prayer was introduced or taught in the "Sermon on the Mount," and as given in Matthew, consists of nine parts—one salutation or invocation, seven petitions, and "Amen." In the salutation there are three distinct points; first, the word "Father," implying fatherhood, sonship, children of. Second, the word "Our," which includes all mankind, a profession of brotherhood, a manifestation of charity in the most effective manner. Third, "Heaven," where God is in His glory, for where His glory is revealed that is heaven. The seven petitions are usually divided into three parts. The first three petitions refer to the honor of God; the last three to our own advantage; and the fourth petition has an element of both the first and the last groups. The first petition is, "Hallowed be thy name," because by the name of a thing we express the object itself. "Hallowed be," or as expressed by the Greek, "Sanctified be," thy name among men—thy external glory throughout the whole world. The second petition is, "Thy kingdom come,"—internally and externally without any limitations. The third petition is, "Thy will be done as in heaven so upon earth," which relates to free co-operation of our wills with the will of God; that obedience here will be as perfect as in heaven, that perfect peace may reign on earth. The fourth petition is, "Give us to-day our daily bread." Various authorities differ as to the exact meaning of the word qualifying bread, some holding that it makes the word bread mean spiritual food alone, others, bodily food, necessary food for the body; others that it implies food for both soul and body. The fifth petition is, "And forgive us our debts (trespasses) as we also have forgiven our debtors (those who have trespassed against us)." The petitions preceding related to something good to be obtained; the fifth petition relates to deliverance from evils. The word translated "debts" or "trespasses" is translated "sins" in the gospel of Luke. This petition asks that both the forgiveness and the perfection of the forgiveness on the part of God will correspond to our forgiveness of our enemies. The sixth petition is, "And lead us not into temptation." The seventh petition is, "But deliver us from evil." The word "but" in this place, confirms what has been said and forms the transition to what follows. Differences of opinion have existed as to the meaning of the word "evil," some authorities regarding it as meaning the "evil one," others as

LORDS SPIRITUAL

moral evil, anything that hinders spiritual progress. The fifth petition relates to freedom from sin, the sixth to deliverance from sin, the seventh to warding off all spiritual dangers. The "Amen" is a common ending to prayer, usually derived from the Hebrew verb meaning "to be firm," or from a Hebrew noun meaning "truth," and commonly rendered "so be it" or "may it be so." In this place its signification is usually regarded as meaning a stronger confirmation of what has just been said. In places in the liturgy of the Roman Catholic, the Protestant Episcopal, and the Greek churches where the word "Amen" occurs, it is usually said by the server or clerk; but the "Amen" belonging to the "Lord's Prayer" is said by the celebrant of the mass.

Some of the early writers divided the petitions into six, thus joining the sixth and seventh. Many Protestant writers make this division, but Roman Catholic writers follow Saint Augustine, and divide the prayer into seven petitions. Lutheran writers generally follow this division, also the Protestant writers, Bleck, Hilgenfeld, Keil, and Tholuck. The gradation of the petitions is remarkable: First, the honor and glory of God is sought; second, our own greatest good; third, the necessary means to attain eternal life; fourth, necessities for the present life; fifth, to be freed from the greatest evil; sixth, to be freed from the evil next to the greatest; seventh, to be freed from all evil. The fifth, sixth, and seventh petitions are directed against the respective impediments opposed to the good mentioned in the second, third, and fourth petitions.

The doxology is explained in various ways; as a liturgical addition, as an ancient continuation used by the priests and then the people. The "kingdom" in the doxology seems to refer to the first and second petitions; the "power" to the third petition; and the "glory" to the following petitions.

Directly following the "Lord's Prayer," in the gospel of Saint Matthew vi. 14, there is an extension or explanation of the fifth petition, giving again the conditions of forgiveness: "For if ye forgive men their trespasses, your heavenly Father will also forgive you."

Commentators differ as to the exact relation between the form of the "Lord's Prayer" in the gospel of Matthew and in Luke. It is held by many authorities that the prayer was taught on two different occasions, to different persons, except the apostles who were present on both occasions. Both forms were given as models, and both contain the essentials. The prayer occurs in all ancient liturgies except the so-called Clementine liturgy—given in the Apostolic Constitutions. In all the principal liturgies it occurs shortly before Communion.

Many polyglot collections of the prayer have been published from the 16th century downward, the most remarkable of which were those of John Chamberlayne in 150 languages (1715), of Conrad Gesner in 200 (1748), and that of Padre Hervaz in 307 (1787). There are expositions of the Lord's Prayer by Origen, Chrysostom, Gregory Nyssa, Cyprian, Luther, Leighton, and Tholuck.

Bibliography.—Maas, 'The Gospel According to Saint Matthew'; Kenrick, the gospels of Saints Matthew and Luke in 'The Four Gospels'; Saint Thomas Aquinas, 'The Lord's

Prayer'; and the following authors in various writings, Bleck, Meyer, Kiel, Schanz, Spirago, Tholuck, W. Grimm, Hilgenfeld, Peischel, Saint Augustine, and Saint Alphonsus.

Lords Spiritual, in Great Britain, archbishops and bishops of the Anglican Church, who are given seats in the House of Lords. The present primate of all England, who is the 95th Archbishop of Canterbury, was nominated by King Edward soon after the death of Queen Victoria, and stands at the head of the Lords Spiritual. Among the most important and least known of the prerogatives of the Archbishop of Canterbury, is that of heading the commission of great dignitaries of the realm who form a species of council of regency in the event of any time intervening between the demise of a sovereign and the assumption of the reins of government by his successor. The Archbishop of Canterbury, in addition to an official residence within the cathedral precincts at Canterbury, and a stately palace in London, possesses a stipend of \$75,000 a year. But few are aware of the sources from which this money is derived. It does not form part and parcel of the supplies voted every year by Parliament for the administration of the government. Nor is it derived from the revenues of the state, that is to say, from the pockets of the taxpayers. The Church of England is enormously rich. Not all ecclesiastical property was diverted from religious uses at the time of the Reformation. Much of it was left to endow the Church of England, and to-day the annual income of the latter is estimated at near \$40,000,000, the administration of which is vested in the hands of a body known as the Ecclesiastical Commissioners, who pay to the archbishops and bishops their stipends, provide salaries for the minor dignitaries of the Church, and spend the remainder in improving the parochial endowments and buildings, and in providing funds for additional clergy. The Ecclesiastical Commission consists of the two archbishops, namely, of Canterbury and of York, of all the bishops of English and Welsh dioceses, of the deans of Canterbury, St. Paul, and Westminster; of five cabinet ministers, three judges of the High Court of Judicature, and twelve laymen, all of them churchmen of the Church of England, two being appointed by the Archbishop of Canterbury and the remainder by the crown.

The Commissioners have the power of creating new bishoprics, deaneries, and archdeaconries, of creating new parishes, of uniting existing ones, etc. But any of the more important steps which they take have to be ratified by the king and council, that is to say, by the sovereign sitting with a quorum of his Privy Council, and when thus ratified the acts of the Ecclesiastical Commissioners have the power of an act of Parliament.

The Archbishop of Canterbury, like the Archbishop of York and the 24 bishops who represent the Established Church in the House of Lords, is not a peer of the realm, but only a Lord Spiritual of Parliament. The Lords Spiritual have no right to demand trial by the House of Lords as peers, but are amenable to the jurisdiction of the ordinary courts of law. Although the Lords Spiritual of the upper house are distinct from the Lords Temporal, they do not vote separately, but jointly, forming for purposes of legislation one estate. The prelates vote on every subject

LORD'S SUPPER

brought before the Lords, except in trials for high treason and other cases of a criminal nature. On such occasions they never attend or vote; this, however, being in deference to those canon laws which forbid them from participating in matters of blood, and not owing to any parliamentary requirement. There can be no quorum of the House of Lords without the presence of an archbishop or bishop, two peers and a prelate being needed to constitute a House of Lords for the transaction of business, and the Spiritual Lords cannot vote or even take their seats in the House unless robed in their ecclesiastical vestments, with rochet, lawn sleeves and mortar-board cap complete. The discrimination between the peers of the realm and the Lords Spiritual of Parliament also extends to the families of the latter.

Lord's Supper (Lat. *Cena Domini*, Fr. *La Sainte Cène*, Ger. *Abendmahl*), one of the sacraments of the Christian religion, in the observance of which Christians commemorate the death of the Founder of their religion. It is so called because the Lord Jesus Christ instituted the rite when he took his last meal with his disciples. It has also the names of *eucharist* and *communion*, and is celebrated by all Christian bodies however much their views may differ as to its nature and virtue, except the Quakers. It was instituted at the time of the Jewish passover, as we read in the gospels of Matthew, Mark, and Luke, the two former agreeing very closely in their accounts, while that of Luke has features of its own. A brief statement to the same effect is in 1 Cor. xi. There is no corresponding section in the fourth gospel, though in John vi., Christ speaks of the eating of his flesh and the drinking of his blood. In all the churches founded by the apostles the Lord's Supper was introduced. In the 1st and 2d centuries this rite was celebrated in connection with the *agapæ* or *love-feast*. After the third century when the congregations became more numerous, the *agapæ* ceased, and the Lord's Supper was from thence celebrated separately in the churches, in such a way that all present could partake, with the exception of catechumens (that is, Christians not yet baptized) and unbelievers. These were obliged to withdraw when the celebration of the Lord's Supper commenced, because communion was considered as a mysterious act, which was to be withheld from profane eyes. The deacons carried the bread of life to those whom sickness or imprisonment had prevented from being present at the meeting of the congregation. It was always believed to possess a peculiar efficacy, and ideas of the awful and mystical were associated with it. From the first, Christians ascribed supernatural power to the rite, and the consecrated bread and wine were regarded as more than mere bread and wine, and as having become, in some mysterious way, the body and blood of our Saviour. In the early Church we find no scientific formulation of the change undergone by the sacred elements, but in the 9th century, in consequence of the attacks of Berengarius (q.v.) on the doctrine of the Real Presence, the term, transubstantiation, commonly ascribed to Paschasius Radbertus first, came into use to describe metaphysically the real and objective change of the elements of bread and wine into the body and blood of Christ. This term was

adopted by the Council of Rome in 1079, and confirmed in 1215, in the Fourth Lateran Council, by Innocent III., and has ever since been employed by the Roman Catholic Church as the proper expression of her faith in the Eucharist. The Council of Trent in the 16th century laid it down as of faith to confess the "change of the whole substance of the bread into the body, of the whole substance (*substantia*) of the wine into the blood [of Christ], only the appearances (*species*) of bread and wine remaining; which change the Catholic Church most fitly calls Transubstantiation." The Roman Catholic Church holds that the Eucharist has been both a sacrament and a sacrifice from the beginning. This, she declares, is evident from Christ's words of institution, as narrated in the synoptic gospels and from St. Paul's words in his first Epistle to the Corinthians. And unbroken testimony from the Apostles through the Fathers of the Church, she further avers, bears ample evidence to her claim; besides this, she claims that her own witness as the duly divinely appointed guardian of the deposit of revelation and its infallible interpreter commissioned to teach all nations, is sufficient seal to the truth of the doctrine. As a sacrament it is the true body and blood of Christ under the appearance of bread and wine to be partaken by the faithful as a means of grace and union with Christ; as a sacrifice it is the unbloody oblation of the body and blood of Christ by a duly appointed minister, that is, priest, by whom alone the elements can be consecrated. Such she declares has been the Christian teaching and practice from the beginning. The reception of the sacrament under both kinds, that is, under the forms of both bread and wine, was general until the Middle Ages, when communion under one kind, bread alone, began to be adopted, partly to avoid the danger of spilling the consecrated wine and partly to counteract a growing heresy that Christ was not received whole and entire under either kind alone. The Council of Constance, in the 15th century, made it universally obligatory to communicate under one kind to meet the heresy of Huss and Jerome of Prague. The Protestant reformers in the 16th century averred that the Church had deviated in the celebration of the Lord's Supper from the purpose of Christ and the example of the apostolic age, and both the German and Swiss reformers agreed in rejecting the doctrine of Transubstantiation and the mass, and maintaining that the Lord's Supper ought always to be celebrated before the whole congregation, and with the administration of both bread and wine. In explaining the words by which the supper was instituted, Luther and Zwinglius differed, and their different opinions on this subject formed the principal subject of the dissension between the Lutheran and Calvinistic churches. Luther took the words, "This is my body," etc., in their literal sense, and thought that the body and blood of Jesus Christ were united, in a mysterious way, with the bread and wine, which, however, remain unchanged, so that the communicant receives, in, with, and under the bread and wine, the real body and blood of the Redeemer. Zwinglius, on the other hand, understood the words in a figurative sense, and supposed that Jesus Christ meant to say, "The bread and the wine represent my body and my blood," and maintained,

therefore, that the bread and wine were mere signs of the body and the blood of Christ, and that the Lord's Supper was a mere commemoration of the death of Christ, and a profession of belonging to his church, and this view was in substance adopted by the Socinians and Arminians. From this difference of opinion arose a violent dispute between Luther and Zwinglius, which in later times has been continued between the Lutheran and Calvinistic divines. The opinion advanced by Calvin, by which a spiritual presence of the body and blood of Christ is supposed in the communion, by partaking of which the faithful receiver is brought into union with Christ, through the medium of the Holy Ghost, though it came nearer to the Lutheran doctrine than that of Zwinglius did, yet was essentially different, and therefore also met with a strong opposition from the strict adherents of Luther. Melancthon inclined to the Calvinistic notion, and so did many other Lutheran divines, who were called by the opposite party Philippists and Crypto-Calvinists. The *formula concordia*, or articles of religious peace, suppressed the Crypto-Calvinists in the greatest part of the Lutheran Church, and established the idea of Luther, consequently there was a final separation of the Lutheran and Reformed or Calvinistic churches, but in recent times many Lutheran divines have inclined to the Calvinistic doctrine. The Greek Church has substantially held the doctrine of Transubstantiation in its whole extent. The Oriental Christians differ from the Western, in using leavened bread in the Lord's Supper, and in administering it to children. (See GREEK CHURCH.) It thus appears that the differences between the contending churches hinge on the *mode* in which the body and blood of Christ are present in the elements of bread and wine, for that they are in some way present is admitted by them all. The Protestant churches hold that *presence* means presence in efficacy, and will admit that it is "real" in the sense of being efficacious, though not in the sense of being corporeal. However, when they are called on to define efficacy they differ in this, that some mean by it a sacrificial, and others a mysterious supernatural efficacy, emanating from Christ's glorified body. The confessions of the Protestant churches were framed expressly to conciliate the Lutherans, and contain, in consequence, more of the mystical element than is consistent with the sentiments of the framers, as expressed in their writings. The 28th article of the Church of England, while repudiating Transubstantiation as "repugnant to the plain words of Scripture," declares "that to such as rightly, worthily, and with faith receive the same, the bread which we break is a partaking of the body of Christ, and likewise the cup of blessing is a partaking of the blood of Christ." It further declares that "the body of Christ is given, taken, and eaten in the supper only after a heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the supper is faith." The Westminster Confession, chap. xxix., s. 6 and 7, thus formulates the doctrine adopted by the Presbyterian Church of Scotland, which in the main agrees with that propounded by Calvin: "That doctrine which maintains a change of the substance of bread and wine into the substance of Christ's body and blood (commonly called Transubstantia-

tion) by consecration of a priest, or by any other way, is repugnant not to Scripture alone, but even to common sense and reason, overthrowing the nature of the sacrament, and hath been and is the cause of manifold superstitions, yea, of gross idolatries. Worthy receivers, outwardly partaking of the visible elements in this sacrament, do then also inwardly by faith, really and indeed, yet not carnally and corporally, but spiritually, receive and feed upon Christ crucified, and all benefits of his death: the body and blood of Christ being then not corporally or carnally in, with, or under the bread and wine; yet as really, but spiritually, present to the faith of believers in that ordinance, as the elements themselves are to their outward senses." The elevation, adoration, and carrying about of the host, practised in the Greek and Roman Catholic churches is thus spoken of in the 28th article of the Anglican Church: "The sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up, or worshipped." While the Roman Catholic Church makes its communicants receive the consecrated wafer with the mouth from the hands of the priest, the Protestant churches put the bread and the chalice into the hand of the communicant.

Lordwood. See LIQUIDAMBAR.

Lorelei, lô-rê-lî, o **Lurlei,** loor'li, a rock in the Rhine, near St. Goar, about 425 feet above the river. Once a serious menace to passengers on the river and always famed for its echo, the rock has been personified by German poets, notably Heine, as a siren, luring sailors to destruction by the music of her voice, an evident idealization of the danger of the rock and of its echo.

Lorente, Sebastian, sâ-bäs-tî-ân lô-rên'tê, Peruvian historian: b. about 1820; d. Lima November 1884. He was a professor of history at the University of San Marcos from 1845 and made valuable contributions to the historical literature of his country in his 'History of Peru' (5 vols., 1860); 'History of the Conquest of Peru' (1861); and articles in the 'Peruvian Review.'

Lorenz, lô-rên'ts, Adolf, Austrian orthopedic surgeon: b. 1854. He was graduated from the University of Vienna in 1890, and worked as an assistant under Billroth and Albert in Vienna. On the advice of the latter he began specialization in orthopedic surgery, and after years of study developed his so-called "bloodless" method of reducing congenital dislocation of the hip joint. Before he developed his own method of operation he was one of the chief exponents of Haffa's cutting method, which, however, he modified somewhat. His operation consists of the forcible stretching of all the soft parts about the hip until the head of the bone can be brought to the place where the socket should be (the acetabulum), and then holding it in that position and rotating the joint so as to deepen the cavity of the acetabulum. A plaster of paris cast is worn by the patient from six to nine months after the operation. Dr. Lorenz has performed this operation successfully in a large percentage of his cases; he demonstrated his method before the Medical Congress at Berlin in 1895; and has also given demonstrations in England and the United States. His visit to the United States aroused widespread interest and enthusiasm. His pub-

LORENZ — LORIMER

ications include 'Ueber die unblutigchirurgische Behandlung der angeborenen Hüftverrenkung mittels der functionellen Belastungsmethode' (1896); 'Orthopädie der Hüftgelenks-Kontrakturen und Ankylosen' (1889); 'Das instrumentelle kombinierte Redressement der Hüftgelenks-Kontrakturen' (1898); and 'Ueber die Heilung der angeborenen Hüftgelenks-Verrenkung durch unblutige Einrenkung und functionelle Belastung' (1900).

Lorenz, lō'rentz, Ottokar, German historian: b. Iglau 7 March 1832. His first work was 'The Consular Tribunal' (1855). He was appointed professor of history in the University of Vienna, 1862, and in 1885 accepted a call to the University of Jena. Among his writings are: 'German History in the 13th and 14th Centuries' (1863); 'Sources of Mediæval German History' (1870); 'History of Alsace,' with Scherer (1871); 'History and Politics' (1876); 'Genealogical Manual of the History of European States' (1895).

Lorenzo, lō-rēn'sō, or Lourenço Marques, lō-rān'sō mār'kēs, East Africa, a Portuguese province and port, the latter on Delagoa Bay, and the seacoast terminus of the railway to Pretoria in the Transvaal Colony, completed in 1895. A considerable import and export trade is carried on. Pop. (1898) 6,630, of whom 5,130 are Europeans. See DELAGOA BAY.

Loreto, lō-rā'tō, Italy, city in the province of Ancona; about five miles from the Adriatic Sea and 15 miles south of the city of Ancona. It is situated in a fertile agricultural region, remarkable for its beautiful scenery. The city is known for its possession of the Santa Casa, said to be the house in which Jesus, Mary, and Joseph lived while in Nazareth. The building is 31 feet in length and 13 feet in width. It is enclosed in a stately domed church, the work of Bramante, and stands under the dome. The original outer walls have been covered, but inside the coarse stonework of the original masonry is visible. The material is a dark reddish-colored stone, unlike the stone in the vicinity. The tradition is that after the power of the Christians was destroyed in Palestine, by the capture of Acre, in 1291, on 10 May 1291, angels moved this house from Nazareth to the hill of Tersatta, near Fiume. After a time, on 10 Dec. 1294, the house was again removed by angels to the opposite side of the Adriatic, near Recanati; and again, in 1295, it was removed to where it now stands. Consult: Caillu, 'Histoire, Critique et Relig. de N. D. de Lorette' (1843); Hutchinson, 'Loreto and Nazareth' (1863); Jerome Angelita, 'Historie della Translatione della Santa Causa'; Kenrick, 'The Holy House of Loreto'; Meyrick, article on Loreto in 'Christ, Remembrances'; Stanley, 'Sinai and Palestine'; Zucchi, 'Istoria di Loreto.'

Loreto, Peru, an interior department watered for thousands of miles by the Marañon and its tributaries; area, 288,456 square miles; pop., chiefly Indians, 1896, 100,596. The quickest route from the coast to this province, which is only about 700 miles distant in a direct line, is round the northern coast of South America and up the Amazon, a journey of 6,500 miles. Loreto is separated from the coastal departments by the Andes, has a tropical climate, and is densely forested; the chief products are rubber and salt. The principal towns are Moyobamba (the capital, pop. 10,000), Tarapoto, and Iquitos.

Lorette, Ancienne, ān-sē-ēn lō-rēt, Quebec, Canada, a village seven miles southwest of Quebec city, with industries connected with the waterworks of Quebec. Pop. 1,600. Three miles to the north is INDIAN or JEUNE LORETTE, peopled by about 300 Christianized Indians, descended from the last of the Huron Indians who had found a refuge at Ancienne Lorette in 1650. The settlement was removed to Jeune Lorette in 1697. Jeune Lorette commands a fine view of Quebec for which it is visited, as also for the falls of Lorette, and for its ancient chapel and statue of the Virgin, a replica of those at Loreto, Italy.

Loria, lō'rē-ā, Achille, Italian economist: b. Mantua 1857. He studied law at Bologna, and proceeding successively to Rome, Berlin, and London, made a study of economical problems. In 1881 he was appointed professor of economics at Siena and 10 years later at Padua. He has approached the subject of wealth distribution and land-tenure in a hopeful spirit of optimism, and has published many works on the subject. Among his writings are: 'Studii sul Valore della Moneta' (1891); 'La Terra ed il Sistema sociale' (1892); 'La Costituzione economica odierna' (1889); and 'Il Capitalismo et la Scienza' (1901).

Loricata, Loricata. In zoology, (1) the group of pagolins (see MANIS); (2) the group of *Crocodilia*; (3) a group of decapod *Crustacea*, which includes the spiny lobsters (*Palinurus*, etc.), and the bear-crabs (*Scyllarus*, *Ibacus*, etc.). These forms are large, with thick shells and without pinching claws. All are edible, the spiny lobster replacing the true lobster as an article of food in the warmer parts of the earth.

Lorient, lō-rē-ōn, or L'Orient, France, a fortified seaport town, in the department of Morbihan, at the mouth of the Scorff, on the Bay of Biscay; about 40 miles west of Vannes. It was founded in 1666 by the East Indies Company, and in 1690 it became a military fort. After the dissolution of the company, in 1782, the government bought the ship-building plant. The large harbor can accommodate with safety a great number of vessels. Lorient is a station of the French fleet, and has extensive docks and building yards for the construction and fitting out of war vessels. It has, also, large artillery barracks, an artillery park, and a marine arsenal. It has an observatory, schools of marine, artillery, and hydrography, and other educational institutions, and a large number of manufacturing establishments. About five miles south of Lorient, at the entrance to the roadstead, is the fortified town of Port Louis.

Lorikeet', a small kind of lory (q.v.).

Lorimer, lōr'ī-mēr, George Claude, American Baptist clergyman: b. Edinburgh, Scotland, 1838. He came to the United States in 1856 and was educated at Georgetown College, Ky. In 1859 he was ordained to the Baptist ministry, and held pastorates at Harrodsburg, Paducah, and Louisville, Ky.; he was then at Albany for a short time, at the Shawmut Avenue Church and Tremont Temple in Boston in 1870-9; and at Chicago till 1891. In the latter year he returned to Boston to become pastor at Tremont Temple. In 1902 he went to New

LORIMER—LORNA DOONE

York as pastor of the Madison Avenue Church. He was associate editor of the 'Watchman' and has written 'Isms Old and New' (1882); 'Under the Evergreens' (1872); 'The Great Conflict' (1876); 'Studies in Social Life' (1886); 'Christianity and the Social State'; 'Christianity in the Nineteenth Century'; 'Messages of To-day to the Men of To-morrow' (1897); and a 'Master of Millions' (1903), a story of modern life.

Lorimer, George Horace, American journalist: b. Louisville, Ky., 6 Oct. 1868. He is a son of G. C. Lorimer (q.v.), and was educated at Colby College, and at Yale. Entering the field of journalism, he advanced steadily in his profession, and since 1899 has been editor-in-chief of the 'Saturday Evening Post,' Philadelphia. He has written 'Letters from a Self-made Merchant to his Son' (1902).

Lorimer, John Henry, English painter: b. Edinburgh 1856. He was educated at the Edinburgh Academy and University, and began his art studies at the Royal Scottish Academy. One of his pictures was admitted to the annual exhibition of that institution when he was but 19. His most important exhibited pictures are 'The Ordination of Elders'; 'Pot Pourri'; 'The Eleventh Hour' (1896), which received a second class medal at the Salon, and in 1890 was awarded a gold medal at the Paris Exposition. In 1894 the French government bought his 'Benedicite,' which is now in the Luxembourg, where his portrait of Colonel Anstruther Thompson has also been deposited.

Lorimer, Norma Octavia, Scottish novelist: b. Auchterarder, Perthshire, 1864. She has been an extensive traveler, having spent three years in the United States, and has written 'Josiah's Wife'; 'By the Waters of Sicily' (1901); 'Catherine Sterling' (1902); etc.

Loring, lōr'ing, Charles Greeley, American lawyer and orator: b. Beverly, Mass., 1794; d. 1868. He was graduated from Harvard in 1812 and practised his profession in his native city, becoming in 1857 actuary of the Massachusetts Hospital Life Insurance Co. In 1862 he entered the State senate. He was of much prominence as an orator and was the author of 'Neutral Relations between the United States and England' (1863); 'Life of William Sturgis' (1864).

Loring, Charles Greeley, son of the preceding: b. Boston 1828; d. Pride's Crossing, Beverly, Mass., 20 Aug. 1902. He was graduated from Harvard in 1848 and served in the Union army during the Civil War, being brevetted major-general of volunteers at its close. He became a trustee of the American Museum of Fine Arts in 1873 and was the executive officer of the institution from 1876 until his death.

Loring, Edward Greeley, American jurist: b. Massachusetts 1802; d. 1890. He was graduated from Harvard, and for many years was probate judge and United States Commissioner in Boston. While holding this post he sent back into slavery the negro Anthony Burns, and for this act was removed from the bench. In after years he was appointed by President Lincoln judge of the Court of Claims, which post he resigned in 1877.

Loring, Ellis Gray, American lawyer: b. Boston 1803; d. 1858. He was educated at the Boston Latin School, entered Harvard in 1819,

but without graduating left college and studied law. In 1827 he was admitted to the bar, where he soon won high distinction. He was one of the first pleaders for the abolition of slavery, and one of the founders of the first anti-slavery society, in Boston, 1832, whose constitution he wrote. As a defender of fugitive slaves he gave freely of his time and talents, and shared the odium visited upon all the early abolitionists. Before the Supreme Court of Massachusetts he made a memorable defense of a slave-child called Med, by which, against so formidable an opponent as B. R. Curtis (q.v.), he secured a decision declaring that every slave brought into that State thereby became legally free. The effect of his convincing argument was both instantaneous and lasting, and his triumph was a substantial service to the anti-slavery cause. He published numerous addresses on the slavery question.

Loring, George Bailey, American agriculturalist: b. North Andover, Mass., 8 Nov. 1817; d. Salem, Mass., 14 Sept. 1891. He was graduated from Harvard in 1838 and from the Harvard Medical School in 1842, and after several years of medical work at the Chelsea Marine Hospital devoted himself from 1850 onward to scientific agriculture, writing many essays and papers on farming and allied topics. He became famous as an orator, served several terms in the Massachusetts legislature, was member of Congress 1876-81, United States commissioner of agriculture 1881-5, and minister to Portugal 1889-90. He was president of the Massachusetts State Agricultural Society for many years.

Loring, William Wing, American general: b. Wilmington, N. C., 4 Dec. 1818; d. 30 Dec. 1886. He entered the United States army as a private in a troop of volunteer cavalry, and was active in the Florida war in 1835-42. During the war with Mexico he was distinguished for bravery at Contreras, Churubusco, and Chapultepec, and was brevetted lieutenant-colonel and colonel. Although opposed to secession he held States Right views and in May 1861 resigned his commission and became a brigadier-general in the Confederate army and later major-general. For a few years after the close of the war he was a banker in New York, then went to Egypt in 1869 and was made a pasha and chief of staff in the army of the Khedive. In 1879 he returned to the United States and published a description of his Oriental experiences in 'A Confederate Soldier in Egypt' (1883).

Loris. See LEMUR.

Loris-Melikoff, lōr'is - mēl'ī - kōf, Mikhail Tarielovitch Tainoff, COUNT, Russian soldier and statesman: b. Tiflis, Russia, 1 Jan. 1826; d. Nice, France, 22 Dec. 1888. He was of Armenian descent, entered the army in 1843, and distinguished himself at the siege of Kars in 1854. He served in the Crimean war and was made lieutenant-general in 1863. In the Turco-Russian war of 1877 he took Kars in November and for his services in the campaign was made a count in 1878. In 1880 he was appointed minister of the interior, in which post he showed a tendency toward liberal measures, but on the accession of Alexander III. his position became untenable, and he resigned.

Lorna Doone, lōr'na doon, a romance of Exmoor, a famous novel by R. D. Blackmore,

LORNE—LOS ANGELES

published in 1869. It is its author's best-known work, and its popularity has been equally great on both sides of the Atlantic. Much as Hardy acquaints us with Wessex, Blackmore impresses Exmoor upon us. It is out-of-door England, with swift streams, treacherous bogs, dangerous cliffs, and free winds across the moors.

Lorne, Iórn, MARQUIS OF (JOHN GEORGE DOUGLAS SUTHERLAND CAMPBELL). See ARGYLE, CAMPBELLS OF.

Lorraine, Ió-rân'. See ALSACE-LORRAINE.

Lorraine, Claude. See CLAUDE LORRAINE.

Lo'ry, any of several East Indian parrots, but more especially one of the brush-tongued family *Trichoglossidae*, the smaller examples of which go by the name of lorikeets. Both the lorics and the lorikeets are remarkable for their extensible tongue, furnished with a pencil at its extremity, by which they are enabled to lick up the nectar of flowers. The lorikeets are smaller than the lorics, and have long tapering tail-feathers. Swainson's lorikeet (*T. nova-hollandiae*) is the best-known species. It is found in eastern Australia and Tasmania, and is popularly known as the blue mountain lory or the blue mountainer.

The name lory is also given to the large brilliantly colored parrots of the psittacine genus *Eclectus*. Consult Newton, 'Dictionary of Birds' (1896) and see PARROTS.

Los Angeles, Cal., city, county-seat of Los Angeles County; on the Los Angeles River, about 20 miles from the mouth, and on the Atchison, Topeka & Santa Fé; the Southern Pacific, the Southern California, the Los Angeles & Salt Lake, and the San Pedro R.R.'s.

The pious Spanish pioneers who first introduced civilization in Alta California were in the habit of giving names to places in accordance with the church calendar. Consequently when mass was first celebrated on the present site of the city, it was named *Nuestra Señora Reina de Los Angeles*, which the practical "Yankees," upon their arrival, at once proceeded to shorten to Los Angeles. Los Angeles is situated about 15 miles in an air line from the Pacific Ocean, in the valley of the Los Angeles River, a dry river bed in summer, but in winter sometimes a lively stream, for a short time after a heavy rainfall. There are mountains on the north and west. The city covers a large area of ground, the old city limits embracing an area of six miles in each direction, with the old plaza in the centre. To this area several large additions have been made during the past few years. The average altitude is about 300 feet above sea-level. Every variety of location for a residence may be found within the city limits, about a third of the city being hilly, with commanding views of the surrounding country. Los Angeles was settled in 1781. While the country was a Mexican province, Los Angeles and Monterey alternated as the capital of California.

The city has railroad competition, in the shape of three transcontinental lines, the two Southern Pacific systems, by way of Ogden and El Paso, and the Santa Fé, by way of Albuquerque. Work is now progressing on a fourth system by way of Salt Lake, which will shorten the distance from Los Angeles to Chicago over

200 miles. Altogether, there are a dozen lines of railroads leading to Los Angeles. The Pacific Coast Steamship Company runs vessels every few days from Los Angeles county ports to San Francisco and San Diego.

Los Angeles is an old place, having been founded 4 Sept. 1781, by soldiers from the mission of San Gabriel, under the protection of the Spanish governor. Modern Los Angeles is, however, less than twenty-five years old, for it was not until more than half a century after its founding that it began to take shape as an American city. Since then, its growth can only be described as wonderful. A city that in less than a quarter of a century has increased its population from 11,311 in 1880 to 135,000 (conservatively estimated) in 1903, is certainly something remarkable, even in the rapidly growing West. It is only within the past 20 years that the real growth of modern Los Angeles has taken place. In 1883 the city was a somnolent semi-Mexican pueblo of about 12,000 souls, without any public buildings and with only one private building of architectural pretensions, a considerable proportion of the residences being constructed of adobes, or sun-dried bricks, such as are commonly used in Mexico and oriental countries. The entrance of the railroad brought home-seekers in large numbers to Los Angeles and vicinity; the Atchison, Topeka & Santa Fé Railroad was opened in November 1885. In 1886-7 the record transfers of property amounted to \$100,000,000, prices of outside property in some cases being pushed up to ridiculously high figures. There was, of course, a period of stagnation following the subsidence of this wild speculative movement, but the fact that there was no general crash is a proof that the prosperity of the city was well founded.

There are a dozen public parks within the city limits, aggregating over 600 acres, four of them having lakes of considerable size. Elysian Park, the largest within the city limits, is a wild and picturesque hill tract. To these was recently added, through the beneficence of a citizen, Griffith Park, a picturesque mountainous tract of over 3,000 acres, a short distance north of the city limits. Work has commenced (1903) on a system of boulevards which is intended to connect the various parks. Los Angeles is a city of homes; a large proportion of the people owning their own dwellings. There are many attractive cottages, embowered in climbing plants, roses, heliotrope and vines often covering the entire side of a house, while the lawns are adorned with palms, bananas and other semi-tropical trees. The city is practically frostless, callas, heliotropes, and other delicate plants flourishing throughout the winter in the open air. In the southwestern and western sections of the city are hundreds of handsome mansions, in various pleasing styles of architecture. The residence streets are generally aligned by shade trees, the most popular of which are the pepper, with its bright red berries, and the grevillea, with its feathery yellow blossoms.

There are over 200 miles of graded and graveled streets in the city, 20 miles of paved streets, 350 miles of cement and asphalt sidewalk and 160 miles of sewer, the sewer system extending to the ocean. The city is brilliantly lighted, having been the first city in the United

LOSSING

States to entirely abandon gas for street lighting and replacing it with electricity, which was done over 20 years ago. It is now one of the best lighted cities in the Union, the lights being on tall masts.

The electric street railway facilities are excellent. The total mileage of single track is about 200 miles. In addition to the local electric lines, there are half a dozen suburban lines, extending to various points from 10 to 20 miles from Los Angeles, and work is rapidly progressing on a vast interurban system of electric railroads, that will extend from San Diego on the south to Santa Barbara on the north, each place being about 125 miles from the city. The wealth and general prosperity of Los Angeles are founded largely upon the abundant natural resources. The healthy climate and beautiful scenery attract many visitors and home-seekers. The oranges shipped annually average 20,000 car loads, which bring about \$500 for each car. The following table prepared by the Los Angeles Chamber of Commerce shows the estimated value of the principal products of the seven southern counties—the immediate tributary country of Los Angeles—for 1902. These aggregate \$82,000,000, including \$24,000,000 of miscellaneous manufactured products. The principal items in the list are as follows:

Citrus fruits	\$14,000,000
Gold and silver	5,674,000
Petroleum	6,000,000
Borax	1,274,700
Hay	3,300,000
Vegetables and fruits consumed.....	3,000,000
Dried fruits and raisins.....	2,000,000
Grain	3,000,000
Canned goods	1,500,000
Sugar	3,600,000
Nuts	1,400,000
Cement, clay, brick, sandstone and granite..	1,278,000
Beer	1,000,000
Beans	1,800,000
Pork, beef, mutton—dressed.....	3,234,000
Miscellaneous manufactured products.....	24,000,000

This, however, is only a small portion of the trade products of Los Angeles. The merchants of the city, wholesale and retail, and the manufacturers, do a large and increasing business with a section of country extending from central California to New Mexico. The manufacturing industry has been greatly stimulated by the supply of petroleum fuel at a low price and by the bringing of electricity from the mountain streams a distance of nearly 100 miles. The United States census gave the value of manufactures in Los Angeles for the year ended 19 June 1900 at \$21,297,727, since which time it has vastly increased.

The banks of Los Angeles are noted throughout the country for their generally solid and prosperous condition, with deposits aggregating nearly \$50,000,000. The clearings of the Los Angeles banks for the year 1902 amounted to over \$243,000,000. The value of the buildings erected in Los Angeles during 1902 amounted to nearly \$10,000,000, and for 1903 will be considerably more. The annual municipal expenditures are about \$1,355,000; the chief items of expenses are: for schools, about \$446,000; for the police department about \$130,000; for the street cleaning, \$90,000; for the fire department, \$126,000; for municipal lighting, \$44,000; for parks, \$56,000.

The principal harbor of Los Angeles is at San Pedro, where for several years the govern-

ment has been engaged in constructing a great breakwater that will cost over \$3,000,000, and which will permit the entrance to the harbor of deep-sea vessels, when Los Angeles expects to make a bid for trans-Pacific trade. The city is the seat of the University of Southern California, opened in 1880 by the Methodist Episcopal; a State Normal School; Saint Vincent's College, opened in 1865 by the Roman Catholics; Occidental College, opened in 1887 by the Presbyterians; three academies under the Roman Catholics, a public high school, and public and parish schools. There is a public library of 65,000 volumes, the Blanchard Art Gallery, and extensive botanical gardens. It has several hospitals, homes for the friendless, and orphanages. Some of its prominent buildings are a Government building, the county court-house, the city-hall, cathedral, opera house. There are a number of buildings of historic interest, as General Frémont's headquarters, the Plaza Church, some of the adobe houses, homes of the first settlers. The mayor holds office for two years; he appoints five trustees for the library, and is ex-officio a member and chairman of several committees. The council has four commissioners who have charge of police, health, fire and park departments. The board of education consists of nine members chosen by popular election, one from each ward.

Los Angeles has a cosmopolitan population, drawn from every State in the Union, and from almost every country in the world. The people are intelligent, cultured and enterprising. There are numerous churches, several fine theatres, a first-class public library, and a number of clubs for men and women. According to the United States census, the city made the largest percentage of increase of population of any city in the United States during the decades 1880-1900. Los Angeles has for many months led all American cities in increase of postal receipts, of bank clearings, and of buildings erected. Pop. (1880) 11,183; (1890) 50,395; (1900) 102,479. In 1900 the foreign born population was 20,000.

HARRISON GRAY OTIS,

Editor of the Los Angeles 'Times.'

Lossing, lō'sing, Benson John, American historian and engraver: b. Beekman, Dutchess County, N. Y., 12 Feb. 1813; d. near Dover Plains, N. J., 3 June 1891. In 1826 he was apprenticed to a watchmaker in Poughkeepsie and subsequently entered into partnership with his employer, but in 1835 relinquished the business, and became joint owner and editor of the 'Poughkeepsie Telegraph.' He soon after settled in New York as an engraver on wood, and at the same time edited and illustrated the 'Family Magazine.' His connection with his newspaper enterprises in Poughkeepsie, however, continued until 1841. That year appeared his 'Outline History of the Fine Arts,' followed in 1847 by an illustrated work, 'Seventeen Hundred and Seventy-Six,' and in 1848 by 'Lives of the Signers of the Declaration of Independence.' His 'Pictorial Field Book of the Revolution' was issued in numbers in 1850-2, with more than 1,000 illustrations by himself. In the preparation of this work, which is remarkable for the minute and accurate information which it conveys, the author traveled at different times upward of 9,000 miles, visiting

LOST CAUSE—LOTHAIR

every important battlefield of the Revolution, and making sketches on the spot. Among other works are: 'Illustrated History of the United States for Schools and Families' (1854); 'Our Countrymen, or Brief Memoirs of Eminent Americans' (1855); 'Primary History of the United States' (1857); 'Mount Vernon and its Associations,' illustrated by himself (1859); 'Life and Times of Philip Schuyler' (1860); 'Life of Washington' (3 vols.) (1860); 'Lives of the Presidents'; 'Pictorial Field Book of the War of 1812' (1868); 'The Civil War in America' (1866-8); 'The American Centenary' (1875); 'Cyclopedia of United States History' (1881); 'Compendious History of the Commonwealth of New York' (1887).

Lost Cause, The, a phrase which first became current as the title of a history of the Civil War (1886) by E. A. Pollard. It is used as an expressive designation for the purposes and aims which the Southern people, through the war, vainly sought to realize in the permanent establishment of the Confederate States of America.

Lost Chord, The, title of poem written by Adelaide A. Procter. It was first printed in 'Household Words,' and appeared again in her collection of 'Legends and Lyrics' (1858). The verses were set to music by Sir Arthur Sullivan, whose spirit was so attuned to that of the poet that words and music, both sounding a strain of grandeur, intellectual and emotional, may be regarded as mutually interpretative.

Lost or Hidden Island, an appellation anciently applied to Cephalonia, early navigators often being unable to find it on account of its diminutive size. The name also has been given to islands in different parts of the world that once discovered have disappeared or have not been found again.

Lost Pleiad, plē'ād, a star of the Pleiades constellation which tradition says was once visible, being the seventh of that cluster. Only six stars are now to be seen with the naked eye. Probably the origin of the story is less astronomical than mythological. The legend figures in poetry and in art, a poem by Letitia Landon and a painting by Thomas Buchanan Read each bearing the title.

Lost Property, strays and waifs excepted, may be retained by the finder with impunity, after proper means have been taken to advertise it; and if it cannot be conveniently preserved without hazard he may dispose of it if not claimed. If, however, the loser can identify his property he has a right to restitution, and a third party purchasing lost property from the finder must restore it to the owner, if called upon, and may proceed against the seller for satisfaction. The owner of lost movables must not only prove that they once belonged to him, but that he lost possession either by the fraud of some other party, or in such a way that the ownership still remained with him. The finder's "special property" in his find makes his title good against all save the real owner; the most striking exception is in the case of treasure-trove, that is, hidden valuables, of which, in England, a share goes to the crown, to which notice of such finding must be made. In the United States the law is less clear as to treasure-trove;

but it is distinguished from other found property in that the finder has not so good a title as the owner of land in which valuables are found, whereas the finder's title to property found in dwellings, and especially in stores and other semi-public places, is better than that of the owner of the premises. A derelict (q.v.) is distinguished from lost property in that it passes from possession of the owner with his knowledge and consent. Lost property at sea is governed by peculiar principles. The limitation is one year, within which time the possessor may recover property upon the payment of expenses of the finder and of the remarkably heavy percentage of its value called salvage. There are certain cases in which a jury will construe the retention of lost property into larceny. If the finder knows the owner, or can readily discover him, the taking with the intent to keep will amount to larceny. But the more common ground for action in America is detinue, that is, the unlawful retention of property. Obviously there is no recourse if the property detained be of such a character that it cannot be identified.

Lost River, a short stream in the north-western part of West Virginia, which disappears from view in one part of its course. It passes for some distance along underground channels but reappears again.

Lot, according to the book of Genesis, the son of Haran, and the nephew of Abraham. In order to avoid dissensions between his followers and those of Abraham, he went east into the plain of Jordan, toward Sodom, while his uncle dwelt in Canaan. Having been taken captive by some marauders (styled kings in Gen. xiv.), Lot was delivered by Abraham. Having received two angels into his house in Sodom, an attack was made upon it by the inhabitants, who were struck blind, and the impending destruction of the city was announced to Lot. He escaped with his family; but his wife, looking back "became a pillar of salt." The name "Lot's wife" is still given to a detached pillar about 40 feet high, on the Jebel Usdum, a height near the Dead Sea.

Lot (ancient *Loda* or *Oliis*), France, one of the largest tributaries of the Garonne River, rises at Mount Lozère, one of the Cevennes, near Mende, department of Lozère. It flows west by south across the departments of Lozère, Aveyron, and Lot, and joins the Garonne at Aiguillon, in the department of Lot-et-Garonne. Total course about 250 miles, of which 180 miles, commencing at Entraigues, are navigable.

Lothair (lō-thāir') I., Roman emperor, eldest son of Louis-le-Debonnaire: b. about 795; d. Prüm, Prussia, 29 Sept. 855. He became associated with his father in the government of the empire in 817 and was crowned and named King of the Lombards in 820. On his father's death Louis and Charles, his brothers, joined their forces and defeated him at Fontenay in June 841. In 843 the three brothers concluded the noted treaty of Verdun, by which Lothair retained the title of emperor, with Italy, and some French provinces beyond the Rhine and the Rhone. Charles then became king of France, and Louis received a tract of country bordering on the Rhine.

LOTHAIR—LOTTERY

Lothair II., called **THE SAXON**, Roman emperor: b. about 1060; d. near Trent 4 Dec. 1137. He became duke of Saxony in 1106 and was elected king of Germany in 1125 and crowned by Pope Innocent II. in 1133.

Lothair, a novel by Benjamin Disraeli, published in 1870. The scene of this extravagant, but remarkable, story is laid chiefly in England about the period of its publication. The hero, Lothair, a young nobleman of wide estates and great wealth, has been surrounded by a Protestant atmosphere. When, in accordance with his father's will, he goes to Oxford to complete his education, his other guardian, Cardinal Grandison, determines to bring him into the Roman Church. The story is a graphic description of the struggles of rival ecclesiastics, statesmen, and leaders of society to secure the adherence of the young nobleman.

Lo'thop, Amy. See **WARNER, ANNA BARILETT.**

Lothrop, Harriet Mulford Stone, "MARGARET SIDNEY," American writer for young people: b. New Haven, Conn., 4 Oct. 1844. She was married to the Boston publisher, D. Lothrop, in 1881, and was founder and president of the National Society of the Children of the American Revolution. Among her numerous publications, mainly for young people, may be cited: 'The Five Little Peppers' series (1882-1903); 'So As by Fire' (1881); 'The Pettibone Name' (1883); 'The Golden West' (1885); 'The Minute-Man' (1886); 'Dilly and the Captain' (1887); 'Little Maid of Concord Town' (1898); 'The Judge's Cave: a Romance of the Days of Regicides'; etc.

Loti, Pierre, pê-âr lô-tê. See **VIAUD, LOUIS MARIE JULIEN.**

Lo'tion, a wash, solution, or medicinal mixture for external application to the body; usually a liquid remedy, consisting principally of water, as a menstruum, and applied to circumscribed portions of the skin, or of the mucous surfaces. Lotions are either cooling, stimulating, astringent, soothing, or sedative. Water combined with spirit or vinegar is an example of the first. The spirit is added to the water in the proportion of half an ounce and upward to the half-pint. The lead lotion is at once cooling and astringent. A good stimulating lotion is procured from a mixture of water with a third or a half of its bulk of spirit of wine, which is applied to the skin by means of lint, and covered to prevent evaporation. Astringent lotions are formed by adding from 1 to 10 grains of sulphate of zinc or of white vitriol to an ounce of very cold water, having other astringents in solution. Soothing lotions consist of the various preparations of opium, of the decoction of poppies, hemlock, etc., and prussic acid is employed in the preparation of sedative lotions. Stimulating lotions are applied to indolent ulcers and tumors, and sedative and narcotic mixtures are employed to alleviate pain.

Lotophagi, lô-tôf'a-jî. See **LOTUS-EATERS.**

Lot'ta. See **CRABTREE, CHARLOTTE.**

Lotter (lôt'tër) Family, a family of printers in Germany, the founder of which, Melchior Lotter, born at Aue, appeared in Leipzig about 1491. There his publications of brevi-

aries and missals brought him reputation, which his larger enterprises extended. He published: 'Persius' (1512); 'Horatii Epistolæ' (1522); 'Lutheri Tessaradecus Consolatoria pro Laborantibus' (1520); etc. One of his innovations was the reservation of Gothic types for German and use of Roman for Latin. He is supposed to have given at least secret sympathy and aid to the Reformation. His son, Melchior, who died about 1540, was the original printer of Luther's Bible (1522-4), and was succeeded by Hans Luftt (q.v.). His publications also included various works of Luther, Melancthon, and other writers.

Lot'tery, a public gambling scheme, by which, for a valuable consideration, one may by favor of the lot obtain a prize of a value superior to the amount or value of that which he risks. In its best and most frequent application, the word describes those schemes of this nature which are conducted under the supervision and guaranty of government, and the proceeds of which are devoted to public objects. Almost all modern states have, at some period of their history, employed lotteries as a means of revenue. But though they supply a ready mode of replenishing the public treasury, they have always been found to exert a mischievous influence upon the people. The poor are invited by them rather than the rich. They are diverted from persistent labor and patient thrift, by the hope of sudden and splendid gains; and as it is the professed principle of these schemes to withhold a large part of their receipts, a necessary loss falls upon a class which of all in the community can least afford to bear it. Between the years 1816 and 1828 the French government derived from lotteries an annual income of \$2,400,000. Some years later the government suppressed them, and in January of the next year \$10,000 more were found to be in the savings banks of Paris alone than in the same month of the preceding year. In several European states government lotteries are still maintained. They have become an almost indispensable source of revenue; and they are defended by the argument that as the passion for play is irrepressible among the people, and their money would otherwise be invested in foreign or in secret and less fairly managed schemes, the state may well assume the conduct of lotteries at home; that under its supervision the evils attendant upon them are diminished, and their earnings are devoted to the public welfare. There were lotteries in ancient Rome and in England as early as 1650.

In the United States, the lottery has been from the earliest settlement of the country a familiar means of raising funds, which in this country could have been secured in no other mode so easily if at all. The Virginia company derived a large profit from English lotteries, and the influence of them extended gradually to the eastern colonies; for it is reported that an assembly of ministers at Boston in 1699 denounced the lottery as "a cheat," and its agents as "pillagers of the people." Generally, however, lotteries enjoyed a fair reputation, and certainly were soon extensively employed throughout the country. In the 18th century they were extraordinarily popular in America. Legislatures authorized lotteries for every species of public improvement, for the building of

churches and colleges, for the repair of losses to individuals by fire and otherwise; for example, Faneuil Hall, after the fire of 1761, was rebuilt by lottery. The Continental Congress tried to raise money by lottery in 1777.

In 1833 a society was formed in Pennsylvania which advocated their suppression. In July 1834 the society issued an address to the public, setting forth its objects and views. It is to the efforts of this society that we should mainly attribute the action of most of the States in prohibiting the further establishment of lotteries. Where they are not especially authorized (and in some States the constitution expressly forbids the legislature to authorize them), the parties concerned in them are, in nearly all the States, subject to the imposition of heavy penalties. There exist in the State reports many cases where the provisions of State statutes concerning lotteries have been construed by the courts, but these decisions are necessarily of a particular character, and no important general principles can be derived from them. In Tennessee and Virginia, the acts abolishing lotteries have been by express decisions pronounced constitutional. In Massachusetts, a clause in such an act authorizing a search for tickets provided for the purpose of drawing a lottery is not held to be inconsistent with that article of the bill of rights which declares that every subject has a right to be secure from all unreasonable searches and seizures of his house or person. In New York and Pennsylvania lotteries are declared to be public nuisances, and they may therefore be indicted as such. The schemes known as art unions are held to be lotteries by express decisions. In the language of the court in New York: "These associations distribute a small number of prizes among a great number of persons. The prizes and blanks are drawn in the same manner as in other lotteries. The intention of these schemes is to sell works of art for more than they can be sold for at private sale, and this is to be brought about by an appeal to the universal passion for playing at games of chance. They have all the attributes and elements of lotteries."

The sums annually employed by Americans in lottery speculations probably amounted to hundreds of thousands. The last lottery supported by governmental encouragement was the Louisiana State Lottery. An Act of Congress passed in 1890 attempted to crush it by forbidding it the use of the United States mails, which act compelled its removal to Honduras, where in 1903 it was still in existence, and thousands of tickets for this lottery were sold monthly in the United States, particularly on the Pacific Coast, where as late as November 1903 the daily newspapers issued "extras" giving the winning numbers in the drawings of the Honduras company.

Lot'to, a game having its origin in Italy but now played occasionally in other countries. It is played on boards, divided in 27 small squares, arranged in three horizontal rows; five squares in each row are marked with numbers between 1 and 90, four of the squares being left blank. Each person playing is provided with a board upon which he covers the space marked with the particular number called out by the dealer, who draws the counters from a bag. The player who first covers all the five numbers on any horizontal row is declared the winner.

Lo'tus, a popular name for a large number of unrelated plants, and also a generic name for certain plants of the natural order *Leguminosæ*. The genus contains between 50 and 100 species of herbs or sub-shrubs common in the temperate zones. They have trifoliate leaves; pea-shaped, yellow, red, or white flowers, generally in axillary umbels; and linear or oblong pods. The best known species are probably *L. corniculatus* and *L. tetragonolobus*, the former popularly known as bird's-foot trefoil and babies' slippers, the latter as winged pea. The former is a perennial often planted in dry soils for ornament and for forage; the latter, an annual whose young pods are eaten like string-beans, and the ripe seeds used as a substitute for coffee.

As a popular name, lotus is applied to various water-lilies, especially to certain African and Asiatic kinds, which were held to be sacred to national deities, and were also symbolical of the world, the residence of the gods and of beauty. The fruits of several plants known by this common name have been used for food; for instance, *Zizyphus lotus*, a close relative of but inferior to the jujube (q.v.), *Celtis australis*, the hackberry, *Nitraria tridentata*, *Rhamnus lotus*, and *Nelumbo lutea*, an American plant also known as water chinquapin and yellow water-lily.

The date, plum or persimmon is sometimes called lotus from the specific name of one of its species, *Diospyros lotus*, which by some writers is supposed to be the plant whose fruit was eaten by the fabled lotus-eaters, and whose juice made into wine caused these people to forget their native land. In this connection other plants have been similarly designated; for instance the blackberry and *Zizyphus lotus* mentioned above.

Lotus-eaters (Latin *Lotophagi*), in ancient Greek legends a people on the north coast of Africa who lived on the fruit of the lotus-tree. According to Homer they received Ulysses and his followers hospitably, but the sweetness of the fruit induced such a feeling of happy languor that they forgot their native land and ceased to desire to return to it, their sole object being to live in delicious dreamy idleness in Lotusland. See **LORUS**.

Lotze, Rudolph Hermann, German philosopher and physiologist: b. Bautzen, Saxony, 21 May 1817; d. Berlin 1 July 1881. He studied philosophy and medicine at Leipsic and in 1842 was appointed extraordinary professor of philosophy in that University, and in 1844 ordinary professor in Göttingen. In 1881 he filled the same chair in Berlin. His philosophical position is that of a teleological idealist, and he makes metaphysics to be destitute of all independent existence, apart from ethics. The Universe has its cause in the notion of the Good, which underlies all the phenomena and activities of the world. His position as a teleologist is the same as that of Asa Gray, and while allowing that mechanism obtains in the movements of the universe he denies that this excludes the possibility of creative design. Lotze is, however, considered to have done his most original work in the domain of psychology. He teaches that our space-consciousness is built out of the distinctive, non-spatial sense-attributes, which vary according to the locality of the sense-organs stimulated. Among his works are: 'Metaphysik' (1841); 'Logik' (1843); 'Mikrokos-

LOUBAT—LOUIS

mus' (1856-64); and 'Geschichte der Aesthetik in Deutschland' (1868).

Loubat, Joseph Florimond, zhō-zěf flō-rimōnd loo-bā, Duc DE, French author and philanthropist: b. New York 21 Jan. 1831. He was graduated from the University of Paris and has been a liberal giver to public institutions, among his benefactions of this character being a gift of \$1,000,000 to Columbia University, including valuable books and MSS. He has likewise given much to the Roman Catholic Church, and in recognition of this fact received his title of Duc de Loubat from Pope Leo XIII. in 1893. He has written: 'Narrative of the Mission to Russia in 1866 by G. V. Fox'; 'Medallion History of the United States.'

Loubet, Emile, ā-mēl loo-bā, French statesman: b. Marsanne (Drôme) 1838. He was graduated in law at Paris, in 1865 was admitted to the bar at Montélimar, attracted attention by his legal ability, became counsel for the Paris, Lyons, and Mediterranean railway, in 1869 was elected conseiller d'arrondissement, and 4 Sept. 1870 was chosen mayor of Montélimar. Elected in 1871 to the general council of the Drôme, of which he afterward (1885) became president, he was returned to the Chamber of Deputies for Montélimar in 1876, where he served with the Republican left until 1885. In 1885 he entered the Senate for the department of the Drôme, and from December 1887 until April 1888, when he retired with his colleagues of the ministry, filled with much credit the post of minister of public works in the Tirard cabinet. He was chairman of the finance committee of the Senate in 1890, chairman of the customs committee in 1893; and on 29 Feb. 1892 was made premier by President Carnot. His cabinet, in which he held the portfolio of the interior, lasted until November of that year, when its retirement was caused by attacks on its supposed laxity in the prosecution of the Panama case. In 1896 he was chosen president of the Senate. Upon the sudden death of President Faure (16 Feb. 1899), the National Assembly met in congress (18 February) and elected Loubet president of the Republic on the first ballot. His position in politics is that of a moderate Republican, without the tendency to Radical views sometimes ascribed to him. He has been not only a skillful administrator, but a close student of economic questions. He is a protectionist, though not of the extreme type, and an advocate of economy in finance, having made an able speech on financial reform in 1895. His administration as president has done much to strengthen the Republicans, and the Monarchist party has almost entirely disappeared as a serious factor in national affairs. Among the events of his term were the trial of Captain Dreyfus at Rennes, the strike of the miners at Montceau and of the dock-workers at Marseilles, and the enforcement of the association's law, with the attendant disturbances; but throughout all of these difficulties the government retained general confidence. See FRANCE, History.

Loudon, low'dōn, Fort, a name given to two forts built during the Colonial period, and intended for defense against the Indians. One built in 1750, was in Loudon County, Tenn., on the Tennessee River. An Indian massacre took place here a few years after the erection of the

fort. The other Fort Loudon was erected in 1752, near Winchester, Va. It was a square building with four bastions, mounting 24 guns. It was large enough to accommodate nearly 500 men.

Loughead, lō'hēd, Flora Haines, American novelist and journalist: b. Milwaukee, Wis., 12 July 1855. She was graduated from Lincoln University, and was married in 1875 to C. E. Appony, and in 1886 to John Loughead, a journalist. She has done much journalistic work in Chicago, Denver and San Francisco, and is the author of 'The Libraries of California' (1878); 'The Man Who Was Guilty' (1886); 'Handbook of Natural Science' (1886); 'Quick Cooking' (1890); 'The Abandoned Claim' (1890); 'The Man from Nowhere' (1892); 'Santos's Brother' (1892); 'A Crown of Thorns' (1892); 'The Black Curtain' (1897); 'The San Franciscan'; and of several plays.

Louis, loo'is (Fr. loo-ē), called "THE CHILD," king of Germany: b. 893; d. 911. He was the son of the Emperor Arnulfus, and succeeded him in 899. During his nominal kingship the government was mainly conducted by Archbishop Hatto of Mainz. At this time the empire was constantly ravaged by the Hungarians. He was the last prince in Germany of the Carolingian race.

Louis I., surnamed LE DEBONNAIRE, Roman emperor: b. 778; d. near Mainz, Germany, 20 June 840. He was a son of Charlemagne, was early appointed by his father King of Aquitania, and in 813 was named joint-regent of France, of which, in the following year, he became sole sovereign, as well as Emperor of the West. In 817 he divided his dominions among his three sons, and thereby gave rise to disturbances and contests which lasted during the whole period of his reign. In 829, in consequence of the solicitations of his second wife, Judith of Bavaria, who had borne him a son, Charles the Bald, he made a new division of the empire. In 830 the brothers Lothair and Pepin combined against their father, took him prisoner, charged their stepmother with adultery, and shut her up in a monastery. The design of Lothair to make himself sole sovereign having been discovered, the diet of Nimeguen obliged him to submit at discretion. Strife continued for the rest of Louis' life. In 837 Louis made a new division in favor of Charles, who obtained Neustria in addition to Aquitania. Though not without good qualities Louis had neither the statesmanship nor decision necessary for ruling so large an empire. He was succeeded as emperor by Lothair, to whose protection he had recommended his favorite son Charles.

Louis II., Roman emperor: b. about 822; d. Brescia 13 Aug. 875. He was the son of Lothair I., was made king of the Lombards in 844, and became emperor, in succession to his father, in 855.

Louis III., Roman emperor: b. about 880; d. about 924. He was the son of Boson, king of Provence, and Ermengarde, daughter of the Emperor Louis II. He succeeded his father on the throne of Provence at the age of 10, and in 900 contested the imperial throne with Berengar I., who, having surprised him at Verona, deprived him of his sight.

LOUIS

Louis IV., surnamed the **BAVARIAN**, Roman emperor: b. 1286; d. near Munich 11 Oct. 1347. He was the son of Louis the Severe, Duke of Bavaria, and succeeded his father in the dukedom, and was elected emperor in 1314. Frederick le Bel of Austria was also chosen at Cologne by another party of electors, and a war between the rivals ensued. Frederick was taken prisoner and only gained his liberty by renouncing his claims. Pope John XXII. then, in 1322, issued his bull of deposition against Louis, and the latter, appealing to a general council, went to Italy, where he declared the deposition of John and set up Peter de Corbiere as pope under the name of Nicholas V., by whom he was crowned at Rome. In 1328 the German electoral princes in a council at Rhense announced that the emperor's title to the German and imperial crowns were derived from his election by them and required no further sanction from the pope, the validity of which proceeding was not recognized by the Papacy.

Louis I., king of France. See **LOUIS I.**, Roman emperor.

Louis II., surnamed **LE BÈGUE** (the Stammerer), king of France: b. 846; d. Compiègne, France, 10 April 879. He was the son of Charles the Bald, was crowned King of Aquitaine in 867, and succeeded his father on the throne of France in 877. He was obliged to deliver up Provence to Boson, by whom it was erected into a kingdom. His children, Louis and Carloman, divided the kingdom between themselves and a posthumous son, afterward known as Charles the Simple.

Louis III., king of France: b. about 863; d. 822. He was the son of Louis II., and the brother of Carloman, with whom he divided the rule of the kingdom. He defeated Hugh the Bastard, son of Lothaire, marched against Boson, king of Provence, and successfully opposed the Normans at Saucourt, a battle recounted in the famous German poem, the 'Ludwigslied.'

Louis IV., surnamed **D'OUTREMER**, king of France: b. 921; d. September 954. He was the son of Charles the Simple and became king in 936, on the death of Rudolph of Burgundy. He invaded Normandy, but was defeated and taken prisoner in 944. He was set free the next year after being obliged to concede Normandy to Richard, son of Duke William, and Laon to Hugh, father of Hugh Capet.

Louis V., surnamed **LE FAINÉANT** (Do Nothing), king of France: b. 966; d. May 987. He was the last French monarch of the Carolingian dynasty. In spite of the name conferred upon him he was an active ruler. He succeeded his father Lothaire in 986, and soon after becoming king took the city of Rheims and was preparing to march to the assistance of the Count of Barcelona, hard pressed by the Saracens, when he is said to have been poisoned by his queen.

Louis VI., surnamed **LE GROS** (the Fat), king of France: b. about 1078; d. 1 Aug. 1137. He was the son of Philip I., with whom he was associated in the government in 1100, and whom he succeeded in 1108. His reign was greatly disturbed by contests with the Normans, and by feuds among his vassals. He quarreled with Henry I. of England, and thus was begun the struggle between the English and the French,

which continued three centuries. He was ably counseled by his minister, Abbé Suger. Consult: Luchaire, 'Louis VI. le Gros' (1889).

Louis VII., called **LE JEUNE**, king of France: b. about 1120; d. 18 Sept. 1180. He was the son of Louis VI., and succeeded him in 1137. He contested with Pope Innocent II. the right of presentation to benefices, and was excommunicated by Innocent and his kingdom placed under interdict. By the persuasions of St. Bernard, Louis embarked on the Second Crusade, but was defeated by Saladin, and while returning to Europe, was captured at sea by the Greeks, but afterward rescued by Roger, king of Sicily. His divorced queen, Eleanor of Aquitaine, married Henry of Normandy, afterward Henry II. of England, bringing with her as dowry the provinces of Poitou and Guienne. This caused a long war between England and France. Consult: Luchaire, 'Études sur les Actes de Louis VII.' (1885); Hirsch, 'Studien zur Geschichte König Ludwigs VII. von Frankreich' (1892).

Louis VIII., surnamed **THE LION**, king of France: b. 1187; d. Montpensier, Auvergne, France, 8 Nov. 1226. He was the son of Philip Augustus of France and married Blanche of Castile in 1200. Accepting the offer of the English crown made him by the English barons in 1216 he landed in England, took Rochester and Winchester and received the homage of the barons at London. On the death of John he was excommunicated by the legate and withdrew to France in September 1217. He succeeded his father in 1223, and soon regained most of the English possessions in France. In 1226 he led a crusade against Raymond, Count of Toulouse, and the Albigenses; took Avignon after a three months' siege, and laid waste Languedoc. Consult: Petit Dulailis, 'Étude sur la Vie et la Règne de Louis VIII.' (1894).

Louis IX., called **SAINT LOUIS**, king of France: b. Poissy, France, 25 April 1214; d. near Tunis, Africa, 25 Aug. 1270. He was the son of Louis VIII. and Blanche of Castile and came to the throne on the death of his father. Being only in his 12th year he was placed under the guardianship of his mother, who was made regent of the kingdom, and was declared of age in 1236. In 1243 Louis defeated the English in several engagements, and a truce for five years was concluded. Having made a vow, in the event of recovering from a dangerous disease, to march against the infidels in the Holy Land, he in 1248 embarked at Aigues-Mortes with an army of 50,000 men. This expedition proved disastrous and Louis with his army was captured by the Saracens. Damietta, which had been taken by the French, was demanded as the price of the monarch's freedom, and a vast ransom was also claimed for his followers. In 1254 he returned home, and in the interval Queen Blanche, who had ruled the kingdom well in his absence, had died. Louis now turned his attention to the administration of the law. The subjects were now suffered to appeal from the decision of their lords to four royal tribunals, and men of learning were introduced into the parliament. Louis also diminished the taxes. The code of laws known as the 'Établissements de St. Louis' is the work of some unknown compiler. In 1270 he undertook a crusade against Tunis, in the midst of which

LOUIS

enterprise he died. He was canonized by Boniface VIII. in 1297, and his friend, the Sieur de Joinville, wrote his life. Consult: Langlois, 'Saint Louis' (1887); Berger, 'Saint Louis et Innocent IV.' (1893); Lecoq de la Marche, 'La France sous Saint Louis' (1893); Berger, 'Histoire de Blanche de Castile' (1895).

Louis X., surnamed **LE HUTIN** (the Quarrel), king of France: b. Paris 1289; d. Vincennes 4 June 1316. Through his mother he inherited the kingdom of Navarre in 1305, and in 1314 he succeeded Philip the Fair, his father, on the throne of France. His posthumous son, John I., survived but a few months, and Louis' brother then succeeded as Philip V.

Louis XI., king of France: b. Bourges, France, 3 July 1425; d. Plessis-les-Tours, France, 30 Aug. 1483. He was the son of Charles VII., but in all respects very unlike him, and in 1440 he left the court and headed an insurrection against his father. Charles pardoned his son but the latter soon entering into new conspiracies was obliged to take refuge in Burgundy, and lived there five years in a dependent condition. On reaching the throne after the death of his father, in 1461, he dismissed the former ministers and surrounded himself with obscure men, having neither character nor talents to recommend them. In all his acts a crooked policy and sinister views were evident. Pretending to reconcile contending parties, he secretly instigated them against each other, and when negotiating with a foreign government he bribed its messengers and established secret correspondences with them. He carried on a war with Charles the Bold, Duke of Burgundy, which lasted 1465-72, and on the death of Charles in 1477 at the battle of Nancy, he joined Burgundy to France. In 1481 he united Anjou, Maine and Provence to the kingdom. Consult: See, 'Louis XI. et les Villes' (1893); Kitchin, 'History of France,' Vol. I. (1885).

Louis XII., surnamed **the FATHER OF HIS PEOPLE**, king of France: b. Blois, France, 27 June 1462; d. 1 Jan. 1515. He was the son of Charles, Duke of Orleans, and on coming to the throne in 1498 he pardoned all who had wronged him previously. His reign was continually disturbed by war. He subdued the Milanese, Genoa, and Naples; but in 1513 the French were expelled from Italy. Henry VIII. of England, attacking Louis in his own dominion, Louis was obliged to sue for peace after the Battle of the Spurs in August 1513. For his third wife he married the young Princess Mary, sister of Henry VIII., who after his death was married to her first lover, Charles Brandon, Duke of Suffolk. Louis XII. was honest and magnanimous; he was friendly to science, and France prospered under him. Consult: Lacroix, 'Louis XII. et Anne de Bretagne' (1882); Claviere, 'Histoire de Louis XII.' (1890 et seq.).

Louis XIII., king of France: b. Fontainebleau, France, 27 Sept. 1601; d. Saint Germain-en-Laye, France, 14 May 1642. He was the son of Henry IV., whom he succeeded under the regency of his mother, Mary de Medicis. In 1614 he was declared of age and the next year he married Anne of Austria. The realm was now in a very disturbed state. The Huguenots were threatening and a great part of the kingdom rebelled. In 1624 Louis chose Cardinal

Richelieu as his prime minister, and the remainder of his reign was to all purposes that of the great cardinal. Under him the Huguenot power was broken, politically, the governmental power centralized and the influence of Austria materially weakened. Consult: Raumer, 'Geschichte Ludwigs XIII. und des Kardinals Richelieu' (1830); Topin, 'Louis XIII. et Richelieu' (1876); Zeller, 'La Minorité de Louis XIII.' (1897). See **RICHELIEU**.

Louis XIV., king of France; b. Saint Germain-en-Laye 5 Sept. 1638; d. Versailles 1 Sept. 1715. He was only 5 years old when he succeeded to the throne, but his mother, Anne of Austria, was made regent during his nonage which ended in 1651, when he was 13. Cardinal Mazarin was then prime minister and the French army under the leadership of Condé and Turenne was gaining much glory in the war with Spain and the emperor. But internally the nation was in the throes of a civil war; Mazarin's avarice and the speculations of Fouquet had disgusted the Parisians, who were moreover incensed with Anne of Austria's conduct of the regency and the supremacy of her agent the cardinal. The king and his mother were compelled with the unpopular prime minister to flee from the capital, and the Spanish armies streamed over the northeast boundaries from Holland and held their way victoriously through Champagne and Lorraine. When war broke out between England and Holland Louis threw his strength on the side of the latter; but the conflict was largely confined to the sea, and after a few sea fights the war was ended by the Peace of Breda in 1667. Mazarin had died in 1661, Fouquet was condemned to perpetual imprisonment after being compelled to disgorge his ill-gotten gain, and when the king was asked who was to be referred to on matters of public business he astonished his courtiers by saying "Myself." And indeed he reigned as absolute monarch to the end of his days. He appointed Colbert to take charge of the public exchequer, and the consequence was a multitude of needed reforms. He had forced the court of Spain as well as Pope Alexander VII. to submit to his personal dictation and make ample reparation for the wrongs suffered by French ambassadors at the hands of Spaniards and Italians in foreign capitals. All Europe was impressed by his bold self-assertion, and his well-known saying "*L'état c'est moi*," "I am the state," was felt to be literally true. But his great desire was the attainment of military glory. When a child his chief amusement had been to turn his playmates into soldiers and engage in a mimic war. After his victorious campaign in Holland, closed by the Treaty of Nimeguen in 1678, he was acknowledged to be the leading sovereign in Europe. He had the most numerous, the best drilled, the best equipped army in the world. His diplomacy had triumphed in every court, and the French nation led Europe in art, science and letters, while trade and industry were amazingly flourishing. Louis shone among his ministers, generals and literary courtiers as the sun among the stars, an ideal king, a paragon of learning, strength and wisdom. At Versailles he built himself a palace at a cost of 150,000,000 francs. Here the splendor of his surroundings was the envy and admiration of all other monarchs, great and small. But his wisdom and political sagacity were much criti-

LOUIS

cised when in 1685 he revoked the Edict of Nantes by which the policy of Henry IV. had made certain indulgences to Calvinists of France. By unsheathing the sword of religious persecution he drove away many citizens whose industrial skill and steady lives formed one of the stablest and most precious elements in French national life. Soon after this half of Europe formed a league against France. Holland, Germany and Spain joined their forces in an attempt to humble the overweening arrogance of a monarchy whose greatness was a menace to each of them. In 1688 the dauphin took Philipburg on the Rhine, but was forced to evacuate and retreat before the overwhelming forces of the allies. The war continued with varied fortunes until the peace of Ryswick, 1697. The death of Charles II. of Spain, the last of the house of Hapsburg (1700), brought on the war of the Spanish Succession. He left his crown to Philip of France, Duke of Anjou, who assumed the title of Philip V., but his claim was disputed by the Archduke Charles, who had the support of the emperor, as well as of Holland and England. In 1704 Prince Eugene and Marlborough routed the French forces at Blenheim, Barcelona surrendered to the Archduke Charles, Marlborough won the battle of Ramillies and in 1708 that of Oudenarde. The fatal defeat of Malplaquet the following year decided the struggle in favor of the allies and the Peace of Utrecht (1713) completed the humiliation of France and added to the power and ascendancy of England. France was, however, saved from dismemberment, mainly through the boldness and vigor of Louis and his counsellors, and the principal foreign conquests of the king were not forfeited. For the two remaining years of his reign the country enjoyed tranquillity. Louis in his declining years expressed regret for the distress he had brought on his well-loved country by his love of foreign conquest and warlike glory. His unworthy private life had some part in rousing the remorse which tortured his last days, and caused him to show that spirit of piety and devotion which Lesage ridiculed as hypocrisy. His mistresses, La Vallière, Montespan, Fontanges, and others had made his court a by-word of scandal. Madame de Maintenon, who was married to him a year after the death of his queen Maria Theresa (1683), was influential in rousing his sense of past licentiousness. In this she was aided by the eloquence of Bossuet.

The reign of Louis le Grand was made brilliant by the great soldiers, sailors, literary men, artists, and men of science who were his contemporaries. His reign has indeed been aptly styled the Augustan or golden age of France. Among his sea commanders were Château-Renand, Duquesne, and Tourville; Vauban was his military engineer; Perault, Mansart and Blondel architects; among his painters were Claude Lorraine, Poussin and Lebrun; among poets and writers of his reign were Corneille, Racine, Molière, among his great preachers were Massillon, Bossuet and Flechier. He was worthy of the title of the Great Monarch for his strong and astute statecraft, the magnificence of his court, his dignity and munificence, and he fixed for the French monarchy that type of absolutism which Balzac has declared to be in France the safest and best foundation on which national greatness was to be developed.

Consult: Voltaire, 'Siècle de Louis XIV.'; Hassall, 'Louis XIV. and the Zenith of the French Monarchy' (1895); and Philippon, 'Das Zeitalter Ludwigs des Vierzehnten' (1879).

Louis XV., king of France: b. Versailles, France, 15 Feb. 1710; d. there 10 May 1774. He was the great-grandson and successor of Louis XIV., and coming to the throne when only five years old, Philip, Duke of Orleans, was made regent. Louis was declared of age in 1723 and married Marie Leczinska, daughter of the king of Poland. The Duke of Orleans died that year and was succeeded as prime minister by the Duke of Bourbon, who was removed in 1725 to make way for Cardinal Fleury, who died in 1743. After the Cardinal's death the king's mistresses, Pompadour and Du Barry, controlled the election of the prime minister and other officers. In 1741 France became entangled in the war of the Austrian Succession against Austria but in 1756 was involved in the Seven Years' war, in which Austria was the ally of France. This was ended by the Peace of Paris in 1763. By this treaty Louisiana and Canada were lost to France. The kingdom was left impoverished at the death of Louis, partly by war and partly through the enormous sums squandered upon the royal mistresses. Consult: De Tocqueville, 'Histoire philosophique du Regne de Louis XV.' (1846).

Louis XVI., king of France: b. Versailles 23 Aug. 1754; d. Paris 21 June 1793. He was the third son of Louis and of Marie Josepha, daughter of Frederic Augustus, king of Poland and elector of Saxony. During the lifetime of Louis XV. he bore the title of Duke of Berri. Amid the corruptions of the French court he kept aloof from licentiousness, was reserved and taciturn, and took most delight in practising some mechanical art, such as lock-making or printing. In 1770 he was married to Marie Antoinette, archduchess of Austria, and four years later became a king by the death of his grandfather. He began his reign with many popular measures tending to alleviate the financial distress under which the country labored, and his appointment of Turgot as minister of finance gave general satisfaction. The people were moreover pleased to see the parliaments again convened (1774), and the king set an example of national economy and retrenchment by the simplicity of his personal life, and the reduction of his retinue. The war of the American Revolution had sent Franklin and Deane to Paris to ask help for the young republic. Louis XVI. was weak enough to take sides with the English colonists against their mother country, and the French and English war cost France an amount of treasure that almost plunged her into bankruptcy. At the same time French enthusiasm, roused in favor of republicanism, caused a feeling to prevail which threatened to endanger the stability of the monarchy. Necker by his attempts at reform and economy so offended the nobility that he was compelled to resign and was succeeded by the reckless and wasteful Calonne. The queen was meanwhile very unpopular, and the affair of the "Diamond Necklace" (q.v.) was made to aggravate public disaffection toward the throne. The notables met in 1787, but rejected a measure for universal taxation which would comprise the notables and clergy of the realm. Calonne, the finance minister, resigned, bankruptcy menaced the nation and Necker was

LOUIS

recalled, and suggested the convening of the States-General. The assembly met amid great popular excitement in May, 1789, at Versailles, a series of reforms in public expenditure was begun, and the country was filled with enthusiasm. Necker sought to reproduce on French soil the limited monarchy of Great Britain. Louis proposed concessions, which were coldly greeted, and when he dissolved the assembly, Mirabeau, who sat in the third estate, defied the royal power, and refused, in the name of the people, to obey the mandate of dissolution. So great meanwhile was the excitement and anxiety which reigned in Paris that a national guard was formed with Lafayette for a commander. The king vacillated, dismissed Necker, surrounded Paris with his army and the people rose in a burst of frenzy and sacked the Bastille. The king ordered the approach of the troops on Paris, but to conciliate the people appeared at Hotel de Ville wearing the tricolor. Meanwhile the princes of the blood and the nobles were leaving the country. Necker was recalled, and the king returned to Versailles, but on 5 October the mob took possession of the royal palace there, and compelled the king and the royal family to return with them to Paris, where they were kept strictly guarded in the Tuileries. There they were confined as prisoners till the following year (1790). Necker had fled to Switzerland, Mirabeau, the one hope of the monarchy, had died. The king made an attempt to visit St. Cloud (1791) but was prevented by the mob. He then escaped unnoticed from the Tuileries, but was stopped at Varennes, 150 miles from Paris. The invasion of France by the Prussians and Austrians roused the Parisians to fury. They stormed the Tuileries and massacred the Swiss guard; the royal family were flung into the ancient fortress known as the Temple. The national convention met on 20 September; in December they brought the king to trial on a charge of conspiring to overthrow the constitution and restore the ancient order of things. He was condemned by unanimous vote 5 Jan. 1793 and was guillotined. Consult Bouvet, 'Histoire de Louis XVI.' (1825); Jobez, 'La France sous Louis XVI.' (1877-93); Beaucourt, 'Captivité et derniers Moments de Louis XVI.' (1892); Courian, 'Louis XVI. et la Révolution' (1893).

Louis XVII., titular king of France: b. Versailles 27 March 1785; d. Paris 8 June 1795. He was the second son of Louis XVI. and Marie Antoinette; was at first styled Duc de Normandie; and after the death of his elder brother, in 1789, became heir to the throne. With his relatives, in 1792, he was imprisoned in the Temple; after his father's death in the following year was styled king by the Royalists; but being given into the keeping of a shoemaker named Simon, in derision called his tutor, was subjected to brutal treatment, from which he died. The fact of his death was denied by certain impostors, whose claims to his name and to the throne found some supporters. Such claims continued to be urged almost down to the middle of the 19th century, about which time Eleazar Williams (q.v.) a half-breed Indian missionary, born in the State of New York, was led to believe that he was the lost dauphin, he and his friends declaring that he had been delivered from prison and while still very young brought to this country. He died in 1858. Although Williams made lit-

tle attempt to enforce his own claim, others argued it, and a book was written in its support. But nothing in the nature of historical proof has been established to cast doubt on the actual death of the dauphin as above related. Consult: Hanson, 'The Lost Prince' (1854); Bülow, 'Geheime Geschichten und rätselhafte Menschen,' Vol. II. (2d ed. Leipsic 1863); Evans, 'The Story of Louis XVII. of France' (1893); Chantelauze, 'Louis XVII., son Enfance, sa Prison, et sa Mort au Temple' (1895).

Louis XVIII., "Stanislaus Xavier" (given the title of LE DESIRÉ, by the Chamber of Deputies), king of France: b. Versailles, France, 17 Nov. 1755; d. Paris 16 Sept. 1824. As the younger brother of Louis XVI. he was designated Monsieur, his rank in the nobility being Count of Provence. He early showed himself a political marplot, a hinderer of reform, and one of the great obstacles to his brother's success in handling the difficulties of the revolutionary movement. When the king escaped from the guards of the Tuileries (1791), Monsieur was by his side, and while Louis XVI. was seized and taken back to confinement, escaped to the frontier. With his brother, the Count d'Artois, he held court for some time at Coblenz, where he issued animadversions on the revolutionists in France, and seriously complicated the difficulties of the royalist cause by his want of temper and judgment. When the Duke of Brunswick invaded France, Monsieur and the Count d'Artois joined his forces and shared his disasters. On the death of Louis XVI. (1793) the Count of Provence declared his nephew king, and when Louis XVII. died (1795) he took the title of king of France. He wandered from court to court of Europe, and finally settled in England (1807), where he remained until the fall of Napoleon. At last he crossed the Channel and entered Paris (3 May 1814) after an absence of twenty-three years. His reign was inaugurated with the bitter retaliatory measures of the White Terror (q.v.). When Napoleon made his escape from Elba and arrived at Paris (1 March 1815) the unpopularity of the Bourbon restoration was proved by the enthusiasm and devotion of those who flocked to his standard. The king fled from Paris, but, after the battle of Waterloo, was once more restored, entered the capital under the protection of victorious Wellington, and appointed a new ministry with Talleyrand at the head of it. Louis proceeded to disband the army, to exclude from the general amnesty those who came under the head of "rebels," those who had voted for the death of Louis XVI. and were consequently "regicides," and those who had received rank and honors from Napoleon in 1815. The rest of his reign was satisfactory neither to Blues nor Reds, and the real stay of the country was the Duc de Richelieu, the successor of Talleyrand. In accordance with the policy of the Holy Alliance the despotic Ferdinand VII. was re-established on the Spanish throne by a French army (1823) and the last year of the king's life was spent in disease, followed by paralysis, which carried off a feeble and illiberal monarch whose only work in life had been to prove that political disquiet in France had not been and was not to be allayed, by the restoration of the Bourbons. Consult Dulaure and Anguis, 'Histoire de la Révolution depuis 1814 jusqu'à 1830' (1834-8); Viel Castel, 'Histoire de la Restauration' (1860 et seq.).

LOUIS PHILIPPE — LOUISBURG

Louis Philippe, fê-lêp, king of the French: b. Paris 6 Oct. 1773; d. Claremont, near Windsor, England, 26 Aug. 1850. He was the eldest son of Duke Louis Philippe Joseph of Orleans, afterward surnamed Egalité, and of the Princess Louise Marie Adelaide of Penthièvre. In infancy he held the title of Duke of Valois, and in 1785 that of Duke of Chartres. In 1782 his father entrusted the education of Louis Philippe and his other children to Madame de Genlis. Having entered the national guard in 1790, he became a member of the Jacobin Club. In May 1792 he commanded a brigade of cavalry in Luckner's army, rose under Kellerman in September to be lieutenant-general, and did good service in the famous cannonade at Valmy. He next joined the army of Dumouriez, and took part in the victory of Jemappes. Dumouriez had formed a scheme for placing him on the constitutional throne, and being included in the order of arrest directed against Dumouriez, in April 1793 he took refuge within the Austrian territory. After many wanderings he procured the situation of teacher of geography and mathematics in the school of Reichenau, near Coire, where, during eight months, he passed under the name of Chabaud-Latour. In 1796 Louis Philippe, since his father's death, Duke of Orleans, arrived in America, where, in the following year, he was joined by his two younger brothers. The three princes traveled in the United States, and at last took ship for England, where they landed in 1800. The brothers lived above seven years at Twickenham, near London. After the news of Napoleon's downfall the Duke of Orleans set out for Paris, where he was received by Louis XVIII., not without distrust, and in 1814 appointed colonel of hussars. On the news of Napoleon's return he set out for Lyons to assist the operations of the Count d'Artois. After an unsuccessful attempt to hold the northern departments for the Bourbons, he left Lille and set out for England to join his family, who had preceded him. He returned in July 1815 and obtained the removal of the sequestration of his domains which had been imposed by the imperial government. The estrangement of Louis XVIII. from him was, however, increased, and he withdrew in October 1815 to England, but returned to Paris in the following year. After the coronation of Charles X. his relation to the court became more friendly. During the bloody days of 27, 28 and 29 July, the court had entirely forgotten him. Nor during the struggle was his name mentioned in Paris. On the 29th the provisional chamber, on Laffitte's suggestion, resolved to offer him the regency as lieutenant-general of the kingdom. In a sitting of the chamber on 9 August he swore to the reform charter, and ascended the throne as king of the French. Being hated by the extreme Democrats, frequent attempts were made on his life; but during this period France made vast progress in industry and wealth, and the durability of the July throne seemed to be thereby consolidated. But his selfish policy had estranged the European courts, and a loud demand for a change in the electoral system being foolishly opposed by the king and the Guizot ministry, his position in France became extremely precarious. On 22 Feb. 1848 an insurrection began in the streets of Paris. Next day Guizot gave in his resignation; but the insurrection gained in extent and intensity, and neither the command given to the troops on the

morning of the 24th to stop firing, nor the abdication of the king a few hours after in favor of his grandson, the Count of Paris, sufficed to lay the storm. Louis Philippe, completely disheartened, unsupported by any administration, and forsaken even by the courtiers, about midnight of 24 February quitted the Tuileries with his family, and fled from Paris, and on 3 March 1848 took up his residence in England, which he never again left.

Louis Quatorze, loo'ê-kä-tôrz', a term applied to a style of architecture and internal decoration which prevailed in France in the reign of Louis XIV., and was especially employed in palaces, mansions and large buildings. It was marked by a lavish application of the Roman columnar orders. The principal architect of the style was Jules Hardouin Mansart (q.v.). The windows were larger, the rooms more lofty, than in the preceding period, and in everything there was a striving after pomp and sumptuousness. In internal decorations gilt stucco work was largely used, while the scroll and shell patterns prevailed as features of ornamental decorations.

Louis Quinze, loo'ê-känz', a term applied to the architecture and internal ornamentation prevailing in France during the reign of Louis XV. This style was generally employed in the state apartments of castles and palaces and the mansions of the aristocracy. In the treatment of architectural forms free scope was given to the most fantastic combinations, while the ordinary and characteristic details were volutes, shell-fish and scrolls, groups of fruit, and flowers.

Louis D'Or, loo'ê dôr (Fr. "golden Louis"), a gold coin formerly current in France. It was first struck in consequence of an edict of Louis XIII. dated 31 March 1640. It was 22 carats fine, and originally was worth 10 livres of the period (equal to 21 francs 33 centimes). Afterward it ranged in value from about \$4 to \$4.60. In 1810 the louis d'or was replaced by the napoleon of 20 francs, and when the coin was again struck under the restoration the same value (20 francs) was retained.

Louis, Order of, a French order founded in 1693 for military service. It was abolished at the Revolution, was restored by Louis XVIII., and ceased to exist in 1830. It was named after its founder, Louis XIV.

Louisa, loo-é'za, queen of Prussia. See LUISE, AUGUSTE WILHELMINE AMALIE, QUEEN OF PRUSSIA.

Louisa, Order of, a Prussian order founded in 1814 by Frederick William III. in memory of Queen Louisa. Its membership was limited to 100. In 1848 and 1849 the order was bestowed on Prussian women who rendered service caring for the wounded, and was bestowed for like services in 1866 and 1871.

Louisburg, loo'is-bêrg or loo'ê-bêrg, Nova Scotia, town, on Cape Breton Island; on the coast at the entrance to the Gulf of St. Lawrence. In 1713, by the Peace of Utrecht, the French came into possession of Cape Breton Island. At a cost of about \$5,000,000 and 30 years of labor, fortifications were built, which made Louisburg the commanding point at the Atlantic entrance to the Saint Lawrence and the Great Lakes. It was made the rendezvous of the French fleet. The New England colonists

LOUISEVILLE — LOUISIANA

claimed that the French prevented them from fishing in the waters around Newfoundland, and that their cod-fishing was in danger of being destroyed. In 1745, the New Englanders in union with a British squadron attacked Louisburg and succeeded in capturing the town. In 1748, under the treaty of Aix-la-Chapelle, the place was restored to France; but in 1758 the British again captured it, and it has ever since been under British rule. The thriving French fishing town has become only a stopping-place for steamers and coast vessels; and the once grand fortifications are now few straggling ruins.

Louiseville, loo'èz-vîl, or **Rivière du Loup**, rê-vê-â dü loo, Canada, town, capital of Maskinongie County, in the province of Quebec; on Lake Saint Peter, an expansion of the Saint Lawrence River; and on the Canadian Pacific railroad; about 18 miles west of Three Rivers. The mineral springs of Saint Léon, in the vicinity, bring many people to Louiseville. The chief industry is tanning leather, but flour and dairy products are among the manufactures. Pop. (1901) 1,055.

Louisiade (loo-ê-zê-âd) **Archipelago**, in the Coral Sea, southeast of New Guinea; belongs, administratively, to British New Guinea. The largest islands of the group are Southeast (Sudest) Island, Saint Aignan, and Rossel. Southeast Island is about 45 miles long and from 4 to 10 miles wide. Rossel and Saint Aignan each have an area of over 100 square miles. They are all mountainous. Saint Aignan has a peak about 3,500 feet in height. Many of the small islands are of coral formation; and the vegetation is varied and luxuriant. The islands were discovered in 1666 by Torfès, and became British possessions in 1888. The majority of the inhabitants are uncivilized, and are of the Papuan race.

Louisiana, one of the United States, bordering on the Gulf of Mexico; one of the largest and most important of the Southern States. The name "Louisiana" was first applied by La Salle in 1683 to the vast territory watered by the Mississippi and its tributaries, which he thus dedicated to King Louis XIV.

It was the fifth State admitted to the Union under the Federal Constitution. It lies between lat. 28° 59' and 33° N., and lon. 88° 40' and 94° W. Its extreme length is 300 miles, and extreme width 240 miles, with an area of 41,346 square miles. It is bounded on the north by Arkansas on parallel of 33° to the Mississippi and thence on the parallel of 31° to eastward Pearl River, on south by the Gulf of Mexico, on the west by the Sabine River and a line drawn from it directly north to meet the 33° parallel. Within these limits are included 445,420 square miles of land and 3,300 of water, 540 in rivers and 2,760 in lakes. The State is divided into 59 parishes gradually created from the five original divisions under French and Spanish domination.

Rivers and Lakes.—The Mississippi River in its devious course splits Louisiana in twain with 37,000 square miles on the western bank. With but rare interruptions the river flows through alluvial soils of low elevation requiring the protection of levees. The coast line of the delta and eastward consists of lands little above

sea level intersected by small tracts of elevated prairies and low ridges covered with live oak. Northwestward the land rises until in north Louisiana the hills attain the height of 500 feet. Both on the Mississippi and the other river valleys, the highest land is formed by the banks themselves, from which the land slopes away gradually to the marshes. To protect these low-lying lands there have been built at vast expense some 1,500 miles of levees of great strength. These, however, give way occasionally before the mass of waters brought down by the Mississippi in flood, and great damage results. (See **LEVEE**.) The drainage system of the State is toward the Gulf and mainly through the Mississippi and its tributaries, the Red River and the Ouachita. On the east Pearl River and on the west the Calcasieu River and the Sabine, which divides Louisiana from Texas — each drain small districts. The Red River formerly flowed directly to the Gulf of Mexico. Its old channel is now filled by the Atchafalaya, which has increased so rapidly of late years as to give rise to fears of its becoming the main channel of the Mississippi. The lakes of Louisiana are of three kinds. Those on the coast are shallow estuaries enclosed within the delta, of which the greatest are lakes Pontchartrain and Maurepas. At the entrance to the former is Lake Borgne. A second class is formed by the curved sections of the river which are cut off and silted up as in the smaller rivers by the action of accumulated debris and rafts of driftwood such as are found above Shreveport. These are rapidly disappearing through the removal of the obstructions, and the lands are being reclaimed.

Of the 28,000,000 acres of land in the State only 3,000,000 are in cultivation. Nearly the entire upland is covered by strata of drift or red sandy clays. One thousand nine hundred square miles are alluvial. The soil next the river is the lightest or soundest, the surface of the backlands consists of a peculiarly friable soil known as buckshot to such a depth as to permit of the deepest cultivation and with a high absorptive power which secures crops against drought. South of the Red River the soils are less varied in character, but all are rich in the essential elements of plant food and require only drainage and good culture to produce excellent crops. The land is distributed as follows: Alluvial lands, 13,225 square miles; bluff prairies, 5,739 square miles; oak uplands, 8,103 square miles; long-leaf pine hills, 7,582 square miles; long-leaf pine flats, 2,556 square miles; central prairies, 785 square miles; coast marshes, 7,420 square miles.

Geology and Mineralogy.—The entire State is part of the Mississippi deposit on the bottom of an ancient gulf whose shore touched Cairo, Ill. Its oldest sediments were Cretaceous, now covered except in a few small spots in the northwest. The upland region west of the northern course of the Calcasieu, and of the Washita, is a mass of horizontal Tertiary beds, clays, and clay sandstones. The entire alluvial region and coast swamps, besides much bordering prairie, is Quaternary. Such formations could hardly be rich in minerals, and though some iron ore and low-grade brown coal are found in the Tertiary districts, the only important minerals are rock salt, sulphur and petroleum. The salt is found in the chain of isolated hills known as Islands,

LOUIS PHILIPPE — LOUISBURG

Louis Philippe, fê-lêp, king of the French: b. Paris 6 Oct. 1773; d. Claremont, near Windsor, England, 26 Aug. 1850. He was the eldest son of Duke Louis Philippe Joseph of Orleans, afterward surnamed Egalité, and of the Princess Louise Marie Adelaide of Penthièvre. In infancy he held the title of Duke of Valois, and in 1785 that of Duke of Chartres. In 1782 his father entrusted the education of Louis Philippe and his other children to Madame de Genlis. Having entered the national guard in 1790, he became a member of the Jacobin Club. In May 1792 he commanded a brigade of cavalry in Luckner's army, rose under Kellerman in September to be lieutenant-general, and did good service in the famous cannonade at Valmy. He next joined the army of Dumouriez, and took part in the victory of Jemappes. Dumouriez had formed a scheme for placing him on the constitutional throne, and being included in the order of arrest directed against Dumouriez, in April 1793 he took refuge within the Austrian territory. After many wanderings he procured the situation of teacher of geography and mathematics in the school of Reichenau, near Coire, where, during eight months, he passed under the name of Chabaud-Latour. In 1796 Louis Philippe, since his father's death, Duke of Orleans, arrived in America, where, in the following year, he was joined by his two younger brothers. The three princes traveled in the United States, and at last took ship for England, where they landed in 1800. The brothers lived above seven years at Twickenham, near London. After the news of Napoleon's downfall the Duke of Orleans set out for Paris, where he was received by Louis XVIII., not without distrust, and in 1814 appointed colonel of hussars. On the news of Napoleon's return he set out for Lyons to assist the operations of the Count d'Artois. After an unsuccessful attempt to hold the northern departments for the Bourbons, he left Lille and set out for England to join his family, who had preceded him. He returned in July 1815 and obtained the removal of the sequestration of his domains which had been imposed by the imperial government. The estrangement of Louis XVIII. from him was, however, increased, and he withdrew in October 1815 to England, but returned to Paris in the following year. After the coronation of Charles X. his relation to the court became more friendly. During the bloody days of 27, 28 and 29 July, the court had entirely forgotten him. Nor during the struggle was his name mentioned in Paris. On the 20th the provisional chamber, on Laffitte's suggestion, resolved to offer him the regency as lieutenant-general of the kingdom. In a sitting of the chamber on 9 August he swore to the reform charter, and ascended the throne as king of the French. Being hated by the extreme Democrats, frequent attempts were made on his life; but during this period France made vast progress in industry and wealth, and the durability of the July throne seemed to be thereby consolidated. But his selfish policy had estranged the European courts, and a loud demand for a change in the electoral system being foolishly opposed by the king and the Guizot ministry, his position in France became extremely precarious. On 22 Feb. 1848 an insurrection began in the streets of Paris. Next day Guizot gave in his resignation; but the insurrection gained in extent and intensity, and neither the command given to the troops on the

morning of the 24th to stop firing, nor the abdication of the king a few hours after in favor of his grandson, the Count of Paris, sufficed to lay the storm. Louis Philippe, completely disheartened, unsupported by any administration, and forsaken even by the courtiers, about midnight of 24 February quitted the Tuileries with his family, and fled from Paris, and on 3 March 1848 took up his residence in England, which he never again left.

Louis Quatorze, loo'ê-kâ-tôrz', a term applied to a style of architecture and internal decoration which prevailed in France in the reign of Louis XIV., and was especially employed in palaces, mansions and large buildings. It was marked by a lavish application of the Roman columnar orders. The principal architect of the style was Jules Hardouin Mansart (q.v.). The windows were larger, the rooms more lofty, than in the preceding period, and in everything there was a striving after pomp and sumptuousness. In internal decorations gilt stucco work was largely used, while the scroll and shell patterns prevailed as features of ornamental decorations.

Louis Quinze, loo'ê-kânz', a term applied to the architecture and internal ornamentation prevailing in France during the reign of Louis XV. This style was generally employed in the state apartments of castles and palaces and the mansions of the aristocracy. In the treatment of architectural forms free scope was given to the most fantastic combinations, while the ordinary and characteristic details were volutes, shell-fish and scrolls, groups of fruit, and flowers.

Louis D'Or, loo'ê dôr (Fr. "golden Louis"), a gold coin formerly current in France. It was first struck in consequence of an edict of Louis XIII. dated 31 March 1640. It was 22 carats fine, and originally was worth 10 livres of the period (equal to 21 francs 33 centimes). Afterward it ranged in value from about \$4 to \$4.60. In 1810 the louis d'or was replaced by the napoleon of 20 francs, and when the coin was again struck under the restoration the same value (20 francs) was retained.

Louis, Order of, a French order founded in 1693 for military service. It was abolished at the Revolution, was restored by Louis XVIII., and ceased to exist in 1830. It was named after its founder, Louis XIV.

Louisa, loo-ê'za, queen of Prussia. See LUISE, AUGUSTE WILHELMINE AMALIE, QUEEN OF PRUSSIA.

Louisa, Order of, a Prussian order founded in 1814 by Frederick William III. in memory of Queen Louisa. Its membership was limited to 100. In 1848 and 1849 the order was bestowed on Prussian women who rendered service caring for the wounded, and was bestowed for like services in 1866 and 1871.

Louisburg, loo'is-bêrg or loo'ê-bêrg, Nova Scotia, town, on Cape Breton Island; on the coast at the entrance to the Gulf of St. Lawrence. In 1713, by the Peace of Utrecht, the French came into possession of Cape Breton Island. At a cost of about \$5,000,000 and 30 years of labor, fortifications were built, which made Louisburg the commanding point at the Atlantic entrance to the Saint Lawrence and the Great Lakes. It was made the rendezvous of the French fleet. The New England colonists

LOUISEVILLE — LOUISIANA

claimed that the French prevented them from fishing in the waters around Newfoundland, and that their cod-fishing was in danger of being destroyed. In 1745, the New Englanders in union with a British squadron attacked Louisburg and succeeded in capturing the town. In 1748, under the treaty of Aix-la-Chapelle, the place was restored to France; but in 1758 the British again captured it, and it has ever since been under British rule. The thriving French fishing town has become only a stopping-place for steamers and coast vessels; and the once grand fortifications are now few straggling ruins.

Louiseville, loo'èz-vîl, or **Rivière du Loup**, rê-vê-â dü loo, Canada, town, capital of Maskinongé County, in the province of Quebec; on Lake Saint Peter, an expansion of the Saint Lawrence River; and on the Canadian Pacific railroad; about 18 miles west of Three Rivers. The mineral springs of Saint Léon, in the vicinity, bring many people to Louiseville. The chief industry is tanning leather, but flour and dairy products are among the manufactures. Pop. (1901) 1,055.

Louisiade (loo-ê-zê-äd) **Archipelago**, in the Coral Sea, southeast of New Guinea; belongs, administratively, to British New Guinea. The largest islands of the group are Southeast (Sudest) Island, Saint Aignan, and Rossel. Southeast Island is about 45 miles long and from 4 to 10 miles wide. Rossel and Saint Aignan each have an area of over 100 square miles. They are all mountainous. Saint Aignan has a peak about 3,500 feet in height. Many of the small islands are of coral formation; and the vegetation is varied and luxuriant. The islands were discovered in 1666 by Torfès, and became British possessions in 1888. The majority of the inhabitants are uncivilized, and are of the Papuan race.

Louisiana, one of the United States, bordering on the Gulf of Mexico; one of the largest and most important of the Southern States. The name "Louisiana" was first applied by La Salle in 1683 to the vast territory watered by the Mississippi and its tributaries, which he thus dedicated to King Louis XIV.

It was the fifth State admitted to the Union under the Federal Constitution. It lies between lat. 28° 59' and 33° N., and lon. 88° 40' and 94° W. Its extreme length is 300 miles, and extreme width 240 miles, with an area of 41,346 square miles. It is bounded on the north by Arkansas on parallel of 33° to the Mississippi and thence on the parallel of 31° to eastward Pearl River, on south by the Gulf of Mexico, on the west by the Sabine River and a line drawn from it directly north to meet the 33° parallel. Within these limits are included 445,420 square miles of land and 3,300 of water, 540 in rivers and 2,760 in lakes. The State is divided into 59 parishes gradually created from the five original divisions under French and Spanish domination.

Rivers and Lakes.—The Mississippi River in its devious course splits Louisiana in twain with 37,000 square miles on the western bank. With but rare interruptions the river flows through alluvial soils of low elevation requiring the protection of levees. The coast line of the delta and eastward consists of lands little above

sea level intersected by small tracts of elevated prairies and low ridges covered with live oak. Northwestward the land rises until in north Louisiana the hills attain the height of 500 feet. Both on the Mississippi and the other river valleys, the highest land is formed by the banks themselves, from which the land slopes away gradually to the marshes. To protect these low-lying lands there have been built at vast expense some 1,500 miles of levees of great strength. These, however, give way occasionally before the mass of waters brought down by the Mississippi in flood, and great damage results. (See **LEVEE**.) The drainage system of the State is toward the Gulf and mainly through the Mississippi and its tributaries, the Red River and the Ouachita. On the east Pearl River and on the west the Calcasieu River and the Sabine, which divides Louisiana from Texas — each drain small districts. The Red River formerly flowed directly to the Gulf of Mexico. Its old channel is now filled by the Atchafalaya, which has increased so rapidly of late years as to give rise to fears of its becoming the main channel of the Mississippi. The lakes of Louisiana are of three kinds. Those on the coast are shallow estuaries enclosed within the delta, of which the greatest are lakes Pontchartrain and Maurepas. At the entrance to the former is Lake Borgne. A second class is formed by the curved sections of the river which are cut off and silted up as in the smaller rivers by the action of accumulated debris and rafts of driftwood such as are found above Shreveport. These are rapidly disappearing through the removal of the obstructions, and the lands are being reclaimed.

Of the 28,000,000 acres of land in the State only 3,000,000 are in cultivation. Nearly the entire upland is covered by strata of drift or red sandy clays. One thousand nine hundred square miles are alluvial. The soil next the river is the lightest or soundest, the surface of the backlands consists of a peculiarly friable soil known as buckshot to such a depth as to permit of the deepest cultivation and with a high absorptive power which secures crops against drought. South of the Red River the soils are less varied in character, but all are rich in the essential elements of plant food and require only drainage and good culture to produce excellent crops. The land is distributed as follows: Alluvial lands, 13,225 square miles; bluff prairies, 5,739 square miles; oak uplands, 8,103 square miles; long-leaf pine hills, 7,582 square miles; long-leaf pine flats, 2,556 square miles; central prairies, 785 square miles; coast marshes, 7,420 square miles.

Geology and Mineralogy.—The entire State is part of the Mississippi deposit on the bottom of an ancient gulf whose shore touched Cairo, Ill. Its oldest sediments were Cretaceous, now covered except in a few small spots in the northwest. The upland region west of the northern course of the Calcasieu, and of the Washita, is a mass of horizontal Tertiary beds, clays, and clay sandstones. The entire alluvial region and coast swamps, besides much bordering prairie, is Quaternary. Such formations could hardly be rich in minerals, and though some iron ore and low-grade brown coal are found in the Tertiary districts, the only important minerals are rock salt, sulphur and petroleum. The salt is found in the chain of isolated hills known as Islands,

LOUISIANA

commencing with Petite Anse on the Gulf, and extending to New Iberia. The first workings were at Avery's Island; recently two other mines have been opened and the output will be largely increased. The oil fields in Calcasieu and Saint Martin's parishes give promise of exceeding those of Texas in extent and value of product. The sulphur is also in Calcasieu Parish.

Climate and Rainfall.—Louisiana, ranging from the parallel of lat. 33° to 29° N. is semi-tropical in climate and products. The summer heat reaches 105, and averages 85 for the hottest month; it does not reach zero south of Shreveport, and the coldest month ranges on an average from 45° to 60°, according to location. The gulf vapors make it very equable, the prevailing winds being south and southwest,—that is, from the ocean. There are only three months of frost in the year, the beginning varying from the first of November to the first of December. The rainfall varies from an average of 60 inches a year in the southeastern part, to 50 in the northern. This abundant moisture and the steady warmth cover the State with luxuriant tropical growths, and the magnificent profusion and beauty of its flowers are famous. The magnolia is most familiar as a specially southern product, but the roses, jasmynes, oleanders, cannellias, etc., are notably beautiful. The orange, fig, and most other semi-tropical fruits will flourish here.

Fauna.—The only large quadrupeds surviving are black bears and a few catamounts in the less accessible forests and swamps. Many deer are found during the winter. The wildcat is not uncommon, and the raccoon and opossum are familiar. The alligator is common to all bayous and ponds. Bird-life is plentiful; it comprises eagles and vultures, pelicans and cranes, beside wild turkeys, geese, and ducks. There is an excellent State game law.

Forestry.—A large proportion of the entire forest wealth of the United States is represented by the immense areas of long- and short-leaf pine. It is estimated that there are standing respectively 26,588 millions of long-leaf pine and 21,628 millions of short-leaf pine, occupying 15,000 square miles of upland. In the swamps are vast forests of red and white cypress, the value of which has only recently been recognized. Other valuable woods which are to be found in large quantities on the bluff lands and inland streams are ash, oak, beech, walnut, and cotton wood.

Agriculture.—From the considerations mentioned, an exceptionally fertile soil, a warm climate with variations from northern highlands to southern coast plains, Louisiana has remarkable natural advantages for a great variety of products, from temperate to semi-tropic. Yet less than two fifths of the soil in 1900 was even nominally in farms, and less than one sixth improved; and of the total of \$61,272,676 in value of farm crops, \$56,395,227, or over eleven twelfths, was in two money crops and two food crops, cotton and sugarcane, corn and rice. This lack of diversification of crops is largely a result of the old slave system, which tended to concentrate attention upon a few staples roughly cultivable by gangs; and the break-up of the system added new difficulties to the old industries for many years without any tendency to create new especially as the land had been exhausted by wasteful

cultivation and lack of fertilizing. There are some indications of a change; but the chief feature has been the enormous development of irrigated rice culture, as told below. There has also been a progressive subdivision of farms; the average plantation of 1860 was over 500 acres, the average farm of 1900 was under 100. This does not, however, imply the cessation of large farms; on the contrary, Louisiana is emphatically the State of great plantations outside the ranching States, there being in 1900 over 1,000 containing more than 1,000 acres each. This is due to the heavy capital needed to carry on the sugar business, which must have a large territory to make fair returns. One result of the growth of the class of colored farmers, besides the cutting up of farms,—their average being 40 acres to 150 for the white farmer,—is the increase of rentals, they being usually too poor and unthrifty to buy. They slightly outnumber the white farmers, but they own only about one seventh of their farms against nearly two thirds owned by the whites, and there are nearly three times as many cash tenants and two and a half times as many share tenants as white. They operate but about one fifth of the farm area, however. In cotton culture, Louisiana has been slower to recover from the Civil War than any other State, having not yet reached the figures of 1860, while several others have immeasurably surpassed them, and it has not greatly grown since 1890. Its product in 1899, though exceeded by six other States, was 44 per cent of the total crop production, being 709,041 bales, valued at \$27,004,812. The crop of 1902-3 was 884,000 bales of an average value of \$44.52 per bale. Sugar, the next crop in value (\$14,627,282), is Louisiana's great specialty; it produces three fourths of all the cane grown in the United States, outside of Hawaii, and more than 11 times as much as the next heaviest producer, Georgia. This is an extensive crop, concentrating a great value on a small area; while the value of the crop was over half that of cotton, its acreage was only one fifth as much; with nearly one fourth the total value of farm products, it occupied only 8 per cent of the farm acreage. One of the great drawbacks to Louisiana sugarcane raising, is that about one fifth has to be kept for seed, and cannot be replaced in the same season, while in Cuba the tops of unfit canes are simply dropped into hoe-made holes, and there are plenty always to be had; the Louisiana seed cane often rots, the Cuban never. The Cuban cane is also much richer in sugar, and the yield per acre is about double. From all these causes, the cost of making a pound of sugar is about double in Louisiana what it is in Cuba. Corn, as in all the Southern States,—owing to its value as a food crop, for feeding swine, and in some States for distilling,—has always had far greater attention than any other cereal; in 1900 it was nearly three fourths of the entire cereal crop, valued at \$10,327,723, and increased over 60 per cent in the next decade. But the great coming food crop is rice, whose culture increased about two and a half times in the last decade, and nearly all of this in the last three years; owing to the introduction of improved methods by a quantity of Iowa immigrants, and of a new system of irrigation, which has revolutionized rice culture and worked a complete transforma-

LOUISIANA

tion in the great coast-prairie belt of southwestern Louisiana, and southeastern Texas, formerly almost in primitive solitude. Up to 1897 nearly all the rice grown on these prairies was "Providence" rice, dependent mainly on rainfall. Then two years of drought showed that there was no security without irrigation, and there was a stampede to the "pump lands," where a new world was created by raising water from bayous. This district, as above said, is full of slightly raised ridges; the canals are run along these, not by digging, but by throwing up parallel dikes for a channel; as the water in all these regions lies below the land to be irrigated, it is raised by pumping plants at the heads of the canals, and distributed to the lands by gravity; sometimes two or more pump stations are needed on the same canal to lift the water high enough. This immense draft on the water supply has created alarm for the future; but the whole region is underlaid with exhaustless water-bearing gravel strata, and easily bored wells can irrigate 100 acres without diminishing the flow. In 1900 over 25,000 acres were thus irrigated. This prairie has the further advantage over the delta district, formerly the chief seat of the culture, that in the latter the heavy machinery needed for improved cultivation was apt to sink in the soil. The celebrated perique tobacco is grown in the Parish of Saint James. The product in 1902 was 33,375 pounds.

Stock Raising.—While this is small relatively to the other agricultural branches, it is of some importance; and in the line of dairy products is increasing. These were valued at over \$1,000,000 in 1900, of which something over \$1,000,000 was sold off the farm. Swine slightly increased, sheep slightly decreased; but as natural with increasing farm work of any kind, horses, mules and asses increased considerably more than half.

Fisheries.—Louisiana ranks next to Florida among the Gulf States in the value of its fish catch. As a whole, however, the industry seems not to be increasing largely; the last report in 1897 showed a total little larger than 1890, the figures being \$713,587, the number of men employed 4,403, chiefly on the boat or inshore fisheries. The oyster fishery is second only to that of Chesapeake Bay, and was three fifths the entire value of the fisheries. The oyster reefs extend almost unbroken to the mouth of Atchafalaya Bayou to the State line. Large canneries have been established on the Gulf. The same fishery is declining; but Louisiana is still the chief source of shrimps, as well as for catfish caught with the trot-line. The alligator catching industry is decreasing with the gradual exhaustion of the supply; at the same time the scarcity of hides constantly enhances the market value.

Manufactures.—These are chiefly concentrated in New Orleans, which produced in 1900 more than half the total for the State, which with 4,350 establishments, was valued at \$21,181,683. In the eight chief industries of the State, making more than half the total, there was over a threefold increase from 1800 to 1900, and what is very unusual, there was almost exactly the same increase in the number of wage-earners who number 42,210; the industrial tendency is to increase product, but reduce human labor. The total bulk of manufacturing

in the State is working up its raw materials of sugarcane, cotton, forest products, and rice. Foremost, and amounting to close upon two fifths of the State's entire manufactured products, is the refining of sugar. The sugar and molasses produced in the census year were valued at \$47,891,091, and the business gave employment to 15.4 per cent of all the State's wage-earners. The greatest obstacle heretofore (aside from difficulties stated under *Agriculture*) has been the necessary idleness of the expensive plants during the greater part of the year; but an industry is now developing which serves a doubly profitable end,—the making of paper from the bagasse or cane refuse,—thus keeping the plants going, and utilizing a waste product heretofore used only for fuel. With a little jute or manila, this has been found to make one of the finest grades of heavy paper. Second in importance was the manufacture of lumber and timber products, aside from planing-mill products, sashes, doors, and blinds, etc., these were valued at \$17,408,513, and had more than trebled in the decade. In 1890 the production was almost exclusively of yellow pine lumber, cypress shingles, and white oak staves; in 1900 there had been a great increase of the manufactures from cypress and hardwoods, cypress sawing alone employing many of the largest establishments in the State, and the stave manufacture having practically ceased. The lumber industry is just beginning to attract the attention of capitalists on a large scale,—this and rice being the business "booms" of the present. At no time in the State's history have there been so many large lumber plants under construction. The long-leaf pine manufacture has its centre at Lake Charles, in the southwest. The manufacture of cottonseed-oil and cake holds third place; in 1900 the products were valued at \$7,026,452, while in 1890 they were somewhat over one fifth that amount. This is one of the industries fostered indirectly by the Mississippi jetties, which by increasing New Orleans' distribution facilities, have made it worth while to import cotton seed and develop a larger manufacture than the local supply would make possible. The refining of cottonseed-oil is a recent New Orleans industry. The cleaning and hulling of rice produced \$5,736,451 of finished product. A great and rapidly developing industry is the manufacture of burlap bags for handling cotton seed, fertilizers, etc.; it grew from \$669,945 in 1890, to \$3,443,468 in 1900. The foundry and machine-shop products amounted to \$2,672,761, their work largely in making and repairing sugar machinery. Planing-mill products and carshop work were considerable. There were in Louisiana in 1902-3 eight cotton mills with 101,752 spindles; the consumption was 18,003 bales of cotton. Many new mills are in construction.

Commerce and Transportation.—Louisiana is the richest State in the Union in total length of navigable streams, 3,771 miles. Its lower part is a vast web of paths to the ocean, aggregating 2,500 miles. The entire 600 miles of the Mississippi's length in the State is navigable and largely navigated, and the jetties have trebled its value, made New Orleans a far greater corn and cotton port than before, and will draw foreign commerce still farther. A canal from the river to Lake Borgne has greatly lessened the dis-

LOUISIANA

tance from the city to the Gulf and to the coal-fields of Alabama, hence reducing the cost of fuel for manufacturing purposes. The railroad facilities have not been very extensive till the last decade, when they increased from 1,739 to 2,801 miles, and are now 3,221. The growing importance of New Orleans has led a number of trunk lines to make a special effort for its business; owing to the nature of the Gulf coast, all turn away many miles from it. The chief lines are the Southern Pacific, the Texas Pacific, the Louisville & Nashville, the Queen & Crescent, and the Illinois Central. Many others are laying plans for entering the city. As with most Western and Southern States now, rates are fixed by railroad commission. New Orleans is the third port in the United States in amount of foreign commerce, next to New York and Boston. For the year ending 30 June 1902, its imports and exports (principally the latter) amounted to over \$158,000,000. In 1902-3 it received 2,316,617 bales of cotton, and exported 2,112,281 bales. The vessels entering and clearing for the year were upward of 4,000, with a gross tonnage of nearly 5,000,000.

Banks.—The State has an excellent banking system, very conservative in its holdings of reserves; the New Orleans banks were notable for their exceptional solidity and punctuality in meeting northern obligations when the Civil War broke out. On 30 June 1902 there were 27 national banks in operation, with \$4,182,580 capital, \$2,667,364 in outstanding circulation, and \$2,372,750 in United States bonds. There were also 66 state banks with \$4,255,287 capital, and \$631,295 surplus. In the year ending 30 Sept. 1902 the exchanges at the United States clearing house in New Orleans aggregated \$663,918,045, an increase in two years of \$163,000,000.

Government and Finance.—The Constitution of 1898 was devised to exclude the illiterate negro vote, except for owners of property to over \$300 who are excepted from educational qualification. Otherwise than that, each voter must be able to fill out his application blank for registration, but this does not apply to anyone who was a voter on 1 Jan. 1867 (that is before the 14th or 15th Amendment was passed), or his son or grandson of mature age. Women taxpayers can vote on all questions of taxpaying in any subdivision of the State. State officers are elected for four years. The Governor has \$5,000 salary, the pardoning power, and a veto by items, which may be overridden by a two thirds vote of the elected members of each house. The legislature holds biennial sessions limited to 60 days; both houses are elected for four years; the Senate may be from 36 to 41 in number, the House from 98 to 110, and as a fact the numbers are now 39 and 114; there must be one representative to each parish, and to each ward of New Orleans. The judiciary is headed by a supreme court, consisting of a chief justice and four associates appointed by the governor with the consent of the senate, for 12 years. There are judicial districts, to be not less than 20 nor more than 29; the judges are elected for nine years, as is the district attorney for each. From and after 1 July 1904 there is to be a court of appeals, composed of two district judges designated by the supreme court. There is a militia of 2,693. The State

has a large Democratic majority. It sends two Senators and seven members to Congress. The assessed valuation of property in 1902 was \$301,216,222; the State tax is limited to six mills on the dollar. The legislature cannot incur debts except to repel invasion or suppress insurrection. A poll tax on each adult male goes to the school fund (see *Education*). The bonded debt 31 Dec. 1902 was \$11,108,300, with a floating debt of \$1,157,002. The year's receipts from taxation were \$2,747,262.

Education.—Louisiana, formerly near the foot of the ladder in the general education of its people, has made extraordinary efforts in the past two decades, and in some respects has surpassed all other Southern States; a fact more creditable from its large negro population. The average school term (120 days) was the longest of any Southern State, the terms of colored schools were as long as those of the white, and the amount expended is exceedingly creditable, being in 1901 \$1,236,647, or nearly half as much as the current receipts of the State, and in 1902 nearly \$1,500,000. The school revenues are made up of 1¼ mills from the State property tax of six mills on the dollar, a poll tax of \$1 on all males over 21,—retained in the parish were levied, and other local taxes may be laid,—special corporation taxes, etc. By the law of 1902, the school administration is centralized in a State board of education consisting of the governor and seven appointees, the superintendent of education, and the attorney-general; this appoints a four-year board of education for each parish (county), who appoint parish superintendents. The enrolment in schools during 1901 was 63 per cent of the white children from 6 to 18, and 40 per cent of the colored; in both cases more than a three-fold increase in 20 years. Despite all efforts, however, the load of illiteracy is a heavy one to struggle against; 61 per cent of the negro and 17 per cent of the white population above 10 could neither read nor write. In 1901 there were 3,219 white teachers, nearly three fourths female; and 1,152 colored teachers, about evenly divided. Besides these there were many hundred private teachers. The pupils in the Catholic schools alone were stated at 23,398. Total pupils enrolled in common schools were 198,896. For higher education there were 22 public and 30 private high and secondary schools, two industrial colleges, the Industrial Institute at Ruston (north Louisiana) and the Southwestern Industrial Institute at Lafayette, two normal schools, the State at Natchitoches, and that of the city at New Orleans; the State University and Agricultural and Mechanical College at Baton Rouge, partly supported by the United States; Tulane University, with affiliated special colleges, one of the best reputed institutions in the South; and a number of Roman Catholic and sectarian colleges. For the colored people are four—Southern University, Leland University, New Orleans University, and Straight University. Total income for universities and colleges \$284,623. Male students 1,518, female 563.

Charitable and Penal Institutions.—The State Board of Charities and Corrections can only inspect and report. The old system of leasing out convicts to private contractors was abolished by the constitution of 1898, and they are now only employed on public works or convict farms,

LOUISIANA.

THE GREAT HOUSE AT NATCHAL BOULEVARD

LOUISIANA

STATE OF LOUISIANA

LOUISIANA

or in manufactures owned and operated by the State; and parish jail inmates may be employed on public works within that parish. The State Insane Asylum is at Jackson, a Lepers' Home in Iberville Parish, institutions for the deaf and blind at Baton Rouge, and there are State hospitals at New Orleans and Shreveport. The health of New Orleans is regulated by the State Board of Health, composed of nine physicians, four appointed by the governor, and five by the New Orleans City Council.

Churches.—The strongest denominations in order of church societies, are the Baptists, Southern Methodists, the two forming the bulk of the Protestants, Roman Catholics, Presbyterians, Protestant Episcopalians, Lutherans, and Unitarians. The Roman Catholics are stronger here from the long Spanish and French domination than anywhere else in the South. In New Orleans are located a Roman Catholic archbishop and bishops of the Protestant and Methodist Episcopal churches. There is also a Roman Catholic bishop at Natchitoches.

History.—The earliest knowledge of Louisiana dates from the discovery of the mouth of the Mississippi in 1528 by Narvaez. De Soto, 13 years later, crossed the great river on rafts at some point about the Arkansas; of the importance of this discovery the Spaniards were wholly ignorant. The next Europeans to sail on the great river were the French. In 1673 Marquette and Joliet were sent by the governor of Canada to seek the river which might lead to the great western ocean. They descended as far as the mouth of the Arkansas. In 1682 they were followed by La Salle, who completed the work of discovery and took possession of the country, which he called Louisiana, in the name of Louis XIV. In 1684 he sailed from France with colonists to form a settlement. He missed the mouth of the river, landed at Matagorda Bay and was murdered in 1687. Brave men were not lacking to take up the enterprise, and in 1698 Iberville, with his brother, Bienville, sailed from Brest for the Mississippi. Finding the Spanish in possession of Pensacola, he stayed for a short time at Mobile, and then entered and explored the lower part of the rivers. His first settlement was at Biloxi, despite the protest of the Spanish governor of Pensacola. In 1702 the site of the colony was removed to Mobile. Antoine Crozat obtained the concession of Louisiana in 1712. It was handed over for 25 years to the Western or Mississippi Company, founded by John Law. Bienville was again made governor and was able to carry out his long-formed plan to create a city where is now New Orleans. Later, in 1722, he was able to make it the capital of the colony. The Western Company sent out large numbers of emigrants, and the colony increased in population, but not in prosperity; misgovernment and Indian wars prevented all progress. In January 1732 Louisiana was surrendered to the king. Iberville resigned in 1743 and was succeeded by Vaudreuil, under whom were issued levee ordinances and police regulations for New Orleans. In the following years there was no improvement in the condition of the colony, of which the annual expense was a drain on the exhausted resources of France. In 1762, by the treaty of Fontainebleau, Louisiana west of the Mississippi, together with the island of Orleans, was ceded to Spain, and in the next

year Louisiana east of the Mississippi, together with Florida, was surrendered to Great Britain by the Treaty of Paris. The dissatisfaction of the Louisianans, and the long delay of Spain in taking possession of her new colony, gave rise to a serious revolt which was sternly suppressed by O'Reilly. He, however, provided for a form of government under which the colony made considerable progress. The great growth of the population on the upper Mississippi caused a demand for freedom from all restrictions of commerce on the river. This was obtained temporarily by concessions from the Spanish governors, but when the right of deposit was refused in 1803, there was grave danger of a descent on New Orleans. The desire of Napoleon to create a colonial empire in America led to the secret treaty of St. Ildefonse in 1800, by which France acquired that portion of Louisiana formerly ceded to Spain. In 1803 fear of English invasion induced Napoleon to sell Louisiana to the United States for \$15,000,000. (See ANNEXATION; LOUISIANA PURCHASE, for statistics of size and location.) On 28 March 1804 the part south of lat. 33° N. was organized as Orleans Territory; the northern part being organized as Louisiana Territory, afterward changed to Missouri Territory. An enabling act was passed 20 Feb. 1811 to form Orleans into a State, and it was admitted 8 April 1812. The French element was so strong that the constitution allowed members of the legislature to debate either in French or in English, and the dividing line in politics was usually between the two, with temporary alliances of other elements. The organization of the Whig Party, one of whose cardinal tenets was protection, which helped sugar, turned Louisiana into one of the strongest Whig States in the South, she twice voting for Whig Presidents. The slavery issue, after 1860, made it more and more strongly Democratic, and in 1860 it was heavily for secession. New Orleans was captured by the Federal troops 25 April 1862, and the State government, whose seat had been Baton Rouge since 1852, was transferred to Opelousas. During the rest of the War the territory held by the Federals was recognized as the legitimate State government, though under a military governor, and sent members to Congress. On 30 July 1866 an attempt of the colored leaders to hold a constitutional convention at New Orleans and secure the admission of their race to the franchise, resulted in the massacre of many of the delegates by the whites; which had much to do with the excessive severity with which the subsequent Reconstruction government bore on the latter. (For the general history of the time, see RECONSTRUCTION. For the part borne by the State in the imbroglio of 1876, see ELECTORAL COMMISSION.) The most important item in the subsequent history was the passing of the Constitution of 1898, with the "Grandfather Clause," to disfranchise the negroes, which has reduced the negro registration to about 7,000, as against over 120,000 whites. The State governors have been W. C. Claiborne 1812, Villere 1816, T. B. Robertson 1820, H. S. Thibodeaux 1824, H. Johnson 1824, P. Derbigny 1828, A. Beauvais 1829, J. Dupre 1830, A. B. Roman 1831, E. D. White 1835, A. B. Roman 1839, A. Mouton 1843, I. Johnson 1846, J. Walker 1850, P. O. Hebert 1853, R. C. Wickliffe 1856, T. O. Moore 1860, H. W. Allen 1864, M. Hahn

LOUISIANA—LOUISIANA CREOLES

1864, J. M. Wells 1865, B. F. Flanders 1867, J. Barker 1868, H. C. Warmouth 1868, P. B. S. Pinchback 1872, W. P. Kellogg 1873, F. T. Nicholls 1877, L. A. Wiltz 1880, S. D. McEnery 1881, F. T. Nicholls 1888, M. J. Foster 1892, W. W. Heard 1900. The following are the names of the principal authors who have written on Louisiana: *History*: Le Page, DuPratz, Martin, Gayarre, Fortier. *Description*: Darby, Stoddard. *Botany*: Rafinesque, Chapman. *Ornithology*: Audubon. *Literature*: Fortier. *History and Development of New Orleans*: Cable, King, Castellanos.

Population.—The census figures from 1810, when it was first counted separately as the Territory of Orleans, are as follows: (1810) 76,556; (1820) 152,923; (1830) 215,739; (1840) 352,411; (1850) 517,762; (1860) 708,002; (1870) 726,915; (1880) 939,946; (1890) 1,118,587; (1900) 1,381,625. It was estimated in 1903 at about 1,470,000. The foreign born were 52,903, of whom 17,431, or about one third, were Italians, 12,604 Germans, 6,500 French, and 6,436 Irish. The colored population was 650,804, or nearly half, a relative decrease since 1890 of over 12 per cent, due to the higher death rate among the negroes. Louisiana was sixth in absolute number of colored inhabitants, and third in relative number, next below Mississippi and South Carolina. There are 59 parishes or counties in the State. The legislature is forbidden to create new ones with less than 625 square miles and 7,000 inhabitants, or divide an old one so as to leave either portion less than these magnitudes. There are no large cities, except New Orleans with 287,104 people, in 1900, and in 1904 over 300,000; the great Mississippi port, and destined to a much larger growth. Shreveport, the next, on the upper Red River, had 16,013; Baton Rouge, the capital, on the Mississippi, 11,269. The only others above 5,000 are New Iberia in the south and Lake Charles in the southwest (the latter the head of the long-leaf pine manufacture), Alexandria on the lower Red River, and Minden east of Shreveport.

Sociology.—Owing to the preponderance of the population and the general importance of New Orleans it has been found useful to locate there institutions usually found at the State capitol. The Supreme Court sits in the Cabildo on Jackson Square, and the State Library is also in the city. The two most important libraries in the State are the Howard Memorial Library for reference, and the New Orleans Public Library for circulation established, which provide for the public of New Orleans the use of nearly 100,000 books. There are published in the State 188 newspapers, of which two, the *New Orleans Picayune* and the *New Orleans Times-Democrat*, are important dailies. The literature of the State consists of two groups of writings: the one in French covering the period between 1835 and 1855, including those of Gayarre and Rouquette, and a brilliant series of works in English prose and poetry by Townsend, King, Davis, Fortier, Ficklen, etc., which have been produced in the last 30 years of the 19th century.

WILLIAM BEER,
Librarian Howard Memorial Library,
New Orleans.

Louisiana, Mo., city, in Pike County, on the Mississippi River; and on the Chicago & A.,

and the Chicago, B. & Q. R.R.'s; about 85 miles northwest of St. Louis. It is situated in an agricultural region, and is the trade centre for a large extent of country in both Missouri and Illinois. Its chief industrial plants are flour and lumber mills, button factories, brick yards, lime works, tobacco factories, wagon and carriage factories. Nearby are large quarries and extensive nurseries. The trade is chiefly in its manufactured articles, dairy and nursery products, grain, fruit, and live stock. There is a good public library. Pop. (1900) 5,131.

Louisiana, Code of. In the history of law in the United States the first important experiment with a code in the United States was made in Louisiana, which State, originally a French colony, afterward ceded to Spain, again returned to France, and subsequently acquired by the United States from France, has had many changes of law. After the United States acquired Louisiana there arose a strong demand for a code, owing to the great confusion of laws. In 1806-8 a code was adopted, but only to supersede the ancient laws when they conflicted with it. A complete civil code was adopted for the State in 1824, which had for its basis the *Code Napoléon*, although some provisions of the common law were injected into it. The Louisiana code was the foundation for a later code prepared for the State of New York under the guidance and supervision of David Dudley Field. This code, although published, and having formed the foundation for many of the codes adopted by the various States, was never accepted by the legislature of New York. See CODE.

Louisiana Creoles. This appellation belongs exclusively to persons of French and Spanish descent born in Louisiana: notwithstanding the prevalent error to the contrary according to Louisiana-born children of any European blood. Though often misrepresented, the creoles of Louisiana, as a matter of fact, are intelligent, brave and generous, and are, by no means, inferior in the matter of education; they are also in the enjoyment of the highest social privileges. The women of true creole lineage are world-famed for grace and beauty. The creoles have furnished Louisiana some of its ablest governors, its most distinguished military men, its eminent writers, its leading professional men, financiers and merchants. In 1904 they held a number of the most exalted offices in the State, and were likewise fully represented in all branches of high and meritorious effort. Very many of the creoles now in Louisiana are descended from high and noble families in France and Spain, and they treasure the lofty traditions of their ancestry. The expression "creole negro" is often used, and its employment has perhaps contributed to the false impression which some entertained that the Louisiana creole, truly such, must be, or is, of negro blood. The term under immediate consideration simply means that the negro to whom it is applied, or his progenitors, has been reared under a creole master. So far as the true creole families are concerned, they have been jealous of their Caucasian lineage and careful to maintain the purity of their blood. The word "creole" is often used to designate the origin of certain products of the field and farm, such as creole chickens, eggs, butter, etc. The meaning of

LOUISIANA — LOUISIANA PURCHASE EXPOSITION

this is that the products thus named are strictly from creole portions of the State of Louisiana. A certain debased idiom of the French employed among negroes, and, to some extent, among creole children and lower whites, is popularly called "creole." It has figured in literature in the shape of short stories, proverbs, etc. The better element of creole adults speak and write the French language in its purity. The majority likewise, have a correct and fluent use of the English language. An effective answer to the aspersions, by some sought to be cast upon the character of the olden creoles, is the following citation from the Chevalier Guy Soniat du Fossat, a distinguished officer of the French army who was in New Orleans in 1751. In his 'Synopsis of the History of Louisiana, etc.' he gives the following:

"Creoles are defined to be 'the children of Europeans born in the colony.' They, in general, measure about 5 feet 6 inches in height; they are all well shaped, and of agreeable figure; they are lively, alert, and agile, and, notwithstanding the great heat of this climate, are laborious. They are born with ambition, and an honest self-esteem. They are endowed with a natural disposition for all sciences, arts, and exercises that amuse society. They excel in dancing, fencing, hunting, and in horsemanship. Nature has favored them with a penetrating and active mind, and they are capable of being easily instructed. The lack of teachers renders their education somewhat incomplete, and it must be said, in all justice, that among the many qualities which they possess are politeness, bravery, and benevolence. They are good fathers, good friends, and good kinsmen.

"The women, besides having the qualities above enumerated, are agreeable in figure and seldom deformed. They make good mothers, and are devoted to their husbands and their children, and in their marital relations seldom are they unfaithful. I must also add that the stranger arriving in this wild and savage country will be surprised to see in this capital, as exists in all countries of Europe, brilliant assemblies where politeness, amiability and gayety reign supreme."

Officier d'Académie,

Secrétaire perpétuel de l'Athénée Louisianais.

Louisiana, District of. See ORLEANS, TERRITORY OF.

Louisiana Purchase, The, was the purchase by the United States from France of the Province of Louisiana, the treaty of sale being dated 30 April 1803. The price paid for the province was \$15,000,000. Its area was 875,000 square miles (almost as great as that of England, Ireland, Scotland, Wales, France, Germany, Spain, the Netherlands, Italy and Switzerland), as compared with 820,944 square miles in the original 13 States. Its limits extend from the Mississippi River on the east (including the New Orleans district east of the Mississippi) to the main divide of the Rocky Mountains and to the Arkansas, the Red and the Sabine rivers on the west; and from the Gulf of Mexico to the Canadian line.

The results of this transaction were to prevent forever the erection of a hostile power on

the west bank of the Mississippi and to make inevitable the ultimate annexation of Texas, Oregon, New Mexico, and California, and the expansion of the United States into a nation of continental proportions and of world influence. It was perhaps the most important sale of territory ever made. President Jefferson wanted New Orleans in order to control the mouth of the Mississippi on the east side, and offered to guarantee to Napoleon all the territory west of the Mississippi if this inducement became necessary in order to get that town. Looking for a city, he had an empire thrust upon him. Napoleon's necessities — his war with England, his desire for money to aid in prosecuting the war, his determination that England should not gain the territory, and his wish to raise up a rival to England on sea and land — worked to the eternal advancement of the United States, of representative institutions, and of the world's progress.

The wilderness which Jefferson's enemies ridiculed him for buying comprises to-day, in whole or part, chiefly in whole, 12 States — Louisiana, Arkansas, Missouri, Iowa, Minnesota, North Dakota, South Dakota, Nebraska, Kansas, Colorado, Wyoming and Montana — and Oklahoma and the Indian Territory. This region is nearly a third of the area of the present United States, and it gives homes to almost a fifth of its inhabitants. Its population of 50,000 in 1803 had expanded to 1,470,616 in 1900, or nearly three times the population of the entire United States in 1800, and in 1904 amounted to nearly four times the whole country's population at the time Washington was first inaugurated as President.

The States and Territories of the Purchase produced 264,000,000 bushels of wheat in 1900, valued at \$152,000,000 — more than half of the wheat crop of the whole United States; 1,013,000,000 bushels of corn, or 48 per cent of the country's product; 38 per cent of the country's oats. The wheat, corn, oats, rye, barley, cotton, hay and potatoes produced in this region in 1900 brought \$755,000,000, and its farm animals were valued at \$825,000,000, 38 per cent of those of the whole country.

Besides transferring the United States' boundaries from the Mississippi ultimately to the Pacific, the Louisiana annexation and its direct results, the acquisition of Texas, of New Mexico, of California and of Oregon, swung the seat of the country's activities across the Alleghenies into the great valley. The geographical centre of the contiguous parts of the United States is in northern Kansas, in the heart of the Louisiana Purchase, and the other pivotal points are traveling rapidly in the same direction. The centre of population, which was a few miles west of Baltimore in 1801, when Jefferson was first inaugurated, was near Columbus, Ind., in 1900; and the centre of manufactures, which was hurrying after it, was close to Mansfield, Ohio, in the same year. At the same time the centre of the corn production was 54 miles southwest of Springfield, Ill., and the centre of the number of farms was 110 miles east by south from St. Louis, in Wayne County, Ill., not far from the Louisiana Purchase border.

Louisiana Purchase Exposition, The, or Universal Exposition, held at Saint Louis,

LOUISIANA PURCHASE EXPOSITION

Mo., in 1904, opening 30 April; one of the greatest exhibitions the world has ever known; 42 States and 53 foreign governments having exhibits. The various States appropriated \$3,000,000 more for this exposition than for the Chicago World's Fair, and the vast exhibit covers more ground than the Chicago, Paris and Buffalo expositions combined. The Government Building is one mile from the Grand Trianon of France, along a stately boulevard, between eight of the finest exhibit palaces ever built. The boulevard is crossed by three courts; the central court is 2,500 feet long and 600 wide. Between the palaces is a mile of lagoons and canals. The amusement street is a mile long. The Philippines cover 40 acres. The Agricultural Palace is 1,600 feet long and covers 20 acres. The dome of the Hall of Festivals is 200 feet high. In it is the largest organ in the world, 62 feet wide, 40 feet high, with 10,000 pipes. The intramural railroad is nine miles long and touches every point of interest in a site two miles long and one mile wide. In fact, the attractions at this exposition are so many and varied and the undertaking so enormous that no detailed description can be given. A volume of over 200 pages is required for the prize lists and regulations of the Live Stock Department alone. This department includes eight groups, and there are 15 of these great Exhibit Departments, including 141 groups and 801 classes. Large bodies of State commissioners in all the States, assisted by local committees in counties were engaged for over a year past in collecting the best specimens that liberal prizes could call forth. All known governments co-operated in this work, each intent upon making the best possible exhibit. The Exposition shows all the products, processes, inventions, discoveries and triumphs of art and industrial skill, and is a vast museum of human progress, human efforts, hopes and aspirations. Besides broadening the scope of each department so as to include a greater number of related groups and classes, this Exposition was the first to organize a distinct Educational Department and rank it in the post of honor at the head of the list. Here, for the first time, the educator is given opportunity to compare intelligently the educational systems, institutions, methods and work of the various European nations with those of the United States, which include the competitive exhibits of the public schools of all the States and cities. In the Social Economy Department is exhibited the most complete and thorough illustration of the new Science of Humanity yet attempted, embracing all the enormous advances in the past ten years along this line by every government and city of Europe and America; showing state regulations of industry and labor, industrial organization of workers, methods of industrial remuneration, co-operative institutions, the housing of the working classes, liquor regulations and general betterment movements. Independent of this department, but related to it as an "outside exhibit" there is a great "Model City" in which the leading cities of Europe and America have displays illustrating their municipal utilities, economies and betterments—displays full of interest and edification for the urban taxpayers and home owners of America. The Physical Culture Department, equipped with a gymnasium and athletic field, race track and an immense amphitheatre, and aided by the counsels and active co-

operation of the leading athletic associations of the world, conduct a protracted series of athletic events lasting from 14 May to 24 November, at which a long list of splendid prizes and championships will be competed for in intercollegiate, interscholastic and international contests, embracing all sorts of games, feats and sports. Among these will be the great Olympic games under the direction of the International Olympic Committee; contests of historic and worldwide interest, enlisting the world's most famous athletes and champions. The still exhibits of this department will include everything illustrative of physical culture and its methods; gymnastic trophies and gymnastic equipments for schools and associations. Among other features are the International Press Parliament, the International Congress of Jurists and the World Congress of Arts and Sciences, in the discussions of which the most distinguished professors, publicists and teachers of the world were invited. The deliberations illuminate every branch of art, science, and education, economics, politics, philosophy, technology, sociology, etc., involved in the comprehensive scope of the exhibits. Here will also be assembled the world's first fleet of air-ships and flying machines, in competition for a prize of \$100,000.

Each of the 15 departments in the great exhibition outgrew all plans and anticipation; and the result is a much vaster display than was thought possible even in this advanced age. Additional areas were necessarily allotted to the great palaces of Art, of Liberal Arts, of Manufactures, of Varied Industries, of Machinery, of Electricity, of Transportation, of Agriculture, of Horticulture, of Fish, Game and Forestry, and of Mines and Metallurgy. Besides the Exposition Company's cash fund of \$15,000,000, there has been spent \$1,650,000 by the United States Government on its own separate exhibits; over \$6,000,000 by foreign governments; \$6,500,000 by the several States on their exhibits, and immense sums by cities, associations, fraternities, corporations and individual exhibitors.

During the last 50 years each of the recognized Universal Expositions has surpassed its immediate predecessor. Each was an epitome of the new ideas, new discoveries, new achievements of a new period in the world's progress, and as the art of organizing and equipping Expositions progressed, and the world's appreciation of their value increased, larger endowments were obtained for them, and choicer and more comprehensive exhibits became available from all parts of the world. Governments, scientific societies and art organizations were everywhere accumulating finer specimens in their museums, and becoming prepared to make better and better contributions to the treasures of a World's Fair exhibit, thus greatly widening the Exposition's choice of articles. By this natural process the Louisiana Purchase Exposition came into possession of better opportunities and advantages, and far ampler resources than any of its predecessors. In every field of improvement, social, industrial, or intellectual, it gathered the priceless products of the prolific seeds its predecessors planted. For the first time in the history of expositions, foreign governments actively helped to collect for the exhibition the finest productions of every clime, and the most excellent achievements of mankind, in arts and crafts and in all lines of social improvement. The ar-

LOUISIANA STATE UNIVERSITY — LOUISVILLE

rangement of exhibit plans and the preparations were under the direction of first honor graduates in Exposition science—men identified with Exposition work at home and abroad for the last 30 years. The knowledge and inspiration diffused abroad from every great exposition have stimulated and guided men to so many new discoveries and the invention of so many new industrial utilities, to say nothing of what has been done for the elevation of public ideals in morals and matters of taste, that the world is now, more than ever before, sensible of its indebtedness to their unique educative influence. Instead of being the last, the Exposition of Saint Louis will merely fix the higher standard and afford the better model for other Universal Expositions that will follow in succeeding decades, so long as the Promethean spirit impels men to emulate the gods as benefactors of mankind. The periodic market "fairs" of earlier centuries were the natural outgrowth of economic conditions under a ruder civilization and a cruder industrial development. Such "fairs" still survive under similar conditions in several countries and some have risen to great importance as promoters of trade. As advancing civilization with its modern appliances and modern industrial organization has superseded the market fair with better traffic facilities, their other social utilities have been preserved in competitive exhibitions, offering prizes for the best productions. The noted effect of these local competitive exhibitions in arousing emulation and directing attention to better models and higher standards of industrial effort led to the National Expositions which the great Napoleon inaugurated in France more than 100 years ago, the evolution of which has given us the constantly progressing series of World's Fairs that have stimulated and guided the geniuses of all nations through the last five decades of the 19th century.

DAVID R. FRANCIS,

Pres. of the Louisiana Purchase Exposition.

Louisiana State University and Agricultural and Mechanical College, a State educational institution at Baton Rouge, La. In 1855 a State school was founded under the name of the State Seminary of Learning, and was opened in 1860 with W. T. Sherman (later General Sherman) as superintendent. In 1861-5 the school was suspended on account of the war. In 1874 an agricultural college was established and temporarily located at New Orleans; in 1877 it was merged with the college at Baton Rouge and the university chartered under its present name. The courses offered are the Latin-scientific, literary, general science, mechanical and civil engineering, agriculture, and commerce; in the agricultural department a special course of 5 years is given on the cultivation and manufacture of sugar. There are three experiment stations connected with the University, one at New Orleans, one at Baton Rouge, and the third at Calhoun. Military drill is also a part of the curriculum. In 1903, the total income, including State and Federal appropriations, amounted to \$55,500; the number of students was 400, of professors and instructors, 27; and the library numbered 23,000 volumes.

Louisville, loo'is vil or loo-i-vil, Ky., the capital of the County of Jefferson, and the principal city of the State of Kentucky, is situated opposite to the falls of the Ohio River, on the

Southern shore of the river, on the Louisville & Nashville, the Southern, the Chesapeake & Ohio, the Baltimore & Ohio Southwestern, the Pennsylvania, and other railroads.

Falls of the Ohio.—The falls of the Ohio River are caused by a ledge of Devonian rocks, rich in corals and other fossils, which were lifted from the bottom of the Silurian Sea, in which they were formed, and left here thousands of feet above their place of formation. In ancient geological times this wall of rock, in the form of an anticlinal axis, dammed up the water 25 feet and formed a lake a mile wide and several miles in length, above the dam, while the water below rushed down the other side of the axis, at the rate of a dozen miles an hour, until it was lost in a seething whirlpool below. When the river was low, it was dangerous to attempt to conduct a boat over these falls but when it was high, on account of the narrowness of the stream below and its width in the lake above, the excess of water filled the narrower stream below to a level with the wider one above and vessels passed over the falls as if they had not been there. In 1830 a canal two miles long was finished around the falls, on the Kentucky side, and on the 5th day of December the steamboat *Uncas* passed through it. The canal has since been enlarged and improved so as to meet the wants of the largest boats and is always used in going over the falls in low water. When the river is high, boats go over the falls and do not have to use the canal.

Site of Louisville.—The natural beauty of the falls of the Ohio was such that they could hardly fail to attract the attention of the intelligent eye which looked upon them. A dense forest with a very great variety of growth covered the country for miles around and the huge sycamores and cottonwoods, growing down to the water's edge, cast their shadows into the stream, not yet polluted by the waste of cultivated lands, and imaged another forest there. Crystal ponds scattered through the forest and verdant islands in the river added beauty and variety to the landscape. When Capt. Thomas Hutchins, of the British Engineers, saw the falls in 1766 he was so delighted with their natural beauty that he drew a picture of them which appeared in his 'Topographical Description of Virginia,' published at London in 1778. It was a very pretty picture then, is now, and always will be.

Plan of Louisville.—The plan of Louisville as originally laid out by John Corbly, in the spring of 1779, consisted of one range of streets parallel with the river and another range cutting them at right angles. The streets parallel with the river and running east and west bore names such as Water, Main, Market, and Jefferson, while the cross streets were known by numbers, such as One, Two, Three, etc. This plan was adhered to until additions to the original boundary made it necessary or gave an excuse for laying out new streets differently. In some of the additions the streets now run in all directions. Broadway as originally laid out, is 120 feet wide; Main, Market, and Jefferson, each 90 feet, and the other streets with a few unimportant exceptions 60 feet in width. In 1813 the paving of streets began. Previous to this time they were mud holes in winter and dirt-piles in summer. That part of Main Street

LOUISVILLE

from Third to Sixth was paved after the McAdam style. There are now in the city 176 miles of streets and as many miles of alleys paved with vitrified brick, asphalt, granite, or boulders, and a few with broken stone after the McAdam fashion.

Original Area of Louisville.—The original tract of land given to Louisville for a site by the Legislature of Virginia contained 1,000 acres. The land cost the State of Virginia nothing because it was confiscated from Dr. John Connolly, an adherent of the British during the War of Independence. The Legislature simply took the land from Connolly and gave it to Louisville. The city has since added many other tracts of land to the original until its external boundary now embraces 20½ square miles or 13,120 acres. In other words, Louisville, in a century and a quarter, has increased her original landed estate thirteen fold.

Dwelling-houses.—The first dwelling-houses built in Louisville were 16 by 20 log cabins with board roof and puncheon floor where there was any floor at all, but in many instances the native earth was the floor. The furniture was as plain as the houses and consisted principally of three-legged stools, a bed set on forks, a puncheon table and a few pewter or wooden spoons and plates. The rifle and scalping-knife were in every cabin and were the most costly and useful articles of the household. 'Squire Boone to gratify his own pride and improve the architecture of the town, secured some boards from a flat-boat which had brought immigrants, and built what he thought was a model house. The boards when used were water-soaked and when the moisture was dispelled by the sun the boards warped and twisted and sprang and turned in every direction. The house looked more like an angry porcupine than anything else and Boone was so disgusted with it that he left the town and built a log fort near where Shelbyville now stands. Capt. James Patton, more practical than Boone, found on his lot a huge sycamore that was hollow at the root and had an inside diameter of 12 feet. He utilized this hollow of the tree by building a log cabin against it and using it as a second room. The example of neither of these builders was followed by others but that of Michael La Cassange was. La Cassange was a Frenchman who secured the lot extending from Fifth to Bullitt Streets on the north side of Main. Here he erected a cottage in the style of Louis XIV., which was the only building pretending to any architecture that had been erected up to that time. The cottage was very showy and was the admiration of everybody and was especially liked for the large lot around it with its original forest trees, its shrubbery, its flowers, and its blue-grass, which La Cassange was careful to keep in the best order. The example of La Cassange was followed by others who soon began to build their dwelling-houses on large lots. The fashion has been kept up to our own times and it is rare to see a dwelling-house of any pretensions in Louisville without vacant ground around it, adorned with blue-grass and flowers and shrubbery and trees. On a summer's day one can, in some parts of the city walk for squares beneath the shade trees without the rays of the sun ever reaching him. Louisville is to-day distinguished for no one thing more than for the handsome and comfortable dwelling-houses of her citizens.

Business-houses.—The few rude dwellings were promptly followed by business houses equally rude if indeed the cabin used for a dwelling was not at the same time used for a shop or manufactory. Michael Humble so soon as the town was laid out erected a cabin near the fort at Main and Twelfth streets in which he made and mended guns and wrought out of metal the few things that were used. Joseph Cyrus had next to him a shop in which he made spinning-wheels and looms and everything that was carved out of wood. George Vensonier followed next with a tailor's shop and Henry Duncan with a hat-shop. A little further up town between Fifth and Sixth Streets, Daniel Brodhead had a store in which every kind of article used in the community was sold over the same board counter. These were humble beginnings at manufacturing but they continued to increase until now, according to the last census we have in Louisville 2,307 manufacturing establishments which invest every year in raw material \$41,016,391 and turn out manufactured articles valued at \$78,746,390. Our pioneers who were used to log-cabins for all purposes could not conceive of the necessity of the modern establishments if they were to behold them now in use, built of stone or brick, some covering whole squares and others ribbed with steel ascending into the clouds. The public buildings of the city have proportionately increased in dimension and style until they have become real ornaments. The court-house with its severe classic features, the city hall in its Gothic outlines, the custom-house in its blended styles of architecture, the sky-scrappers at the corner of Fourth and Main, and Main and Market, some of the great tobacco warehouses on Main street, and many of the manufacturing establishments and stores in different parts of the city are fine specimens of architecture adapted to the wants of business. The Galt House on the corner of Main and First is one of the finest hotels in the country and a new hostelry is being erected on Fourth Street which will ascend high into the air, and meet every want of the guest. A new jail is going up on the site of one of the early churches which will not only rob the prison of some of its horrors but will be an ornament to the city. The great department stores of Lewis, and Kaufman-Straus, and the New York Store, by furnishing the purchasers with every want have revived the fashion of pioneer times when every article which was for sale was sold under the same roof and made shopping a delight rather than a burden. The building of the American National Bank on the corner of Third and Main and that of the Louisville Trust Company at Fifth and Market are palatial business houses well suited to the purposes for which they were erected as well as ornaments to the city. It is possible that in the near future a business establishment will be erected on the southwest corner of Fourth and Jefferson that will equal if it does not surpass any yet built in the city.

Education.—Louisville as an educational centre is surpassed by but few cities. The University of Louisville with its law and medical departments, the Female High School, the Male High School, the Manual Training School and the Normal School, which are colleges of a high order, the 70 ward schools where children are trained free of cost for the higher depart-

LOUISVILLE

ments; the 9 medical colleges, the 2 theological seminaries, the 10 musical societies, the 25 Catholic institutions and the 9 educational associations in some of which the sciences are taught, all together offer advantages to students in almost every branch of knowledge. The Male High School, the Female High School, the Normal School and the Manual Training School, like the ward schools, are free institutions entirely supported by the city.

Charitable Institutions.—Hospitals, asylums and homes are almost as numerous in Louisville as schools. The Children's Free Hospital, where afflicted little ones are cared for, the Kentucky Institute for the Blind, where the sightless are taught to read and write, and 51 other institutions maintained for different purposes are prepared to meet almost every form of infirmity.

Churches.—There are 240 churches in Louisville, in which quite a variety of religions are cherished. The principal denominations are the Baptists, the Methodists, the Presbyterians, the Christians, the Episcopalians, the Catholics, and the Lutherans, but there are also Unitarians, Evangelists, Jews, and those who call themselves Non-Sectarians, Scientists, Seventh Day Adventists, Social Settlements, Spiritualists, Swedenborgians, United Brethren, and Theosophists. Some of the houses of worship like the Cathedral of the Assumption, the Warren Memorial, the Third Avenue Baptist and the Fourth Street Christian, are fine specimens of ecclesiastical architecture and capable of seating large congregations.

Banks.—There are 14 banks and banking institutions in Louisville with a combined capital of more than \$7,000,000 and a surplus of half as much more. If the four trust companies and the two title companies which necessarily do a good deal of banking business are added to the banks the capital and surplus of all combined will exceed \$12,000,000. The clearing of the banks for the year 1903 were \$529,241,195. The largest day's clearing amounted to \$2,867,000 on the 2d of January and the whole month of January showed the sum of \$50,766,431. Although the banking capital of the city cannot be said to be large the manner in which it is managed makes money almost always abundant. It is seldom that there is a stringency in the money market here which continues long or really amounts to inconvenience.

Finances.—The finances of Louisville will compare favorably with those of any other municipality in our country. According to the last published report of the assessor the assets of the city amounted to \$17,442,552 and the liabilities to \$8,836,129. If the liabilities therefore are deducted from the assets, a balance of \$8,616,422 will remain in favor of the city. Any bonds issued by the city are therefore what is known as gilt-edge, for if the city should fail to pay the interest or the principal its property can be sold for the payment. The city, moreover, besides owning this large amount of property in its own name has an income from taxes sufficient to meet all of its fixed liabilities and current obligations. The property within the city limits owned by individuals was assessed last year at \$132,000,000. The charter only allows 95 per cent of this amount to be considered in providing for current expenditures so that \$6,600,000 must be deducted from this

amount. We must also deduct 2¼ per cent allowed for prompt payment of taxes. At the rate of \$1.86 tax, the sum of \$2,279,960 is raised from the balance, to be expended by the city during the year. This amount is distributed through the different departments of the city so as to provide for every liability and at the end of the year balances are generally left in different departments which are again distributed.

Largest Industries.—Six of the largest industries are whiskey, tobacco, cement, wagons, plows, and leather. More Bourbon whiskey is made in the Fifth District of Kentucky and handled in Louisville than in any other locality. The same may be said of leaf tobacco, and especially Burley leaf. Louisville is the largest market in the world for both of them. The quantity of hydraulic cement, and plows and wagons and leather made here is also enormous. The Board of Trade gives the following figures for 15 leading articles:

Agricultural Implements—pounds	40,000,000
Boots and shoes—cases	114,000
Dry Goods and Notions—cases	678,000
Flour—barrels	710,000
Furniture—pounds	30,000,000
Hardware—cases	985,000
Fine Leather—pounds	11,500,000
Saddlery—packages	255,000
Stoves and Stove castings—pounds	29,500,000
Soap—pounds	27,000,000
Manufactured Tobacco—pounds	52,000,000
White Lead and Paints—pounds	17,500,000
Wagons—pounds	35,900,000
Whiskey—barrels	365,000
Woolen Goods—pounds	15,000,000

Water.—The city owns the works which supply the citizens with water. They are valued at \$7,000,000, and a filter is now being added to the plant which, if successful in separating the mud and slime from the water, will make the works cost much more and be proportionately more valuable. The water is sold to citizens at a price much lower than they could obtain it in any other way.

Light.—The citizens have choice of three kinds of light furnished by different companies: these are electricity, artificial and natural gas. If they don't like either of them they can go back to the candles and lamps of their ancestors and do as they did before gas or electric light was invented. Natural gas is also much used for heat on account of its cleanliness and convenience.

Street Railways.—Street railways on which cars run by electricity ramify every part of the city and extend into the suburbs and to distant neighboring towns. No one need walk more than a square in any important part of the city unless he or she prefers to do so. The fare is only 5 cents for the longest distance in the city.

Steamboats.—Steamboats with headquarters at Louisville, in spite of the interference of railroads, are yet seen upon the Ohio and other Western waters, and afford the cheapest rates of freight. There are not, however, so many floating palaces upon the Western rivers as there were before railroads came into use, but there are yet a few which prevent the Ohio and its glories of old from being forgotten.

Board of Trade and Commercial Club.—There is a Board of Trade which keeps an eye on the interests of Louisville, and a Commercial Club which helps in the work. Any enterprise which looks to the interests of the city can be

LOUISVILLE

brought before either or both of these associations, and secure recognition and help if deemed worthy. Both of them have done valuable work in behalf of the city.

Newspapers.—There are five daily newspapers, three issued mornings and two evenings. Many weekly, semi-weekly, monthly, and periodical sheets are also issued. The *Courier-Journal* and *Herald* appear mornings and the *Times* and *Post* evenings.

Libraries.—The only public library in the city is the Louisville Public Library, successor to the Polytechnic Library, which was in turn successor to the Public Library of Kentucky. It is located on the upper floor of the fine building erected by it on Fourth Street and rented to Kaufman & Straus. It has some 50,000 or more volumes on its shelves, and is probably arranging at this time to consolidate with a new library which is to be established with money donated by Andrew Carnegie. Ample grounds have been secured on Third and Fourth streets where a suitable building is to be erected to house the books of the two institutions. The Southern Baptist Theological Seminary has a valuable library at the corner of Sixth and Broadway, and there are several other smaller collections which have something of a public character. There are also several large libraries in the city which belong to private citizens, and one of these, which has upon its shelves some 50,000 volumes, is probably the largest private collection in the country.

Sewers.—The sewerage system of Louisville is extensive, but it is undergoing a needed enlargement. The early engineers were disposed to do all the draining of the city toward "Paddy's Run," a probable survivor of the Ohio when its channel was farther to the south. This system, however, had to be abandoned when it was found that Paddy's Run would itself have to be drained as the city enlarged. The present sewerage system has more than 100 miles and terminates in the Ohio River, where it should have gone at first.

Fires.—The fire department of the city, under a chief, several assistants, and 247 firemen, has 17 steam-engines, three chemical engines, and all the necessary accompaniments of water-towers, hooks and ladders, etc. It is kept up at an annual expense to the city of about \$300,000, or at about \$1,215 for each one employed.

Police.—The police force of the city consists of 329 men, at an annual cost of about \$300,000, or about \$1,000 for each one employed. They are arranged after somewhat of a military grading, and consist of one chief with the rank of colonel, 1 assistant with the rank of major, 6 captains, 10 lieutenants, 10 sergeants, 16 corporals, 1 chief of detectives, 11 detectives, 1 special detective, 10 district detectives, 16 mounted men, 13 station-keepers, 10 wagoners, 213 patrolmen, and 1 secretary. The military character of the organization possibly comes from the ascertained fact that policemen have a good deal of fighting to do if they perform their duty.

Amusements.—Theatres are plentiful enough in Louisville to afford every citizen an opportunity of enjoying an evening's amusement. There are six of them, known by the following names: Avenue, Buckingham, Hopkins, McCauley's, Music Hall, and New Masonic.

Clubs.—There are more than 50 clubs in Louisville, either partaking of a literary, scientific, social, political, or some other character. Of these, the best known as a social organization is the Pendennis Club. The Filson Club, besides being social in its organization, is an historic and literary association which, since its beginning in 1884, has published a book every year made up of the original researches of its members into different branches of knowledge. It has now published 19 volumes, and its 20th volume is ready for the printer.

Parks.—The parks of Louisville have only been established in recent years. The present system was organized in 1891, and lands purchased for an eastern, a southern, and a western park. There was no use for a northern park, as the river was on that side. The western, known as Shawnee Park, consists of comparatively level land and embraces 170 acres; the eastern, named Cherokee Park, has 341 acres of gently rolling land cut into picturesque ravines by Beargrass Creek; and the southern, called Iroquois Park, contains 718 acres of land, partly level but mostly hilly, with some of its eminences nearly 300 feet into the air. The park commissioners have recently purchased of the Dupont estate 18 acres known as Central Park, which, added to Baxter and Boone squares, will enlarge the intramural part of the system and meet the wants of those who cannot enjoy the suburban parks. The parks were named after the three Indian tribes who once asserted ownership over the land.

Health.—No city in our country enjoys better health than Louisville. The last report of the Health Office shows the death rate to be only 16 to the 1,000, and this has been the average for many years. Louisville was once an unhealthy city, when the dense forest was first cleared away and the rays of the sun admitted to the many ponds laden with decaying vegetable matter, but all these feeders of disease have long since been removed, and Louisville has become an exceptionally healthy city.

History.—In 1773 Dr. John Connolly located 2,000 acres of land, to which he was entitled for military service in the French and Indian war, on the south side of the Ohio River, immediately opposite the Falls. This land was surveyed for him by Capt. Thomas Bullitt, and on 10 Dec. 1773 Lord Dunmore executed a deed to him for it. Connolly then conveyed to Col. John Campbell one half of this land, and the two undertook to establish a town thereon, which Bullitt had laid out in the original survey. In 1774 they advertised lots for sale, but Indian disturbances arose and no one came to buy the lots. To the Indian troubles difficulties between Great Britain and her colonies succeeded, and increased until actual war was on between them. Connolly, as an adherent of England, was arrested by the patriots and thrown into prison, and Campbell fell into the hands of hostile Indians on his way from the Falls to Fort Pitt. Under such adverse conditions, with both proprietors in prison, the projected town at the Falls came to an end, and was probably forgotten by all except the unfortunate projectors.

In the spring of 1778, while Gen. George Rogers Clark was floating down the Ohio with his boats loaded with soldiers for the conquest of the Illinois country, he felt the necessity of some safe place in which he could discipline

1. James Lane Allen.

2. Henry Watterson.

3. John Fox, Jr.

4. Madison J. Cawelo.

5. Reuben T. Durrant, M.D.

LOUISVILLE

his raw recruits. When he reached an island in the midst of the Falls, afterward known as Corn Island, and saw the rapid waters dashing around it, he concluded that was the place he wanted, and that no deserter could make his escape from this island. Hence he landed on this island, on 27 May 1778, and immediately went to work to erect cabins for some 20 families of emigrants who came on his boats, and a block-house for his soldiers and supplies. He was opposed to these families coming on his boats, but was glad they had come, as he could leave the supplies he could not take with him in their care on the island and thus take with him every soldier. At the end of a month he thought his raw troops had been disciplined enough to make them reliable soldiers, and moved off with them down the river to Fort Massac, leaving the emigrants on the island, while the sun was in a full eclipse. The families thus left on the island became the founders of Louisville. So far as has been ascertained, they were about 50 in number, consisting of men, women, and children, and one negro. They remained on the island until the news came that Gen. Clark had conquered Kaskaskia, Vincennes, etc., and put an end to the Indian raids, that came from the British posts there to prey upon the helpless families of the Virginia border. Then, by order of Gen. Clark, they built a fort on the main shore and moved into it in time to celebrate their first Christmas in the wilderness with a dinner and a dance.

The interest attached to the subject among the descendants of these founders of Louisville, who are numerous, will justify the record of their names here for the preservation of their memories. So far as has been ascertained they were the following:

James Patton, his wife Mary, and their three daughters, Martha, Peggy and Mary.

Richard Chenoweth, his wife Margaret, and their four children, Mildred, James, Jane and Thomas.

John McMance, his wife Mary, and their three children, John, George, and James.

John Fewell, his wife Mary, and their three children, Ann, Minnie, and Jessie.

William Faith, his wife Elizabeth, and their son John.

Jacob Reager, his wife Elizabeth, and their three children, Sarah, Mariah and Henry.

Edward Worthington, his wife Mary, his son Charles, and his two sisters, Mary (Mrs. James Graham) and Elizabeth (Mrs. Jacob Reager).

James Graham, his wife Mary.

John Doune, his wife Martha, their son John, and their colored man, Cato Watts.

Isaac Kimbley, and his wife Mary.

Joseph Hunter, and his children Joseph, David, James, Martha (Mrs. John Doune) and Ann.

Neal Dougherty, Samuel Perkins, John Sinclair, and Robert Tevis.

There may have been others whose names have not been preserved, and some of those named may not have been among the number. The list, however, is probably the best that can be made at this late day.

The above named persons who came to the Falls with Gen. Clark, and those who joined them as immigrants in the following spring, held a public meeting 10 April 1779, and appointed William Harrod, Richard Chenoweth, Edward Bulger, James Patton, Henry French, Marsham Brashears, and Samuel Moore trustees to lay out a town. These trustees met on the 17th of April 1779, and, having agreed upon a plan of the town, named it Louisville and

employed John Corbly, a surveyor, to lay it out and make a map of it. The plan of the town, as mapped out by Corbly, consisted of nothing but one street running along the bank of the river and 12 cross-streets cutting it at right angles. The numbering of the lots on Corbly's map can be likened to nothing but a puzzle of the most exasperating and unsolvable kind. The numbering is not consecutive and could not have been a reliable guide to the owners or anyone else.

On the first day of May, 1870, the legislature of Virginia, in response to a petition of those who had laid out the town, confirmed their act and appropriated 1,000 acres of the land which had been forfeited from Connolly, for the benefit of the town. The same act of the legislature appointed nine trustees to manage the affairs of the town. These trustees were John Todd, Stephen Trigg, George Slaughter, John Floyd, William Pope, George Merriwether, Andrew Hines, James Sullivan, and Marsham Brashears.

The city continued under the government of trustees, either appointed by the legislature of Virginia or Kentucky or elected by the people, from 1780 to 1828. It might be interesting to point out the acts of the trustees as city-builders during the period of 48 years, but space is not permitted here for such details. Room can only be allowed to sum up in a few words the result of their many acts.

Under their administration the city grew from a few log cabins, straggling along Main Street, which was nothing but a blazed dirt road through the forest, to comfortable and tasteful houses of brick and stone along paved streets. They hewed down the dense forests where the wild animal and the wilder savage dwelt, and drained the ponds which bred disease and death. They increased the population from only about 100 to 10,000, and the value of property in the city from nothing, to which they were reduced by their contest with Col. Campbell, to \$2,500,000. They were an easy-going board of old Virginians, who liked things to go well of their own will, but avoided no labor or danger when their duty required them to act. They had some queer rules for the government of their meetings, such as confiscating to their own use any liquor that a member might presume to bring a second time to a meeting, and passed some funny resolutions, such as the one which offered a premium for the scalps of rats; but no breath of scandal was ever whispered against them or their acts. They generally come into office poor and went out poorer. They held office at too early a day to make money out of it as modern officials do. They passed but few, if any, resolutions which yet stand for law, and left no public buildings that are yet among us to call them back to memory. They did one good thing, in laying off Main and Market and Jefferson streets 90 feet wide, but they did another which over-balanced this good act when they abandoned the public grounds Gen. Clark had mapped out and prevented the city from having parks at the beginning of its career.

By the charter of 1828 Louisville passed from the government of trustees to that of a mayor and 10 councilmen. The first election under the charter occurred 4 May 1828, when John C. Bucklin was elected mayor. At the

LOURDES

same election John M. Talbott, W. D. Payne, G. W. Merriwether, Richard Hall, James Harrison, J. McGillycuddy, John Warren, Elisha Applegate, Daniel McCallister, and Fred Turner were elected councilmen.

The elements of progress were in this charter, and Louisville soon began a prosperity such as she had never enjoyed before. One of the wisest provisions of this charter was in the following words:

The Mayor and councilmen shall have power and authority to establish one or more free schools in each ward in the city, and may receive donations of real and personal estate to erect necessary buildings and to provide the necessary revenue for their maintenance and may supply the funds from time to time by a tax on the ward where such school or schools shall be established.

This provision in the charter of 1828 is the foundation on which rests the free school system of the city and State. It was the first official act of any city on the subject, and we owe to it the many ward schools and the Female High School, the Male High School, and all the other free schools in the city.

The city has greatly prospered since the adoption of this charter, although the charter itself was not of long duration. It was superseded by the charter of 1851, which added to the governing power a board of 12 instead of 10 aldermen, and increased the number of councilmen to 24. It also established the school board, the waterworks, the board of health, the board of police, the board of fire, and the sinking fund. If it had done nothing but establish the sinking fund, by which specified parts of the revenue of the city, sufficient to pay the interest on the city's debts and to pay the principal when due, it would have done well. A third charter superseded the second in 1870, but the charter which added most to the departments of the city government was that of 1892. Under this charter a score of new departments or bureaus of the city were established. All of them report to the mayor and council, but it takes them all to conduct the affairs of the city. Some of them are necessary, but others might, in the opinion of wise men, be merged in those that are absolutely necessary and thus save considerable outlay for supernumerary office-holders.

Quite an effort is now being made to enlarge the sewerage of the city and to establish a new public library commensurate with the wants and the growth of the city. Two hundred and fifty thousand dollars have been contributed by Mr. Carnegie for a library building on a lot owned by the city. Such a sum, without any addition, should supply a building equal to all wants for many years to come. Louisville is certainly on the highway to metropolitan dimensions, and there is seemingly nothing in the way to arrest her progress. She now occupies an area of more than 20 square miles, with a population of 230,000 within her walls and 50,000 more in her suburbs. With a noble river connecting her with all the waterways of the Mississippi Valley, and railroads making her a part of the system of the whole country, her progress is assured to the goal of municipal greatness.

Population.—The first inhabitants of Louisville were some 20 families, numbering probably 50 persons and consisting of white men, women,

children and one negro, who came on the boats of General Clark as emigrants to Kentucky and landed on an island in the Ohio, in the midst of the Falls, 27 May 1778. They erected log cabins on the island, afterward known as Corn Island, and remained there until the fall of 1778, when, by the order of General Clark, who had conquered the Illinois country, they erected a fort on the mainland and moved into it. In the spring of 1779, joined by other immigrants, they laid out a town on the mainland and named it Louisville, in honor of Louis XVI., king of France, who was then helping the colonists in their rebellion against Great Britain. By the first of May 1780 these immigrants had increased possibly to 100, and were at work building log cabins so as to free themselves from the confinement of the fort. By 1790 they had probably increased to 350, and in 1800, when the United States census for the first time recorded the population, but did not give it accurately, they had increased to 600. The United States census in after decades gives the population as follows: (1810) 1,357; (1820) 4,012; (1830) 10,341; (1840) 21,210; (1850) 43,194; (1860) 68,033; (1870) 100,753; (1880) 123,758; (1890) 161,129; (1900) 204,731. The population on 1 Jan. 1904 was estimated at 228,550 in Caron's Directory, a conservative and reliable work, and including the suburbs and Jeffersonville and New Albany, which are only separated from Louisville by the river, the population now exceeds 275,000.

Consult: McMurtrie's 'Sketches' (1819); Casseday's 'Louisville' (1852); Johnston's 'Memorial History of Louisville' (1896).

R. T. DURRETT,

President of the Filson Club.

Lourdes, loord, France, town, in the department of Hautes-Pyrénées; on the Gave de Pau; about 85 miles southeast of Bayonne. For many years this mountain town has been known for its love of learning. In the year 1858 Lourdes acquired new fame. A little peasant girl, about 14 years of age, named Marie-Bernarde Soubirous (better known as "Bernadette") reported to her parents, on 11 Feb. 1858, that she had seen a most beautiful lady in a grotto at the rocks of Massabielle, a part of the town. Each day for several days "Bernadette" described the lady, and many who were present when the child made her visits to the grotto became convinced of the young girl's sincerity. The pastor of the Roman Catholic church at Lourdes, and the priests of the neighboring towns, also the bishop of Tarbes, the diocese in which Lourdes is located, all gave the matter no attention until people from a distance began to visit Lourdes, and miracles were reported, and scientists had begun observations and investigations. On 25 Feb. 1858, a spring appeared in a place where no water had been seen before, as many people who had known the locality for years reported. It was some days before the child gave a name to the lady; it was then Virgin Mary, under the name L'Immaculée Conception. The matter was then investigated by the ecclesiastical authorities and pronounced a genuine apparition, and many cures were said to be miraculous. The place has become noted for the large number of visitors, fully 300,000 annually. A magnificent church has been erected

LOUSE—LOUVOIS

at the grotto, the flags of all nations show that pilgrims from the countries of the whole world have visited the place. Again and again have scientists investigated and reported for and against the miraculous appearance of the spring and its efficacy as a cure for diseases. There has never been imputed any wrong motive to "Bernadette" or her parents. They sought to live quiet, retired lives, and they always refused money or presents in any form. Pop. (1901) 8,708.

Consult: Lassere, 'History of Lourdes'; Boissaire, 'Lourdes, Histoire medicale' (1891); 'Les Annales de Notre Dame de Lourdes.'

Louse, the name of small parasitic insects of a family (*Pediculida*) of doubtful affinities, but usually considered to be *Hemiptera*, much degraded through long-continued parasitism. The lice are all of small size, have soft, much flattened bodies with thin integument, the abdomen enlarged, the thorax indistinctly segmented, and without the slightest trace of wings, and the short legs terminated with strongly hooked, stout claws. The mouth-parts are adapted for sucking, but the homology of the several organs with those of the *Hemiptera* is still doubtful. There is a short proboscis provided with hooks, from the centre of which, when fixed in the skin of the host, there protrudes an extremely delicate tube. The head is also provided with a pair of short, three or five-jointed antennæ and small simple eyes. Probably on account of their disgusting habits the lice have been but little studied, and beyond the fact of their parasitism very little is known of their habits. They feed exclusively upon blood, which is secured by wounding the host's skin, fixing the proboscis by means of its hooks, and inserting the delicate tube above mentioned in the wound. A suction-bulb in the head propels the blood through the long writhing oesophagus into the bilobed stomach. Lice never leave their host except to pass to another, and the eggs, as well as all stages of the young, are found with the adult. Only six genera and less than fifty species have been described, but it is probable that a very great many others remain undiscovered. They are found on mammals exclusively, each species of mammal commonly harboring a peculiar species of louse. Man is more richly endowed, having three species: the head-louse (*Pediculus capitis*), the body-louse (*P. corporis*), and the crab-louse (q.v.). The two first mentioned are very closely alike and are said to vary according to the different races of men which they infest. Human lice are of course associated with filth, and are found only upon neglected children and persons of uncleanly habits. A very remarkable louse is found on the seal, and is consequently aquatic. The bird-lice (q.v.) or *Mallophaga* are entirely distinct from the true lice.

Consult: Schiödt, *Annals Nat. Hist.*, 1866; Piaget, 'Les Pediculines'; Giebel and Nitzsch, 'Insecta Epizoica'; and various recent papers on *Mallophaga* by Kellogg in the 'Proceedings U. S. National Museum.'

Louse'wort, any of various weeds of the genus *Pedicularis*, of the broom-rape (q.v.) family, which contains low, usually pubescent, perennial herbs, with chiefly pinnatifid leaves, and a spike of purplish, two-lipped flowers. The species are few, and the most common is *P. canadensis*, sometimes called wood-betony.

Louvain, loo-vân (Flemish, *Leuven*; German, *Löwen*), Belgium, city in the province of Brabant; on the Dyle, 15 miles east by north of Brussels. It was surrounded by earthen ramparts, which have been converted into pleasant promenades, which form almost a perfect circle, diameter nearly two miles. There are many buildings of historical interest, among which are the Hôtel de Ville, one of the richest and most beautiful Gothic buildings in the world, elaborately and exquisitely decorated in every part of its exterior by sculptures of subjects taken, for the most part, from the Old Testament (restored 1842, injured by lightning 1890); the collegiate church of St. Peter, almost opposite the Hôtel de Ville, built at the end of the 14th century, an edifice of vast extent, and rich in works of art, particularly a fine 'Holy Family' by Matsys. The educational institutions are numerous, among them are the university, which has a number of American students who are studying for the priesthood, a college, an academy of fine arts, two normal schools for the training of teachers, several secondary and elementary schools. There are hospitals, homes for orphans, and other charitable institutions. It has a number of manufactories, the most important of which are the tanneries. For a general trade the town is well situated, having ample communication both by railroad and the Louvain canal. The name of Louvain first appears in history about the end of the 9th century. It was surrounded with walls in 1115, but was afterward much enlarged. The dukes of Brabant inhabited the castle till the 13th century. At the beginning of the 14th century Louvain was the capital of Brabant, contained 200,000 inhabitants, and had an extensive and flourishing trade in the manufacture of broadcloth and all kinds of woollens. The populace, jealous of the privileges of the nobles, revolted in 1382, and being overcome by Duke Wenceslaus and subjected to severe oppression, emigrated in great numbers to England, and thus caused the decay of the town. Pop. (1901) 43,308.

L'Ouverture, Toussaint. See TOUSSAINT L'OUVERTURE.

Louvois, François Michel Le Tellier, frân-swâ mê-shêl lê têt-ê-â loo-vwâ, MARQUIS OF, minister of war to Louis XIV.: b. Paris January 1639; d. 16 July 1691. He was early made a royal councillor through the influence of his father. After 1666 he had the whole management of the ministry of war, and soon exercised a despotic control over his master the king, and over the army. His extensive knowledge, his decision, activity, industry, and talents, rendered him an able minister; but he was too lavish of the blood and treasure of France. Justly appreciated, Louvois must be considered as the evil genius of the showy but disastrous reign of Louis XIV. The war of 1672 against Holland was begun at his instigation. The victories of Turin in 1674 and 1675 were gained by a disobedience of the orders of the minister of war; but the desolation of the Palatinate was commanded by him. On the death of Colbert (1683), of whom he had been the enemy, his influence became still greater, and one of its most fatal effects was the revocation of the Edict of Nantes (1685), the *dragonnades*, and the consequent flight of so many peaceful and industrious Calvinists. The encroachments of France had

LOUVRE—LOVEJOY

united the European powers in the League of Augsburg. Louvois would have the king commence operations against the allies at once, but the growing influence of Mme. De Maintenon was sufficient to prevent this. In 1688, however, the French forces took Philippsburg on the Rhine, and on the order of Louvois, the Palatinate was reduced to a wilderness in midwinter (1689). Louvois' organization of the army lasted till the Empire; but he also undid the work of Colbert, and destroyed the commerce of France.

Louvre, loovr, **The**, an old royal palace at Paris, on the north bank of the Seine, a splendid quadrangular edifice, with a court in the centre, completed by Napoleon. The origin of its name, and the time of the erection of the oldest part of it, are unknown. It is only known that Philip Augustus, in 1214, built a fort and a state prison in this place; that Charles V., during the years 1364-80, added some embellishments to the building, and brought his library and his treasury thither. Francis I. erected that part of the palace which is now called the old Louvre. Henry IV. laid the foundation of the splendid gallery which connects the Louvre on the south side with the Tuileries; Louis XIII. erected the centre; and Louis XIV., according to the plan of the physician Perrault, the elegant façade toward the east, together with the colonnade of the Louvre, which is still the most perfect work of architecture in France. At a later period Louis XIV. chose the palace built by him at Versailles for his residence. After Napoleon had taken possession of the Tuileries he began a second gallery, opposite to the former, by which the two palaces would have been made to form a great whole, with a large quadrangular court in the centre; only 600 feet of it were completed at the time of his abdication, and it remained uncompleted till 1857, when the work, in an improved and extended form, was finished. It was greatly injured by the communists in May 1871, the Richelieu pavilion, containing the magnificent library, being burned. The Louvre was set apart by the Convention as a museum for the national collections in science and art. It contains the museums of paintings, drawings, engravings, bronze antiques, sculptures, ancient and modern, together with special collections of antiquities, and an ethnographical collection.

Loveage, an umbelliferous plant of the genus *Levisticum*, native to the south of Europe, sometimes cultivated in gardens, and notwithstanding its strong and peculiar odor, used as a salad plant. Its roots and seeds are aromatic, acrid, and stimulant, and a liquor called "lovage" is made from them. The Scottish lovage is a native of the sea-coasts and has become naturalized in maritime New England. It is eaten, both raw and boiled, by the Shetlanders. The flavor is aromatic, but acrid and very nauseous to those unaccustomed to it.

Lovat, ló'vat, **Simon Fraser**, 12th Lord, Scottish chieftain: b. 1667; d. London 9 April 1747. He was educated at King's College, Aberdeen, and in 1699, on the death of his father, assumed the title of Lord Lovat, to which on the death of the 10th Lord Lovat his father had acquired a disputed claim. In consequence of proceedings taken in 1698 against him and his clan, in which he was declared guilty of treason, he went to France. He afterward obtained a pardon, and returned to Scotland. Being sum-

moned before the High Court of Justiciary, 17 Feb. 1701, for an outrage done to the Dowager Lady Lovat, whom he married by violence, he failed to appear, and was outlawed. In 1715 he was asked by the Jacobites of his clan to espouse the cause of the Pretender, but inducing them to support the government he received in reward the estate and title of Lovat, the other claimant of which had been involved in the rebellion. In 1740 he was the first to sign the association for the support of the Pretender, and on the breaking-out of the rebellion, in 1745, sent his eldest son with a body of his clan to join the Pretender, while he remaining at home asserted his loyalty to the house of Brunswick. He was, nevertheless, found guilty of treason, and was executed on Tower Hill, in the eightieth year of his age. Consult Burton, 'Life of Simon, Lord Lovat' (1847).

Love, Alfred Henry, American woolen merchant and philanthropist: b. Philadelphia, Pa., 7 Sept. 1830. Since 1853 he has been in the woolen commission business in his native city. Since 1867 he has edited 'The Voice of Peace and the Peacemaker,' and 'Court of Arbitration,' a monthly, and in 1866 aided in organizing the Universal Peace Union. He contributed to periodicals many articles on reformatory subjects and made many addresses.

Love-apple. See TOMATO.

Love-bird, one of the very small parrots of the genus *Agapornis*, not larger than sparrows, which show extreme affection for one another, two or more sitting as close as possible to one another, and cooing and caressing in a manner most delightful to watch. They are common as cage-birds all over the world, are pretty in color and fond of being petted. They are to be treated and fed in the cage in the same way as canaries. The true love-birds are African, but dealers give the same name to various other diminutive tropical species of similar habits. See PARROTS and the books cited there.

Love, Court of. See COURT OF LOVE.

Love Feasts, religious meetings held quarterly by the Wesleyan and other sects. Love feasts are retained in avowed imitation of the ancient Agape. See AGAPE.

Love Lies a-Bleeding. See AMARANTHUS.

Love'dale, South Africa, an important educational and mission station about 40 miles west of King William's Town and 650 miles northeast of Cape Town. It was founded in 1841 and generously supported by the Free Church of Scotland. Besides a general education, it trains teachers for native schools, and gives technical instruction in printing, bookbinding, telegraphy, carpentering, and other useful arts and crafts; its success has been most creditable.

Lovejoy, Elijah Parish, American abolitionist: b. Albion, Maine, 9 Nov. 1802; d. Alton, Ill., 7 Nov. 1837. He was graduated at Waterville College in 1826, and at the Princeton Theological Seminary in 1833, and was ordained to the ministry, but soon after assumed the editorship of the *St. Louis Observer*, a Presbyterian paper of considerable influence. His utterances on the slavery question did not begin to appear in the *Observer* until he had been for some time in charge of its columns, and his first references to that subject were marked by mod-

LOVEJOY—LOVERING

eration. But, stirred by the lynching of a negro murderer by burning, he published an editorial which incensed the pro-slavery part of the community. Hostility was so violent that he removed the paper to Alton, Ill., where a mob threw his press into the river. He was presented with another by Alton friends, and 8 Sept. 1836 published the first issue of the *Alton Observer*. He soon took a bolder anti-slavery stand, and began to call for the organization of a State abolition society. Again, in August 1837, he was mobbed, his office wrecked, and the press destroyed, and when a new press was bought, the ruin was again repeated. The fourth press was set up in a warehouse under an armed guard; but during the night of 7 Nov. 1837 a score or two of men attacked the building, disregarded Lovejoy's warning, were fired upon, and one of the assailants was killed. An attempt was then made to set the warehouse on fire, and when Lovejoy was preparing to shoot the incendiary, he himself received a mortal gunshot wound. The mob then took possession of the place, and once more Lovejoy's press was destroyed. The whole country was excited by these events; public feeling was manifested in various ways; but the most significant effect of the tragedy was a more distinct arraying of forces for the "irrepressible conflict" which had already begun. Consult: J. C. and Owen Lovejoy's 'Memoir' (1838); May, 'Some Recollections of Our Anti-slavery Conflict' (1869); Tanner (one of the defenders of the warehouse), 'The Martyrdom of Lovejoy' (1881); Garrison, 'William Lloyd Garrison' (1885); and Martyn, 'Wendell Phillips—the Agitator' (1890).

Lovejoy, Owen, American abolitionist: b. Albion, Maine, 1811; d. 1864. He was a brother of E. P. Lovejoy (q.v.); was educated at Bowdoin College; and in early life he removed to Alton, Ill. Entering the ministry of the Congregational Church, he preached and lectured against slavery with a power that roused his hearers and carried wide conviction. At Princeton, Ill., where he began a pastorate in 1838, he became conspicuous for the earnestness of his anti-slavery addresses, and for his persistence in holding anti-slavery meetings in defiance of legal and official prohibitions. In 1844 he was elected to the legislature, and resigned his pulpit. Elected to Congress in 1856, he participated in its most exciting debates until the time of his death. He was with his brother Elijah at Alton, Ill., 7 Nov. 1837, and was a witness of his tragic death.

Love-lace, Francis, American colonial governor: b. Hurley, Berkshire, England, about 1618; d. England about 1675. He was a younger son of the 1st Baron Lovelace and in 1668 succeeded Richard Nicolls as governor of New York. He oppressed the inhabitants by heavy taxation and became very unpopular. During his temporary absence from the town the Dutch fleet appeared in the harbor and the citizens speedily surrendered.

Lovelace, Richard, English lyrical poet: b. Woolwich, Kent, 1618; d. London 1658. He was educated at Oxford, entered the army and became a captain. He spent his fortune in support of the royal cause, and after entering into the French service, in 1648, returned to England, and was imprisoned until the king's death. His destitute condition at this time is in marked contrast to accounts of his handsome person and

splendid appearance earlier in life. He died in great poverty. His poems, which are light and elegant, were published in 1659 under the title of 'Lucasta.' The best known of his lyrics are 'To Althea, from Prison,' and 'To Lucasta, on Going to the Wars.' Lovelace, who for spirit and gallantry has been compared to Sir Philip Sidney, also wrote 'The Scholar,' a comedy; and 'The Soldier,' a tragedy.

Lov'ell, James, American patriot: b. Boston, Mass., 31 Oct. 1737; d. Windham, Maine, 14 July 1814. He was a son of John Lovell (q.v.), was graduated from Harvard in 1756 and taught in the Boston Latin School under his father in 1757-75. In 1771 he delivered the first anniversary oration on the so-called 'Boston Massacre.' He was imprisoned by General Gage and carried to Halifax, but was exchanged in November, 1776, and sat in the Continental Congress 1776-82. He was collector of the port of Boston, 1788-9, and its naval officer, 1790-1814.

Lovell, John, American educator: b. Boston, Mass., 16 June 1710; d. Halifax, N. S., 1778. He was graduated from Harvard in 1728. The next year he was appointed usher in the Boston Latin School and was its master from 1734 till the siege of Boston caused its suspension, 19 April 1775. He was a rigid disciplinarian, but nevertheless genial and popular. A loyalist in his sympathies he went to Halifax on the evacuation of Boston by the English troops.

Love-man, Robert, American poet: b. Cleveland, Ohio, 11 April 1864. He was graduated from the University of Alabama. He has been a frequent contributor to magazines, and his verse is marked by simplicity and earnestness. He has published 'Poems' in 1889, 1893, and 1897; and 'A Book of Verse' (1900).

Lov'er, Samuel, Irish painter, novelist and poet: b. Dublin 1707; d. Saint Helier's, Island of Jersey, 6 July 1868. He first devoted his attention to painting, and in 1828 became a member of the Royal Hibernian Academy of Art. He afterward wrote novels, which he illustrated himself, dramas, operettas, and songs which he set to music of his own. In 1844 he gave a series of public entertainments called Irish evenings, which he repeated in the United States and Canada in 1846. Among his works are: 'Legends and Stories of Ireland' (1832-4); 'Rory O'More' (1837); 'Songs and Ballads' (1839); 'Handy Andy' (1842); 'Treasure Trove' (1844). The 'Angels' Whisper'; 'Molly Bawn'; and the 'Low-backed Car' are among his most popular songs. His works in 6 vols. with introduction by O'Donohue, were issued in New York in 1900, and with introduction by Roche, in Boston, 1902.

Lov'ering, Joseph, American scientist: b. Boston 1813; d. Cambridge, Mass., 1892. He was a graduate from Harvard, where he became Hollis professor of natural philosophy and mathematics in 1838, and continued to hold the position till 1888, when he was made professor emeritus. From 1884 to 1888 he was director of the Jefferson Physical Laboratory and he was also connected with the Harvard Observatory.

Lovering, William C., American politician and cotton manufacturer: b. Rhode Island 1837. He was educated at the Cambridge High School. He is president of the Whittenton Manufacturing Company, Taunton, Mass., sat in the State Sen-

LOVE'S LABOUR'S LOST—LOW SUNDAY

ate 1874-5 and has been a member of Congress as a Republican continuously from 1897.

Love's Labour's Lost, a comedy of Shakespeare's, supposedly his first dramatic production, written about 1588-9. While marked by immaturity, it has a sprightliness of wit and constancy of good nature which render it both interesting and pleasing. Its sources are not known but, so far as can be told, the plot is Shakespeare's. In 1597 the play was revised and presented at a court entertainment as being "corrected and augmented" by Shakespeare, showing the existence of an earlier version. On this occasion the name of Shakespeare for the first time appeared on the title-page of a play. The cuckoo song ("Spring") and the "Tu-whit, tu-who" song of the owl ("Winter") give the comedy a fine ending.

Low, 16, A. Maurice, American journalist: b. London, England, 1860. He was educated at King's College, London, and in Austria, and since 1886 has been in charge of the Washington department of the Boston *Globe*. He is also the principal American correspondent of the London *Chronicle*. He has published 'The Supreme Surrender' (1901).

Low, Charles Rathbone, English historian and naval officer: b. Dublin, Ireland, 30 Oct. 1837. He went to sea in 1853 and has served in Asiatic and African waters. He is a fellow of the Royal Geographical Society and a lieutenant in the Indian navy, and has published 'Tales of Old Ocean' (1860); 'Land of the Sun' (1870); 'History of the British Navy' (1872); 'History of the Indian Navy' (1877); 'History of Maritime Discovery' (1899); 'Her Majesty's Navy' (1902); 'Britannia's Bulwarks' (1895); 'The Epic of Olympas' (1897); etc.

Low, Sampson, English publisher: b. London 1797; d. 1886. He became manager in 1837 of a trade journal styled 'The Publisher's Circular,' on which his 'British Catalogue' was afterward based. He established the publishing house of Sampson Low & Co., in 1848. His various compilations include: 'Index to Current Literature' (1859-60); 'Low's Literary Almanac' (1873); etc.

Low, Seth, American educator and administrator: b. Brooklyn, N. Y., 18 Jan. 1850. He was educated at the Brooklyn Polytechnic Institute and at Columbia, graduating from the latter in 1870. He then entered his father's tea and silk importing business as a clerk, and passing through all the intermediate grades, became a junior partner in the firm in 1875. In 1879 he and the other junior partners took full control of the business which was finally liquidated in 1888. He was early interested in public affairs, especially in charities, was prominent in the movement which resulted in abolishing the system of outdoor relief of Kings County, and was organizer and first president of the Bureau of Charities. He was also active in the Republican party, being president of the Young Republican Club in the Garfield campaign of 1880; and though he resigned the presidency remained an active member of this club, which soon began agitation for the non-partisan administration of city affairs. In 1881 he was nominated for mayor of Brooklyn on an independent ticket, and elected; after an efficient administra-

tion he was re-elected in 1883, serving another two years. His administrations were marked by reforms in the system of taxation, and in the public schools, but more especially by the introduction of the civil service system and non-partisan appointments in city affairs. In October 1889 he was offered the presidency of Columbia College (now Columbia University), which he accepted. While he was president, the undergraduate department was enlarged, the graduate schools and Barnard closely affiliated, the institution organized as a university, and the site changed. He also gave the university \$1,000,000 for the erection of a library building. He retained his interest in public affairs, was a member of the Rapid Transit Commission, and of the Greater New York Charter Commission, and an earnest advocate of consolidation; he was also twice a referee in labor troubles. In 1897 he was an independent candidate for Mayor of Greater New York and was defeated, though polling over 150,000 votes. In 1899 he was a member of the United States delegation to The Hague Peace Conference. In 1901 he was nominated for Mayor of Greater New York on a Fusion ticket, and was elected. His administration of the next two years led to a reduction of the taxes, sweeping reforms in the police department, and an enlargement of the public school system, and showed a strict adherence to the principles of business-like administration of public affairs which characterized his Brooklyn mayoralty. In 1903 he was again Fusion candidate for Mayor, but was defeated, a defeat generally attributed not to any serious mistakes or faults in his administration, but rather to party questions and complications.

Low, Will Hicock, American painter: b. Albany, N. Y., 31 May 1853. He learned painting at Paris under Gérôme and Carolus-Duran (1873-7), and since 1890 has been Academician of the National Academy of Design, and is one of the founders of the Society of American Artists. He is classed among the most active and versatile of living American artists and has been alike successful in decorative wall paintings, stained glass (at which he worked with John La Farge, q.v.), portrait and book illustration in black and white. His strength as a designer and colorist has been recognized by the public awards made to his work and by the demand for his services on the part of private and public patrons and connoisseurs. He has also had charge of life classes in the schools of Cooper Union, and the National Academy of Design. The following are some of his best known pictures: 'Portrait of Albani' (1877); 'Chloe' (1882); 'My Lady' (Lotus Club, New York); 'Aurora' (1894); 'Homage to Venus' (mural painting, Waldorf-Astoria, New York).

Low Church, a popular name given to a section of the Church of England whose opinions are opposed to those of the High Church party, and are especially hostile to ritualism and sacerdotalism.

Low Sunday, the first Sunday after Easter, so called to emphasize the contrast between the great feast of the Resurrection and the Sunday which ends the octave. In the Missal (q.v.) and the Breviary (q.v.) the name is "Dominica in Albis," because on this day the newly baptized wore their white robes for the last time. Mention is made of this custom in

LOWE—LOWELL

the Breviary hymn used in the vespers of Low Sunday, "Ad regias Agni dapes." The name "Beloken Paschen," close of Easter, is used frequently in Holland; and "Quasimodo," the first word in the introit of the Mass for the day, is the common name for this day in Germany and France.

Lowe, Charles, English journalist and biographer: b. Balconnel, Forfarshire, Scotland. He was educated at the University of Edinburgh and on the Continent and was for 13 years *Times* correspondent at Berlin, returning to England in 1891. He has published two biographies of Bismarck: 'Bismarck's Table Talk'; 'Alexander III. of Russia'; 'King Edward VII.'; 'Our Greatest Soldiers'; etc.

Lowe, Sir Hudson, British general: b. Galway 28 July 1769; d. London 10 Jan. 1844. He entered the army at an early age; in 1813 was attached to the army of Blücher, and took part in the invasion of France in the early part of the following year. Appointed in 1815 to the command of the English troops which were to co-operate with the Austro-Sardinian army in Italy; on the fall of Napoleon he was appointed governor of St. Helena, and entrusted with the care of the ex-emperor. He returned to England in July 1821. He has been accused by the partisans of Napoleon for want of courtesy and for rigor and cruelty to his prisoner. It is, however, freely admitted that Napoleon and his suite made a system of exaggerating their grievances, and even sedulously tried to provoke them, with a view to exciting sympathy in Europe. Many of the grievances were puerile, as that Sir Hudson would not give Napoleon the title of emperor, which England had never recognized, and which he was forbidden by his government to use. Consult: Forsyth, 'Captivity of Napoleon at Saint Helena from Letters and Journals of Sir Hudson Lowe' (1853); Seaton, 'Sir Hudson Lowe and Napoleon' (1898); Lord Rosebery, 'Napoleon, the Last Phase' (1900).

Lowe, John, American rear-admiral: b. Liverpool, England, 11 Dec. 1838. He was educated in his native city and Columbus, Ohio, and entered the American navy in 1861. He served through the Civil War and accompanied the Greeley Relief Expedition in 1884. He was the first naval officer of any nation to serve in a submarine torpedo-boat. This he did in 1898. He was promoted rear-admiral 11 Dec. 1900, and retired the same day. Since his retirement he has participated in an experiment with a submarine torpedo-boat, remaining submerged for 15 hours.

Lowe, Martha Ann Perry, American verse writer: b. Keene, N. H., 1829; d. Somerville, Mass., 1902. She published: 'The Olive and the Pine' (1859); 'Love in Spain, and Other Poems' (1867); 'The Story of Chief Joseph' (1881); 'Bessie Gray'; etc.

Lowe, Robert, Viscount Sherbrooke, English politician: b. Bingham, Nottinghamshire, 4 Dec. 1811; d. London 27 July 1892. He was educated at Winchester College and at University College, Oxford, and directly upon his admission to the bar in 1842 went to Australia, where he quickly attained prominence in political affairs. In 1843 he became a member of the Legislative Council of New South Wales, and

made himself famous by his opposition to the land monopoly, as well as by the part he performed in the development of education and the regulation of finance. He also made effectual protest against the English practice of transporting convicts to Australia. Meanwhile he was not neglectful of his private affairs, but acquired great wealth, and returned to England in 1850. Two years later he was elected to Parliament for Kidderminster, and accepted the position of joint secretary of the board of control, and in 1859, under Palmerston, was placed practically at the head of educational affairs. In consequence of a mistaken vote of censure by the House of Commons in 1864 he resigned his office, but only to participate with ability more marked than before in the proceedings of that body. The rejection of the Whig Reform Bill in 1866 was considered to have been largely due to his powerful speeches against it. As one of the Adullamites (q.v.) he received overtures from the government of Lord Derby, but although he called himself an outcast from the Liberal party he refused to leave it. In 1867 he made a number of speeches designed to justify his opposition to extension of the suffrage. His strong support of the resolutions for disestablishment of the Irish Church, in 1868, restored him to favor in the Liberal party, and in December of that year he became chancellor of the exchequer under Gladstone, giving up that office in 1873 to accept the post of home secretary, in which, however, his tenure was brief. His reforms as chancellor of the exchequer related especially to reduction of sugar duties, the replacing of assessed taxes by license duties, and like readjustments. After the fall of the Gladstone ministry in 1874 Lowe took comparatively little part in public affairs. He was raised to the peerage as Viscount Sherbrooke in 1880. Consult: Parkes, 'Fifty Years of Australian History' (1892); Martin, 'Life of Lord Sherbrooke' (1893); Hogan, 'Robert Lowe, Viscount Sherbrooke' (1893); also Hansard, 'Parliamentary Debates.'

Lowe, Thaddeus S. C., American inventor and scientist: b. Jefferson, N. H., 20 Aug. 1832. He constructed balloons in 1856 and 1858-9 in order to study atmospheric phenomena, and during the Civil War was chief of the aeronautic corps. He devised a system of signaling in 1862, and valuable instruments for atmospheric investigation, etc., constructed and operated the largest aerostat ever built, invented a compression ice machine and made the first artificial ice in the United States (1865); and established the Lowe Observatory in the Sierra Madre Mountains, Cal.

Lowell, 16'el, Abbott Lawrence, American educator and author: b. Boston 13 Dec. 1856. He was graduated from Harvard in 1877, from the law school of the university in 1880, was a legal practitioner in Boston in 1880-97, and from 1897 to 1899 was a lecturer at Harvard. In 1900 he was appointed there to the chair of the science of government. Among his works are 'Essays on Government' (1889); 'Governments and Parties in Continental Europe' (1896), the only work of the sort in English, and a most careful and valuable explanation of the governmental machinery of European states; and 'Colonial Civil Service' (1900).

LOWELL

Lowell, Charles, American clergyman: b. Boston 15 Aug. 1782; d. Cambridge 20 Jan. 1861. He was a son of John Lowell (1743-1802). He was graduated from Harvard in 1800, studied theology at Edinburgh, Scotland, and from 1 Jan. 1806 until his death was pastor of the West (Unitarian) Church of Boston. His ill-health caused his absence in Europe and the East (1837-40), and in his later years his place in the pulpit was largely taken by his colleague, Cyrus A. Bartol (q.v.). He was an able orator and of strong anti-slavery views. A founder and member of the Society of Northern Antiquarians of Copenhagen, he was also secretary of the Massachusetts Historical Society and a corresponding member of the Archaeological Society of Athens. Among his published writings are: 'Meditations for the Afflicted, Sick, and Dying'; 'Devotional Exercises for Communicants'; 'Occasional Sermons'; 'Practical Sermons' (1855).

Lowell, Charles Russell, American soldier: b. Boston 2 Jan. 1835; d. near Middletown, Va., 20 Oct. 1864. He was graduated from Harvard in 1854, at the beginning of the Civil War was manager of the Mount Savage iron-works, Maryland, on 20 April 1861 was made a captain in the 6th United States cavalry, and during the Peninsular campaign, at the close of which he received the brevet of major, commanded a squadron of that regiment. Having been assigned to the personal staff of Gen. McClellan, he distinguished himself at Antietam. In November 1862 he organized the 2d Massachusetts cavalry, of which he became colonel on 10 May 1863. In the winter of 1863-4 he commanded the advanced defenses of Washington, and subsequently he was in command of the provisional cavalry brigade under Sheridan in the Shenandoah, and, ultimately, of the reserve brigade, consisting of three regiments of United States cavalry, the 2d Massachusetts, and a battery of artillery. With this force he fought at Opequan Creek (Winchester) (19 Sept. 1864), and defeated Gen. Rosser's cavalry (9 October). In the battle of Cedar Creek (19 October), he successfully resisted the Confederate attack until the arrival of Sheridan, but later in the action, while leading the final charge, was mortally wounded.

Lowell, Edward Jackson, American author: b. Boston 18 Oct. 1845; d. Cotuit, Mass., 11 May 1894. He was the grandson of Francis Cabot Lowell (1775-1817) (q.v.). He was graduated from Harvard in 1867, was admitted to the Suffolk County bar in June 1872, for a time practised law in Boston, but subsequently devoted himself exclusively to literary work. He was a member of the Massachusetts Historical Society and a fellow of the American Academy of Arts and Sciences. Among his writings are: 'The Hessians and the other German Auxiliaries of Great Britain in the Revolutionary War' (1884), recognized as standard; 'The Eve of the French Revolution' (1892); and the section on 'The Diplomacy and Finance of the Revolution' in Winsor's 'Narrative and Critical History of America' (1884-9).

Lowell, Francis Cabot, American manufacturer: b. Newburyport, Mass., 7 April 1775; d. Boston 10 Aug. 1817. In 1812 he began his attempts to manufacture cotton cloth, an undertaking then rendered the more difficult by the

fact that the war in progress with Great Britain prevented the importation of English machinery. He finally succeeded, by the aid of Paul Moody, a mechanic of Newburyport, in making a suitable loom, and with P. T. Jackson, his brother-in-law, obtained a charter as the Boston Manufacturing Company, with \$100,000 capital, and established at Waltham what is believed to have been the first mill in the United States to combine in one establishment the several operations necessary in manufacturing finished cloth from the raw cotton. He was active in introducing into the tariff act of 1816 the clause imposing a minimum duty on imported cotton fabrics. Jackson, subsequent to Lowell's death, bought a portion of Chelmsford and there located mills; and in 1826 the town was incorporated as Lowell.

Lowell, James Russell, American poet, critic and diplomat: b. Cambridge, Mass., 22 Feb. 1819; d. there 12 Aug. 1891. The Lowells were descended from Percival Lowell of Bristol, England, who emigrated to Massachusetts in 1639. Judge John Lowell, grandfather of the poet, contributed a clause to the Bill of Rights which effected the abolition of slavery in the State. One of the poet's uncles, Francis Cabot Lowell, was a leading promoter of manufactures in New England, and is remembered in the name of the city of Lowell. Another uncle, John Lowell, founded the Lowell Institute of Boston. Rev. Charles Lowell, the poet's father, b. 1782, was graduated at Harvard in 1800, and after some study at the University of Edinburgh, was settled over the West Church of Boston, and remained its pastor till his death in 1861. He married Harriet Spence, from a family of Spences in Portsmouth, N. H., who were of Scotch origin. She was the sister of Robert Traill Spence, of naval fame, and is remembered as having the gifts of "a great memory, an extraordinary aptitude for language, and a passionate fondness for ancient songs and ballads," as also a lively sense of humor. There were five children, two daughters and three sons, of whom James Russell was the youngest. He was prepared for college by William Wells, an English schoolmaster, who gave him an excellent drill in the rudiments of Latin. But perhaps the best part of his early education was derived from the unrestricted use of books at home. His father had come into possession of the old Tory mansion, on the Watertown road, later called Elmwood, and its abundant library was well stocked with attractive authors. He entered Harvard College in his 16th year, graduating in the class of 1838. He was not diligent in the prescribed work of the course, but engaged mainly in desultory reading and in writing essays and verse for college societies and magazines. Because of cleverness thus shown, he was made class poet. But the poem, his first considered effort, was not delivered, as the author had been ordered to Concord, for a brief rustication, on account of some neglect of college rules. It was published the next year, under the title of 'A Poem Recited at Cambridge.' Lowell now entered the Harvard School of Law, took its degree in 1840, and attempted practice. But he was quickly drawn aside to literature, largely through the influence of Maria White, a young lady of Watertown, to whom he became engaged in the latter part

JAMES RUSSELL LOWELL.

LOWELL

of the same year. The poetic gifts and moral enthusiasm of this young woman quickened Lowell's nature, and gave his bent a purpose. In 1841 he collected some of his best poems into a volume called 'A Year's Life,' and inscribed it in covert language to his betrothed. Two years later he began, with Robert Carter, the publication of a literary monthly, called 'The Pioneer,' with Hawthorne, Poe, and Whittier among the contributors, but after three issues it was discontinued. In 1844 occurred his marriage with Maria White; and during the year were published an enlarged edition of the Poems, including 'A Legend of Brittany,' 'Prometheus,' 'Miscellaneous Poems,' and 'Sonnets,' and a volume called 'Conversations on some of the Old Poets.' In 1848 he again published an edition of the Poems, with the addition of the Third Series, including several poems against slavery. Later in the year 'The Vision of Sir Launfal,' 'A Fable for Critics,' and 'The Biglow Papers' came out, the last-named being a reprint of dialect poems furnished to the newspapers of the day. In nothing had Lowell been so effective as in these satires; nothing in the literature of those stirring times attracted more attention. In 1851 he sailed for Europe, with his wife, who was in failing health, and spent a year, mainly in Italy, in study and travel. After their return Mrs. Lowell's health did not improve, and in 1853 she died. A volume of her poems was printed, after her death, for private circulation. In 1855, on the resignation of Professor Longfellow, Lowell was elected Smith professor of the French and Spanish languages, and professor of belles lettres in Harvard College. He spent two years in Europe, to prepare himself more fully, and in 1857 took up the duties of his chair. He married Miss Frances Dunlap, of Portland, Maine, the same year. For the next 20 years his strength was taxed incessantly, being devoted, outside of his service in his college, to editorial and critical rather than poetic writing. He was the first editor of 'The Atlantic Monthly,' and continued in the position for two years. He had an editorial connection with the 'North American Review' from 1862 to 1873, and contribtued to it many critical essays of unusual merit. In 1864 he reprinted, in 'Fireside Travels,' a few papers of less substantial worth. In the lighter work of this busy period falls the 'Biglow Papers,' Second Series, which he began in 1862. These were reissued in 1867. In the next year appeared 'Under the Willows,' a collection of his poems written since 1848. In 1869 he published 'The Cathedral,' over which he had long worked, and in 1870 'Among my Books,' a reprint of some of his best essays on literary themes. In 1871 followed 'My Study Windows,' of like contents, and in 1876 'Among my Books,' Second Series. In 1877 Lowell was called to take the post of Ambassador to Spain, and after three years at Madrid was transferred to the court of St. James. Here he won the admiration not only of his countrymen, but also of the more exacting English public, by his executive abilities and his social and oratoric gifts. He received public honors from Oxford, Cambridge, Edinburgh and Bologna, and in 1883 was chosen Lord Rector by the University of St. Andrews. His residence at St. James terminated in 1885, and the affliction of his wife's death came to

him, the same year, before return. He resumed to some degree his literary labors, after coming back to Cambridge. He published 'Democracy, and other Addresses' in 1887, and 'Heart's-ease and Rue,' and 'Political Essays,' in 1888. He prepared the public address for the celebration of the 250th anniversary of the founding of Harvard University, and delivered a course of lectures on the Old English Dramatists before the Lowell Institute. In the year before his death he revised and edited a definitive edition of his writings in 10 volumes. Supplemental to these, 'American Ideas for English Readers,' 'Latest Literary Essays and Addresses,' and 'Old English Dramatists,' were issued posthumously in 1892. Lowell was first and chiefly a man of books, yet without bookishness or pedantry. The most scholarly of all the group then making a name in literature, he was also the most executive and practical. He never lost the point of view of life, never lost sympathy with people, and was perhaps as wise and strong in affairs as in the fields of textual and æsthetic criticism. He lacked the grace and tenderness of Longfellow, but was gifted with deeper insight than any other of the New England school save Emerson.

Norton (1894); Underwood, 'Lowell, a Biographical Study' (1893); Scudder, 'James Russell Lowell, a Biography' (1901); Hale, 'James Russell Lowell and His Friends' (1899); E. E. Hale, Jr., 'Lowell' in 'Beacon Biographies'; Wendell, 'Literary History of America' (1900).

L. A. SHERMAN,

Of the University of Nebraska.

Lowell, John, American jurist: b. Newburyport, Mass., 17 June 1743; d. Roxbury, Mass., 6 May 1802. He was graduated from Harvard in 1760, studied law, entered practice at Newburyport in 1762, represented that town in the general court in 1777 and Boston in 1779, and was a delegate to the convention of 1780 which framed the constitution of Massachusetts. He obtained the insertion in this document of the clause of the preamble which declares that "all men are born free and equal," with the belief that slavery would thus be abolished in Massachusetts. The supreme court of the State upheld his contention in 1783, and thereby slavery in the State was abolished at his initiative. In 1782-3 he was a delegate in the Continental Congress, and in 1782 was appointed by the congress one of three judges of a court of appeals to hear appeals from courts of admiralty. He was made by Washington in 1789 judge of the United States district court of Massachusetts, and by Adams in 1801 chief justice of the 1st circuit of the United States circuit court. He was a founder of the American Academy of Arts and Sciences (1780), and one of its councillors. He published an oration on James Bowdoin the elder in Vol. II. of the 'Memoirs' of the American Academy; and a poem in 'Pietas et Gratulatio' (1761).

Lowell, John, American publicist: b. Newburyport, Mass., 6 Oct. 1769; d. Roxbury, Mass., 12 March 1840. He was a son of John Lowell (1743-1802) (q.v.). He was graduated from Harvard in 1786, studied law, was admitted to the bar in 1789, retired from practice in 1803, and after travel in the East (1803-6) devoted his attention to literature. He wrote on agriculture

LOWELL

and theology, but chiefly on politics. In various publications he attacked the War of 1812; and by his pen made himself a valuable aid of the Federalists. His interest in horticulture obtained for him the sobriquet of "the Columella of the New England States"; and he was the first in the United States to build extensive greenhouses on a scientific plan. For many years he was president of the Massachusetts Agricultural Society. Among his pamphlets were: 'Peace Without Dishonor, War Without Hope' (1807); 'Diplomatic Policy of Mr. Madison Unveiled' (1810); 'Candid Comparison of the Washington and Jefferson Administrations' (1810); and 'Mr. Madison's War' (1812).

Lowell, John, American merchant and philanthropist; b. Boston, Mass., 11 May 1799; d. Bombay, India, 4 March 1836. He was the son of F. C. Lowell (1775-1817) (q.v.). He studied at Harvard (1813-5), became a successful merchant in Boston, was several times elected to the Boston common council and the State legislature of Massachusetts, and collected a large and valuable library. After 1830 he passed a large part of his time in travel in foreign lands. By the gift of about \$250,000, — then the largest ever made in America by an individual for the endowment of a literary institution, with the exception of Girard's bequest for Girard College — he established in Boston the Lowell Institute, to consist of regular annual courses of free public lectures. The institute was opened in the winter of 1830-40, and has proved exceedingly successful. Consult: Everett, 'Memoir of John Lowell, Jr.' (1840); and Smith, 'History of the Lowell Institute' (1898).

Lowell, Josephine Shaw, American philanthropist; b. West Roxbury, Mass., 16 Dec. 1843. In 1863 she married Charles Russell Lowell (q.v.). During the Civil War she was connected with the work of the Sanitary Commission, and subsequently with labors among the freedmen and with other causes of philanthropy and reform. She was a founder of the Charity Organization Society of New York in 1881, in 1886-9 was commissioner of the State Board of Charities of New York, and in 1899 was appointed to the board of managers of the New York State reformatory for women. Among her writings are: 'Public Relief and Private Charity' (1884); 'Industrial Arbitration and Conciliation' (1893).

Lowell, Maria White, American poet; b. Watertown, Mass., 8 July 1821; d. Cambridge, Mass., 27 Oct. 1853. She was the wife of James Russell Lowell. The best known of her poems are: 'The Alpine Shepherd' and 'The Morning Glory,' which appeared in the collection printed privately at Cambridge in 1855. The death of Mrs. Lowell, occurring the same night that a child was born to Mr. Longfellow, called forth the latter's poem beginning:

Two angels, one of life and one of death,
Passed o'er our village as the morning broke.

Lowell, Percival, American astronomer; b. Boston 13 March 1855. He was graduated from Harvard in 1876, for several years resided in Japan, and in 1883 was made secretary and councillor to the special commission to the United States from Korea, the first embassy sent from that country to any Western power. In 1894 he established at Flagstaff, Ariz., the Lowell Observatory, which in 1896 was for a time removed to

Mexico City. He was elected a member of the Royal Asiatic Society of Great Britain and Ireland, and a fellow of the American Academy of Arts and Sciences. He lectured before the Lowell Institute in 1893-4 and 1894-5, contributed various articles to the publications of learned societies, and wrote: 'Chosön; The Land of the Morning Calm' (1885); 'The Soul of the Far East' (1886); 'Noto: An Unexplored Corner of Japan' (1891); 'Occult Japan, or the Way of the Gods' (1894); 'Mars' (1895); and 'Annals of the Lowell Observatory' (Vol. I., 1898; Vol. II., 1900).

Lowell, Robert Traill Spence, American Episcopal clergyman; b. Boston 8 Oct. 1816; d. Schenectady, N. Y., 12 Sept. 1891. He was a son of Charles Lowell (q.v.) and a brother of James Russell Lowell (q.v.). He was graduated from Harvard in 1833, for a time studied medicine in the Harvard medical school, and later was in mercantile life at Boston. In 1839 he began the study of theology; went to Hamilton, Bermuda; was there ordained deacon in 1842 and priest in 1843; and became inspector of schools for the colony and domestic chaplain to the bishop. In 1843-7 he was rector at Bay Roberts, Newfoundland, and during the famine of 1846 in that district rendered valuable service as chairman of the relief committee. Having returned to the United States in 1847, he was active in mission work among the poorer classes at Newark, N. J.; was rector of Christ Church, Duaneburg, N. Y., in 1859-69, head-master of St. Mark's school (Southboro, Mass.) in 1869-73, and professor of Latin language and literature in Union College in 1873-9. He published 'The New Priest in Conception Bay' (1858; revised in 1889), in which Bay Roberts appears as "Peterport"; 'Fresh Hearts That Failed Three Thousand Years Ago, and other Poems' (1860); 'Anthony Brode' (1874); 'Burgoyne's March' (1877), written for the Saratoga County celebration at Bemis Heights; and 'A Story or Two from an Old Dutch Town' (1878).

Lowell, Mass., city, county-seat of Middlesex County; at the junction of the Concord and Merrimac rivers, and on the New York, N. H. & H. and the Boston and M. R.R.'s; about 25 miles northwest of Boston. Lowell, formerly Chelmsford, was founded in 1822, by the "Merrimac Manufacturing Company," and named in honor of Francis Cabot Lowell (q.v.). In four years it was incorporated as a town, and in 1836 it was chartered as a city. The city now has an area of over 12 acres. The city is noted for its great number of manufactories and its large annual output of manufactured articles. The power is obtained from the falls of the Merrimac which here descend 32 feet and from the Concord River; but some steam power is used. The "Canal and Lock Company" was organized early in the 19th century, for the purpose of obtaining and supplying power for cotton factories. The canal system was nearly completed in 1825, but the first canals were more like ordinary ditches; now they are walled and fitted with locks and bridges, all of the best construction and latest improvements. They are so well built, that the annual amount spent for repairs is comparatively small. By means of this canal system water-power is furnished to many factories in Lowell, then returned to the Merrimac to be used lower down the stream to

LOWER CALIFORNIA—LOYALISTS

turn the wheels for the mills in Lawrence, Haverhill and Newburyport. Coal is so expensive in Lowell that water-power is used extensively; but the large mills are fitted with steam-power machinery that may be used in a dry season.

Some of the manufacturing establishments are woolen and cotton factories, hosiery and knitting mills, carpet and felt factories, bleacheries, dyeing works, machine-shops, patent-medicine works, a cartridge factory, and furniture factories. Lowell has many points of historic and scenic interest and a number of fine public buildings. The educational institutions are the State Normal School, the Rogers Hall School, the Lowell Textile School, Saint Patrick's Academy, a high school, and public and parish elementary schools. The city has the Lowell Hospital, Lowell General Hospital, Saint John's Hospital, Saint Peter's Orphanage, Theodore Edson Orphanage, Ayer Home for Young Women and Children, Saint Patrick's Home for Working Women, and the Old Ladies' Home.

The annual amount of municipal expenditures is about \$1,320,000; the principal items are for schools about \$330,000; for hospitals, almshouses, etc., \$120,000; for police department, \$121,000; for the fire department, \$118,000; for municipal lighting, \$84,500; for waterworks, \$85,000. The waterworks were built in 1873 at a cost of about \$2,875,000. There are now about 130 miles of mains. The waterworks are owned and operated by the city. Pop. (1890) 77,696; (1900) 94,969, about 44 per cent of whom are of foreign birth, many from Canada. Consult: Drake, 'History of Middlesex County'; 'Illustrated History of Lowell.'

Lower California. See CALIFORNIA, LOWER.

Lowndes, Lloyd, American capitalist and politician: b. Clarksburg, W. Va., 21 Feb. 1845. He was graduated from Allegheny College, Meadville, Pa., and from the law school of the University of Pennsylvania. He entered the Maryland legislature in 1871, and in 1895 was elected governor of Maryland by the Republican vote and held that position until 1899.

Lowndes, Marie Adelaide Belloc, English author; b. 1868. She is a sister of Hilaire Belloc (q.v.) and was married to F. S. Lowndes in 1896. She has published 'Life and Letters of Charlotte Elizabeth, Princess Palatine' (1889); 'King Edward VII.' (1901); 'The Philosophy of the Marquise,' a novel in dialogue (1899).

Lowndes, Rawlings, American statesman: b. in the West Indies 1722; d. 1800. His parents removed with him to Charleston when he was very young, and his career was ever after associated with that city. Having studied law he became an associate judge of the colonial court in 1766, and in that position opposed the Stamp Act. He assisted in outlining a new constitution for South Carolina in 1776, and in 1788 became president of the State. He was subsequently a member of the State legislature and vigorously opposed the ratification of the Federal constitution.

Lowth, Robert, English prelate and biblical scholar: b. Winchester, Hampshire, 27 Nov. 1710; d. London 3 Dec. 1787. Educated at Winchester School and Oxford University, he became professor of poetry in the latter in 1741, and in 1744 was appointed rector of Ovington, Hampshire. In 1753 he published his lectures on 'The

Sacred Poetry of the Hebrews,' and became famous as one of the first biblical critics of his age. Ecclesiastical preferments followed, and he was made successively prebend of Durham, bishop of St. David's, (1766), of Oxford the same year, and of London in 1777. In 1783 he declined the archbishopric of Canterbury. In 1778 he published 'Isaiah, a New Translation,' with a preliminary dissertation and notes, which was highly commended.

Lowville, 18'vil, N. Y., village, county-seat of Lewis County; on the New York Central & Hudson River railroad; about 100 miles northwest of Albany and 60 miles north by west of Utica. It is situated in an agricultural section, and the industries of the village are connected chiefly with farm and dairy products. Its trade is principally in hay, grain, vegetables, and the noted Lewis County butter and cheese. The principal buildings are the town-hall, the county buildings, a club-house, and the Lowville Academy. The academy library has about 4,500 volumes. Pop. (1900) 2,352.

Loxodrom'ic Curve, the course which is represented by the path of a ship when her course is directed constantly to the same point of the compass, thereby cutting all the meridians at the same angle.

Loy, Matthias, American Lutheran theologian: b. Cumberland County, Pa., 17 March 1829. He was graduated from the Theological Seminary at Columbus, Ohio, in 1849, and was pastor at Delaware, Ohio, 1849-65. He was editor of the 'Lutheran Standard' (1864-91), and president of the Evangelical Lutheran Synod of Ohio 1860-78, and 1880-94. He has published 'The Doctrine of Justification' (1869); 'Christian Prayer' (1890); 'The Christian Church' (1898); etc.

Loyal Legion of the United States, Military Order of the, was the first society formed by officers in the Civil War, who were honorably discharged. Members are eligible from the army, navy and marine corps. On the day after the assassination of President Lincoln, Col. S. B. Wylie Mitchell, Capt. Peter D. Keyser, M. D., and Lieut.-Col. T. Ellwood Zell met in Philadelphia to arrange for a meeting of ex-officers of the army and navy to adopt resolutions relative to the death of President Lincoln. It was decided to effect a permanent organization, and an adjourned meeting was held for this purpose in the hall of the Hibernia Fire Company in Philadelphia 3 May 1865. There are State commanderies in Pennsylvania, New York, Maine, Massachusetts, California, Wisconsin, Illinois, District of Columbia, Ohio, Michigan, Minnesota, Oregon, Missouri, Nebraska, Kansas, Iowa, Colorado, Indiana, Washington, and Vermont. The total membership in 1902 was over 10,000.

Loyal Temperance League, an organization of children founded in 1886, by the Woman's Christian Temperance Union, for the purpose of teaching children the evil effects of alcohol and tobacco. The graduates, who follow a systematic course of instruction, are organized into State legions, holding annual conventions. There are upward of 200,000 members in the United States.

Loy'alists, or Tories, in American history, were those persons who remained loyal to Great Britain, during the Revolutionary War. They

LOYALTY ISLANDS—LOYSON

represented all classes, a majority of them, however, being office holders and members of learned professions. Others were adventurers who adhered to England with the hope of gain or official preferment. At the close of the Revolution the Royalists were estimated at 1,000,000 or a third of the entire population of the colonies. The Whigs took vigorous action against the loyalists, banished many of them under penalty of death and confiscated the estates of others. Between 40,000 and 50,000 loyalists are said to have fled to Canada prior to 1786. Consult: Rycerson, 'Loyalists of America, 1620-1816,' (1880); Van Tyne, 'The Loyalists in the American Revolution' (1902).

Loyalty Islands, a group in the Pacific Ocean, east of New Caledonia, of which French colony they form a dependency. They consist of the islands Uvea (Uea), Lifu, and Maré, with many small islands. Total area, about 1,040 square miles. Water is scarce, but some fruits, vegetables, and grains are cultivated. The inhabitants are of mixed descent, Melanesian and Polynesian, and nearly all Protestants. Pop. about 20,000.

Loyola, Iō-yō'lā, Ignatius (INIGO LOPEZ DE RECALDE), founder of the order of the Jesuits: b. at the castle of Loyola, Guipuzcoa 1491; d. Rome 31 July 1556. He seems to have been from the first of an enthusiastic temperament, which was fomented by the Spanish romances, in which religion and chivalry are blended, and is said in early youth to have himself written a romance of which the apostle Peter was the hero. In 1505 he became attached as a page to the household of Ferdinand V. His relative Don Antonio Manriquez, duke of Najara, trained him to the profession of arms and his valor was indicated at the siege of Pampeluna, on the occasion of the invasion of Navarre by Francis I. in 1521, when the garrison was induced to hold out by his example alone. Loyola was made a prisoner by the French, having been wounded in both legs by a cannon ball in such a manner as to render him lame for life. He had twice to undergo a painful operation, followed by a long confinement. The only books he found to relieve its tedium were books of devotion and the lives of saints. This course of reading threw him into a state which he has minutely described in his 'Spiritual Exercises,' a devotional book written in Spanish, and which has been translated into many languages. His ambition now turned from a military life, for which he was incapacitated, to imitation of the self-denial of Saint Dominic and Saint Francis. He made pilgrimage to Montserrat in Catalonia, where he hung up his arms before the Virgin and assumed the pilgrim's staff. After dedicating himself to the church at Montserrat he proceeded to the hospital of the Dominican convent of Manresa, where he devoted himself to the care of the poor and sick. After ten months spent at Manresa he proceeded on a pilgrimage to Rome and Jerusalem (1523). His object at this time was the conversion of the infidels, but being refused a permanent residence at Jerusalem by the primate of the church he returned to Spain and attended (1524-7) the schools and universities of Barcelona, Alcalá, and Salamanca. In Spain he was several times arrested by the Inquisition under suspicion of heresy, but was always acquitted. He then went to Paris, where, placing himself in

the lowest classes, he went through, from 1528 to 1535 a course of general and theological training. Here he formed the first nucleus of the society which afterward became so famous. Under his influence Pierre Le Fèvre, a Savoyard priest, Francis Xavier; professor of philosophy, Lainez, Salmeron, Bobadilla and Rodriguez of Azevedo, students, met together with Loyola on 15 Aug. 1534, in a subterranean chapel of the Abbey of Montmartre, took the sacrament administered by Le Fèvre, and bound themselves together by vows of chastity and poverty, devoting themselves to the care of the church and the conversion of infidels. In 1536 he met the members of this body at Venice with a view to the pilgrimage to Jerusalem, but the war which broke out in 1537 between the Venetians and the Turks prevented the accomplishment of this object. At Venice Loyola became attached to Cardinal Caraffa (Paul IV.), the founder of the order of the Theatines, and proceeded to Rome to procure the recognition of his order, which was granted partially in 1540, and fully three years later, taking the name of the Company of Jesus. Besides the vows of poverty and chastity their vow of obedience bound them to perform unhesitatingly all the commands of the pope. They discarded the peculiar garb by which monastic orders were usually distinguished, and devoted themselves to the highest objects to which a religious society could aspire—the education of youth, the defense of the church, and the propagation of the faith. Besides missionary enterprises for the extension of the church, their chief means of influence were the pulpit, the confessional, and their schools and colleges for training the young. Thus the romantic devotion of Loyola took a practical shape. On 22 April 1541 Loyola was elected general of the order, and drew up its constitution, assisted by the organizing genius of Laynez. He continued to reside in Rome and govern the society he had constituted till his death. He died worn out with the fatigues of his ascetic severities on 31 July 1556. He was beatified in 1607 by Paul V., and canonized in 1622 by Gregory XV. See JESUITS.

Loyson, Charles, shārl Iwā-zōn (known by his monastic name, PÈRE HYACINTHE), French ecclesiastic: b. Orléans 10 March 1827. He studied in the College of Pau and the ecclesiastical college of Saint Sulpice, was ordained priest in 1850, taught philosophy at the seminary of Avignon and theology at that of Nantes, entered the Carmelite order, and became renowned as a preacher at Lyons, Bordeaux, Nantes, and Paris. But his unorthodox utterances soon drew the censure of ecclesiastical authority, and his superiors prohibited him from preaching. He then left the Order, and refusing to remain silent, he was excommunicated. In 1869 he visited the United States, where he was heartily welcomed. He protested against the dogma of papal infallibility, attended the Old Catholic congress in Munich, and to some extent fraternized with Protestants, but he repeatedly declared that he had no intention of leaving the Catholic Church. In 1873 he became pastor of an Old Catholic church at Geneva, and thus the founder of the Christian Catholic Church of Switzerland. In 1878 he opened in Paris an independent church, the Eglise Gallicane. Among his writings are: 'Le Dimanche et les Classes laborieuses'; 'L'Eglise catholique en Suisse'; 'La Réforme catholique,' and other works.

LOZIER—LÜBECK

Lozier, lō'z'hēr, **Clemence Sophia** (HARNED), American physician: b. Plainheld, N. J., 11 Dec. 1812; d. New York 26 April 1888. In 1829 she was married to A. W. Lozier; in 1849 began the study of medicine, and in 1853 was graduated from the Syracuse Medical College. She entered practice in New York, and there had great success as a surgeon. The New York medical college and hospital for women was founded largely through her efforts, and for many years she was a professor in that institution and dean of its faculty. She was also for four years president of the National Woman Suffrage Society. She was a prominent woman suffragist and active in reform and philanthropic movements.

Lualaba, loo-ä-lä'bä, Central Africa, a head-stream of the Kongo River, which rises near Kabinda on the southern boundary of the Kongo Free State, receives several affluents such as the Lufira and Lubudi, passes through a hilly, forest and lake region, and after a course of about 650 miles, the last 250 of which are navigable, unites with the Luapula (q.v.) at Ankoro to form the Kongo.

Luapula, loo-ä-poo'lä, Central Africa, a river, the chief of the two principal head-streams of the Kongo. It rises as the Chambezi south of Lake Tanganyika, near Fwamba on the Stevenson Road, flows southwest through Lake Bangweolo whence it issues as the Luapula, flows northward through Lake Moero, then northward until it unites at Ankoro with the Lualaba (q.v.) to form the Kongo.

Lubang, loo-bäng', Philippines, the largest and only inhabited island of the group of the same name lying at the western entrance of the Verde Passage between Luzon and Mindoro, southwest of Manila. The island of Lubang is 17 miles in length from northwest to southeast; area, 51 square miles; area of group 76 square miles. The interior of the island is mostly mountainous, but the coasts are low. The chief town is Lubang on the north coast, which has considerable native trade; the only port safe for all vessels at all seasons of the year is Tilig, on the northeast coast. Civil government was established in these islands in 1901, and in June 1902 they were detached from the province of Cavite and annexed to the province of Marindque. Pop. 3,000.

Lubao, loo-bä'ō, Philippines, a pueblo of the province of Pampangas, Luzon, situated on the northwestern channel of Pampanga delta, 5 miles south of Bacolor. It is the trade centre of an agricultural region. Pop. 21,200.

Lubbock, lüb'ök, **Francis Richard**, American politician: b. Beaufort, S. C., 16 Oct. 1815. He early entered a mercantile career, went to Texas in 1836, held the office of comptroller under the republic of Texas, in 1856 became lieutenant-governor of Texas, and was its governor in 1861-3, whence he was known as the "war governor." Subsequently he entered the Confederate service, became colonel of cavalry, was aide-de-camp to President Jefferson Davis and was captured with Davis and imprisoned for eight months in Fort Delaware. He wrote 'Six Decades in Texas' (1900).

Lubbock, John, **BARON AVEBURY**, British archaeologist and man of science: b. London 30 April 1834. He was educated at Eton and

joined the banking business of his father, Sir John William Lubbock (q.v.) in 1848, becoming a partner in 1856. He rose to great eminence in his profession, and was appointed to various honorable and responsible posts in connection with it. He entered Parliament in 1870 for Maidstone in the Liberal interest, and from 1880 till 1900 sat for London University, from 1886 as a Liberal Unionist. In 1900 he was raised to the peerage as Baron Avebury. He is a recognized authority on financial and educational questions, and his name is associated with several important public measures, such as the bank holidays, ancient monuments, shop hours, and public libraries acts. He is still more distinguished as a man of science. His studies have been chiefly directed toward the ancient remains and history of mankind; and the habits of insects, particularly of wasps, ants, and bees. Among his volumes are: 'Prehistoric Times' (1805); 'Origin of Civilization' (1870); 'Origin and Metamorphoses of Insects' (1874); 'British Wild Flowers in their Relation to Insects' (1875); 'Addresses: Political and Educational' (1879); 'Ants, Bees, and Wasps' (1882); 'Representation' (1885); 'Flowers, Fruits, and Leaves' (1886); 'The Pleasures of Life' (1887); 'The Senses, Instincts, and Intelligence of Animals' (1889); 'The Beauties of Nature' (1892); 'The Use of Life' (1894); 'The Scenery of Switzerland' (1896); and 'Buds and Stipules' (1898), besides a large number of papers in the transactions of learned societies. He has done much to promote a popular interest in matters of science, not only by making more accessible the work of others, but by extensive personal investigation. He presided over the York meeting of the British Association in its jubilee year (1881), and the address he delivered on that occasion was published separately under the title 'Fifty Years of Science.' He is connected with a large number of scientific bodies both in the United Kingdom and on the Continent.

Lubbock, **SIR JOHN WILLIAM**, English astronomer and mathematician: b. Westminster, London, 26 March 1803; d. 20 June 1865. He was graduated from Trinity College, Cambridge, in 1825; became a banker; found an avocation in scientific studies; made particular investigations in physical astronomy and Laplace's theory of probability; was treasurer and vice-president of the Royal Society in 1830-5 and 1838-47; and was the first vice-chancellor of London University (1837-42). Among his writings are: 'An Elementary Treatise on the Computation of Eclipses and Occultations' (1835); 'An Elementary Treatise on the Tides' (1839); and 'On the Gnomonic Projection of the Sphere' (1851).

Lübeck, Germany, one of the three free city-states (see FREE CITIES), and a constituent of the German confederation, situated on a low ridge at the confluence of the Wackenitz with the Trave, 38 miles northeast of Hamburg, and 12 miles from the Gulf of Lübeck, on the Baltic. It was anciently surrounded by walls and bastions, which have been leveled and converted into pleasant walks; but it is still entered by four gates, and furnishes striking specimens of the architecture of the 15th and 16th centuries. Among the buildings are the cathedral, a structure of red brick, begun

LÜBKE—LUCAS

in 1173, surmounted by two spires 416 feet high, and containing a finely carved choir-screen; the Marienkirche (St. Mary's Church), a fine specimen of early Gothic, the Ägidienkirche (St. Giles' Church) and the Petrikirche (St. Peter's Church); the town or senate house, an ancient Gothic building; the Hospital of the Holy Ghost (13th century); the Holstein Gate, with its two lofty towers, etc. There is a public library of about 100,000 volumes. The city has fine municipal waterworks, electric lighting and a system of electric street railroads connecting the suburbs. The manufactures are comparatively unimportant, but the trade is extensive, especially with Hamburg, the Baltic ports, and the interior of Germany. Lübeck possesses a territory of 116 square miles, and includes the port of Travemünde, and several isolated portions in Holstein and Lauenburg. It has a senate of 14 members and a council of burgesses of 120 members. It became an imperial free city in 1226, and about 30 years later it became the head of the Hanseatic League. It is represented by one member in the Bundesrat and one in the Reichstag (q.v.). Pop. of city (1900) 82,098; of city and state 96,755.

Lübke, Wilhelm, vil'hēlm lüb'kē, German historian of art: b. Dortmund, Westphalia, 17 Jan. 1826; d. Karlsruhe (Baden) 5 April 1893. He studied at Bonn and Berlin; held the chair of architecture at the Building Academy of Berlin in 1857-8; was professor of the history of art and archaeology at the polytechnic school at Zürich 1861-6; at Stuttgart, 1866-85; and at the high school in Karlsruhe, 1885-93. Chief among his works are: 'Mediæval Art in Westphalia' (1853), which at once gave him a high place among art-critics; the 'History of Architecture' ('Geschichte der Architektur' 1855), the first popular manual of the subject, and a great success; 'Outlines of the History of Art' (1860, 11th ed. 1891), translated into English by Clarence Cook, 1880; 'History of the Renaissance in France' (1868); 'History of the Renaissance in Germany' (1873); 'History of German Art' (1888); 'Recollections' (1891). He was extremely versatile, and previous to his work in art, gave instruction in vocal and pianoforte music.

Lublin, loo'blin, Russian Poland, capital of the government of Lublin; on the Bistriza, about 95 miles southeast of Warsaw. Lublin was, in the 12th century, a place of importance. The union of Poland and Lithuania was decreed at a diet which met here in 1568. There are at present some manufactures, chiefly woolen goods, agricultural implements, and leather. There is a jail with which is connected a government cloth-factory. Lublin has several good educational institutions and a number of ancient buildings. Pop. about 52,000, one half of whom are Jews.

Lubricant, any substance applied to machinery or any rubbing surfaces to diminish friction. Lubricants fill the interstices between the particles of the surfaces in contact, and so prevent their interlacement. Tallow is used where the rubbing surfaces are of metal and wood, and even when they are both metal, if they happen to be rough. Oil is more commonly employed for metal surfaces, and the harder and smoother the surfaces, the finer must be the oil. Powdered plumbago has been used

for highly polished surfaces. Water is found to be a good lubricant at all rubbing surfaces which happen to be under water. Very many other substances are also in use as lubricants, such as cottonseed oil, olive oil, sperm oil, castor oil and other vegetable oils. Hard lubricants include graphite and soapstone. See also OILS.

Lucan, lū'kan (MARCUS ANNÆUS LUCANUS), Roman poet: b. Corduba, Spain, 39 A.D.; d. 65. His father, a Roman knight, was the youngest brother of the philosopher Seneca. Lucan went to Rome when a child, and having early obtained celebrity, was forbidden by Nero, who himself aspired to literary honors, to recite in public. This induced Lucan to join the conspiracy of Piso. The plot was discovered, and Lucan, who is said to have informed against his own mother as accessory, was condemned to death. He chose the death of Seneca, and had his veins opened. Of his poems, only his 'Pharsalia' has come down to us, in which he narrates, in ten books, the events of the civil war between Cæsar and Pompey. The poem is unfinished, and as it appears to have been produced at different times, it is uncertain whether it was left unfinished by the author or whether the latter part has been lost. In the earlier portions the liberal sentiments of the author are checked by deference to the emperor, in the latter he is inveighed against in unsparing language. The best editions are Burmann's (Leyden, 1740), Weber's (Leipsic, 1821-31), and those of Haskins (Cambridge, Eng., 1887), Hosius (Leipsic, 1892), and Francken (Leyden, 1896-7). Lucan has been translated into English by Rowe (1718) and by Riley (1853).

Lucania, lū-kā'ni-a, Italy, a district of ancient Italy, corresponding nearly to the present province of Potenza and the eastern part of Salerno. The region was mountainous, and covered with extensive forests. The Chones and the Ænotrians were the ancient people of this section; but before the introduction of Christianity into Italy, they had been nearly destroyed. Lucania became Roman territory about 300 B.C.

Lucas, lū'kas, **Daniel Bedlinger**, American lawyer and author: b. Charlestown, W. Va., 16 March 1836. He was graduated from the University of Virginia (Charlottesville, Va.), in 1856; in law from Washington College (Lexington, Va., now Washington and Lee University) in 1858; in the Civil War served in the Confederate army on the staff of Governor Wise of Virginia in the Kanawha Valley, and from 1867 practised law at Charlestown. In 1884-7 he was a member of the West Virginia legislature; in 1887-8 was a United States senator under appointment of the governor; and in 1888-93 was president of the supreme court of appeals of West Virginia. He was a presidential elector on the Democratic ticket in 1872, 1876, 1884, and 1896. He obtained in the South a considerable reputation as a public speaker, and published a 'Mémoir of John Yates Bell' (1865); 'Nicaragua and the Filibusters'; and, in verse, 'The Wreath of Eglantine and other Poems' (1869); 'The Maid of Northumberland: A Dramatic Poem' (1879); and 'Ballads and Madrigals' (1884).

Lucas, Edward Verrall, English author: b. 12 June 1868. He was connected with the London 'Globe' 1893-1900 and with the 'Academy' 1896-1901. He has published a popular 'Book

LUCAS—LUCERNE

of Verses for Children' (1897), as well as other works for young readers; 'The Open Road' (1899); etc.

Lucas, John Seymour, English artist: b. London 21 Dec. 1849. He studied with the wood-carver Gerard Robinson; and painting at the Royal Academy; first exhibited at the Academy in 1872; first made his mark by his 'By Hook or Crook,' shown at Burlington House in 1875; and obtained recognition for the high technical excellence of his work. Among his later canvases are 'Fleeced'; 'For the King and the Cause'; 'Intercepted Despatches'; 'Charles Before Gloucester'; 'After Culloden'; 'The Call to Arms.'

Lucbán, look-băn', or **Lugbang**, loog-bāng', Philippines, pueblo of the province of Tayabas, Luzon, 8 miles northwest of Tayabas, the provincial capital. It is in the heart of a mountainous region, and in the surrounding country rice is grown on *savus* or terraces on the hillsides. It is on the main road, and has a profitable trade. The chief industries are the weaving of fine straw hats from the fibre of the buri palm-leaf, and the manufacture of pandanus mats. Pop. 12,800.

Lucca, look'kä (originally **LUCAS**), **Pauline**, Austrian opera singer: b. Vienna 25 April 1842. She made her first appearance in opera in 1859 as Elvira in Verdi's 'Ernani' at Olmütz; at once attained great success on the Continent; and later sang in London (1863-5) and New York (September 1872). Illness impaired her voice and in 1889 she retired. Among her chief parts were those of Margaret, in 'Faust'; Cherubino, in 'Le Nozze di Figaro'; and Zerlina in 'Fra Diavolo.'

Lucca, Italy, the capital of the province of Lucca, and former capital of the ancient Tuscan republic and duchy of Lucca, near the left bank of the Serchio, 37 miles by rail northwest of Florence. Encircled by walls flanked with bastions, it stands in a fertile plain surrounded by the Apennines, and has a striking appearance. It is entered by four gates and is well built. Lucca is an archiepiscopal see, and the seat of several important courts and public offices. It contains numerous antiquities; one of the most interesting is the fish-market, the large oval of which is the Roman amphitheatre; while the buildings around it, though converted into modern dwellings, are in a great measure composed of the ruins of the amphitheatre, and exhibit huge solid arches, and masses of brick and stone, on their original sites. The principal edifices are the *Duomo*, or cathedral, with a magnificent façade, a Romanesque portico, and stained glass of the richest kind; the Church of San Michele, an ancient and imposing structure; the Church of San Frediano, founded in 686, furnishing an interesting specimen of early Christian architecture, and adorned with fine mosaics, frescoes, and paintings; the ducal palace; the Palazzo Borghi, now converted into a poor-house; and an aqueduct, carried from a distance into the city, over 459 arches. The manufactures consist chiefly of silk goods; and there are numerous silk mills. The trade is almost confined to the above articles of manufacture, agricultural produce, and olive-oil, particularly the latter, which bears a high name, and is largely exported. Pop. of commune (1901) 74,971.

First an Etruscan, then a Ligurian town, Lucca 177 B.C., became a Roman colony. It followed the varied fortunes of northern Italy until about 1115 it was made the seat of a republic. In 1320 it fell under the dominion of Castruccio Castracani, who became Duke of Lucca, and after his death Lucca was sold to Florence. It purchased its liberty from Charles IV. in 1369, and maintained its independence until the French occupation in 1799. In 1814 the Congress of Vienna re-created it a duchy. It became part of the kingdom of Italy in 1860.

Luce, **Stephen Bleecker**, American naval officer: b. Albany, N. Y., 25 March 1827. He was appointed midshipman from New York in 1841; saw service in various waters and made the circuit of the globe; during the Mexican War was on the Pacific coast; and in the Civil War was commander of the monitor Nan-tucket, and of the Sonoma, Canandaigua, and Pontiac. In 1884-6 he was president of the naval war college, and in 1886-9 was in command of the North Atlantic station as head of the rear-admirals on the active list. On 25 March 1889 he was retired. He was an associate editor of the 'Universal Cyclopædia,' naval editor of the 'Standard Dictionary,' and author of 'Seamanship' (1863-98), 'Naval Songs' (1889), and 'The Patriotic and Naval Songster.'

Lucena, loo-thā'nā, Spain, an Andalusian city in the province of Cordova, 30 miles south-east of that city, in a picturesque hilly situation. It is well built, has a fine parish church, schools, benevolent institutions, a town-house, a magnificent "paseo" or public promenade, and in the neighborhood are medicinal baths of repute. It manufactures linens, shoes, earthenware, glass, iron, copper, and other metallic vessels, oil, vinegar, brandy, and is in a region noted for its wines, and for stock-raising. Pop. (1900) 21,294.

Lucerne, lū-sèrn' (Fr. lū-sārn), Switzerland, the capital of the canton of Lucerne, and one of the three seats of the Swiss diet, on an acclivity at the west end of Lake Lucerne. The Reuss, which issues from the lake and flows through the town, is crossed by five bridges, two of which are covered and ornamented with curious mediæval paintings, including a Danse Macabre. The town retains its feudal walls and watch-towers, and with the neighboring mountains, including the Pilatus and Rigi, is noted for its picturesque features and scenic beauties, making it a much-frequented tourist centre. Lucerne is well-built, has regular, clean streets, electrically lighted and traversed by street railroads, a town-hall, with collections in art and antiquities; Jesuit college, now the government building; a 15th century parish church, with two slender towers; a Gothic Protestant church; Ursuline convent, with handsome church; a museum and cantonal library of 90,000 volumes; large town hospital, poor-house, deanery, arsenal, a new International Museum of War and Peace, mint, casino, etc.; and besides the college or lyceum, several well-conducted educational establishments. An interesting monument is the 'Lion of Lucerne,' designed by Thorwaldsen, in memory of the Swiss guards who fell in Paris in 1792 while defending the Tuileries, and hewn out of the solid rock. Lucerne has some transit trade, but the manufactures are unimportant; it depends chiefly

on the important tourist traffic, accommodating annually over 100,000 visitors. Pop. (1900) 29,255.

Lucerne, Lake of, or Vier-Waldstättersee (Lake of the Four Forest Cantons), Switzerland, the largest, and in many respects the most magnificent, Swiss lake, near the centre of the country, 1406 feet above sea-level, surrounded by the cantons of Lucerne, Schwyz, Uri, and Unterwalden. It is irregular in shape, and divided into reaches, separated by narrow straits, giving it the appearance of three distinct lakes. The extreme length from west to south through its centre is 25 miles; average width, 3 miles; extreme width, 9 miles; while the depth varies from 300 to 900 feet. It presents every variety of lake scenery. In the upper reach, lofty mountain masses, including Pilatus and the Rigi, tower above the lake, and descend in sheer precipices to its very edge. Owing to the violent storms which suddenly burst over the lake, its navigation is dangerous. Steamers ply regularly upon it. The Reuss River enters the lake at Flüelen and flows out of it at Lucerne. Cut out of the solid rock on the eastern shore is the Axenstrasse, one of the most beautiful of lake-shore roads.

Lucerne, the European term for the fodder plant called in America alfalfa (q.v.).

Luchaire, Achille, ä-shël lü-shär, French historian: b. Paris 24 Oct. 1846. He was at first professor in the Bordeaux faculty of letters, and in 1885 was made a professor at Paris, where in 1889 he obtained the chair of mediæval history. In addition to studies of the Basque language, such as 'Noms de Lieux du Pays Basque' (1872), and 'De Lingua Aquitanica' (1877), he published a comprehensive work on the Gascon dialects, 'Etudes sur les Idiomes pyrénéens de la Région française' (1879), crowned by the Academy, and several historical narratives, such as 'Institutions monarchiques de la France sous les premiers Capétiens' (1884), and 'Les Communes françaises à l'Époque des Capétiens directs' (1890).

Lucian, lü'shī-ān, Greek author: b. Samosata, Syria, about 125 A.D.; d. Egypt toward the close of the 2d century A.D. He went to Antioch and devoted himself first to the law and afterward to rhetoric, and traveled in several countries (among others, Greece, Italy, Spain, and Gaul) as a lecturer. On returning home, probably about his 40th year, he abandoned the profession of rhetoric, which he seems partially to have resumed in his old age, and confined himself to philosophy and literature. He lived to an advanced age, and was at a late period of his life made procurator of part of Egypt. The works of Lucian, of which many have come down to us, are narrative, rhetorical, critical, satirical, mostly in the form of dialogues. The most popular are those specifically known as the 'Dialogues,' in which he derides the popular mythology and the philosophical secrets, particularly his 'Dialogues of the Gods' and 'Of the Dead.' These have given him the character of the wittiest of ancient writers. He seems not to belong to any system, but attacks imposture and superstition freely and boldly where he finds them. The Epicureans, who, in this respect, agree with him, are therefore treated with more forbearance. The Christian religion, of which, however, he knew little, and that only

through the medium of mysticism, was an object of his ridicule. His writings were once largely studied as text-books, but his diction is not of the best. Among editions of his works may be mentioned Lehmann's (1822-9), F. Fritsch's (1882-5), incomplete; and Sommerbrodt's (1886-99). The most complete English translation is by Howard Williams (1888, in Bohn's series), and there are also renderings by Franklin (1781) and Tooke. Consult: Croiset, 'Essai sur la Vie et les Œuvres de Lucien' (1882).

Lucifer, lü'sī-fēr, (1) in ancient astronomy, the morning star. A name given to the planet Venus when she appears in the morning before sunrise. When Venus follows the sun, or appears in the evening, she is called Hesperus, the evening star; (2) a name commonly given to Satan, the prince of darkness; (3) a term originally applied to matches tipped with a mixture of chlorate of potash and sulphuret of antimony, which were inflamed by friction on a piece of emery paper. These have been superseded by a variety of mixtures containing phosphorus.

Luciidae, lü-sī'f-dē, or **Esocidae**, the pike and pickerel family of bony fishes. These fishes have an elongated, somewhat compressed, powerful body, with rather small cycloid scales, an imperfect lateral line; the head and snout prolonged and depressed, the mouth large, and lower jaw longest. The mouth is filled with strong teeth, and these fishes are the fiercest carnivores of the fresh waters. The family is widely distributed in Northern waters, and may be traced back to the Miocene Age. See PIKE.

Lucile, lü-sēl', an epic poem by Lord Lytton (q.v.) (Owen Meredith) published in 1860. The narrative was founded upon a French novel.

Lucilius, lü-sīl'f-ūs, **Gaius**, Roman author: b. Suessa 180 B.C.; d. Naples 143 B.C. He was grand-uncle to Pompey the Great on the maternal side. He served his first campaign against Numantia under Scipio Africanus, with whom he was very intimate. He is considered the inventor of the Roman *satira*, because he first gave it the form under which this kind of poetry was carried to perfection by Horace, Juvenal, and Persius. His satires were superior, indeed, to the rude productions of Ennius and Pacuvius, but he in turn was surpassed by those who followed him. Horace compares him to a river which carries along precious dust mixed with useless rubbish. Of thirty books of satires which he wrote only 940 fragments have been preserved. In his lifetime these satires had an uncommon popularity. Consult the edition by Lachmann and Vahlen (1876); also Müller, 'Leben und Werke des Gaius Lucilius' (1876).

Lucina, lü-sī'nā, in Roman mythology, the goddess of light, a surname of Juno (according to some of Diana; according to others the name of a daughter of Jupiter and Juno), derived from the root of *lucē* (I shine). Her festival was celebrated 1 March, on which occasion the matrons assembled in her temple, adorned it with flowers, and implored a happy and brave posterity.

Lucius, lü'shī-ūs, the name of three popes, as follows:

Lucius I.: d. March 254. He succeeded Pope Cornelius on 23 June and by some authori-

LUCIUS—LUCULLUS

ties is said to have suffered martyrdom under Gallus, but this cannot be proved.

Lucius II. (GHERARDO CACCIANEMICI, gār-rā'dō kā'chē-ā-nā-mē'chē): d. 15 Feb. 1145. He was legate to Germany from Honorius II., supported Innocent II. against the antipope, Anacletus II., and became chancellor of the Holy See. In 1144 he succeeded Celestine II., but was unsuccessful in quelling revolts against the papal authority in Rome and while heading his troops to suppress a disturbance, was killed by a paving stone thrown from the mob.

Lucius III. (UBALDO ALLUCINGOLI, oo-bāl'-dō āl-loo-chēn'gō-lē): d. Verona 25 Nov. 1185. He was the cardinal-bishop of Ostia and became pope 1 Sept. 1181. He was the first pope elected solely by the cardinals. The emperor Frederick Barbarossa having claimed the estates bequeathed to the papacy by Matilda of Tuscany, Lucius demanded their surrender. Frederick refused and the quarrel ended in the expulsion of Lucius from Rome. He died an exile in Verona.

Luck of Edenhall, The. See EDENHALL.

Luck of Roaring Camp, The, a celebrated short story of California mining life written by F. Bret Harte (q.v.), which was first published in the 'Overland Monthly' in 1869. The story attracted attention in the East and appeared in book form the following year. It is perhaps the most notable of the many short stories of Western life written by this author.

Lucknow, India, the capital of Oudh, 580 miles northwest of Calcutta, on both banks of the Gumti, here spanned by two native and two British built bridges. The city is connected by the Oudh and Rohilkund line with the general Indian railway system. Lucknow has an imposing appearance at a distance which a nearer view fails to realize. The principal buildings are: the Kaiserbagh palace, built in 1850, now occupied as government offices and forming a gorgeous pile of domes, pinnacles, terraces and fountains; the Imāmbara or holy palace, where Asuf ud Douelah is buried, now an arsenal; the great mosque or Jama Masjid; and the Iloseinalad or small Imāmbara with the mausoleum of Mohammed Ali. The Martinière College for half-caste children is a striking building founded by Claude Martin, a French soldier who became a general in the East India Company; other educational institutions include Canning College and several English schools, libraries and mission churches. Lucknow was one of the chief seats of the Indian Mutiny (q.v.) and the residency, the Secunder Bagh, and the Alumbagh where Havelock is buried are reminiscences of the siege. Pop. (1901) 264,049. Consult: Innes, 'Lucknow and Oudh in the Mutiny' (1895).

Luckock, Herbert Mortimer, English clergyman: b. Great Barr, Staffordshire, 11 July 1833. He was graduated from Jesus College, Cambridge, was twice vicar of All Saints, Cambridge, and was rector of Gayhurst and Stoke Goldington. Subsequently he was residentiary canon of Ely and principal of the Ely Theological College, and in 1892 became dean of Lichfield. Among his writings are: 'Tables of Stone'; 'The Intermediate State'; 'Footprints of the Apostles'; and 'Old and New Testament Sermons.'

Lucretia, lū-kre'shī-ā, Roman matron of distinguished virtue, whose ill-treatment by Sex-

tus Tarquin led to the destruction of the kingdom, and the formation of the republic of Rome. She was the wife of Collatinus, a near relation of Tarquin, king of Rome. Sextus Tarquinius, who contrived to become a guest in the absence of her husband, whose kinsman he was, found means to reach her chamber in the middle of the night, and threatened, unless she gratified his desires, to stab her, kill a slave, place him by her side, and then swear that he had slain them both in the act of adultery. The fear of infamy succeeded. She afterward summoned her husband, father, and kindred, and after acquainting them with the affair stabbed herself to the heart. The story has been variously adapted by poets and romancers.

Lucretius, lū-kre'shī-ūs, Carus Titus, Roman author: b. probably 97 B.C.; d. 53 B.C. About his life almost nothing is known. He is supposed to have studied Epicurean philosophy at Athens. He is said to have been made insane by a philtre, in his lucid intervals to have produced several works, and to have committed suicide in his 44th year. We possess of his composition a didactic poem, in six books, the 'De Rerum Natura,' in which he exhibits the cosmical principles of the Epicurean philosophy with an original imagination, and in forcible language. The work is in six books, revised by Cicero, and is entire but, evidently, not complete. The theory of corpuscles and their properties; the origin of the vital and intellectual principles; of the senses; of the world and the movements of the heavenly bodies; of the rise and progress of society; and of arts and sciences, with other expositions of natural phenomena, are successively treated. Lucretius' purpose was to free his readers from the fear of death which he believed to be bound up with the superstitions of the popular religion. As a work of art his poem has received the unanimous praise of critics for the skill with which the most unyielding materials are reduced to a poetic diction full of life and sustained majesty. It has influenced the foremost English poets. (See Tennyson's poem 'Lucretius'). The principal editions are those of Lachmann (3d edition, Berlin, 1866), and Munro, with an English translation (3 vols.; revised edition by Duff, 1886). The poem has also been translated into English by Creech, Busby, and Good.

Lucullus, lū-kūl'ūs, Lucius Licinius, Roman soldier of the 1st century B.C. When a young man he served with distinction in the Marsic war, and accompanied Sulla as quaestor into Asia on the breaking out of the Mithridatic war, 88 B.C. He expelled Mithridates from Chios and Colophon and defeated him off Tenedos. After peace had been concluded with Mithridates he remained in Asia till 80 B.C. In 79 he was elected curule ædile, an office which he held in conjunction with his younger brother. Subsequently he held the office of prætor. On the conclusion of this magistracy he went to Africa, the administration of which province he conducted with ability and impartiality, and in 74 B.C. obtained the consulship with M. Aurelius Cotta. As consul he maintained the constitutional laws of Sulla. On the breaking out of the war with Mithridates he obtained the proconsulship of Cilicia and the command of the army. He vanquished the squadron of Mithridates near the island of Lemnos, and this victory enabled

LUCY—LUDLOW

him to drive all the other squadrons of Mithridates from the Archipelago. The generals of Lucullus subdued meanwhile all Bithynia and Paphlagonia. Lucullus, again at the head of his army, although overcome by Mithridates in a battle, soon acquired such advantages that he finally broke up the hostile army, and Mithridates himself sought protection in Armenia. Lucullus now changed Pontus into a Roman province. Tigranes, king of Armenia, refusing to surrender Mithridates to the Romans, Lucullus marched against Armenia and vanquished Tigranes 69-8 B.C. Mithridates, however, contended with varying fortune, till Lucullus was prevented from effectively continuing the war by the mutiny of his soldiers. Lucullus was deprived of the chief command, which was bestowed first on Glabrio, and afterward on Pompey, and recalled 66 B.C. After a delay of three years he succeeded in procuring the merited recognition of his services in a public triumph. He laid out his gardens at Rome with such splendor that they became proverbial, and Pompey called him the Roman Xerxes.

Lucy, Henry W., English journalist: b. Crosby, near Liverpool, 5 Dec. 1845. He was for a time a member of the *Shrewsbury Chronicle* staff; in 1870-3 was connected with the *Pall Mall Gazette* (morning edition); and from 1873 with the *Daily News*, of which—with the exception of the period January 1886-July 1887, when he was editor-in-chief—he was the parliamentary correspondent. He visited the United States in 1883, on his way around the world; an account of which journey appeared in the *New York Tribune* in the form of letters, subsequently collected as 'East by West' (1885). On the death of Tom Taylor (q.v.) Lucy continued the former's 'Essence of Parliament' in *Punch* as 'The Diary of Toby, M. P.' Among his books are 'Men and Manners in Parliament' (1874); 'A Diary of Two Parliaments' (1885-6), and 'Gladstone' (1896).

Lucy, Sir Thomas, English landed proprietor: b. 1532; d. Charlecote 7 July 1600. He was educated by John Foxe (q.v.), the famous martyrologist; and he followed the Puritan sentiments of his tutor. In 1552 he came into possession of great estates in Warwickshire, in 1558-9 rebuilt the manor-house, which still exists, an excellent specimen of the Tudor style. He was knighted in 1565, and elected M. P. for Warwick in 1571 and 1584. His chief interest is in his alleged connection with Shakespeare (q.v.) whom he is said, in a story dating from the 17th century, to have prosecuted for deer-stealing. This story is now thought to be based on fact, though burdened with false details; and Shakespeare is believed undoubtedly to satirize him as Justice Shallow in 'The Merry Wives of Windsor.'

Lud'dites, in British history, a name given to rioters in 1811-16, in Yorkshire, Lancashire, and Nottinghamshire, in England, who attributed the prevailing distress to the introduction of machinery in manufactures, and did a great deal of damage in destroying it. For a time these counties were in a perpetual state of disturbance, but on the return of prosperity the riots ceased.

Lud'ington, Mich., city, county-seat of Mason County; on Lake Michigan and Mar-

quette River. It is the terminus of the Pere Marquette railroad; about 85 miles northeast of Milwaukee, Wis., 130 miles northwest of Lansing, the capital of Michigan, and 61 miles from Manitowoc on the opposite side of the lake. It has regular steamer communication with the large ports on Lake Michigan, and direct freight, connection, by ferry, with Manitowoc, Wis. It was settled in 1851, incorporated in 1867, and chartered as a city in 1874. The principal industries are connected with the manufacture and shipment of lumber. There are large lumber mills, game-board factories, furniture and clothes-pin factories. Lumber, grain, flour, salt, and fruit are among the articles shipped to outside markets. The city has many guests in the summer months, attracted by the cool climate and opportunities for fishing in the several lakes nearby. The Epworth League Training Assembly has nearby grounds and cottages. Pop. (1900) 7,166.

CHARLES T. SAWYER.

Ludlow, lüd'lō, Edmund, English leader of the Republican party in the civil wars of Charles I.: b. Maiden Bradley, Wiltshire, about 1617; d. Vevay, Switzerland, 1692. He was graduated from Trinity College, Oxford, in 1636; fought at Edgehill in 1642; in 1646 was elected to Parliament from Wiltshire; and in December 1648 was one of the chief promoters of 'Pride's purge' (q.v.). He was one of the judges who signed the death-warrant of Charles I., sat in the council of state in 1649-50, and was lieutenant-general of the horse in Ireland and a commissioner for the civil government of that country in 1650-5. In 1656, upon the proclamation of Cromwell as lord protector, he declined to recognize Cromwell's authority, or to give security to keep the peace. Having been allowed to go into retirement in Essex, he was elected to Parliament for Hindon in 1659, and upon the recall of the Long Parliament became a member of the committee of safety (7 May), of the council of state (14 May), and commander-in-chief of the Irish army, with rank of lieutenant-general (4 July). He was impeached upon the Restoration (1660), surrendered, was allowed his liberty on providing sureties, and escaped to Switzerland. His 'Memoirs' (1698-9) furnish a good account of the opposition to Cromwell and of the factional troubles which overthrew the republic.

Ludlow, Fitzhugh, American journalist: b. Poughkeepsie, N. Y., 11 Sept. 1836; d. Geneva, Switzerland, 12 Sept. 1870. He was graduated from Union College in 1856, in 1858-9 studied law in New York, in 1859 was admitted to the bar, but from 1860 devoted himself exclusively to literature. In 1860-1 he was connected with the *World* and the *Commercial Advertiser*, for a time was dramatic, art and musical critic of the *Evening Post*, to which he long contributed, and held a similar post as critic on the 'Home Journal.' In 1863 he journeyed across the plains to Oregon and California, and in an article styled 'Through Tickets to San Francisco,' laid out a route for a Pacific railroad largely identical with that later followed. He was among the earliest contributors to 'Northern Lights' of Boston, upon the establishment of that magazine. Among his works are: 'The Hasheesh Eater: Being Passages from the Life of a Pythagorean' (1857); 'Little Brother and Other Genre Pictures' (1867); 'The Opium Habit' (1868); and

LUDLOW — LUGANO

'The Heart of the Continent: A Record of Travel' (1870).

Ludlow, James Meeker, American Presbyterian clergyman and author; b. Elizabeth, N. J., 15 March 1841. He was graduated from Princeton in 1861, from the Princeton Theological Seminary in 1864, entered the Presbyterian ministry and was pastor of the First Presbyterian Church of Albany 1864-8, and of the Collegiate Reformed Church of New York in 1868-77. His subsequent pastorates were that of Westminster Church, Brooklyn, N. Y., (1877-85) and that of the First Presbyterian Church of East Orange, N. J. (from 1886). In 1885 he declined the presidency of Marietta College (Ohio). His works are: 'My Saint John' (1883); 'Concentric Chart of History' (1885); 'The Captain of the Janizaries' (1886); 'A King of Tyre' (1891); 'That Angelic Woman' (1893); 'History of the Crusades' (1896); and 'Baritone's Parish' (1897).

Ludlow, John Malcolm, English author: b. Nimach, India, 8 March 1821. He was educated at the College Bourbon, Paris, became a barrister of Lincoln's Inn, London, in 1843, and practised as a conveyancer till 1874. He was chief registrar of Friendly Societies, 1874-91, and has published 'Letters on the Criminal Code' (1847); 'The Master Engineers and Their Workmen' (1852); 'British India: Its Races and Its History' (1852); 'Thoughts on the Policy of the Crown Toward India' (1859); 'Sketch of the History of the United States from Independence to Secession' (1862); 'President Lincoln Self-Portrayed' (1866); 'The War of American Independence' (1876); etc.

Ludlow, Roger, American colonial statesman; b. Dorchester, England, 7 March 1590; d. Virginia about 1665. He was by profession a lawyer, came to Boston in 1630, was there assistant to the general court of Massachusetts in 1630-4, in 1634 became deputy governor, but was defeated for the post of governor, removed with a Massachusetts colony to Windsor, Conn., and was, it is thought, the first practising lawyer in Connecticut. In 1639 he was a member of the convention for preparing a constitution, and the document is believed to have been drafted by him. In Connecticut also he was made deputy governor, and here, too, John Haynes, who had defeated him for the governorship in Massachusetts, was again victorious in the gubernatorial election. In chagrin Ludlow sought to evade his "evil genius," as he styled Haynes, by founding the town of Fairfield. Here he held each public office of any importance, was a commissioner to the New England congress, and revised the laws of Connecticut (1672). The Manhado Indians having threatened Fairfield, the citizens declared war against the Dutch, at whose instigation the savages were believed to be acting; and Ludlow was made captain of the forces. The New Haven general court, however, quashed this proceeding, and punished Ludlow's subordinate officers. Ludlow then (1654) withdrew in high dudgeon with all the town records to Virginia, where he quite disappeared.

Ludlow, William, American soldier: b. Islip, Long Island, N. Y., 27 Nov. 1843; d. Convent, N. J., 30 Aug. 1901. He was graduated from West Point in 1864, entered the engineer service, was chief engineer of the 20th corps in the Georgia campaign (July-September, 1864),

in 1864-5 was engineer of the army in Georgia, was assistant engineer on Sherman's staff in the "March to the Sea" and in the Carolinas, and 13 March 1865 was brevetted lieutenant-colonel, U. S. A., for meritorious conduct in the Carolinas campaign. After various service, he was chief engineer of the department of Dakota in 1872-6, engineer in charge of the Delaware River and harbor improvements and defenses in 1882-3, by authority of Congress chief engineer of the Philadelphia water department in 1883-6, and was at different times in charge of lighthouse districts and engineering work. In 1895 he became president of the Nicaragua canal commission and 13 August was promoted lieutenant-colonel of engineers in command of the lighthouse depot. Commissioned brigadier-general of volunteers 4 May 1898, he became engineer-in-chief of the American army in the field in the Spanish-American war, served in the Santiago campaign, was made major-general of volunteers 7 Sept. 1898, and from 13 Dec. 1898 to April 1900 was military governor of Havana, in the rehabilitation of which city he took an important part. On 13 April 1899, he became brigadier-general of United States volunteers, and on 21 Jan. 1900 brigadier-general United States army. As president of the board of officers appointed for the consideration of the establishment of an army war college, he visited France and Germany for purposes of study. In 1901 he was ordered to the Philippines as commander of the department of Visayas, but immediately returned on sick-leave. He wrote: 'Explorations of the Black Hills and Yellowstone Country'; and 'Report of the United States Nicaraguan Canal Commission.'

Ludwig Salvator von Toscana, lood'v'ig sāl-vā'tor fōn tōs-kā'nā, ARCHDUKE OF AUSTRIA, Austrian traveler: b. Florence 4 Aug. 1847. He was the son of Leopold II., Grand Duke of Tuscany. His principal writings, all illustrated by himself and most of them published anonymously, are: 'Levkosia, Capital of Cyprus' (1873); 'Yacht Voyage to the Syrtes' (1874); 'Los Angeles in Southern California' (2d ed. 1885); 'The Caravan Route from Egypt to Syria' (1878); 'The Balearic Islands,' superbly illustrated (7 vols., 1869-91); 'Around the World without Intending It' (4th ed. 1886); 'Paros and Antiparos' (1887); 'The Lipari Islands' (1893).

Lufft, Hans, hänts looft, German printer and publisher: b. 1495; d. 1584. He printed the first complete edition of Luther's Bible, at Wittenberg, in 1534. He also printed other works of Luther, and more than 100,000 copies of the Bible were issued from his press. See LOTTER FAMILY.

Lugano, loo-gā'nō, Switzerland, town, in the canton of Ticino, on the north shore of Lake of Lugano; about 15 miles northwest of Lake Como. Its principal edifices are several churches, one, Santa Maria degli Angioli, contains a fresco of the "Passion," by Bernardino Luini, convents, a hospital, and a theatre. The manufactures are chiefly spun silk and silk goods. The transit trade is considerable. Till 1881 it was, alternately with Locarno and Bellinzona, the seat of the legislature of the canton of Ticino. Pop. 10,000.

Lugano, Lake of (Latin, *Ceresius Lacus*), is partly in the Swiss canton Ticino and partly

LUGGER—LUKE OF LEYDEN

in Italy; between Lakes Como and Maggiore, into the latter of which it discharges its waters. It is of very irregular shape, a narrow body which throws out arms in all directions. Its length is about 20 miles, its breadth about one and one-half, and its depth about 300 feet. Its scenery is very wild and beautiful.

Lugger, the former name for a small vessel not unlike the schooner of the present day; having two or more lug-sails, that is fore-and-aft sails set on one yard hung obliquely to the mast at one-third its length.

Lugworm, or **Lobworm**, a marine annelid (*Arenicola piscatorum*), dwelling in burrows on sandy beaches of the European coast, and in Great Britain much used as bait for anglers.

Luini, **Bernardino**, bër-nâr-dê-nô loo-ê-nê, Italian painter: b. Luino, on the Lago Maggiore, between 1475 and 1480; d. soon after 1533. He was perhaps the most distinguished representative of the Milanese school, and between 1500 and 1533 was active as a fresco and easel painter in Milan and other places of northern Italy. He began his studies as the pupil of Ambrogio Vorigognone, whose influence is plainly seen in his 'Pietà' in the church of Santa Maria della Passione at Milan, though the blandness and delicacy of the early Milanese school is in his work somewhat animated and vitalized by the spirit he derived from the study of Leonardo da Vinci, under whose name some of his ripier work has frequently gone. But though his frescoes are full of spiritual faces, and distinguished by the tenderest coloring, and the most lifelike movement, he never quite made his own the grandeur in composition and passionate energy which distinguish the paintings of Leonardo. Most of his productions are found in Upper Italy. Many of his easel pictures are to be seen in the Ambrosiana (library), Brera (palace), and in private galleries at Milan; others in the cathedral at Legnano. In the Uffizi at Florence is his 'Beheading of John Baptist.' His chief work is 'The Enthroned Madonna with Saint Anthony and Saint Barbara' (1521), a magnificent fresco in the Brera. Other examples of this painter are now in the Palazzo Sciarra at Rome, as well as in the Louvre, the National Gallery of London, and the Berlin Museum.

Luise, loo-ê-zê, **Auguste Wilhelmine Amalie**, queen of Prussia: b. Hanover 10 March 1776; d. Strelitz 19 July 1810. She lost her mother in her 6th year and was brought up in charge of her grandmother at Darmstadt. In her 17th year she was married to the crown prince, afterward Frederick William III., of Prussia. On her husband's accession to the throne she won all hearts by her beauty, gracefulness, and kindness of disposition. Her highest happiness was found in her husband and children, but she was also a queen who has left a deep impression on the annals of the Prussian court. In her travels with the king through the provinces she was constantly engaged in helping the poor and unhappy. When the war of 1806 broke out she accompanied her husband to Raumburg and, after the disaster of Jena, to Königsberg and Memel, setting an example to all by her unbroken fortitude. Before Tilsit she hoped to win from Napoleon more favorable conditions for her beloved country, and inter-

ceded with the conqueror in vain. She is a household name to this day in Prussia, and the Order of Luise was founded in her honor by her husband, the king, 3 Aug. 1814. It is the object of this order to honor patriotic and benevolent women of the Prussian nation. The badge is a gold cross enameled in black. In the centre is a shield of blue on which the letter L is enclosed in a circle of stars. The ribbon is white, striped with black. Consult: Hudson, 'Life and Times of Louisa, Queen of Prussia' (1874); and Adami, 'Luise, Königin von Preussen' (1888).

Luke, **Saint**, author of the third gospel, and the Acts of the Apostles. His place and date of birth are equally unknown, but it is certain from Col. iv. 11 as compared with 14, that he was a Gentile. Eusebius calls him a native of Antioch, but there is no authentic evidence of this. He was a physician, and his works show him to have been an educated man, with a literary style distinctive and often pregnant and picturesque. He possessed a wide acquaintance with eastern Mediterranean places, their customs, forms of worship, and typical characteristics. Tradition asserts that he was a painter, but this may be merely a fanciful tribute to the manner in which he groups and sets off the incidents of his Gospel with an almost pictorial coloring and a symmetry which show true artistic sense of proportion. According to the Acts of the Apostles he appears as the companion of St. Paul from Troas to Philippi, and some have supposed that his services as a physician were needed by St. Paul, whose frequent sicknesses are alluded to in his epistles. He probably remained at Philippi, the key to Europe in the Apostolic programme, from 52 to 58, and rejoining St. Paul there was his companion till the narrative of his journeys comes to an end. He was most likely in Palestine during St. Paul's imprisonment at Cæsarea (58-63), and then made his researches into the Gospel history (Luke i. 1-4). As he was not an eye witness of Christ's life, he cannot have been one of the seventy, as Epiphanius of Salamis supposes. Of his life after the death of St. Paul absolutely nothing is recorded. We know from the epistles of St. Paul that he was with that apostle during the latter's imprisonment in the Mamertine prison at Rome, from which his leader went forth to martyrdom. In art he is represented with an ox lying near him, and this beast of sacrifice is sometimes called his emblem; or as painting the portrait of the Virgin, or surrounded by the implements of the painter, or robed like a learned physician. According to some records he preached in Bithynia, and St. Jerome says he lived to the age of 84. See GOSPELS; ACTS OF THE APOSTLES.

Luke, **Gospel of**. See GOSPELS.

Luke of Leyden (**LUCAS VAN LEYDEN**, properly **LUCAS JACOBZ**), one of the founders of the Dutch school of painting: b. Leyden, 1494; d. there 1533. In earlier life he was taught painting by his father, Huig Jacobz, and afterward by Cornelius Engelbrechten. At 9 he began to engrave, and in his 12th year astonished all judges by a painting, in water-colors, of St. Hubert. In his 15th year he produced several pieces, composed and engraved by himself, among which the 'Temptation of St. Anthony,' and the 'Conversion of St. Paul,' in regard to

LULLY—LUMBER INDUSTRY IN THE UNITED STATES

composition, characteristic expression, drapery, and management of the graver, are models. After this he executed many paintings in oil, water-colors, and on glass; likewise a multitude of engravings, which spread his fame widely. He formed a friendly intimacy with the celebrated John of Mabuse and Albert Dürer, who visited him in Leyden. His overwork at last resulted in hypochondria and he imagined himself poisoned by envious painters, and hardly left his bed for the last six years of his life. The fullest and most beautiful collection of engravings by this master is in the library at Vienna. His paintings are scattered through the galleries of London, Berlin, Rome, as well as in Holland, where is his masterpiece, 'Mount Calvary,' a composition containing some 80 figures.

Lully, lū'ī, Lull, or Lul, Raimon (DOCTOR ILLUMINATUS), Spanish scholastic: b. Palma, Majorca, 1235; d. at sea in sight of Palma 1315. After having been attached to the court of James I. of Aragon, he retired to a cell on his estate, where he lived as an ascetic. Encouraged by visions, he came to believe himself appointed to refute Mohammed and convert the Moslems to Christianity, and studied Latin, Arabic, and logic in preparation for this work. His 'Ars Demonstrativa Veritatis' was devised as an infallible and universal logical method to be used in making conversions, for the purpose of proving that the mysteries of faith were not contrary to reason. Lully believed that his method was destined to supplant the scholastic logic of the Middle Ages. His history now becomes a record of ceaseless travel. He endeavored without success to obtain aid from Pope Nicholas in establishing colleges for the study of Oriental languages. The Ars Lulliana consists mainly in categorizing ideas and combining them mechanically, by which means Lully thought to exhaust their possible combinations. The method was taught and commented on in some schools of little influence in Spain, France, and Italy, but it is hardly necessary to say that it never took root or produced any direct effects. Lully's works are very numerous. A collected edition is that begun by Galzinger (1521-42); Vols. VII. and VIII. never published). Consult: Erdmann, 'Grundriss der Geschichte der Philosophie' (2d ed. 1869).

Lumba'go (from Latin *lumbus*, loin), a painful affection of the muscles and tendinous attachments of the lumbar region. See RHEUMATISM.

Lumber Industry in the United States, The. The history of the lumber industry of the United States began at the landing of the first colonists in Massachusetts, Virginia and Georgia. Loghouses sheltered the early settlers. Planks were split from logs and dressed by axes. At length pit sawing, a hand operation, became the initiative of the great saw-mill industry. As population increased and the demand for building material developed the inventive genius and energy of the people evolved the saw mill, which was run by water power. Subsequently came the steam mill. In the progress of events the evolution, starting from the old sash and muley mill, with a capacity of 6,000 to 10,000 feet a day, has attained to the modern one of 100,000 and even 350,000 feet capacity, in some notable instances. During the 283 years since the Pil-

grims landed at Plymouth Rock the lumber industry of the United States and Canada has grown to a production of probably 1,000,000,000,000 feet, board measure. In but three States—Michigan, Wisconsin and Minnesota—according to best available statistics, the production of pine lumber from 1830 to 1897 amounted to 286,000,000,000 feet, to which can be added 75,000,000,000 of hard woods, making a grand total of 363,000,000,000 feet, the valuation of which has been computed at \$5,250,000,000.

The early development of lumber manufacture of course occurred in that narrow fringe of Atlantic coast country first settled by emigrants from Europe. They found the entire country heavily wooded. White pine abounded in the New England States and pitch pine in Virginia, the Carolinas and Georgia. The most stupendous growth of the lumber industry has involved white or soft pine, since it abounded from Maine westward to beyond the Mississippi, in the States wherein the most rapid growth of population, settlement of new territory, the elaboration of internal improvements, and development of transportation facilities have occurred. In the early history of the country the people chose white pine for structural purposes because of its abundance and availability. Other woods were used, but the main supply of lumber was derived from pine. In New England and the Middle States, however, the industry was largely local, the lumber produced being mainly devoted to the erection of farm and village structures in the immediate vicinity of the mills, all of which were small. As such cities as Boston, New York and the lesser ones grew up along the coast a market for a large product was developed. There was also a demand for ship-building, and at length for shipment to the West Indies and other foreign parts. The coast trade began to be largely supplied from Maine, which came to be known as the Pine Tree State. Logs reached the mills by floatage down the rivers. It was in Maine that the white pine lumber industry became of great commercial importance, and the evolution of the saw-mill began. Along the Canadian border of Vermont and New York, likewise, there was notable development of the white pine business from about 1800 to 1830. Large quantities of pine were yearly cut and floated down Lake Champlain and the Sorel river into the Saint Lawrence, and thence to Quebec for shipment foreign.

About the time this pine was exhausted and that of Maine and New Hampshire was beginning to approach exhaustion the great West began to attract settlers. The opening up of the prairie States induced a demand for lumber, and the white pine industry of Michigan and Wisconsin naturally arose. It seems as if there was a divine purpose in planting the immense pine forests contiguous to the Great Lakes, which provided for transportation, and to the prairie country, which furnished a market for lumber and timber. By the influences of supply and demand the pine product of Michigan, Wisconsin and Minnesota rose to its maximum in 1800, when the total output was 8,597,623,000 feet. The earliest statistical record was made in 1873, when the total amounted to 3,993,780,000 feet. The totals did not materially vary until 1879, when the aggregate product swelled to 4,806,943,000 feet. The yearly output tended upward, with some annual depressions, until the highest mark

LUMBER INDUSTRY IN THE UNITED STATES

was reached in 1890. A positive decline in total product was noticeable in 1894, and it was gradual, with some fluctuations, until 1902, when the total had dropped to 5,294,395,000 feet, figures which still represent an enormous amount of lumber. The development of the prairie States, the rapid increase in population and wealth, the building of thousands of miles of railroad and the magical growth of cities, including Chicago, all caused a demand for lumber of a rapidly swelling volume unprecedented in the history of the world. Hence we have a forest product swelling in two decades nearly 300 per cent and reaching a value in one year of at least \$85,976,230.

The declension of the annual product of white pine and its consort, Norway pine, has been marked since 1896, and never again in one year can the production reach the total of 1890, or even of the later one in 1895, when the output was 7,050,669,235 feet. The pine supply of the lower peninsula of Michigan is verging toward exhaustion, that of the once prolific Menominee district in upper Michigan and Wisconsin is long past its zenith, the Wolf river district in Wisconsin turns out but a few million feet of logs annually, while the same is true of the Black River and other streams in that State. More than four fifths of the total product of the three States is now turned out from the western two thirds of Wisconsin and Minnesota. This territory produced 4,328,930,000 feet of a total for the three States named of 5,294,395,000 feet. The diminishment of the white and Norway pine supply of the North would have been an unmitigable calamity if compensation had not resulted from the growth within recent years of the yellow pine product of the South. This began to be manifest in the lumber trade of the Middle West early in the '80s of the last century. But before this, and beginning with the early settlement of the Atlantic coast colonies, the pitch pine of Virginia, North Carolina, South Carolina, Georgia and Florida held a relation in respect to consumption like white pine in the North. It entered into the local supply for building material, and as the cities grew and coastwise and foreign commerce increased, the pine of the southern coast was used for building of houses and ships, and was sent to foreign lands. In time the product of the mills was shipped by sea to New York, Baltimore, Philadelphia, Boston and other ports. For many years the flooring manufactured from Georgia pine has been a favorite in the northeastern States. The export of pitch pine, or yellow pine, timber from the southern coast has built up such important shipping points as Pensacola, Mobile, Fernandina, Jacksonville, Savannah, Wilmington and Norfolk. Yet it remained for a later time to develop a vast interior demand for the yellow pine of Georgia, Alabama, Mississippi, Louisiana, Arkansas and Texas. The promotion of this growth arose from the decline in the supply of northern pine already referred to, which was seen to be imminent early in 1900. Ten years before that efforts had been made in Mississippi, Arkansas and Texas to push yellow pine as a competitor in middle western markets, with varying success. More rapid progress was made from 1890 forward and still greater from 1901 to 1903. Lumbermen and capital from the old pine States of the North were attracted to the southern field, many new and

modern mills were built, and railways were constructed for hauling logs from the forests to the mills. In the meantime the total northern pine supply in the three main producing States had declined from 8,597,623,000 feet in 1890 to 5,294,395,000 in 1902. This gave yellow pine opportunity to pass into the vacuum caused by the shrinkage of northern product. The longleaf pine of the gulf section, from Georgia to Texas, was admirably adapted to conversion into bridge, railroad and building timber, car sills and other parts of car building, as well as to flooring and interior finish. The shortleaf pine, while not so much in request for the heavier forms of construction, was much sought after for the lighter frames of buildings and all interior and exterior work. It was peculiarly adapted to enter into a various manufacture, especially of doors, sash, interior trim, etc. The remarkable development of Kansas, Nebraska, Indian Territory, Texas and Oklahoma has given an impetus to yellow pine manufacture and distribution in the southwest. At the same time Mexico has increasingly drawn upon the supply, and the South American, West Indian, South African and European demand is an important feature of the trade in localities convenient to Gulf and Atlantic ports. As the northern pine supply diminishes, the main lumber resource of the country east of the Missouri River will be the yellow pine of the South. Included in the whole will be the longleaf, shortleaf, loblolly, Cuban and North Carolina varieties. The United States census estimates from obtainable data that the yellow pine forests of the South cover approximately 150,000 square miles, or 100,000,000 acres. The average stand per acre is estimated at 3,000 feet, board measure, thus giving a total of 300,000,000,000 feet. The cut in the census year 1900 was made out to be 8,523,000,000 feet, or 3 per cent of the estimated stand. If the estimate of the total stand is approximately correct there was enough in 1900 to supply the annual cut, at the rate in that year, for 33 years, without allowing anything for growth in the interval.

Another factor within recent years has been thrust into the lumber supply of the United States; this is lumber from the Pacific coast States, with an appreciable quantity from Idaho, Montana, Arizona, New Mexico, Colorado and Wyoming. The prominent features of this far western supply are the fir, cedar, spruce and hemlock of Washington and Oregon, and the redwood, sugar and white pine of California. Fir and redwood are the leaders in Pacific coast lumber resources. Before the building of the transcontinental railways the consumptive demand of the Pacific States and the export trade were the only outlets for mill product. For many years after the Union Pacific, the Southern Pacific and the Northern Pacific railroads were opened to traffic west coast lumber made but little progress in the East. In the eighth decade of the last century attempts were made to introduce California redwood of high grade for interior finish and some special cabinet purposes, but high freight rates precluded much use of such lumber. Small amounts reached the Atlantic coast cities by sea. At about the same period, though somewhat later in the decade, fir timber from Washington was sent into the Middle West to be used where especially long and large pieces were required for special work. From these

A GIANT RAFT ON THE COLUMBIA RIVER, BOUND FOR SAN FRANCISCO.

LUMBER INDUSTRY IN THE UNITED STATES

initiatives the trade in redwood and fir made slow and irregular progress until about 1900, when the declining supply of white pine and advancing prices therefor turned the attention of manufacturers of doors and sash to the consumption of California sugar pine and white pine in their industry. Idaho pine was also exploited in the same connection. Redwood also began to receive more attention in the country east of the Rocky Mountains. Increased energy was given to the pushing of Pacific Coast lumber of all sorts in the eastern and middle portions of the country by the capital and enterprise of lumbermen of the old pine States who had begun to operate in the newer fields on the Pacific coast.

The three Pacific coast States, Washington, Oregon and California, contain an estimated one-third of the standing timber of the country—about 660,000,000,000 feet for the three. The timber found in the greatest abundance in these States is fir, red, yellow and white, the last named forming a very small percentage of the whole. Red cedar is found in Washington and Oregon and white cedar in Oregon and California. The various species of the pine are found in eastern Washington, southern Oregon and northern and central California. The fir forests are intermixed with spruce, hemlock and cedar. The growth of the lumber industry on the Pacific coast has been very rapid during the last few years, due to the expansion of trade in the far eastern countries, the opening of the Philippines and a wider distribution abroad. The home consumption has increased steadily and has been a potent factor in the development. Shipments to eastern States have assumed larger proportions and will continue to grow as the forest resources of the older lumber-producing States become exhausted. Fir, which is used for almost every purpose where lumber is desired, and which makes a large percentage of the entire output, comprised nearly two thirds of the output in 1902, according to the statistics compiled by the 'American Lumberman', the total being 2,238,962,000 of a grand total of 3,932,364,000 feet, which included the product of Nevada, Idaho and Montana. The remaining product was about evenly divided between spruce, cedar, redwood, sugar pine, white or yellow pine and other soft woods. About the same ratio held good in 1901. None of the Pacific coast States is a heavy producer when the standing timber is taken into consideration with that in the East. Washington, which has an outlet to the East by three railroads, is far in the lead. It also has unequaled facilities for handling the export trade and the best natural harbors of the world. Oregon practically has only two lines of railroad and only two good harbors, so that the industry in that State has not kept pace with the growth in Washington, although Oregon has more timber than any other State in the Union. In making up the figures for the Pacific Coast, Idaho, Montana and Nevada were included. The report, which was very comprehensive although not entirely complete gave an output of fir of 2,238,962,000 feet in 1902; in 1901, when the report was not so comprehensive, the total was 1,424,007,000; spruce—1902, 242,082,000; 1901, 149,499,000; cedar—234,529,000 in 1902, 138,882,000 in 1901; redwood—317,568,000 in 1902, 119,476,000 in 1901; sugar pine—150,914,000 in 1902, 132,653,000 in 1901; other pine—716,622,000 in 1902, 448,367,000 in 1901; other soft woods—

89,516,000 in 1902, 73,850,000 in 1901; hard woods—3,330,000 in 1902; 30,600,000 in 1901; shingles—6,297,916,000 in 1902, 3,940,848,000 in 1901.

Comparing the figures compiled by the 'American Lumberman' with the census reports for 1900, a big increase is shown but not all the increase that was made, as the census figures are more complete owing to the facilities at the command of the government for gathering data. These totals compare as follows, the 1902 series of figures being those compiled by the 'American Lumberman' and the 1900 by the census bureau: California, 1902, 829,792,000; 1900, 734,232,000. Oregon, 1902, 915,848,000; 1900, 734,181,000. Washington, 1902, 1,886,087,000; 1900, 1,428,205,000. Fir is the great export timber of Oregon and Washington, and is also used in the manufacture of sash and doors, for car material and for general building purposes. The wants of the world where big timbers are required are pouring in upon the fir manufacturers to be filled. Some of the higher grades of stock are shipped east and large timbers are also going east for special structural work. Timbers have been cut as large as 24 x 24 inches, 120 feet long, but trees capable of producing such lumber are growing scarcer. Red cedar is used mainly for shingles, though of late years mill workers are turning their attention to it and making porch columns, doors, and similar products. The spruce is used as factory stock, for outside finish, moldings and box materials. There are very few paper factories on the west coast as yet. Hemlock is being used to some extent during the last two or three years. Sugar pine is coming into prominence in the East, where there is a good demand for high grade stock among the factories. The lower grades are used for boxes. The other pines are used for a variety of purposes.

Among the problems confronting the manufacturers at the present time is the difficulty in disposing of the lower grades to advantage. Methods of manufacture are getting closer year by year, but there is still a considerable part of the stock wasted, as there is now no avenue through which it can be marketed to advantage. The other pines are used for general building purposes and to a certain extent in the manufacture of boxes. The redwood lumber industry is separate and distinct from the others. Accurate records have been kept from year to year of the output of the mills. The shipments from the mills increased nearly 70 per cent from 1894 to 1902, the figures being 157,544,080 feet in 1894 and 262,597,015 feet in 1902. This year the shipments from the mills will aggregate perhaps 300,000,000 feet. All of the Pacific coast timber country is rough and broken, necessitating expensive methods of logging. In the fir and redwood districts all logging is done by steam, donkey engines being used to drag the logs from where the trees fall to the logging railroad. In the pine districts high wheels are used as a general rule, although the donkey engines are employed to a certain extent. The lumbermen of the Pacific coast have hardly begun their onslaught on the timber. The wood is already being used in appreciable measure to replace the decreased product of the old Northwest and is coming into competition with the yellow pine of the South. The coast States are the coming giants of the lumber trade. The output has

LUMBER INDUSTRY IN THE UNITED STATES

been increasing very fast and it would seem as though it was getting ahead of the demand or that it was growing faster than the markets. This is especially true of the cedar shingle industry, in which the great increase in the production caused values to depreciate in 1903.

The most plebeian of all American lumber woods is hemlock. It is a coarse-grained wood, much given to unsound knots and shape. Its growth is scattered from the north Atlantic coast to Minnesota; it is mostly found among the hardwood growths of the uplands, but sometimes standing in groups and groves on the lower levels bordering swamps. Hemlock is a cheap kind of lumber. It has been used from the earliest days of the republic by the farmers and villagers of the northern tier of States, Pennsylvania and West Virginia, for the building of houses and barns. Within a few years it has been exploited in the lumber trade of Michigan and Wisconsin as a supplement to the diminishing supplies of white and Norway pine. It is distributed in the Middle States and the northerly belt of the Middle Western States, being largely used for framing dimension, and coarse boards, shingles and lath. The total output of hemlock lumber for the United States in 1899 was 3,420,673,000 feet.

Spruce from an early period has furnished the northeastern States a large aggregate of structural and manufacturing material. It is a coniferous wood, grows with a lofty, smooth body, of moderate diameter. It abounds in Maine, New Hampshire, Vermont, northern New York in large commercial quantity, and stands in considerable amount in upper Michigan, northern Wisconsin, northern Minnesota, also in the Appalachian range in the South. Industrially and commercially considered, spruce has occupied an important position in the lumber trade of the East. Maine has been the most prolific source of supply. Though spruce holdings in that State have been much reduced within recent years the annual cut is still considerable. The Adirondack region of northern New York is next to Maine in magnitude of spruce production. Spruce furnishes a large part of framing dimension used in Boston, New York, and other coast cities, and the districts contiguous to those centres. Spruce also enters into other forms of building material and also factory product. It is highly esteemed for siding of clapboards throughout New England. Spruce is also the main dependence in the manufacture of paper pulp, and a great industry has been developed in getting out pulp wood. In the old pine states of the Northwest the rather limited growth of spruce is being utilized for lumber and pulp wood. Pacific coast spruce is elsewhere treated of in this article.

White cedar, another conifer, is prevalent in all the New England and Middle States, and those touching the Great Lakes. It is used for railroad ties, telegraph and telephone poles and fence posts. Shingles also are comprised in white cedar products. The annual output is large, but no statistics of it have ever been gathered.

Cypress is a tree growth of the damper alluvial bottoms of the South and the Ohio River Valley. It makes a sizable growth and turns out a large percentage of clear lumber. The wood is comparatively soft and easily worked, and as a shop lumber and one adapted to interior building purposes, as well as for siding, porch work

and shingles, is taking the place of white pine. The same can also be said in reference to tank making, and it is much devoted to car building. The strongest present factor in the cypress trade is the red cypress produced in Louisiana. The most copious supply comes from the mills of that State and enters into the lumber trade of the Middle West, the Southwest and the East. Cypress is also in vogue among consumers in all the Gulf coast cities. A large amount of cypress is produced in the Carolinas and Florida, Georgia, Alabama, Mississippi and Arkansas.

The hardwoods of the United States in the early history of the country were much less prized than the coniferous timbers, especially the pines. This was because in the settlement of the country the soft woods were more available than the hard for structural purposes. They were abundant, were easily cut and handled and were light enough to float in the streams and lakes, then the only means of transportation. The live oak of the south Atlantic coast and the white oak of the North were from an early date used for ship-building and any purpose where great strength and durability were requisites. Oak, cherry, maple and birch were also employed for the making of furniture. In the latter use, however, mahogany entered into the making of furniture for the rich throughout the earlier and middle portions of our history. When the railroad era came in, the great interior of the northern States was opened up, population expanded and numerically increased, and the utility of and demand for the hardwoods began to be developed. Western New York, Ohio, Indiana, Michigan, southern Illinois and the valleys of the southern rivers abounded with abundant growths of fine oak of several varieties, ash, black walnut, yellow poplar, hickory, sycamore, gum and other useful woods. New England, New York, Michigan, northern Wisconsin and northern Minnesota were included in the zone where maple, beech, elm, birch, black and white ash and other available woods abounded.

Commercially considered, the great leader among American hardwoods is oak in its several varieties; paramount among the varieties is white oak. In trade and the industries white oak ranks relatively with white pine, and for cabinet purposes is a near approach to mahogany. No other wood enters into so wide a range of uses as white oak. It is employed as timber and planking in ships, in the construction of canal locks, bridges, railroads, cars, vehicles of all kinds, agricultural machinery, tools, cooperage etc., outside of interior finish and furniture manufacture. In respect to the last two named uses white oak has taken first place in the common application, though red oak is largely employed. In the very finest finish and furniture mahogany only ranks above white oak. The growth of the hardwood lumber trade was accelerated after railroads began to penetrate the western States, beginning with about 1845, the mileage extending rapidly after 1850. For many years thereafter the oak and ash supply was largely drawn from the States north of the Ohio River, but considerably from Kentucky and Tennessee. Along in 1880 hardwood lumbermen began to invade the rich hardwood regions of the lower Mississippi and tributaries, lying along the river bottoms in Missouri, Arkansas, Mississippi and Louisiana. The hardwood industry of these States has in latter time grown to immense pro-

LUMBER INDUSTRY IN THE UNITED STATES

portions, though the output of oak in either Indiana or Ohio up to 1900 continued to exceed that of any of the Southern States.

The total production of oak in 1900 was 4,438,027,000 feet, the total valuation having been \$61,174,120 on a basis of \$13.78 a thousand. During the past 25 years there has been a remarkable increase in the use of both white and red oak in finishing the interior of buildings and the making of furniture. In the earlier history of the country, pine was mostly employed in the interior work of all but first rate structures throughout the country from the eastern seaboard westward. But in the recent period of rapid accumulation of wealth and the growth of artistic and luxurious tastes, soft woods for interiors have largely been discarded, and oak has been substituted as the most available for medium class structures, and to a large extent the better class when mahogany and other tropical woods were not utilized. This copious use of oak has promoted a great industry and a trade which is not only domestic in prevalence but extends to Europe and other foreign countries. Quarter sawing is a special feature in the treatment of both white and red oak, that kind of manufacture being especially chosen for the finer finish and furniture. Red oak has long been the favorite in both plain and quarter-sawed treatment among home finishers and furniture manufacturers, because of its softness and easiness of working and its bright and conspicuous figure when plain sawed lumber is finished. Next to oak, ash leads in the manufacture of agricultural machines and implements, boat oars and various other manufactures. White ash is the strongest variety, but black ash is largely used in cooperage, bent work, some cabinet work and house finish. The available quantity of ash of both varieties is rapidly diminishing.

As late as 1880 to 1884 black walnut was the most conspicuous furniture wood in the United States, and also much employed for interior finish. It not only was a favorite in this country but in Europe as well. Its most abundant supply was in the States of the Ohio River watershed, Indiana probably leading in the total production. It is a regal wood, though it has passed to the rear in demand, partly because of its diminishing supply and partly because the public taste at length revolted at its sombre hue. Yet walnut stands preeminent as a cabinet wood in some particulars. There are its softness under the operation of tools, its satiny appearance when finished, its durability under hard treatment, and its dignity as compared to other woods either in furniture or finish. Though the supply of black walnut has so far diminished as to place it among the minor kinds of American lumber, it is still present in considerable quantity. Indiana, Ohio, Missouri, Tennessee, Iowa and Kentucky still furnish the market with walnut, the total from the last census having been 38,636,000 feet. Of this total Indiana is credited with 10,637,000 feet, Ohio coming next with 6,857,000 feet and Missouri third with 6,285,000 feet. The larger portion of the black walnut now produced is shipped to foreign countries, Germany and France probably being the larger purchasers.

Maple, elm of the soft and hard varieties, birch, cherry, chestnut, sycamore and beech are all used for furniture making, for house trim, and various other things. At one time cherry

was an important furniture wood, but the supply is so nearly exhausted that it commands less attention than formerly. Chestnut is much devoted to coffin making, and sycamore is employed when a rarity in figure is wanted in interior finish or furniture. Both are minor woods in the trade. Hickory has always been a favorite in the construction of vehicles, on account of its toughness and elasticity. The available quantity is never in excess of demand.

Basswood is classed among the hardwoods commercially speaking, because it is a deciduous growth. Its texture is, however, softer than that of some of the coniferous woods. Basswood abounds in the northern forests, and to a degree in the South, but its most natural habitat is in the maple and beech zone. It has entered largely into the lumber industry, being especially prized by the furniture makers, used to some extent in exterior and interior building, and is highly prized in all work where a white, easily worked and sometimes elastic wood is required. The forest growth is being rapidly exhausted in Michigan and Wisconsin, which States have harbored the most abundant tracts within recent years.

Among the hardwoods gum, or satin walnut, as it is called in Europe, has recently risen in importance. It abounds in the Ohio and lower Mississippi valleys and wherever river bottoms are found all over the South. It is a hard, compact wood of involved grain, but is of large growth, comparatively free of knots, and is being made adaptable to various uses. The two main varieties are red gum and tupelo. The red variety, so called from the color of the heart wood, is preferred by the mill operators and consumers. A few years ago gum was a rejected kind of lumber, because the saw-mill operators and handlers were ignorant or regardless of the best methods of treating it so as to prevent its tendency to warp. But the demand within recent years has so increased that manufacturers have been urged to the discovery and practice of improved methods, with the result that gum is now successfully treated and has become an important factor in demand. Since there is a vast growth of gum on southern river bottoms a great enlargement of product is inevitable.

Cottonwood in recent years has come to the front as a kind of lumber adapted to box manufacture, wagon box boards, backing for furniture and other purposes where cheap and workable lumber is requisite. The supply is mainly confined to the bottom lands of the lower Mississippi, and at the rate it is being cut out will not last many years.

As an all-purpose wood poplar is perhaps as adaptable as any that is converted into lumber. Reference is here made to the poplar of Kentucky, Tennessee, West Virginia, Indiana, Ohio and southern Michigan. The wood is called the tulip, and in northern Indiana and southern Michigan whitewood. It should not be confounded with the aspen poplar of the North and Canada. Poplar or tulip, the commercial wood here treated, attains a large growth. Poplar lumber is devoted to a great variety of uses. Owing to the size of the logs the average of the lumber is wide, and therefore is adapted to work that demands such lumber. It is of tough fibre, though easily worked, and adapted to re-

LUMBER INDUSTRY — LUMPSUCKER

sawing and bent work. It is much used for carriage bodies, coffins, wagon boxes, furniture, stained finish, packing boxes, porch columns, agricultural machines, billiard tables, siding and casings for houses, door and sash making, and a multitude of applications that cannot be mentioned here. In fact there is little wood work to which poplar cannot be made to apply. For this reason the domestic and foreign demand for poplar has always readily absorbed the supply, but it is constantly brought into sharp competition with other woods.

J. E. DEFEDAUGH,
Editor of the 'American Lumberman.'

Lumber Industry. See AMERICAN LUMBER INDUSTRY.

Lumber State, a popular designation for the State of Maine; because of the large forests and the great number of its people engaged in lumbering.

Luminais, Evariste Vital, év-ä-rêst vë-täl lü-më-nä, French painter: b. Nantes 14 Dec. 1822. He studied with Léon Cogniet and Troyon, received a third-class medal at the Paris exposition of 1855, and one of the first class at that of 1889. His works are largely genre and historical studies from Gallic legends and early French annals, and his manner is spacious and full of vigor.

Luminiferous Ether. See ETHER.

Luminous Paint, a paint containing phosphorus, which after exposure to strong light becomes luminous in the dark for a time. It is used for street signs, buoys, clock dials, etc. See also PAINT; PHOSPHORESCENCE.

Lump'nis, Charles Fletcher, American author: b. Lynn, Mass., 1 March 1859. He was graduated from Harvard in 1881, went to Los Angeles, Cal., there was an editor of the *Daily Times* (1885-7), and later became editor of the monthly 'Out West.' He spent five years among the Pueblo Indians of New Mexico, studying their speech and customs. Among his writings are: 'A Tramp across the Continent' (1892); 'The Land of Poco Tiempo' (1893); 'The King of the Broncos' (1897); 'The Enchanted Burro' (1897); 'The Awakening of a Nation' (1898), and the collection, 'The Man who Married the Moon, and other Pueblo Indian Folk-Stories' (1894).

Lump'kin, John Henry, American jurist: b. Oglethorpe County, Ga., 13 June 1812; d. Rome, Ga., 6 June 1860. He studied at Franklin College of the University of Georgia and at Yale; after a course in law was admitted to the bar in March 1834, entered practice at Rome, Floyd County, Ga., was a member of the Georgia house of representatives in 1835, and was solicitor-general of the Cherokee circuit in 1839-42. As a Democrat he sat in the United States Congress in 1843-9 and 1855-7; and in 1849-52 he was judge of the Cherokee circuit court. In 1857 he was Democratic candidate for governor of Georgia, but was defeated. In 1860 he was a delegate to the State Democratic convention (June) and to the Democratic national convention held at Charleston, S. C., and Richmond, Va. (23 April; 21 June).

Lumpkin, Joseph Henry, American jurist: b. Oglethorpe County, Ga., 23 Dec. 1799; d. Athens, Ga., 4 June 1867. He was a brother of Wilson Lumpkin (q.v.). He was graduated

from the College of New Jersey (now Princeton) in 1819, studied law in the office of Judge Cobb at Athens, was admitted to practice in October 1820, and practised at Lexington, Ga., until 1844. In 1824 and 1825 he represented Oglethorpe County in the State legislature of Georgia, and from 1845 was chief justice of the Georgia supreme court. He was one of the chief organizers of the Lumpkin law school of the University of Georgia, and occupied the chair of law in the school in 1859-61. He resumed the professorship in 1865, and retained it until his death. In 1833 he assisted in the compilation of the penal code of Georgia. Both as an advocate in criminal cases and as a judge he is described as exceedingly able. For many years he was prominent in the temperance movement.

Lumpkin, Samuel, American jurist: b. near Lexington, Oglethorpe County, Ga., 12 Dec. 1848; d. Washington, Wilkes County, Ga., 18 July 1903. He was graduated from the University of Georgia in 1866, was admitted to the bar in 1868, was solicitor-general of the northern Georgia circuit in 1872-6, and State senator in 1878-80. In 1885-90 he was judge of the superior court of the northern circuit, on 1 Jan. 1891 became associate justice of the supreme court of Georgia, and on 4 Jan. 1897 presiding justice of the 2d division of that court.

Lumpkin, Wilson, American politician: b. Pittsylvania County, Va., 14 Jan. 1783; d. Athens, Ga., 28 Dec. 1870. He was a brother of Joseph Henry Lumpkin (q.v.). He removed to Oglethorpe County, Ga., in 1784; in 1797 was made a copyist in the superior court of Oglethorpe County; was admitted to the bar; and practised at Athens, Ga. He was elected several times to the lower house of the Georgia legislature, and also served in the State senate. In Congress he sat as a representative from Georgia in 1815-7 and 1827-31. In 1831-5 he was governor of Georgia (two terms). During his administration the Cherokees were deported across the Chattahoochee, and the region previously occupied by them was subdivided into thirteen counties, the county and town (in Stewart County) of Lumpkin being named in his honor. From 13 Dec. 1837 to 3 March 1841 he was United States senator to fill a vacancy. In 1823 he was appointed by President Monroe to determine and map the boundary line between Georgia and Florida; and he was also a member of the first State board of public works, appointed by the legislature. As State surveyor he laid out most of the lines of early Georgia railways.

Lumpkin, Tony, in Goldsmith's comedy 'She Stoops to Conquer,' a rude country squire, the son of Mrs. Harcastle by her first marriage. He is ignorant and boisterous, and clownishly conceited, and the humor of his practical joking bears the stamp of his innate viciousness.

Lump'sucker, an extraordinary marine fish (*Cyclopterus lumpus*), of oval, ugly form and allied to the sea-snails (*Liparis*) and gobies. It is remarkable for the brilliant red and purple colors which the male puts on in the breeding season in the spring, when it approaches rocky shores on both sides of the northern Atlantic to deposit its spawn. This fish has the short ventral fins so united as to form a sucking disk by which it attaches itself to the bottom and holds on against waves and currents, while it preys upon small fishes, crustaceans, etc. It

LUMPY JAW—LUNDY

is well known and eaten in Scotland under the name "cockpaddle."

Lumpy Jaw. See ACTINOMYCOSIS.

Luna, Antonio, an-tō'nē-ō loo'nā, Filipino insurgent politician: b. Manila, Philippine Islands, about 1854; d. Luzon Island, Philippines, 8 June 1899. He was educated largely in Paris, returned from Europe to Manila early in 1898, and became the editor of 'La Independencia,' organ of the insurgent party. Upon the formation of a so-called government by Emilio Aguinaldo in December 1898, the latter placed Luna at the head of the war department. Shortly afterward Luna was removed from this post and made the immediate commander of Aguinaldo's forces with general's rank. Difficulties arose between himself and Aguinaldo; and the latter, fearing, it was said, an attack upon his life by Luna, ordered the guards to kill anyone regardless of rank who might attempt to enter the headquarters. Upon Luna's appearance and demand for an interview, he was accordingly shot.

Luna, Pedro de, pā'drō dā, antipope: b. Spain 1334; d. Peñíscola, Valencia, 1424. He was sprung from a noble family of Aragon, and, after entering the priesthood, became distinguished as a canonist, and was appointed professor in the university of Montpellier. He received a cardinal's hat in 1375 and was elected to Avignon as antipope in 1394. The conclave of cardinals annexed as a condition to his election, that he should resign if ever an opportunity occurred when, by so doing, he could put a stop to the schism. This he refused to do although he was deposed by the council of Pisa (1409), and by that of Constance (1417). Banished from Avignon, he retired to the fortress of Peñíscola, near Valencia; where he spent the rest of his life in excommunication.

Luna, lū'na (the moon), among the Greeks *Scelēnē*. Her worship is said to have been introduced among the Romans in the time of Romulus. She had a temple on the Aventine, one on the Capitol, a third on the Palatine.

Luna Moth, one of the largest and most beautiful of the great American silkworm moths, *Tropæa luna*. Its general color is delicate green, there is a purple brown band along the front edge of the fore wings, and a pair of richly colored ocelli upon each of both pairs of wings, the hinder pair of which terminate in long curving "tails." The caterpillar grows to a length of about three inches, and is pale bluish green with a pearl-colored head; it has a pale yellow stripe along each side of the body, and a transverse yellow line on the back between each two abdominal segments. It feeds upon leaves of forest trees, as the hickory, walnut, etc. The cocoon is formed of a very thin, leaf-like material with little silk, and is usually found upon the ground.

Lu'nacy, Lunatic, etc. See INSANITY.

Lunalilo, loo-nā-lē'lō, **William C.**, king of the Hawaiian Islands (1873-4): b. 1835; d. 3 Feb. 1874. He received a good education, and was liberal in his political views. His health failed soon after his ascending the throne, and he paid inadequate attention to administrative business.

Lu'nar Caustic. See SILVER, NITRATE OF.

Lunar Theory, The, in astronomy, the deduction of the moon's motion from the law of gravitation. See MOON.

Lunar Year. See YEAR.

Lund, loond, Peter William, Danish naturalist: b. Copenhagen, Denmark, 14 June 1801; d. Lagôa Santa, Minas Geraes, Brazil, 5 May 1880. He traveled in Brazil 1827-30 and was sent there on a Russian scientific expedition in 1831. Three years later he established himself at Lagôa Santa, where he passed the rest of his life in exploring the limestone caves of the region and studying the fossils contained in them, discovering several hundred species in the course of his investigations.

Lund, Sweden, town, in the län of Malmöhus, on an extensive plain, about eight miles from the Sound and 24 miles east of Copenhagen. It is a very ancient place, and was once surrounded with wooden fortifications, and had its warehouses filled with the merchandise and treasures. In the Middle Ages the Scandinavian monarchs were elected kings of Scania on a hill in the immediate vicinity. The present town occupies a large extent of space, and is very irregularly built. It has an ancient Romanesque cathedral, one of the finest churches in Sweden (recently restored); a university attended by 700 students, and occupying buildings erected in 1878-82, while the old building contains the library (180,000 volumes), historical museum, etc. With the university are connected a zoological museum and a botanic garden. The town boasts of a statue of Tegnér, and the house in which he lived. Glovemaking and iron-founding are among the industries, and there is a trade in agricultural produce. Pop. (1901) 16,621.

Lun'dy, Benjamin, American abolitionist: b. Hardwick, Sussex County, N. J., 4 Jan. 1789; d. Lowell, La Salle County, Ill., 22 Aug. 1839. His parents were members of the Society of Friends. At 19 he removed to Wheeling, Va., where he labored as an apprentice to a saddler. At this place his attention was first directed to the subject of slavery. He subsequently settled in business in St. Clairsville, Va., where in 1815 he originated an anti-slavery association, called the "Union Humane Society." Soon after a journal entitled "The Philanthropist" was commenced at Mount Pleasant, Ohio, to which Lundy contributed. He then visited St. Louis, where he remained nearly two years engaged in a newspaper exposition of the slavery question. At Mount Pleasant, he commenced, in 1821, the publication of the 'Genius of Universal Emancipation,' the office of which was removed to Baltimore in 1824. In 1825 he visited Hayti to make arrangements for the settlement of emancipated slaves. In 1828 he visited the eastern States, where he formed the acquaintance of a number of prominent abolitionists, one of whom, William Lloyd Garrison, afterward became associated with him in editing his journal. In 1830-1 he traveled in Canada and Texas to obtain subscribers to his paper, and to continue his observations on the condition of the slaves. He continued his literary connection with the

LUNDY'S LANE — LUNGS

'Genius of Universal Emancipation' as long as it was published, and was the first to establish anti-slavery periodicals and the delivery of anti-slavery lectures, and probably the first to introduce the formation of societies for the encouragement of the produce of free labor. Consult Earle, 'The Life, Travels, and Opinions of Benjamin Lundy' (1847).

Lundy's Lane, Battle of, also called the Battle of Niagara, or Battle of Bridgewater. This was a severe engagement fought on Canadian soil near Niagara Falls, 23 July 1814, between the British and American forces. Two days after the defeat of the British under Gen. Riall at Chippewa by Brig.-Gen. Scott 5 July 1814, the American forces under Gen. Brown, numbering about 3,000 men, crossed the Chippewa River and took post at Queenstown; Riall, after throwing a portion of his force into Fort George, retreating to a strong position near the head of Lake Ontario. Occasional skirmishes took place between the outposts of both armies; but Brown, finding that he had no battering cannon to besiege Fort George, and being unwilling to leave that fortress in his rear, fell back after a few days to the Chippewa. Here on the 25th he received intelligence that Gen. Drummond, who had reached Fort George with British reinforcements, had crossed the Niagara River at Queens-town to attack Fort Schlosser, where the American supplies were deposited. Scott was at once detached with 1,200 men to make a demonstration at Queenstown, and about sunset unexpectedly came up with Riall and his whole force at the head of Lundy's Lane. The small American force received the full fire of the British infantry, and held their ground until the arrival of the main body of the American army. Fighting continued during the night. Scarcely an officer remained unwounded in the American ranks, and the men, faint with their exertions and tormented by thirst, were ready to sink with exhaustion. Unwilling, however, to relinquish the field, they replenished their ammunition from the cartridge boxes of their fallen comrades and foes, who covered the ground around the battery, and then calmly awaited the assault of the British. After an hour's pause the latter, reinforced by fresh troops from Fort George, advanced under Gen. Drummond to the last assault. The conflict which ensued was more deadly than ever. At length the enemy, broken, and foiled at all points, retired. Brown and Scott being now disabled by wounds, the command devolved upon Colonel Ripley, who, finding the enemy indisposed to renew the attack, drew off his troops to the camp. In this battle, the most obstinately contested perhaps ever fought upon the American continent, the British force, beside greatly outnumbering their opponents, had the advantages of position and preparation. Against these odds the troops of Brown fought with a valor and obstinacy unparalleled in the war, and which did much to disabuse the country of the idea, then prevalent, that American troops could not cope with the trained veterans of Europe. According to the official accounts, the Americans lost in killed and wounded 743 men, and the British 878. Ripley, finding his forces reduced to less than 2,000 effective men, retired to the neighborhood of Fort Erie, having first destroyed the bridge over the Chippewa and a portion of his stores.

Lunenburg, loo'nën-bérg, Canada, town, seaport, capital of Lunenburg County, in the province of Nova Scotia; and about 35 miles southwest of Halifax. The first settlement was made by Germans, in 1753. It has a large, safe harbor. The chief industries are ship-building and fishing. Lunenburg has a large fishing-fleet engaged in the cod and other fisheries, and it exports considerable fish and lumber to the West Indies. Pop. (1891) 4,898; (1901) 2,916.

Lungfish, a fish of the group *Dipnoi* (q.v.), few existing species of which remain. These are mostly sluggish fishes of tropical fresh waters, whose respiratory organs are lung-like. See BARRAMUNDA; CERATODUS; LEPIDOSIREN; and ICTHYOLOGY.

Lun'gren, Fernand Harvey, American painter and illustrator: b. Maryland 13 Nov. 1859. He was educated at Maryland University, but before he could graduate he launched into the career of an artist with marvellous success, and became a favorite illustrator for some of the leading New York monthlies. He has paid great attention to night effects in city streets, but since 1891 has made an exhaustive study of the life, religion and folklore of the Indians of the Southwest, having had special opportunities as priest of the Snake-Antelope fraternity. His most notable pictures are: 'Thirst'; 'The Snake Dance'; 'Night in the Desert'; and 'A Ford on the Rio Grande.'

Lungs, the principal organs of respiration in air-breathing vertebrates. They are enclosed in the chest, an air-tight chamber which, mainly by means of the diaphragm (q.v.), acts as a bellows and moves in and out of them. There are two lungs, one on the left, the other on the right side of the chest, and between them are situated the heart and the great blood-vessels springing from it, the esophagus, the thoracic duct, etc. The left lung is the smaller of the two, and both consist of a mass of ramified tubes, branches of the trachea, which unite them. Through the walls of the lungs all the blood of the body passes, receiving oxygen and throwing off carbonic acid. The simplest lung imaginable would be an elastic membranous bag, well supplied with blood-vessels, and with a pipe connecting it with the air; the most complicated lungs that exist are essentially of that construction, the purpose of the complications being merely the enlarging of the surface exposed to the air.

In all air-breathing vertebrates, the atmospheric air reaches the larynx through the nasal and the buccal cavities, then passes into the trachea, and into its ramifications which are called bronchi or bronchial tubes, and from these tubes into membranous pouches named alveoli. The terminal twig of a bronchial tube is a small canal, in which are found many openings or orifices of very short tubes, which are the ultimate ramifications of the tube. The lung-substance is composed of the alveoli, the air-sacs, the small bronchi, blood and lymphatic vessels, and nerves; the whole enclosed in a membrane that surrounds each of the lungs and is known as the pleura. The trachea or windpipe extends from the lower part of the larynx, of which it is the continuation, to the middle of the thorax, where it divides into the two large bronchi. It is situated in the middle

LONG FISHES

 3. African Mud-fish, or Barramunda.

LUNGS

line of the body, in front of the last cervical and the first five or six dorsal vertebræ. In the back part of the trachea there are transversal muscular fibres of the unstriped variety. The fibrous tissue found in the trachea belongs to the two varieties of yellow elastic and white fibres. The mucous membrane is thin and in perfect continuity with that of the larynx and that of the bronchi. Its most remarkable feature is that its epithelial covering is composed of ciliated cells having in high degree the vibratile movement. All along the trachea there are many mucous glands, and these are especially numerous upon its back part. The cilia lash upward, and thus keep the passages free from mucus and remove foreign particles. As the passages become smaller they lose their cartilages, and the muscles form a continuous circular layer. The length of the trachea is from four to five inches. The average transversal diameter of this tube is between nine and twelve lines in adults. The anterior two thirds of the trachea is cylindrical, the posterior third is a flattened wall. In the neck the trachea is covered by the skin and a few flat muscles; in the chest it is placed between the two lungs and covered by muscles, lymphatic glands, and the bony and cutaneous walls of the thorax. The structure of the trachea is complicated. This tube is essentially composed of an internal layer which is a mucous membrane and an external one which is fibrous. Imbedded in these membranes are from 16 to 20 cartilaginous pieces, with the shape of a horseshoe, or of a ring one third of which is missing. These incomplete rings are placed transversely at nearly equal distances one from the other; they give to the anterior two thirds of the trachea the cylindrical form.

The essential parts of the lungs are the air-cells or air-sacs, in which the function of respiration is performed. They consist of somewhat elongated cavities, which communicate with a bronchial ramification by a circular opening, usually smaller than the cavity of the cell. The air-cells are arranged in groups and separated from each other by thin walls. Many small,

shallow, cup-like depressions, separated from each other by portions of membrane, are found at the bottom and on the lateral walls of the air-sacs. These, the alveoli, have no communication with each other except by their opening in the cavity of the air-sac. An epithelial layer exists in the air-cells and the alveoli. The walls of the air-cells are formed of a thin membrane in which the blood and lymph-capillaries ramify. Minute openings lead from the air-cells into the lymph-spaces of the membrane. The membranous walls are partly formed of elastic tissue. It is this that gives to the lungs their elasticity. At the root of the lungs the membrane known as the visceral pleura is continuous with a membrane which lines the chest-cavity (the parietal pleura). The space between the two is the pleural cavity; it is in reality a large lymph-space, and communicates with the lymphatics of the pleura. Owing to the air-pressure within the lungs, the two pleuræ are closely pressed together, the lungs entirely filling the chest-cavity.

The lungs are united with the heart and with the trachea by a part called the root, which, in each side, is composed of the large bronchus, a branch of the pulmonary artery, two pulmonary veins, and smaller vessels and nerves, the whole being almost completely covered by the pleura. Each lung is divided into lobes, two in number in the left one and three in the other. Each lobe is divided into lobules, which are arranged on the bronchial tubes like grapes on a bunch. Each lobule is surrounded by condensed areolar tissue mixed up with yellow elastic tissue. Each lobule is a fair representation, on a small scale, of a whole lung, as it hangs upon a bronchial tube, a branch of the pulmonary artery, branches of bronchial vessels, and nerves. In the roots of the lungs the two large bronchi divide, the right into three, and the left into two bronchial tubes, one for each of the pulmonary lobes. The primary bronchial tubes are very short, and divide into two or three smaller tubes, each of which gives off two or three divisions. Before reaching their termination, the tubes branch off four or five times more.

The weight of the lungs varies much according to age and sex. In adult men the two lungs weigh from 40 to 50 ounces, and in women from 28 to 35 ounces. The ratio of the weight of the lungs to that of the body is as 1 to 30 or 40. The specific gravity of the lungs is very slight, and, unless the air has been expelled from the cavities of the bronchial tubes and of the alveoli, any part of the lungs dipped into water will rise and float.

As respiratory organs the lungs bear a certain average relation to the physical proportions and condition of the individual. The average amount of air in the case of an individual 5 feet 8 inches in height that goes in and out of the lungs at each inspiration and expiration is about 20 cubic inches; this is called the tidal air. By means of forced inspiratory movements the ingoing tide may be increased by 120 cubic inches; by means of a forced expiration the outgoing tidal air may be increased by 90 cubic inches. After the most forced expiration possible there always remain within the lungs about 90 cubic inches of air. So that if a person takes as deep a breath as possible, and then makes as forced an expiration as he can, he will

LUNGS

drive out $120 + 20 + 90 = 230$ cubic inches of air. This is termed the respiratory capacity. Since the tidal air is only 20 cubic inches, and 180 cubic inches remain in the chest after an ordinary expiration, it follows the air directly changed during respiration is not that really within the lungs themselves, but is that within the nose, windpipe, and larger bronchi, the pipes that result from the branching of the windpipe. Therefore the changes of the air within the essential parts of the lungs are the result of diffusion between it and the purer air of the bronchi, aided by the rush with which the tidal air flows in.

The ordinary respiratory movements differ in the two sexes and at different periods of life. In young children the chest is altered in size chiefly by the movements of the diaphragm, and the protrusion of the abdominal wall during inspiration is therefore very marked. In men also it is the diaphragm which is chiefly operative, but the ribs are also moved. In women it is the movement of the ribs, especially the upper ones, which is the most extensive. The respiratory rhythm is the relation of the acts of inspiration and expiration to each other as regards time. See ANATOMY; BREATHING AND HEALTH; CIRCULATION; LUNGS, DISEASES OF; RESPIRATION.

Lungs, Diseases of. The disorders to which the lungs of man are subject form a long list of maladies, involving numerous complications. Of these the more important will be considered here.

Congestion of the Lungs.—Pulmonary congestion (hyperæmia) may be active or passive. In the majority of cases active congestion is a symptom or a condition associated with bronchitis, pleurisy, pneumonia, or tuberculosis. In rather rare instances it may result from violent exertion, or from drunkenness and exposure to great cold or heat, followed by œdema, possibly by death. As symptoms this primary congestion presents cough, rapid breathing, frothy, blood-tinged expectoration, harsh respiration with fine moist râles, and absence of fever unless there is co-existing inflammation. Passive hyperæmia may be mechanical or hypostatic. Mechanical congestion is due to the presence of some obstruction to the return of the blood to the left side of the heart, such as emphysema or affections of the left ventricle, especially mitral narrowing or incompetency. Rarely it arises from pressure by tumors. The symptoms are cough, shortness of breath, blood-stained, frothy expectoration, and possibly spitting of blood (hæmoptysis). Hypostatic congestion (settling of blood to the lowest parts of the lungs) occurs in conditions of great debility attended by feebleness of the heart, and is favored by prolonged lying upon the back. It is therefore most common in long-continued typhoid fever, paralyses, prolonged unconsciousness, abdominal dropsy or tumors, and wasting diseases, especially tuberculosis and cancer. The physical signs are slight dullness over the bases of the lungs posteriorly, with weak or harsh and perhaps broncho-vesicular respiration, and moist râles.

Œdema of the Lungs.—This condition—an effusion of watery fluid (serum) from the capillaries into the air-cells and their walls—is almost invariably a sequel of congestion or in-

flammation of the lungs. It may be local, surrounding a circumscribed and usually inflammatory lesion; or general, due to causes in all respects similar to those which produce congestion. Pulmonary œdema occurs most commonly in connection with pneumonia, cancer, grave anæmias, Bright's disease, acute specific fevers with weak heart, valvular disease of the heart, and apoplexy. The œdema may occur suddenly, especially in Bright's disease. Usually its onset is gradual. The symptoms are increasing shortness of breath (dyspnœa), blueness (cyanosis) of fingers, lips, and skin, cough, and abundant watery, frothy, perhaps blood-stained, expectoration, without fever except from a causative inflammatory or febrile disease. The physical signs are slight dullness over the bases, and weak, perhaps broncho-vesicular, breath-sounds, with many unusually liquid large and small râles.

Embolism of the Lungs.—Foreign bodies (emboli) carried by the blood and lodging in the smaller arteries or capillaries of the lungs usually consist of disintegrated blood-clots (thrombi); less commonly of vegetations from diseased heart-valves, or masses of pathogenic germs. As a result of the cutting off of the blood-supply circumscribed dark-red wedge-shaped areas of necrosis (hemorrhagic infarctions) occur. Emboli may be non-septic (not containing disease-germs), originating most commonly from chronic disease of the heart; or septic, arising from a gangrenous or suppurating focus in some part of the body. A non-septic infarct may in time be replaced by scar-tissue; if septic, abscess or gangrene of the lung may result. If the embolus is so large as to obstruct a main branch of the pulmonary artery, sudden death may take place. In occlusion of medium-sized branches there will be cough, spitting of blood, intense breathlessness, fainting, perhaps coma and convulsions. When the smallest branches are involved there may be slight cough, hæmoptysis, and dyspnœa. The spitting of dark frothy blood during the course of chronic cardiac disease is particularly suggestive. If the infarction is very large the physical signs of a limited consolidation are present, followed, if the embolus is septic, by the evidences of pulmonary abscess or gangrene.

Pneumonia.—Two main varieties are recognized, lobar pneumonia and broncho-pneumonia.

Lobar Pneumonia.—This disease (called variously croupous pneumonia, pneumonitis, lung fever, inflammation of the lungs) is caused directly in the large majority of cases by the *Diplococcus pneumoniae* (or *lanceolatus*) of Fraenkel. Exposure to cold and wet, alcoholism, and debility from pre-existing disease predispose. One attack renders a second more likely. Three stages are recognized in the pathological anatomy, congestion, red hepatization, and gray hepatization. In the first stage the lung is deep-red, rather firm, does not collapse, and the cut surface exudes a frothy, blood-stained, watery fluid. In the second stage the affected portion is dark-red, firm, and sinks in water. It tears easily, the torn surface is granular and dry, and the air-cells (alveoli) are filled with coagulated fibrin containing many red and some white blood-cells. In the third stage the color becomes a mottled gray, and the cut surfaces are moist. The exudate in

LUNGS

the alveoli undergoes softening and liquefaction, and is either expectorated or carried away by the lymphatics.

The symptoms of a typical case begin abruptly with a severe chill, and a sharp stabbing pain in the side, followed by a quick rise of temperature to 104° or 105° F. The breathing is rapid, varying from 40 to 60 or over, with an expiratory grunt, and a dry, restrained, and painful cough. The face is flushed, there is often a circumscribed redness on the cheek of the affected side, and the nostrils dilate with each inspiration. A thick, tenacious, rusty, or blood-stained expectoration appears. The pulse is rapid (100 to 120) and bounding. The tongue is coated, the bowels constipated, the urine scanty, high-colored, often slightly albuminous, and as a rule strikingly deficient in chlorides. The lips are often bluish and present herpetic eruptions (cold-sores). Delirium is frequently manifest. In the majority of cases there is an increased number of white cells in the blood (leucocytosis), the count ranging from 12,000 to 50,000. The fever, having risen to its highest point (as a rule within 24 hours), remains high, with remissions, for from 5 to 10 days, when typically it falls (by crisis) within a few hours (5 to 12) to or below the normal.

With reference to the physical signs: Compensatory increase of the movement of the unaffected side may be observed, and the vocal fremitus over the affected portion of the lung is increased, unless the bronchial tubes are filled with a thick secretion. There is marked dullness over the solidified lung areas. The percussion-note over the healthy parts of the lung, especially over those portions lying above an area of consolidation, may be hyper-resonant, or even tympanitic. In the early stages the breath-sounds may be weak, and the crepitant r  le is often audible at the end of inspiration. As consolidation occurs, the breath-sounds become broncho-vesicular and finally intensely bronchial. The spoken and whispered voice-sounds are conveyed with great distinctness. During the second stage no r  les may be heard, but friction sounds are often present. In the third stage (resolution) small moist crepitations (*r  le redux*) become audible.

Death may take place at any time during the disease. It is a very fatal malady in drunkards, and in persons of 60 years or over (60 to 80 per cent); so also in infants under one year. As a rule, above one year, the younger the patient the better the outlook for recovery. The most common cause of a fatal result is the tox  mia (blood-poisoning) due to the causative germ, and the heart-weakness arising therefrom. Meningitis as a complication is always lethal. Unfavorable symptoms are the super-vention of the "typhoid status," very high fever (105° F. or over), marked cyanosis, severe dyspno  , rapid extension of the disease to other lobes or to the opposite lung, and increasing weakness of the heart with pulmonary   dema.

In some instances of recovery the consolidation may persist for from eight to ten weeks (delayed resolution), during which there is fever of a remittent type. In rare cases lobar pneumonia may terminate in abscess, gangrene, or chronic fibrosis. Recurrences are frequent; third or fourth attacks are common, and eight to ten have been reported. Relapses are rare.

Like other infections due to specific micro-organisms, lobar pneumonia may present striking variations both in symptoms and character. Thus the fever may be slight or entirely absent in old persons and chronic alcoholics. The crisis may be as early as the third day. The fever may terminate by lysis (gradual fall) instead of by crisis (sudden fall), especially in children. There may be a false (pseudo) crisis two or three days previous to the final fall. Not infrequently cough and expectoration are slight or absent in the very old, the very young, in topers, and in those previously ill with serious acute or chronic maladies. The sputum may be of a red, rusty, yellow, or dark-brown ("prune-juice") color. Very seldom there is spitting of blood early in the disease. Pain is absent in deep-seated pneumonias when the pleura is not involved. In children the pain is usually referred to the abdomen; and abdominal pain, often severe, and generally due to involvement of the diaphragmatic pleura, is not uncommon in adults. Tympanites (excessive amount of gas in intestines) is by no means rare. The pulse may be dicrotic in severe cases, or small and rapid, or full but soft and followed by serious weakness of the heart. The character of the pulse is no indication of the manner in which the right ventricle is standing the strain of pulmonary obstruction. A more reliable criterion is the pulmonary second sound, which, if accentuated, shows that the lesser circulation is being maintained. A persistent absence of leucocytosis is, except in mild cases, a symptom of bad omen. Convulsions often initiate the disease in children, and in them the symptoms may closely resemble those of meningitis. Deafness not depending upon inflammation of the middle ear is not infrequent. The delirium of lobar pneumonia may be active or maniacal, especially in drunkards.

The variations in the character of the disease depend partly upon the site and extent of the local lesions, but mainly upon differences in the resisting power of the patient and the virulence of the pneumococcus. Among the atypical cases are those occurring in old persons. In them the disease is often latent, there is no chill, and but slight cough or expectoration. The general prostration is marked, while the physical signs are indefinite or obscure. In infants and young children the disease frequently begins at the apex (top) of the lungs, the temperature is high, and convulsions, delirium, stupor, and coma are often prominent symptoms. Not infrequently vomiting and diarrh  a are so severe and persistent that the pneumonia may be overlooked. Typhoid pneumonia is characterized by muttering delirium, dry brown tongue, teeth covered with sordes, twitching of the tendons (*subsultus tendinum*), and perhaps picking at the bed-clothes or grasping at imagined objects in the air (*carphologia*)—symptoms resembling those which may appear in a severe attack of typhoid fever. In drunkards the disease may begin gradually, the fever may not be high, the delirium is commonly of the violent type, and the typhoid status often develops, ending in death by exhaustion. The localization of pneumonia is variable. Most frequently the right lower lobe is attacked, and in double pneumonia both lower lobes are usually involved. When the consolidation steadily advances from lobe to

LUNGS

lobe it is called wandering or migratory pneumonia. Cases presenting delayed physical signs are very perplexing unless rusty sputum is present. The evidences of consolidation may not appear until the fifth or even the eighth day of the disease, a fact doubtless to be explained by the consolidation beginning in the centre of the lung and extending slowly to the surface.

Among the complications of lobar pneumonia the most frequent is pleurisy, either serous or purulent (empyema). When the pleurisy is so severe and extensive that it rivals or surpasses the pneumonic element it constitutes pleuropneumonia. The ordinary dry pleurisy which covers the consolidated area, and which is responsible for the stabbing pain in pneumonia, cannot be considered a complication. When a pleurisy follows pneumonia an irregular, perhaps slight, rise of temperature persists, the physical signs of fluid in the pleura become manifest, and leucocytosis continues. Endocarditis, usually affecting the left side of the heart, is the next most frequent complication, and it may be of the ulcerative type. From 15 to 25 per cent of cases of the malignant form of the disease originate from pneumococcal infection. Symptoms are uncertain and sometimes absent. A prolonged irregular fever, with chills and sweating, is suspicious; if evidences of embolism occur, and meningitis is present, together with the development of a loud diastolic murmur not previously found, the diagnosis of ulcerative endocarditis is assured. Pericarditis, usually fibrinous or serous, rarely purulent, occurs particularly in the double or left-side pneumonia of childhood. It is often latent or overlooked. Increased dyspnoea, weak pulse, and præcordial pain may declare its presence. Meningitis, a very serious and fatal complication, is fortunately rare, and when occurring often co-exists with malignant endocarditis. Marked cervical retraction, intense headache, delirium, and coma indicate a basilar inflammation. Meningitis of the convexity is usually not recognized. Jaundice of toxæmic origin is very common in some epidemics of pneumonia. Otitis media is not infrequent in children, parotitis is of occasional occurrence, so also are colitis and venous thrombosis. Nephritis, peritonitis, peripheral neuritis, embolism of the femoral or other large artery, and cerebral embolism with aphasia and hemiplegia are rare complications. Pneumonia and malarial fever may either precede or occur during an attack of pneumonia. Redness, swelling, and pain in one or more joints may become manifest during or after the crisis of a pneumonia, and the inflammation proceed to suppuration. The pneumococcus is found in the diseased joints (pneumococcal arthritis).

The diagnosis of lobar pneumonia is as a rule readily made, most cases presenting distinctive and unmistakable symptoms. The disease may be overlooked in the very old or the very young, or in those already seriously ill. Hypostatic congestion can usually be distinguished from pneumonia by the absence of rusty sputum, or of fever, and is commonly bilateral. In pulmonary oedema, cardiac disease or nephritis usually co-exist, and although dyspnoea, cough, and expectoration are present, there is no fever, the breath sounds are weak, there are numerous fine and coarse liquid râles on both sides of the

chest, and marked dullness and bronchial respiration are absent. In oedema the sputum is fluid, frothy, and not rusty. Acute bronchitis in children may simulate pneumonia, but there is no chill, convulsion, dullness, or bronchial breathing, the fever is not so high as in pneumonia, and there are dry and moist râles over both sides of the chest. Broncho-pneumonia generally follows a bronchitis or an acute infection like measles. The fever is irregular, lasts for weeks, and does not terminate by crisis. The sputum is streaked with blood rather than rusty. The physical signs consist mainly of dry and moist râles over both chests. If evidences of consolidation are found they lie in a vertical strip on both sides of the spine, while, on the other hand, in lobar pneumonia they are quite as well and often better perceived on the sides of the chest. Pleurisy with effusion is very rarely mistaken for pneumonia, except in children. In pleurisy there is seldom a chill, the fever is not so high and declines by slow lysis, the cough is dry, and there is no rusty sputum. The affected side is distended, vocal fremitus is absent, the line of dullness may shift as the patient is moved, the voice-sounds are absent or diminished, or there is egophony (a quavering quality of sound), and the respiratory murmur is absent or decreased. Bronchial breathing, if heard, is distant. The apex-beat may be displaced. Finally puncture affords proof positive of the presence of fluid. Acute pneumonic phthisis may exactly resemble lobar pneumonia until the eighth or tenth day, when the fever continues with profuse sweats, and the signs of softening (gurgling râles, amphoric or cavernous breathing) gradually appear. The sputum becomes green, and tubercle bacilli and elastic fibres are discovered in it. It may be impossible to distinguish between pneumonia presenting the typhoid status and typhoid fever complicated by pneumonia unless the case is seen from the outset, or rose-spots appear and a positive Widal reaction is present.

The treatment of lobar pneumonia involves careful attention to the details of nursing. The room should be especially well ventilated in order that the air of the chamber should contain the maximum natural percentage of oxygen. Too much bed-clothing and the swathing of the trunk in cotton, both too often seen, tend to keep the fever higher than it would otherwise be, and add to the discomfort of the patient. Absolute rest in the recumbent position together with the use of the urinal and bed-pan is, with rare exceptions, to be insisted upon. The regular free giving of water is of great importance. The diet should be that usually given in fever, comprising milk, clear or diluted, flavored or not, perhaps peptonized, plain ice-cream, and junket; broths of beef, mutton, chicken, oysters, or clams; tea, coffee, or weak cocoa; grape or orange-juice, lemonade, ginger-ale, and fruit-ices; albumin-water, egg-lemonade; and if necessary one of the proprietary liquid foods. The medicinal treatment depends so much on the character of the individual case and the intensity of the special symptoms that it is not practicable to describe it here in detail. There is as yet no specific—a remedy which cures or tends to cure a particular disease—for lobar pneumonia, although in the future a reliable anti-pneumococcal serum may

LUNGS

be discovered. Sodium salicylate and carbonate of creosote, the latter especially, have given apparent good results. One or two initial doses of quinine, say seven or eight grains of the sulphate, are highly recommended. An initial dose of calomel does good service. Side-pain is to be relieved, preferably by mustard, poultices, or the ice-bag; if necessary by the small-est efficient doses of morphine or Dover's powder. The use of oxygen is desirable except in the milder cases. Delirium and restlessness may need the use of trional, veronal, bromides, chloral, camphor, hyoscine, hydrobromate, or morphine. For very high fever frictions with cold water are desirable. The cold tub may or may not be advisable, but its use is as a rule not to be commended. For weakness of the heart—the main channel through which life runs away in this disease—strychnine, caffeine, ammonia, and wine or spirits are most useful. In addition may be required digitalis, nitroglycerine, sparteine, strophanthus, camphor, and musk.

Broncho-pneumonia.—This (called also capillary bronchitis, lobular pneumonia, catarrhal pneumonia) is an inflammation of the terminal bronchi and their communicating air-cells, due to the presence of two or more varieties of micro-organisms. Those most commonly found are the *Pneumococcus lanceolatus*, *Streptococcus pyogenes*, *Staphylococcus aureus et albus*, and the germs of diphtheria and influenza (la grippe). The disease may come suddenly during good health, or may be secondary to some pre-existent disease. It attacks especially the very young (under five), the very old, or the debilitated of any age. It is most common among those who live in unsanitary surroundings. The primary cases are usually due to cold and exposure. The secondary cases follow acute bronchitis, measles, whooping-cough, diphtheria, scarlet fever, erysipelas, and small-pox. It may succeed the inhalation of food or drink while the patient is unconscious; or operations on the mouth or nose; or any accident or disease which permits germ-containing particles to enter the bronchial tubes.

The pathology of the disease involves the presence of small areas of consolidation around the bronchioles, and small patches of collapsed lung (which can be inflated) due to occlusion of the bronchi. The terminal bronchioles and the air-cells are filled with an exudate composed of leucocytes and degenerating epithelium. The bronchial walls also contain numbers of leucocytes. In the majority of instances both lungs are involved.

The symptoms, if the disease is primary, begin abruptly, with a chill and a rapid rise of temperature, thus resembling lobar pneumonia. If there is a pre-existing bronchitis of the larger tubes the onset is less abrupt and there is rarely a distinct chill. The characteristic symptoms are cough, dyspnoea, rapid respiration (40 to 80) with an expiratory moan, rapid pulse, and perhaps cyanosis. As the disease affects both lungs, the physical signs are bilateral. There are numerous sibilant and sonorous râles, at first and perhaps all through the disease, without evidences of consolidation. If areas of consolidation sufficiently numerous and confluent exist, there will be slight or even decided dullness, broncho-vesicular or bronchial respiration, and increased vocal fremitus and bronchophony.

These signs are commonly found at the bases posteriorly and on either side of the spine.

The type of the disease varies. In certain cases (suffocative catarrh) the dyspnoea and cyanosis steadily increase, the cough lessens, the respirations become rapid and shallow, and the râles larger and moister. The patient is drowsy, but restless, and death ensues from weakness and overdistention of the right ventricle. The fever in some instances, especially in children, may be of a remittent type and lead to a mistaken diagnosis of malaria. The primary form in infants and young children sets in abruptly with chill and high fever, and bears a close resemblance to lobar pneumonia; in adults it may begin like a severe acute bronchitis, but the fever, cough, and dyspnoea are more marked than in a bronchitis, and the sputum is tenacious and rusty. The secondary form begins as a bronchitis, often of slow development, with increase in the fever of the primary disease (for example, measles), cough, dyspnoea, and rapid breathing.

The duration is variable. Cases of great severity, especially in children, may prove fatal in from three to six days; the common type ending in recovery endures from one to three weeks; exceptionally the disease may be protracted to six or eight weeks, rarely even to ten or twelve weeks. Death may occur at any time. The fever declines by lysis.

In the diagnosis of the disease the cardinal symptoms are fever, cough, dyspnoea, rapid respiration, and bilateral physical signs. Its differential diagnosis from lobar pneumonia has been stated in the description of the latter disease. From the broncho-pneumonic form of pulmonary tuberculosis the distinction may be extremely difficult. A tuberculous family history, progressive emaciation, the finding of tubercle bacilli in the sputum, and the occurrence of the signs of softening, will declare for tuberculosis.

With regard to the prognosis, it is to be remembered that broncho-pneumonia is always a grave disease. The primary cases usually recover; the fatality is greatest in the secondary forms. In children among the well-to-do the mortality varies from 10 to 30 per cent; in hospitals, and among the very poor, from 30 to 50 per cent. Inhalation broncho-pneumonia is usually fatal because of its frequent termination in abscess or gangrene.

Concerning treatment, the utmost importance should be attached to prophylaxis, for instance, the prevention of the spread of an ordinary bronchitis of the larger tubes to the terminal bronchi, especially in children. Perhaps the most important measure of prevention is to keep the patient in an even temperature of 68° to 70° F., and to avoid all depressing agencies, as overfatigue, improper food, etc. The disease, having declared itself, requires in the main the same management as a lobar pneumonia. Opiates, however, should rarely be employed. Local counter-irritation of the chest, poultices, wet compresses, and frictions with stimulating liniments, constitute a much more important element of the treatment than in lobar pneumonia; so also perhaps do the so-called expectorants, such as the ammonium preparations. If the child is unable to expel accumulated mucus the use of an emetic (ipecac, alum) may be desirable.

LUNGS

Pneumonoconiosis.—This is a chronic pneumonia due to the inhalation of dusts incident to various employments, and giving rise to anthracosis, or coal-miner's disease; chalicosis, stone-cutter's phthisis, or grinder's rot; siderosis, caused by the inhalation of metallic particles by metal-workers; etc. The symptoms and signs are those of chronic bronchitis with emphysema and fibroid changes. In the later stages the lungs may become tuberculous. The prognosis is favorable in the early stages upon quitting the obnoxious work; in advanced cases grave, although the disease is essentially chronic.

Atelectasis.—Collapse of the lungs—partial or entire disappearance of air from the air-cells—may be congenital, occurring in the new-born as a result of weakness or some form of obstruction in the air passages. The acquired variety is due variously to obstruction of the smaller bronchi by mucus; to compression of the lung by large effusions or tumors in the chest; to respiratory paralysis; or to great abdominal distention.

Emphysema.—The lungs in this disease contain an abnormal amount of air. The common form—hypertrophic emphysema—is characterized pathologically by distention of the air-cells and thinning of their walls. The lungs are large, pale, and do not collapse. Many of the pulmonary capillaries are obliterated, thereby causing obstruction in the pulmonary circulation with compensatory hypertrophy of the right ventricle.

The predisposing cause is a congenital weakness of the lung structure; the exciting cause is increased intrapulmonary tension due variously to chronic or severe cough, heavy lifting, glass-blowing, or using wind-instruments.

The symptoms come on insidiously, often in early life. These are dyspnoea, perhaps only on exertion; cough, ultimately becoming chronic; frequent attacks of bronchitis or spasmodic asthma; and cyanosis, with subnormal temperature and cool skin.

When the right ventricle fails there are swellings of the feet and other evidences of general venous congestion. The physical signs are usually distinctive. Inspection shows the short broad barrel-shaped chest of emphysema, with its vertical movement, poor expansion, and prolonged expiratory motion. Usually there is a marked epigastric pulsation. The apex-beat is not seen. The percussion note is hyper-resonant, even slightly tympanitic. The normal limits of pulmonary resonance are extended in every direction. The characteristic auscultatory finding is that of a low-pitched, often wheezy, greatly prolonged expiratory sound. The inspiration is short and weak. Bronchitic râles, at times in great frequency, are often heard.

The course of the disease is essentially progressive and chronic. It is incurable, although the patient may live to old age. Death may occur from intercurrent pneumonia or phthisis, or from failure of the right heart.

The treatment is that of chronic bronchitis (q.v.). When practicable, the subject should live in a warm equable climate in order to avoid recurrent acute bronchitis. The bowels should be kept regular, and the diet carefully supervised to avoid abdominal distention. Inhalations of oxygen, and appropriate treatment by compressed and rarified air, may be helpful.

Strychnine, iron, and digitalis are of much service when judiciously employed; so also are the arsenic and iodine compounds.

Abscess of the Lung.—An acute suppurative inflammation caused by pus-producing organisms. The pus collections may be single or multiple. The organisms may reach the lung by way of the bronchi, as in an inhalation pneumonia; or by infective emboli (see **EMBOLISM**); or by direct extension, as from a purulent pleurisy. Very rarely it is a sequel of an ordinary broncho-pneumonia or lobar pneumonia.

The symptoms are chills, high and irregular fever, sweats, and leucocytosis. In time the physical signs of cavity are manifest. The sputum is yellow or green, of an offensive, but not putrid, odor, and contains particles of lung tissue and elastic fibres.

The prognosis is usually hopeless. There are occasional recoveries in the cases following pneumonia (except of the inhalation type), or the penetration of external abscesses into the lung. If the abscess is single and accessible, operation may be successful.

Gangrene of the Lung.—A result of infection of a necrotic portion of lung by the bacteria of putrefaction, conjoined with an abnormal vulnerability of the tissues. Diabetes and long continued fevers predispose; pneumonia (particularly inhalation-pneumonia), tuberculous cavities, new growths, embolism, and abscess, are the most frequent antecedent conditions.

The symptoms are irregular, generally moderate, fever, with rapid pulse, cough, dyspnoea, and prostration. The physical signs, when present, are those of cavity. The characteristic symptom is the excessively fetid odor of the breath and sputum. The latter contains fragments of lung tissue, elastic tissue, blood pigment, and numerous bacteria. If allowed to stand, the sputum separates into three layers—the uppermost frothy, the middle watery, the lower with a heavy greenish-brown sediment.

The prognosis in the majority of cases is bad. Small strictly circumscribed areas may become encapsulated, the broken down tissue discharging by way of the bronchi. In accessible cavities surgical interference may succeed.

New Growths of the Lung.—The most common forms are carcinoma and sarcoma, usually bilateral and secondary to cancer elsewhere. Associated lesions are pleurisy, enlargement of the tracheal, bronchial, and cervical glands; perhaps also pulmonary gangrene. The symptoms may be latent. Ultimately cough, pain, and dyspnoea appear. The physical signs are variable, depending largely upon the presence or absence of pleural effusion. According to the size and location of the growth pressure symptoms will be present, for example, hoarseness from pressure on the recurrent laryngeal nerve; or distention of the veins and swelling of the face, neck, and arms from the pressure of the growth on the venous trunks in the chest.

The diagnosis depends largely upon the presence of malignant growths elsewhere, or upon the history of the previous removal of such growths. The disease ends fatally with a duration varying from six weeks to two years. **CONSUMPTION; CONSUMPTION, PREVENTION OF.**

GLENTWORTH REEVE BUTLER, A.M., M.D.
Author of 'Diagnostics of Internal Medicine.'

LUNGWORT—LURAY CAVE

Lungwort. The name of several plants supposed to have medicinal value in respect to diseases of the lungs. One is a lichen (*Sticta pulmonacea*) growing on the trunks of trees in moist sub-alpine countries. In Siberia it is used as a substitute for hops. Another such a plant is a genus of borages (*Pulmonaria*). The narrow-leaved lungwort is *P. angustifolia*, and the common lungwort, *P. officinalis*; the former is wild. These are European; but an American borage, the blue-blossomed Virginia cow-slip (*Mertensia virginica*) is called tree-lungwort in the Southern States, and used by compounding of simples. A near relative is the sea-lungwort (*Pucumaria maritima*). Another is one of the hawkweeds (*Hieracium pulmonarium*), called French or golden lungwort in Canada. Bullock's or cow's lungwort is the great mullein (*Verbascum thapsus*).

Lunn Hemp. See FIBRE.

Lunt, George, American journalist and poet: b. Newburyport, Mass., 31 Dec. 1803; d. Boston, Mass., 17 May 1885. He was graduated from Harvard in 1824, studied law and was admitted to the Essex bar in 1827. He sat in the State legislature, was appointed United States District Attorney by President Tyler and during the Civil War was associate editor with George S. Hillard (q.v.) of the Boston *Courier*. He published 'Poems' (1839); 'The Age of Gold' (1843); 'The Dove and the Eagle' (1851); 'Lyric Poems' (1854); 'The Union,' a poem (1860); 'Origin of the Late War' (1866); 'Old New England Traits' (1873).

Lupercalia, lū-pēr-kā'li-a, an ancient Roman festival celebrated annually in honor of Lupercus, an ancient pastoral god of the Italians, afterward identified with the Arcadian Pan, who protected the flocks against wolves and gave them fertility. The festival dates from the earliest period of the history of Rome; it was held on the Lupercal, where Romulus and Remus were supposed to have been nurtured by a she-wolf. The day of celebration was 15 February, which was originally the last month of the Roman year.

Lu'pine, a genus of annual and perennial herbs and a few shrubs (*Lupinus*) of the order *Leguminosæ*. The species, of which there are about 80, are sparsely represented in the Mediterranean region and in the Eastern United States, but most numerous in the Western and Pacific Coast States. They have usually digitate leaves; pea-like showy blue, yellow or white flowers in terminal racemes; and rather flattened pods containing several large seeds. Several of the species have been long used for forage, for human food, and for green manuring. Many others are grown for ornament. They thrive especially well upon light, dry soils deficient in lime, and are said to fail upon wet and limy soils. They are readily propagated by means of seed, or, the perennials by division, but these cannot be satisfactorily transplanted when once established. The most important species are the blue lupine (*L. hirsutus*), the white lupine (*L. albus*) and the yellow lupine (*L. luteus*), all of Old World origin. The plants are rich in nitrogenous matter and are thus especially useful for stock-food as well as green manure. Like clover, peas and beans they can obtain free nitrogen from the air by means of their root tubercles. The ripe seeds are rich in proteid

substances and but for their bitter principle would probably be more popular as human food than they are even in Europe, where their consumption is enormous. The bitterness may be removed by long soaking in water. In America, though gaining in popularity as soil improvers and forage crops, the plants are seldom grown except for ornament.

Lupus, a generic term used to describe several varieties of chronic localized infiltrations of the skin. The most common of these are *Lupus erythematosus* and *Lupus vulgaris*. The former occurs in slightly elevated, scaly, red patches, varying in size, which show a strong tendency to the production of atrophic scars. It is most common on the face, ears, and scalp, more rarely occurring on the hands and feet. It begins in several isolated or grouped red spots little larger than a pin-head, and having a thin scale. These spots increase in size by peripheral extension, while the surface is partly covered by the grayish scales or thin scar tissue. The color is characteristic, and is violaceous. They may remain small, or may grow large enough to cover the side of the face. Practically nothing is known of the etiology. The comparatively small patches have little effect on health, but the disseminated variety may cause death.

Lupus vulgaris is a chronic disease of the skin, due to its invasion by the tubercle-bacillus; characterized by one or more brownish-red lumps or patches that tend to absorption, ulceration, and scar formation. The disease usually begins in childhood, the most frequent site being the face, particularly the cheek and nose. There may be one or more such spots, but they show no tendency to symmetrical development. After a time slightly scaly patches will form by the coalescence of the tiny red spots. Sometimes the disease has a slow course, for years remaining quiescent; in other cases it suddenly takes on a rapid growth. The erythematous form is treated by superficial caustics. *Lupus vulgaris* being a tubercular disease, hygiene is of great importance, and the X-rays and other powerful rays seem to exert a curative influence on the growths.

Luray, lū-rā', Va., town, county-seat of Page County; on the Norfolk & Western railroad; about 100 miles north by west of Richmond and the same distance west by south of Washington. It is situated in a beautiful valley almost surrounded by mountains; nearby are a number of mineral springs. A spring which flows through the town furnishes water-power. It manufactures flour, lumber, wagons, carriages, and some agricultural implements and wooden ware. It has a distillery and a large tannery. The Luray College for Young Ladies is located here. Pop. (1900) 1,147.

Luray Cave, in Page County, Va., is near the town of Luray, and on the Norfolk & Western railroad. This cave was discovered by Andrew J. Campbell and companions in August 1878. It is in the limestone belt of the Shenandoah Valley, on the western side of the Blue Ridge, and extends under the low spurs of some of the mountains. The area explored underlies about 100 acres. Electric lights have been put in, and they enable one to see the numerous stalactites, the tiers of galleries, nearly 300 feet in height, the various rooms or cavities, the colors from white to yellow, brown, and red,

LURCHER—LUTHER

and the marks which indicate the action of water for ages. Many of the columns are over 50 feet in height, and are hollow; when struck they give out bell-like notes. Many people visit this cave each year.

Lur'cher, an English breed of dog, a mongrel between a greyhound and a shepherd's dog, whose size is moderate and coat rough, wiry and usually reddish. It is the favorite dog of game-poachers, and has both keen eyesight and strong powers of scent, as well as great speed.

Lusatia, lū-sā'shī-a, or **Lausitz**, Germany, an extensive region, bordering on Bohemia to the south, Meissen to the west, Brandenburg to the north, and Silesia to the east. It was formerly divided into two independent margravates, Upper and Lower Lusatia. Lusatia was granted to the Elector of Saxony in 1635. In 1815 Lower Lusatia (1,740 square miles), with a large part of Upper Lusatia, was ceded to Prussia (in all 3,200 square miles, with 294,700 inhabitants), and was annexed to the governments of Frankfort and Liegnitz. The part of Upper Lusatia which remained to Saxony (953 square miles, with population (1900) 405,173) now forms the circle of Bautzen, comprising the eastern part of the kingdom. It is not very fertile, hardly supplying half of the consumption of its inhabitants. Flax is raised in all parts, but great quantities are imported for the use of the manufacturers. Linen, woolen, and cotton are the principal manufactures.

Lush, Charles Keeler, American journalist and novelist: b. La Crosse, Wis., 5 Dec. 1861. He learned the printers' trade, was reporter on Chicago *Evening Journal*, now *Record-Herald*, and Milwaukee correspondent of that paper, 1889-1901. He has published 'The Federal Judge' (1897); 'The Autocrats' (1901).

Lusiad, lū'sī-ād, a celebrated Portuguese epic poem, written by Camoens in 1571 on the establishment of the Portuguese empire in India.

Lusitania, lū-sī-tā'nī-a, Spain, the name of an ancient region which occupied about two thirds of the west coast of the peninsula and extended eastward to the Anas (Guadiana). The inhabitants were warlike and brave, lived upon plunder, and were rude and unpolished in their manners. The Romans had great difficulty in conquering them, being frequently defeated by Viriathus, chief of the Lusitanians, who was captured by treachery and put to death, about 140 B.C., Lusitania shortly afterward coming under Roman control.

Luska, Sidney. See HARLAND, HENRY.

Lus'san, Zélie de, American vocalist: b. New York 1863. Her parents were French, her mother an accomplished singer, and the girl was but nine when she made her first public appearance. After singing at Wagner festivals, she made her operatic debut in 1886, as a member of the Boston Ideal Opera Company, singing in the part of Arline in the 'Bohemian Girl.' She went to London in 1889 and joined the Carl Rosa opera troupe. Her reception in England was marked by great cordiality. In 1894 she made a successful appearance at the Metropolitan Opera House in New York; during the following years sang in Spain and Portugal, and in France. In 1897 and 1899 she again came to

the United States, and her concert tour here in 1902 will be remembered. She has appeared upward of 600 times as Carmen, and among her other favorite roles are Marguerite, in Berlioz's 'Damnation de Faust'; Mignon; Marie, in 'La Fille du Régiment'; Zerlina, in 'Don Giovanni'; and Musette, in 'La Bohème.'

Lustration, in ancient Rome, a ceremony of solemn purification or consecration of the Roman people, by means of an expiatory sacrifice, which was performed after every census. The sacrifice consisted of a bull, a sow, and a sheep or ram. The ram was dedicated to Jupiter, the swine to Ceres, and the bull to Mars. As this lustration took place at the end of every five years, *lustrum* came to signify a period of five years.

Lutangas, loo-tāng'ās, Philippines, a mixed race of Moros and Subanos, inhabiting the island of Olutanga and the neighboring coast of Mindanao. They are Mohammedans. See PHILIPPINE ISLANDS.

Lutayos, loo-tā'yōs, or **Lutãos**, Philippines, a Moro tribe living in the district of Zamboanga, island of Mindanao; their name appears to be a Hispanized form of the Malay word Orang-Laút. See PHILIPPINE ISLANDS.

Lute, a stringed musical instrument formerly much in use. It originally contained six strings, but the number was gradually increased till it reached 24. The lute consists of four parts, namely, the table, the body, constructed of nine convex ribs; the neck, which has as many frets or divisions; and the head or cross, in which the screws for tuning it are inserted. In playing this instrument the performer strikes the strings with the fingers of the right hand, and regulates the sounds with those of the left. The notes of the lute are generally written on six lines, and not on five. There were formerly various kinds in use.

Luther, Martin, German religious reformer: b. Eisleben, Saxony, 10 Nov. 1483; d. there 18 Feb. 1546. Hans Luther, his father, a miner in very humble circumstances, removed with his family to Mansfeld in 1484, and in the course of time was appointed to a seat in the council. Martin was educated in the deepest respect for religion, and under the severest discipline, his parents practising the most austere lives of virtue and piety. At 14 he was sent to the school at Magdeburg, whence he removed in 1499 to Eisenach. At first he obtained his support by singing songs at the door like many other poor scholars; but was soon taken under the care of a benevolent lady named Ursula Cotta. At school he made rapid progress in Latin and in other studies; in 1501 he entered the University of Erfurt, where his mental ability soon won him distinction among his fellows. In 1505 he received the degree of Master. He was originally destined by his father for the law, but circumstances at this time turned his attention to religious truth, and he began the study of divinity. Then to the surprise and regret of his father came the young man's "great renunciation" and his determination to enter the monastery of the Augustines at Erfurt in 1505. Luther regarded himself as an unprofitable servant, tortured himself with bitter reproaches, and was attacked by a severe fit of sickness, during which one of the elder brothers consoled him and

MARTIN LUTHER.

LUTHER

promised him the forgiveness of his sins through faith in Jesus Christ, a doctrine which Luther afterward declared brought a new light into his soul. He was also much encouraged by Staupitz, the provincial of the Order, who perceived his great talents and encouraged him to continue his theological studies. Staupitz himself had a singularly clear gospel conception of the cardinal doctrines of faith, repentance, the love and holiness of God, and it is no doubt true that Luther owed much of his "insight" into truth and the opportunity to give it expression to the kindly vicar-general. It is also well to remember in considering the life and work of Luther that some of his best and most cherished works—the Epistles to the Romans and the Galatians, his edition of Tauler's 'Theologia Germanica,' and the exposition of the Seven Penitential Psalms were conceived while he was a member of his Order.

In 1507 he was ordained priest, and in 1508, by the influence of Staupitz, Luther was called by Frederick of Saxony to the chair of philosophy at the newly founded University of Wittenberg. He lectured on the Aristotelian philosophy at the University as well as in the monastery, and at the same time began his activity as a preacher. In 1510 he made a journey to Rome on business of his Order. In 1512 he took the degree of doctor of theology. It was shortly after this, in 1514, that Leo X. issued a bull, granting an indulgence to all who should contribute to the rebuilding of St. Peter's church at Rome. Tetzel, a Dominican friar, was chosen by the cardinal archbishop of Mainz, who, jointly with the guardian of the Franciscan friars, was named commissary of the indulgence for Saxony and the north of Germany, to preach the indulgence through this district. It was the preaching of Tetzel which was the occasion of the beginning of the Reformation. Tetzel was preaching at Jüterbogk, a few miles from Wittenberg, when, on the eve of All Saints' day, 31 Oct. 1517, Luther affixed his 95 theses to the door of the Schlosskirche, challenging the Dominican friar. Though carefully guarded in their wording, Luther's propositions were clearly contrary, in some respects, to the current doctrine. The 6th thesis denied the power of the keys, and maintained that the pope can only declare a sin to be forgiven by God; the 36th, that through true contrition a Christian is freed from all guilt and punishment; the 66th spoke not of abuses, but said of indulgences in general that they were nets to catch money with; but the 71st declared anathema to him who would reject indulgences altogether. It is clear that Luther at this time had no conception of the Reformation as a movement in opposition to the Catholic Church, nor any idea of denying the supremacy of the chair of Saint Peter, but was worked into a fury by abuses which he thought the ecclesiastical authorities were not sufficiently active in regulating, and his zeal carried him to the breaking point with the ancient church. His propositions were condemned as heretical as soon as they appeared. Hoogstraaten, a Dominican of Cologne, Eck at Ingolstadt, and Prierias, an officer of the Roman court, immediately made replies to his theses; but neither argument, invective, the summons to Rome, which he did not obey, nor the mild counsels of Cardinal Cajetan at Augsburg in 1518, and of the nuncio Militz at Altenburg in 1519, were sufficient to

induce him to recant. His replies were made with great boldness and determination, and even after his dispute with Eck at Leipsic in 1519, he still maintained the invalidity of indulgences and of the supremacy of the pope. He appealed from the decision of Cardinal Cajetan to the pope, and from the pope to a general council.

In the year 1519 occurred the famous public disputation, at Leipsic, between Luther and Carlstadt on the one side and Eck on the other, upon the questions at issue. The result was barren. Both sides claimed the victory, and the contestants parted unchanged in their respective attitudes. The Leipsic disputation only precipitated a long and bitter controversy, and Luther remained as determined in his opposition as ever. Militz tried once more to make peace, and met Luther for a second time at Liebenwerda. But the conference was again without fruit. Luther's position had now grown more and more radical, though as yet there was no formal, complete, and definite rupture with Rome. The controversy by this time had spread throughout all Germany, and princes and people were arrayed in bitter factions over the issue. Early in 1520 Luther appealed to Charles V., who had succeeded the Emperor Maximilian. He also addressed letters to the bishops of Mainz and Merseburg to enlist them in his cause. The bishop of Mainz, in his reply, treated the questions at issue as of a trivial and frivolous character, and the bishop of Merseburg repudiates Luther's position and exhorts him to submit. Among his friends at this time were Willibad Pirckheimer and Albrecht Durer, though they did not follow him when the formal break with Rome came. Ulrich Von Hutten encouraged and urged him forward. Franz von Sickingen and Sylvester von Schaumberg declared their readiness to put a number of armed knights in the field for him, should it be necessary. Two notable books now appeared from his pen defining his attitude: 'To the Christian Nobility of the German Nation,' and the 'Babylonian Captivity.' In the former he proclaims the universal priesthood and declares against any especially instituted priestly order. He also contests the right of the pope to interpret the Bible, which he declares to be free to everybody. He likewise inveighs against the pope's exclusive right to summon a general council. In the 'Babylonian Captivity' he altogether repudiates the doctrine of indulgences, holds that the papacy is nothing but Babylon, and reduces the sacraments to three only: "Baptism, Penance, and Bread." The latter work was in preparation when the bull of excommunication against Luther arrived in Germany.

The attitude of Luther was more and more one of outspoken opposition to the pope and to the doctrines of the Church itself, and so far had his opposition now advanced that the Roman authorities decided to proceed to extreme measures to crush it. In October 1520, therefore, the memorable bull excommunicating Luther and his friends was published at Leipsic. His writings were burned at Rome, Cologne, and Louvain. The answer to the papal bull was characteristic of Luther. At Wittenberg 10 Dec. 1520 he burned the bull of excommunication and the decretals of the papal canon. By this act he dissolved all connection with the pope and the Roman Catholic Church. Frederick, the elector of Saxony, doubted whether he should protect

LUTHER

him. But the German noblemen, Hutten, Sickingen, Schaumburg, whom he called upon to defend the new opinions, hailed him as the champion of religious liberty, and offered him the protection of their fortresses and their arms. On 28 January Charles V. opened the Diet of Worms, and commanded Frederick to bring Luther with him to appear before that body to answer for his conduct. Frederick demurred, on the plea of his fear for the safety of his protégé. When, however, Luther's opinion was asked, he declared that he was ready to appear, and that not even illness would hold him back. In the meantime Charles had revoked his command in order to allow the 60 days to pass granted by the bull of excommunication. An other papal bull was issued, however, after the burning of the first, in which Luther was definitely declared a heretic, and an interdict put upon all places harboring him. Summoned a second time before the Diet, he expressed his willingness, if he were granted a safe conduct, which was accorded him by the emperor. He was met by about 2,000 persons on foot and on horseback at the distance of a league from Worms. When the palatine sent a messenger to warn him of his danger he answered "If there were as many devils in Worms as there are tiles upon the roofs of its houses I would go on." Before the emperor, the Archduke Ferdinand, 6 electors, 24 dukes, 7 margraves, 30 bishops and prelates, and many princes, counts, lords and ambassadors Luther appeared, 17 April, in the imperial diet, acknowledged all his writings, and on the following day made his defense before the assembly. He concluded his speech of two hours with the words: "Let me then be refuted and convinced by the testimony of the Scriptures or by the clearest arguments, otherwise I cannot and will not recant, for it is neither safe nor expedient to act against conscience. Here I take my stand; I can do no otherwise, so help me God! Amen." Frederick the Wise conveyed him privately to the Wartburg to save his life. Luther took advantage of this retirement to translate the New Testament into German. But this seclusion continued only 10 months. When informed of the disturbances excited by Carlstadt on the subject of images he could no longer endure restraint, notwithstanding the new outlawry which the emperor had issued against him at Nuremberg; and at the risk of provoking the displeasure of the elector he hastened to Wittenberg, through the territory of George, duke of Saxony, who was one of his most bitter enemies. The sermons which he delivered for eight successive days after his return (in March 1522) to quell the violence of the enraged insurgents in Wittenberg are patterns of vigorous and popular eloquence.

Amidst these disputes and attacks his plans for a total reformation of the Church were matured. In 1523 at Wittenberg he began to revise the liturgy, and in 1524 laid aside his cowl. In 1525 Luther married Katharina von Bora, who some years previously had left the cloister and joined the reformed religion. He prepared, from 1526 to 1529, a new church service, corresponding to his ideas of the doctrines of the gospel, under the patronage of the elector and with the aid of Melancthon (q.v.) and other members of the Saxony Church. His larger and smaller catechisms, to be used in schools, were also of great service. An un-

successful effort was made in 1529, at Marburg, in a conference between Luther and Zwingli, the Swiss reformer, to bring the German and Swiss movements into harmony. But Luther's peremptory refusal to accept Zwingli's views upon the question of the Lord's Supper precluded any possibility of agreement. The Reformation (q.v.) spread rapidly, and the Augsburg Confession, the earliest symbol of Lutheran Protestantism, was drafted by Melancthon from articles prepared by Luther. During all these years he waged a ceaseless polemic against Rome, and made strenuous efforts to establish harmony among German Protestants. The intolerance which he manifested toward the Swiss reformers, because their views differed from his own in regard to the Lord's Supper, show that he was not yet ready to grant that liberty to others which he demanded for himself. He was in this matter the chief cause of the separation which took place between the Calvinists and the Lutherans. The rapidity with which the Reformation advanced after the Confession of Augsburg in 1530 rendered the papal bulls and the imperial edicts against Luther ineffectual. In 1537 Luther wrote the Schmalkaldic articles; he gave no heed to the ambassadors of Brandenburg and Anhalt, who were sent in 1541 by the Diet of Ratisbon to make him more submissive to the Church, and in 1545 he refused to participate in the Council of Trent.

The occasional asperity which he showed in the defense of his faith, however, by no means diminished the merit of his constancy; and an apology may easily be found for the frequent rudeness of his expressions in the prevailing mode of thinking and speaking; in the nature of his undertaking which required continual conflict; in the provocations by which he was perpetually assailed; in his frequent sickness; and in his excitable imagination, evident from the days of his novitiate. The same excitability of temperament will serve to explain those dreadful temptations of the devil which disquieted him. That age regarded the devil with horror as a personage ever active; and those devoted to the cause of God felt themselves constantly obliged to resist attacks of the evil one. Luther himself says "I was born to fight with devils and factions. This is the reason that my books are so boisterous and stormy. It is my business to remove obstructions, to cut down thorns, to fill up quagmires, and to open and make straight the paths; but if I must necessarily have some failing let me rather speak the truth with too great severity than once act the hypocrite and conceal the truth." No one can behold without astonishment his unwearied activity and zeal. The work of translating the Bible, which might well occupy a whole life, he completed, with some assistance from Melancthon and other friends, between 1521 and 1534. This translation takes the same place in Germany as the King James version does in England and the United States with regard to the religious life and literature of the people. Luther equaled the most prolific authors in the number of his treatises on the most important doctrines of his creed. After the year 1512 he preached several times every week, and at certain periods every day; he officiated at the confessional and at the altar, he carried on an extensive correspondence in Latin and German on various subjects with men of rank and of distinguished lit-

LUTHER LEAGUE — LUTHERAN CHURCH IN AMERICA

erary attainments and with his private friends. He gave advice and assistance wherever it was needed and interested himself on behalf of every indigent person who applied to him. In company he was lively, and abounded in sallies of wit and humor preserved in his 'Tischreden' ('Table-Talk'). Luther was no stranger to the elegant arts. His excellent hymns such as 'Ein feste Burg,' 'Aus tiefer Noth,' are well known. His fondness for music, too, was such that he would often relax his mind with composition, with singing, and playing on the flute and lute. Just before his last journey to Eisleben, where he was summoned by the Count of Mansfeld to settle a dispute, he wrote, in a letter to a friend, the following description of his condition: "Aged, worn out, weary, spiritless, and now blind of one eye, I long for a little rest and quietness; yet I have as much to do in writing and preaching and acting as if I had never written or preached or acted. I am weary of the world, and the world is weary of me: the parting will be easy, like that of a guest leaving the inn; I pray only that God will be gracious to me in my last hour, and I shall quit the world without reluctance." His wife died in 1552. Luther's works are partly in German, partly in Latin. Of earlier editions the most complete is that by Walch (1740-53); and of later, the Erlangen-Frankfort editions (German writings 1826-57; Latin writings 1829-86), and that published at Weimar (1883 et seq.). There are separate collections of his letters and his table-talk. Of accounts of his life may be mentioned those by Meurer (3d edition, 1870); Köstlin (4th edition, 1889), English translation (1883); and Peter Bayne (1887). Consult also Beard, 'Martin Luther and His Reformation in Germany'; Tulloch, 'Leaders of the Reformation'; and Lindsay, 'Luther and the German Reformation' (1900). For Roman Catholic view of Luther consult: M. Evers, 'M. Luther, Lebens- und Charakterbild' (1883-91); Verres, 'Luther' (1884); Janssen, 'History of the German People' (1900).

Luther League, The, a society organized in 1895 at Pittsburg, Pa., having for its basis the unaltered Augsburg Confession and receiving into membership any one connected with a Lutheran congregation or a Lutheran institution of learning. Conventions are held biennially. The society publishes a monthly journal 'The Luther League Review.' The organization had a membership of 50,000 in 1901.

Lutheran Church in America. The first Dutch settlers in New Amsterdam, Manhattan Island, in 1623, brought with them the Lutheran creed and church polity, and in 1664 the first Lutheran pastor took up his residence among them. A colony of Lutherans from Sweden and another from Germany were formed in the following centuries; the Swedes settling on the Delaware (1637-42); the Germans being organized and led by Heinrich Melchior Mühlentberg in 1742. The church grew rapidly under capable ministers, and synods were formed in Pennsylvania (1748); New York (1786); North Carolina (1803); and Ohio (1818).

Vol. 10—5

The General Synod, which was intended to constitute a Pan-Lutheran Alliance in the United States, was founded in 1820, and its organization was of great benefit in centralizing and strengthening the activities, both domestic and missionary, of the church. In 1860 it comprised 26 synods, but one of the unfortunate results of the Civil War was to cut off from the northern synods all those south of the Potomac, who formed themselves into what is known as the United Synod of the South. In 1866 the General Synod became divided over the questions of conservatism and liberalism, one party desiring to draw closer the distinctive lines of Lutheran doctrine and polity, the other preferring to Lutheran exclusiveness an inter-communion and a fraternal understanding with other denominations. The conservatives withdrew from the General Synod in 1867. Uniting themselves with the extensive Lutheran Synods formed by immigrants from Germany, Norway, Sweden, and Denmark, they formed the General Council which took as the basis of its creed the Augsburg Confession, The Apology, the two Catechisms of Luther, the Schmalkald Articles, and the Form of Concord.

The Lutheran Church in the United States has grown with great rapidity in the North and Middle West. Its largest body is the Synodical Conference which embraces the flourishing Missouri Synod, whose nucleus was formed by those earnest religious exiles who in 1839 left Saxony for the United States and settled in Missouri. The Rev. C. F. W. Walther was appointed their pastor in 1841; a synod was organized in 1847, and in 1872 the Joint Synod of Ohio, with other smaller synods, combined with the Missouri Synod to form the Synodical Conference. In 1881 a controversy arose in the Conference on the subject of predestination, which the general body of the Conference had adopted into their creed; the Joint Synod of Ohio dissenting from these views separated from the Conference and the ten districts which it comprehends set up an independent organization. The Synod of Iowa is another independent Lutheran Church which differs with the Missouri Conference on the question of the ministry, holding that all ministerial power and office reside in the whole church and not in the spiritual priesthood. The United Norwegian Lutheran Church was formed in 1889 out of a number of Norwegian Lutheran bodies, and now stands for one fourth of the Scandinavian population of the United States.

Besides the independent Lutheran churches above enumerated there are three distinct Norwegian and five German Lutheran churches, two Danish synods, one Finnish and one Icelandic synod. While the General Synod is mostly composed of Anglo-Saxon and English-speaking elements, and the United Synod of the South entirely so, the English congregations of the General Council Synodical Conference are in a small minority. Lutherans in the United States are not strictly speaking congregational in polity. Each congregation is generally made by them to be the unit of administrative power both in the representative bodies and in the court of appeal, and from them the synods gain all their authority. But the Missouri Conference and the Joint Synod

LUTHERAN CHURCH IN AMERICA

of Ohio are composed of congregations perfectly independent and self-governing. The synod has no power legislative or judicial over a congregation, but is merely an advisory body whose decisions must be ratified by the congregation before they can be accepted as decrees of the Church. On the other hand the General Synod, the General Council, and the United Synod of the South have more power of independent action than is the case in the Synodical Conference formed by the Missouri Synod with other synods. The congregations delegate their authority to the General Synod, the General Council, and the United Synod of the South. The clergy and lay delegates in these synods have full authority over ministers, and the general bodies which comprise a number of such synods settle the requirements made of ministers before ordination, and all such details of worship as liturgies, hymn books, and manuals of religious instruction. While the Lutheran Church in the United States has its form of public worship, 'The Common Service,' which was first published in 1883 in its present shape, this book was only adopted by the General Synod, the General Council, and the United Synod of the South with the proviso that a simpler form of service containing only the principal parts of that prescribed in 'The Common Service' might be used by congregations as occasion required.

One of the principal characteristics of the Lutheran Church has been its earnestness in providing for the high education and religious training of its ministry. The Lutheran theological seminaries are generally well equipped and their professors bound by the confessions of their several synods. The oldest of them all is the Seminary of the General Synod founded in 1826 at Gettysburg, Pa. The degree of B.A. is required in candidates for matriculation, and the teaching staff comprises five professors, exclusive of lecturers. The Seminary of the Joint Synod of Ohio was opened in connection with the Capital University, Columbus, Ohio, in 1830, its students have all completed a college course before entering, and with regard to teaching it is one of the most conservative institutions in the Lutheran body. The Theological Seminary of the United Synod of the South was originally established by the Synod of South Carolina at Lexington, S. C. It is at present permanently settled at Mount Pleasant, near Charleston, S. C., with a staff of four professors.

The remaining more important Lutheran Theological Schools are Wittenberg Seminary, founded at Springfield, Ohio, in 1842, under the auspices of the Evangelical Lutheran Church; Concordia Seminary, Saint Louis, Mo., established originally at Altenberg in the same State 1839, and presided over for some 30 years by the Rev. Carl F. W. Walther. It has six professors and more students than any other Lutheran seminary in the United States. The Practical Seminary of the Missouri Synod was originally a department of the Saint Louis Seminary, but in 1875 an independent faculty of five professors was gathered together and buildings provided at Springfield, Ill., where it boasts an attendance of above 100 students. The Seminary jointly controlled by the Synods of New York and Pennsylvania was established at Mount Airy, Philadelphia, in 1864. The Augus-

tana Theological Seminary is a Swedish institution and was organized at Chicago in 1860. It was amalgamated with Augustana College, Rock Island, Ill., in 1875, and has three theological professors; it is bilingual and the ministers educated there can generally preach both in Swedish and English. The Chicago Seminary was founded in 1861, chiefly through the energetic efforts and munificence of the Rev. W. A. Passavant. The Norwegian Augsburg Seminary was opened at Marshall, Wis., in 1869 and removed to Minneapolis, Minn., in 1872; while the United Norwegian Lutheran Church has its divinity school, the United Church Seminary, in the same city where it was founded with three professors in 1890. The German Synod of Ohio has likewise a seminary of its own, which after moving its quarters several times finally settled at Dubuque. It has a teaching staff of four professors, one of whom lectures in English. The following are the statistics of Lutheranism in the United States for the year 1903. Total number of ministers, 7,116; congregations, 11,874; communicants, 1,868,502.

In the early days of American Lutheranism isolation and other causes produced a great diversity in the forms and orders of worship in the scattered Lutheran congregations. This was much deprecated by many leading Lutheran divines. It was felt to act as an element of disunion, sometimes of disorder, and in 1881-3 it was decided to compile and secure the authorization of a Common Order of Service "on the basis of the common consent of the pure Lutheran liturgies of the 16th century."

The Service in the Common Service begins with the Confession of Sins, followed by the Declaration of Grace, thus corresponding with the Confession and Absolution with which morning and evening prayer begins in the Anglican Book of Common Prayer. Then comes an Introit with the Gloria Patri, or ascription of glory to the three Persons of the Trinity. Next is the "lesser litany" or Kyrie, followed by the "Gloria in Excelsis," the great liturgic hymns of both Eastern and Western Christianity. Then comes the Salutation and Response. The Collect for the day ushers in the reading of the Epistle, a selection from the writings of the Apostles, and the Gospel—a passage from one of the Evangelists. Very fittingly the Creed, known as the Apostles' Creed, follows the Gospel, after which the principal Hymn of the service is sung. The Lutheran Church is remarkably rich in hymns, and the old airs of the German musicians are often reproduced, while in English-speaking Lutheran Churches the great German hymns of Luther, Rinkart and others are sung in an English version. To the singing of a hymn succeeds the Sermon. The alms of the people are then collected, and after the Offertory the General Prayer is said, the Holy Communion follows. Besides the above described office the Common Service has offices for Matins and Vespers.

LUTHERANISM

Lutheranism. The first of the 95 theses which Dr. Martin Luther affixed to the door of the castle-church of Wittenberg on 31 Oct. 1517, read as follows: "Our Lord and Master, Jesus Christ, saying, Repent ye, would have the whole life of believers to be repentance." This academic act has been generally looked upon as the inaugural act of the Lutheran Reformation, so much so, that 31 October is to this day celebrated by Lutherans in all lands as the Festival of the Reformation. And the thesis quoted above is perhaps the most concise exhibition of Lutheranism extant. The thesis is, as a whole and in all its parts, a positive doctrinal statement. Doctrine, positive doctrine, is, and was from the beginning, of first importance, the groundwork—the very life—of Lutheranism. The first and foremost task of the Lutheran Church is the promulgation and maintenance of sound doctrine. Preaching, in the Lutheran Church, is not primarily exhortation but teaching, and doctrinal preaching is considered the chief element of Lutheran public worship. Even the better part of Lutheran hymnology is preponderatingly doctrinal. The great bulk of Luther's voluminous writings is doctrinal, and no other church has so extensive a doctrinal literature as the Lutheran Church. Even its controversial theology partakes of this character. It is true, the Lutheran Church in all its best periods was eminently an *ecclesia militans*; but the subjects at issue were again doctrinal. Perhaps the most masterful polemical work in Lutheran, if not in all Protestant theology, Chemnitz' 'Examen Concilii Tridentini,' is also one of the richest storehouses of doctrinal theology.

But doctrine is knowledge communicated. Teaching presupposes or implies a master and a disciple or number of disciples. And of the master Luther says in his thesis: "Our Lord and Master Jesus Christ." No councils nor synods, no traditions of the Church, no Fathers, early or late, not Luther himself, not any of these, nor all of these together, must be acknowledged as empowered to establish articles of doctrine which every disciple is bound to accept. Bound to accept. For the *Master* is also the *LORD*. He comes with authority; his teaching is not human but divine. Christian doctrine is not a product of evolution, nor of human speculation, nor of self-consciousness of the church, but the truth of God set forth by the Fountain of divine truth, who has said, "I am the Truth." He is the one and only authoritative teacher in the church. There is no such thing as an evolution or perfectibility of Christian doctrine. Here the ancient *αὐτὸς ὁ λόγος*, "He hath said it," is in its place. Here man has no alternative but either to accept or to reject. Here to add or to modify is to adulterate, and to take away or to yield is to deny. Such is the Lutheran concept of the primary source of Christian doctrine.

But the means also whereby such communication of divine knowledge to man is effected is indicated in Luther's thesis when he says: "Our Lord and Master Jesus Christ, saying, Repent ye." Here he refers to an express dictum of Holy Scripture. Christ and the Spirit of Christ taught man in the 16th century and teaches man in the 20th century in and through the written Word. Not by awaiting direct

revelations, not by following the traditions of the Church or the definitions or decrees of its representatives, are we disciples of Christ, but by searching the Scriptures which were written aforetime for our learning. What is clearly taught in Scripture, that and that only is Christian doctrine. That the Bible is the only and sufficient source of Christian doctrine is the formal principle of Lutheranism.

The material principle of Lutheranism, the cardinal doctrine, around which all other doctrines radiate, because it is the central doctrine of Scripture, is also indicated in the thesis. Luther there describes the subjects and disciples of their Lord and Master Christ as believers. According to the Lutheran concept of Christianity and the Christian church it is faith that constitutes a Christian and a member of the church of Christ, which is simply the whole number of all believers. Christianity, as distinguished from all other religions, is that religion according to which salvation is not by works of righteousness which we have done, but by what God has done in Christ, reconciling the world unto himself. And faith is simply the acceptance of this reconciliation. Not as a work of obedience, with any merit of its own, but only as the acceptance of the merits of Christ, faith is saving faith. It is justifying faith inasmuch as, in view and consideration of the merits of Christ accepted by faith, God in his judgment pronounces the believer righteous. And this doctrine, that God justifies the sinner by His grace, for Christ's sake, through faith, is the material principle of Lutheranism, the cardinal doctrine of Lutheran theology. This doctrine is looked upon by the Lutheran Church as *doctrina stantis et cadentis ecclesiae*, the doctrine with which the Church stands and falls.

On the other hand, the doctrine of justification, while the central and ruling doctrine, is not the only doctrine of Lutheranism. According to our thesis, Christ would have the whole life of believers to be repentance. This, too, is a doctrinal statement. Repentance, *μετάνοια*, is a change of heart and mind in *man*. In his natural fallen state man is wholly evil, spiritually dead in sin, unable to will or to do that which is spiritually good. He cannot, therefore, work his own restoration, nor contribute thereto. But God, prompted by His universal grace, and because of the merits of Christ, the redeemer of all mankind, through the gospel, the ever efficacious and never irresistible means of grace, quickens the sinner into spiritual life, translating him, by the bestowal of faith, from a state of wrath and enmity against God into a state of grace and communion with God. This is the Lutheran doctrine of conversion or regeneration in the stricter sense of the terms. In a wider sense, in which repentance also stands in our thesis, it includes the preservation and growth of spiritual life and its activity in works of the spirit, or sanctification. For while the Lutheran Church maintains that man's salvation is in no sense, manner or measure, his own work, but wholly and solely the work of God, and hence denies the necessity of good works unto salvation, it strenuously asserts that good works are necessary fruits and evidence of faith.

There have been Syncretists, within the pale of the Lutheran Church, who held that the real obstacles to mutual recognition between the

LUTHERANISM

Lutheran Church and others were only two—the doctrines of predestination and of the Lord's supper. But by these assertions Syncretism exhibits itself as thoroughly un-Lutheran in letter and spirit. These differences are indeed, while they stand, insurmountable barriers between the conflicting theologies. But the chasm which separates them is far deeper and wider, a difference of the very fundamental principles which affects a multitude of particular doctrines. The formal principle of Lutheranism is, as we have seen, that of the exclusive authority and absolute sufficiency of the canonical Scriptures in matters of faith. The material principle of Lutheranism is the scriptural doctrine of justification. Lutheranism holds that Christ, the only head and foundation of the church, vested all the rights and powers of the church, the keys of heaven, the power of remitting and retaining sins in his name as his agent, the government and discipline of the church, in the local congregation of believers. Lutheranism maintains that Christ, the only mediator between God and man, has instituted an office in the church, the ministry of the word, for the public administration of the means of grace, that this office is conferred on its incumbent, by Christ's authority through the call of the congregation, and has no power but the power of the word as set forth in the Scriptures, all ministers being equal in rank among themselves. Lutheranism looks upon the Lord's Supper as a means of grace, whereby Christ, by virtue of his words of institution pronounced in the night in which he was betrayed, gives to all communicants his body and blood, really present not by transubstantiation, nor by consubstantiation or the formation of a new substance, but by sacramental union, to be eaten and drunk in, with, and under the consecrated bread and wine, for an assurance of the forgiveness of our sins, procured by his sacrifice on Calvary.

Lutheranism also holds and teaches a doctrine of predestination, not, however, a decree of damnation, but only an election and predestination of the children of God to eternal salvation by faith in Christ Jesus, who is the redeemer not only of the elect, but of all mankind, and by whom the decree of election is determined as by its meritorious cause, and not as an accessory means of execution. Thus, likewise, the gospel and the sacraments, according to the Lutheran concept, are the ordained means, whereby the same universal grace, according to which God earnestly desires the salvation of all men, and, by the power of his Spirit in all cases efficaciously, but in no case irresistibly, exerted through such means of grace, calls, converts or regenerates, sanctifies and preserves to eternal life all those who do not wilfully and obstinately resist the saving grace of God.

Having thus briefly portrayed the nature and principles of Lutheranism, we proceed to a summary sketch of its rise and progress and its spread in the era of the Reformation.

The cradle of Lutheranism was Saxony in Germany. Here, at Wittenberg, the great Reformer taught and preached and wrote under the protection of the Elector Frederick the Wise, and hand in hand with his successors John and John Frederick. The effects of his 95 theses far exceeded the expectations of their author. When Luther published this manifesto, he had no thought of the establishment of a new church.

The very name of Lutherans was not adopted by the free choice of those who bore it, but was solemnly inflicted upon them in a Bull published by Pope Leo X. 3 Jan. 1521. By this Bull Luther and his adherents were excommunicated from the Roman Catholic Church, and when Luther had refused to recant at the Diet at Worms, he and the Lutherans were also politically outlawed by an imperial edict, which exposed them to persecution and the death of confirmed heretics. The execution of this edict was suspended in Germany because of the great headway which the Lutheran movement had by this time made, and for various political reasons, which bound the emperor's hands, and at the Diet at Spire, in 1526, the German princes and representatives formally agreed that everyone should so conduct himself toward the edict of Worms as he would deem himself able to answer before God and His Imperial Majesty.

Luther, who had for a time been concealed by the elector in Wartburg castle, had made good use of his enforced rest by translating the New Testament into German and issuing the first installments of his Church Postil, a collection of sermons, from which hundreds of ministers learned how to preach to the people. After his return and during the subsequent years the Lutheran Church in Saxony was organized along conservative lines. Luther provided the congregations with forms of worship and collections of hymns for public service, catechisms for the instruction of young and old and an extensive religious literature. A system of schools of various grades was established throughout the land and an able ministry was educated at the University. The translation of the whole Bible was completed in the course of years. At a second Diet at Spire, in 1529, a majority made an effort to stay the progress of Lutheranism in Germany, and in spite of the protest of the Lutheran members, from which they were called Protestants, these efforts were continued at the Diet at Augsburg, in 1530. Here, however, the Lutheran princes and cities succeeded in presenting to the emperor and Diet and thus publishing to the world, a statement of their faith and doctrine, the Augsburg Confession, which, in the course of time, was adopted as its fundamental creed by the Lutheran Church the world over. (See DIET.) In the same year an apology of the Augsburg Confession was framed and published, which also gained symbolical standing. Although the transactions of the Diet of Augsburg resulted in another proscription of Lutheranism and the inauguration of measures for its extermination, the political conditions of the Empire continued to be such that the emperor and his party could not venture to proceed against the dissenters, and while Luther lived the progress and spread of Lutheranism continued, not only in Germany, but throughout Europe. Even when, after Luther's death, Charles V. marched his armies against his Lutheran subjects and by fraud and force led away into captivity the two foremost of the German Lutheran princes and began the work of stamping out Lutheranism, these reverses, though causing considerable disturbance also within the Lutheran Church, lasted a few years only. The political conditions having once more turned in favor of the suppressed party, the Lutherans, in 1552, by the Treaty of Passau, secured tempo-

LUTHERANISM

rary recognition as a church of lawful standing in Germany. This recognition was made permanent by the Peace of Augsburg, in 1555. This settlement included the Lutherans only of all those who dissented from the Roman Catholic Church, Zwinglians, Calvinists, Anabaptists, and others, being excluded. It was thus menacing the religious as well as the political status of Lutheranism, when men of influence in Saxony, the Cryptocalvinists, by clandestine operations endeavored to change the Lutheran Church of Saxony into a Calvinistic establishment. At the same time a number of doctrinal controversies threatened to vitiate the orthodox character of the church of the Augsburg Confession, until, by the united labors of Lutheran theologians and princes, sound in doctrine and deeply concerned about the peace of the church and the purity of its doctrine, the last of the great Lutheran Confessions, the Formula of Concord, closed the series of Lutheran standards, all of which, the Augsburg Confession, its Apology, the Smalcald Articles, Luther's Large Catechism, Luther's Small Catechism, the Formula of Concord, together with the three ancient Ecumenical Creeds of all Christendom, constitute the body of Lutheran Symbols, known as the Book of Concord of 1580.

While Germany was the home of the Lutheran Church, Lutheranism obtained a permanent foothold and became the church of the realm in a number of extra-German countries during the period of the Reformation.

In Sweden Luther's doctrine was disseminated as early as 1519 by two brothers, Lars and Olav Petersen, who had studied at Wittenberg. Under Gustavus Vasa, Lars Petersen was made professor of theology at the University of Upsala, and Olav Petersen was the leading preacher at Stockholm. The Bible was translated into Swedish and at the Diets of Westeras, 1527, at Orebro, 1529, and at Westeras, 1544, the organization of the Swedish Lutheran Church as a national church with an episcopal form of government was effected.

The first Lutheran preachers in Denmark were Peter Lille and Hans Tausen. The organizer of the Danish Lutheran Church was John Bugenhagen, pastor of Wittenberg, who came to Denmark in 1537 and prepared the new Constitution, which was adopted at Odense in 1539. Soon after Norway and Iceland were also Lutheranized, and thus the Lutheran Church was permanently established without bloodshed throughout all the Scandinavian countries.

In Prussia the Lutheran Church was planted and made the church of this ancient territory of the German knights under John George of Polenz, bishop of Samland. The new Agenda and Church-Order was introduced in 1525 and 1526, and the new Lutheran University of Königsberg was a colony of Wittenberg, of which Sabinus, Melanchthon's son-in-law, was the first rector.

In Silesia Luther's doctrine was preached as early as 1518. John Hess was called as a Lutheran minister by the city council of Breslau.

In Poland Luther's writings were prohibited. But in 1521 the Bible was translated into Polish. Jacob Knade preached at Danzig. From Danzig Lutheranism spread to Elbing and Thorn.

and by 1548 the Polish Church was preponderantly Lutheran.

In the Baltic territories, Riga, Dorpat, and Reval were Lutheran in 1523, and within two decades the Reformation spread throughout these whole regions.

In Hungary the doctrines of the Reformation were promulgated by men who had been Luther's students at Wittenberg. In 1549 five free cities adopted the Augsburg Confession, and under the influence of the Reformation numerous elementary and advanced schools were opened in cities and villages throughout all Hungary. Merchants who returned home from the fair at Leipsic brought Luther's doctrine to Transylvania, and others, who had been students at Wittenberg, promoted its spread. A Lutheran school was opened at Hermannstadt. From 1533 John Honter labored as "Evangelist of the Lord at Kronstadt," and the Reformation took its course from town to town. In cities and villages and in the open country schools were established, and even in the village schools Latin and Greek were taught. With the schools libraries for the people were connected, and endowments were provided for the support of young men who were willing to study at German universities.

In Bohemia and Moravia a large part of the population embraced the Lutheran faith during Luther's lifetime, and when, after the Reformer's death, the emperor made war against the Lutherans in Germany, the Bohemian Lutherans refused to take up arms against their brethren in the faith.

In the Netherlands, also, the church of the Reformation gained headway, principally through the reading of Luther's works. In Antwerp a great Lutheran movement took place, brought on by the preaching of Flacius and Cyriacus Spangenberg, in 1565 and 1566. But it was not long before Lutheran services were prohibited. The Dutch Reformed Church was organized in 1568 and 1571 and proclaimed the church of the realm in 1583. With the Spaniards in possession of Antwerp, in 1585, the Lutherans scattered and founded congregations in Frankfurt, Hamburg, Amsterdam, Leyden, and other cities. Even there they had no rest. In Amsterdam they were antagonized and Lutheran services were again prohibited. Still, the Lutheran congregations continued to enjoy a rapid and steady growth; so much so that a scarcity of ministers began to make itself painfully felt. The Lutherans in Holland had made the great mistake of neglecting the establishing of schools and colleges for the education of ministers, and this eventually brought about their decadence; for the importation of preachers from foreign countries was accompanied by the introduction of unionistic, syncretistic doctrines and practices.

France is another country in which Luther's writings were widely circulated and had great influence in the church. A Lutheran congregation was organized at Maux. Faber Stapulensis, Bricconier, Jean and Pierre Leclerc were some of the most noted preachers. Lefèvre translated the Bible into French. A sound Lutheran movement promised a bright future for Lutheranism, but the influence of Geneva, the stronghold of the Reformed Church, was very strong in France, and through this influence

LUTHER'S HYMN—LUXEMBURG

the Lutheran movement in France was directed into other channels.

In England Luther's books were read as early as 1519, especially at the universities, where they were of vast influence. Great efforts were made to suppress these books, and they were proscribed very early, but this only had the effect that they were now read more than ever. Thomas Cranmer embraced the Lutheran faith, and, though in many ways inconsistent, he remained a Lutheran in doctrine until the year 1548. A collection of Lutheran hymns was published, being translations of German hymns, most of them Luther's. In 1536 the Augsburg Confession was printed in an exquisite translation by Taverner. In 'Sarcerius' 'Common-places,' a Lutheran handbook of Dogmatic Theology was given the English people. Cranmer, in the same year, at the close of which he abandoned Lutheranism, wrote an extensive explanation of Luther's Small Catechism, in which the first English translation of Luther's Small Catechism by Cranmer's hand was embodied. The death of Henry VIII., whose political ambition had been to make himself the head of the Lutheran League of the continent, the personal acquaintance of many English and Scotch refugees with Calvin at Geneva and the imposing work there being reared, and other reasons contributed to the ascendancy of Calvinism in England and Scotland, and the Lutheran movement became virtually extinct about the middle of the century.

For Lutheranism in America see LUTHERAN CHURCH IN AMERICA, THE.

AUGUST LAWRENCE GRAEBNER,
Professor of Theology, Concordia Seminary, St. Louis, Mo.

Luther's Hymn, a name given to a celebrated German hymn composed by Luther about 1521. It was entitled 'Ein' feste Burg ist unser Gott.'

Lützen, lüt'sën, Germany, small town of Prussian Saxony, nine miles southwest of Leipzig. It derives all its interest from the two battles fought in its neighborhood. The first belongs to the Thirty Years' war, being fought on 16 Nov. 1632, between the Swedes under Gustavus Adolphus, and the imperialists under Wallenstein. The Swedish monarch, having joined his forces with those of Bernard, Duke of Saxe-Weimar, attacked the enemy in a strongly intrenched position. The issue was long doubtful, but the Swedes finally triumphed, though Gustavus fell in the action. The place of his death is marked by a square block of granite, called the Schwedenstein (the Swedes' stone). The second battle was fought 2 May 1813, somewhat farther south, at Gross-Görschen. It was the first important conflict between the allied Russian and Prussian armies and the French under Napoleon in that decisive campaign. The French numbered 115,000, while the allies had only 70,000. Napoleon maintained his position, though at a loss of 12,000 men, against 10,000 of the allies killed and wounded. The allies retreated in good order. Pop. about 5,000.

Lützow, lüt'sō, F., COUNT, Austrian author. He has been chamberlain of the Emperor of Austria from 1881. He has published 'History of Bohemian Literature' (1899); 'Prague,' in 'Medieval Towns' series (1901); etc.

Lützow, Karl von, German historian of art: b. Göttingen 25 Dec. 1832; d. 1897. He assisted Lübke (q.v.) in editing 'Denkmäler der Kunst' and in 1867 became professor of the Polytechnicum, Munich. He published 'Munich Antiques' (7 vols., 1861-9); 'Masterpieces of Ecclesiastical Architecture' (1862); 'Monuments of Art,' with Lübke (6th ed. 1892); 'History of German Copperplate and Wood Engraving' (1891). He was the founder, in 1866, of the 'Zeitschrift für bildende Kunst' and edited it till his death.

Luverne, lü-vèrn', Minn., village, county-seat of Rock County; on the Rock River, and on the Chicago, St. P., M. & O. and the Chicago, R. I. & P. R.R.'s; about 200 miles southwest of Saint Paul, and 30 miles northeast of Sioux Falls, S. Dak. Luverne is situated in an agricultural region in which are granite quarries and fire-clay deposits. The chief industrial establishments are flour-mills, grain elevators, brick and lumber yards, and creameries. Large nurseries are in the vicinity. The trade is principally in flour, granite, grain, live-stock, nursery products and dairy products. Pop. (1890) 1,466; (1900) 2,223.

Luxembourg, François Henri de Montmorency-Bouteville, fran-swä ön-rè de môn-mō rôn sē boo-tè-vèl lük-sôn-boor, DUKE OF, marshal of France: b. Paris 8 Jan. 1628; d. Versailles, 4 Jan. 1695. He served when young under the Prince of Condé; in 1662 was made a duke and peer of France, and in 1667 lieutenant-general. In 1672 he commanded during the invasion of Holland; and having gained the battle of Senef in 1674, was created a marshal of France. In the war of France against England, Holland, Spain, and Germany he won the three great battles of Fleurus (1690), Steenkerken (1692), and Neerwinden (1693).

Luxembourg (lük'sēm-bèrg, Fr. lük-sôn-boor) **Palace**, a structure famous for its architecture, art gallery and gardens; situated in Paris, in the Rue de Vaugrard. It was begun in 1616 and completed in 1620; was altered in 1790, and was much enlarged in 1836. At this latter date a magnificent semicircular hall was built for the session of the House of Peers, and later for the Senate. The Senate hall was burned in 1859, but was soon after rebuilt. The name of the palace is derived from the Duke of Piney-Luxembourg, whose mansion once stood on the same site. From 1870 to 1879, the palace was occupied by the Prefecture of the Seine and the Paris municipal council. Since 1879 it has been again occupied by the Senate. It contains a splendid museum of modern art, the most important contemporary collection in the world. The gardens are of the Renaissance order and the most noted in France.

Luxembourg (Fr. lük-sôn-boor, Ger. look'sēm-boorg), **Grand-duchy** of, northwestern Europe, an independent state, bounded north, east and south by Germany, southwest by France, and west by Belgium; greatest length, north to south, 55 miles; greatest breadth, 34 miles; area, 998 square miles. It forms part of the plateau of the Ardennes, and has a rugged and mountainous surface, covered in many parts with heaths and morasses, though in general well wooded. Its drainage belongs almost entirely to the basin of the Moselle. Agriculture is limited in extent by the nature of the surface, but

LUXEMBURG—LUZON

the pastures rear great numbers of cattle, sheep, and horses, the last long in high repute for light cavalry. Considerable quantities of iron are smelted from the ore of the duchy. The inhabitants are mostly of German origin, but French is the language of the educated classes and of business. The people are for the most part Roman Catholics. Pop. (1900) 236,543. Luxembourg, in early times formed a part of Germany. In 1354 it was erected into a duchy by Charles IV. In 1814 it was converted into a grand-duchy under the king of Holland. Though governed by the Dutch kings as grand-dukes it was distinct from the kingdom of Holland; and on the death of Willem III. in 1800 it passed over to Adolf, Duke of Nassau. It is included in the German Customs Union, and formerly was a member of the German Confederation. Capital, Luxembourg.

Luxemburg, the capital of the grand-duchy of the same name, situated 117 miles southeast of Brussels and 34 miles north of Metz. Its natural position is so strong, and the different powers into whose hands it successively fell did so much to extend and improve its means of defense, that it was called "the northern Gibraltar." From 1839 till 1866 it was garrisoned for the Germanic Confederation by Prussian troops, but in accordance with the Treaty of London (1867) the fortifications were dismantled, the Prussians withdrew their troops, and the neutrality of the duchy was guaranteed by the great European powers. It is divided into a low and a high town. The former lies along the banks of the Alsette. The latter stands 200 feet higher, on a plateau with precipices on three sides, the surrounding ravine being crossed by great viaducts. The town is well built; contains a town-house, government-house, house of deputies, old cathedral church, Athenæum, Roman Catholic seminary for priests, grand-ducal palace (rebuilt 1893-4), a handsome public park, etc. It has manufactures of machinery, leather gloves, breweries, dye-works, etc.; and a considerable trade. Luxemburg is the see of a bishop; and during part of the year is the residence of the leading families of the duchy. Its neighborhood abounds with fine promenades and picturesque features of various kinds. Pop. (1900) 20,298.

Luxor, lûk'sôr or look'sôr, Upper Egypt, a village on the right bank of the Nile, occupying the site of ancient Thebes and containing splendid ruins of that historic metropolis. See THEBES.

Luzac, Jean, zhôn lû-zâk, Dutch philologist and publicist: b. Leyden 1746; d. there 1807. He was of a French Protestant family, was educated for the bar at The Hague, and in 1772 became one of the editors of the 'Leyden Gazette,' a journal of European reputation, controlled since 1738 by his father and uncle. For several years subsequent to 1775 he was its sole editor, in which capacity he became known as a friend or correspondent of Washington, Adams, Jefferson, and many eminent Europeans. He subsequently became Greek professor at the University of Leyden, and in 1795 published an address 'De Socrate Cive,' dedicated to John Adams, whose son, John Quincy Adams, had studied under his direction. During the revolutionary troubles in Holland he was forbidden to lecture on Greek history to his classes; and having refused to obey this injunction, was de-

prived of his professorship, which was, however, restored to him in 1802 with an increase of salary. Upon being suspended from his professional functions he received a letter from Washington, expressing sympathy in his behalf, and encouraging him to hope for justice. His 'Lectioes Atticæ,' a defense of Socrates, was published in 1809.

Luzenberg, loo'zên-bêrg, **Charles Aloysius**, American physician: b. Verona, Italy, 1805; d. 1858. Leaving Italy for the United States in his 14th year, he subsequently received a medical education at the Jefferson Medical College of Philadelphia. He removed to New Orleans in 1829, where he made a reputation for brilliant surgery and was enabled to establish the famous New Orleans Medical School. He visited Paris in 1832, where his reputation had preceded him, and he was elected corresponding member of the Paris Academy. His most important work in Louisiana (where he took up his residence again in 1834) was the founding of the Society of Natural History (1839), and the Louisiana Medico-Chirurgical Society (1843), by which science has been much fostered and promoted in the South.

Luzerne, lû-zêrn, N. Y., village, in Warren County; on the Hudson River, at the mouth of the Sacondaga River; about 20 miles north of Saratoga and 10 miles southwest of Lake George. Lake Luzerne is in the vicinity. The village is situated in an agricultural and lumbering region, and its chief industries are connected with the manufacture of lumber and with farm products. A bridge crossing the Hudson connects Luzerne with Hadley, a station on a branch of the Delaware & Hudson railroad. The cool climate in this region, in summer, the beautiful scenery, and the opportunities for fishing make it a favorite summer resort. Pop. (1900) 1,341.

Luzon, loo-zôn' (Sp. loo-thôn'), Philippines, the northernmost island of the Philippine archipelago, lying south-southwest of Japan and south-southeast of China. On the north is the Bachi channel, connecting the Pacific Ocean and the China Sea; on the south are the San Bernardino Strait, separating it from Samar, the channels of the Visayan Sea, and the Tayabas gulf, dividing it from Mindoro.

Topography and Physical Geography.—The island is very irregular in shape, elongated from north to south and southeast, and much wider at the north than at the south. It narrows at lat. 14° 30' where the bay of Manila is, and much more at lat. 14° between Lamón Bay and Tayabas Bay, where an isthmus unites the larger and northwestern part of the island with the smaller southeastern part; it is thus divided into three territorial divisions, Northern Luzon, Central Luzon, and Southern Luzon. The length of Luzon is 283 miles from the north coast to Manila, and from there 225 miles southeast to Babulgun Point; at its widest point near the centre of Northern Luzon it is 138 miles wide; at its narrowest point, the isthmus in lat. 14°, 8 miles wide; area, 43,075 square miles, with dependent islands 44,235 square miles. The mountain system of Luzon consists of three large ranges, the nucleus of which is Caraballo de Baler in the province of Neuva Ecija. The Carabellos Occidentales form the watershed of Northern Luzon, and extend about 150 miles near the western coast and parallel with it; the

LYALL—LYCEUM

Sierra Madre range, starting at Carabello de Baler, extends northeast to Cape Engaño; the Carabellos Sur, starting at the same point, extends south to Banahao, then turns to the southeast and terminates near the straits of San Bernardino. This range has several important branches, one ending on the south side of the bay of Baler. Among the more important single mountains the following may be mentioned: Data (8,333 feet), and Burnay (6,376 feet), of the Carabellos Occidentales; Cana (3,830 feet) of Sierra Madre; and Bulusan and Mayón (7,566 feet) of the southern range. The three last mentioned are volcanos, of which Mayón is the most active. Luzon is well watered; the longest river is the Grande de Cagayan, running nearly the whole length of Northern Luzon; three other large rivers traverse this part of the island, and there are numerous smaller streams. The coast is irregular, and there are numerous bays and excellent ports and harbors, especially on the central and southern coasts.

Commerce and Industries.—There are a number of fine roads in Luzon, which centre at Manila, connecting it with remote points; there is also a railroad from Manila to Dagupan. In 1903 three other railroad lines were proposed, one from Manila to Aparri, following the Pampanaga, Magat and Cagayan rivers, another from Manila to Batangas, skirting the west shore of the Bay Lagoon between Muntinlupa and Calamba, and a third from Dagupan to Laoag. All the staple crops of the archipelago grow in abundance, and the chief industries of the island are agriculture, and the development of the products into the advanced forms of manufacture; the mechanical industries are very largely confined to Manila. Luzon is also rich in forests, having all the woods used in building, as well as the gum-producing, medicinal, and dye trees.

Luzon was the first of the Philippine islands to come under the control of the United States; it was the scene of the earliest military operations against the insurgents, and the base of operations for campaigns of occupation of the other islands. The beginning of civil government under the auspices of the United States was coincident with the occupation of Luzon, and the island is now the seat of the authority of civil government as well as of military domination. Civil government has been established throughout the whole island. The provinces into which Luzon is divided are as follows:

Abra.	Lepanto-Bontoc.
Albay.	Nueva Ecija.
Ambos Camarines (Norte and Sur).	Nueva Vizcaya.
Bataan.	Pampanga.
Batangas.	Pangasinan.
Benguet.	Rizal.
Bulacan.	Sorsogon.
Cagayan.	Tarlac.
Ilocos (Norte and Sur).	Tayabas.
Isabela.	Union.
Laguna.	Zambales.

See PHILIPPINE ISLANDS, and the names of individual provinces.

Lyall, Sir Alfred Comyn, English author and civil servant: b. 1835. He was educated at Eton, entered the Bengal civil service, and was governor of the Northwest Provinces, India, 1882-7. He has published 'Verses Writ-

ten in India'; 'British Dominion in India 'Asiatic Studies'; 'Life of Warren Hastings.

Lyall, Edna. See BAYLY, ADA ELLEN.

Lyall, James, American inventor: b. Auchterarder, Scotland, 13 Sept. 1836; d. New York 23 Aug. 1901. He was brought to this country as a child; when old enough worked at loom-making in his father's shop; was a soldier of the 12th New York infantry during the early part of the Civil War; and afterward became a manufacturer of jute and cotton goods and of machines. He designed corset-making machinery and produced the first machine-made corsets ever manufactured. He also invented a waterproof varnish, and in the latter part of the war knapsacks and haversacks waterproofed by his process were largely used in the Union army. The Lyall positive-motion loom, for weaving wide fabrics, was invented by him in 1863. Various other inventions of his are much employed in cotton manufacture. He received many medals and decorations, including the gold medal of honor from the American Institute, bestowed on him in 1869.

Lycan'thropy. See WERE-WOLF.

Lycaon, li-kā'ōn, a mythical king of Arcadia, generally represented as a son of Pelasgus by Melibœa, daughter of Oceanus, and described by some as the first civilizer of Arcadia, by others as a barbarian who defied the gods. He became by several wives the father of a great number of sons, so notorious for arrogance and impiety that Jupiter resolved to punish them. Appearing to them at their dwelling in Arcadia disguised as a poor man, they invited him to a repast, at which was served up the flesh of a boy whom they had murdered. The god rejecting the food, transformed Lycaon and all his sons save one into wolves, or according to other accounts destroyed them by a flash of lightning. The flood of Deucalion was said by some to have been a consequence of the crimes of the Lycaonidae.

Lycaonia, lik-a-ō'nī-a, Asia Minor, the name of an ancient division which was bounded north, east, south, southwest and west by Galatia, Cappadocia, Cilicia, Isauria and Phrygia, and is now included in the Turkish province of Caramania. Lycaonia is first mentioned in Xenophon's history of the expedition of the younger Cyrus as belonging to the Persian empire. After its conquest by Alexander and his death, it was attached to the kingdom of Syria, and subsequently came into the possession of Eumenes, king of Pergamus, while the other part was ruled by native chieftains. In the latter half of the 1st century B.C. it was conquered by Amyntas, king of Galatia, with which country it passed on his death to the Romans under Augustus, being annexed to the province of Cappadocia. The inhabitants, according to the Acts of the Apostles, spoke a peculiar dialect. They were warlike and skilled in archery. The principal town was Iconium, now Konieh.

Lyceum, li-sē'ūm, an academy in ancient Athens in which Aristotle explained his philosophy. In modern times the name of lyceum has been given to the schools intended to prepare young men for the universities. In France the term is applied particularly to an intermediate classical school. In the United States the term is only applied to the lecture platform, and is

LYCH-GATE — LYCURGUS

occasionally used as a title for a public ball or assembly room.

Lych-gate. See LICH-GATE.

Lychnis, lik'nis, a genus of plants of the pink family (*Caryophyllaceae*) comprising many species well known both as flowering weeds in waste places throughout the northern hemisphere, and as garden ornaments. They have a five-toothed naked calyx, five-clawed petals, ten stamens, and five styles, with flowers generally in terminal corymbs. Ragged Robin, or cuckoo-flower (*L. fls-cuculi*), a fugitive from Europe, is now common in damp meadows in the eastern part of the United States, and has a pretty flower with rose-colored petals; White campion (*L. alba*) is another species naturalized from Europe; as also are the red campion (*L. dioica*), the corn-cockle (q.v.), and some others. Many foreign species are cultivated in gardens, among which are the scarlet lychnis (*L. chalcedonica*) and the mullein-pink (*L. coronaria*). Two or three species are indigenous to Labrador and the Hudson Bay region.

Lycia, lis'i-a, Asia Minor, an ancient maritime province, bounded by Caria on the west, Pamphylia on the east, and Pisidia on the north. Its fertility and populousness are attested by the 27 cities mentioned by Pliny, which formed a confederated republic, with a congress which regulated the public concerns, and a president called the Lyciarch. Lycia was colonized by the Greeks at a very early period, and its historical inhabitants were Greeks, though with a mixture of aboriginal blood. They and the Cilicians were the only people west of the Halys whom Cræsus did not conquer, and they were the last who held out against the Persians. Consult Fellows, 'Account of Discoveries in Lycia' (1841).

Lycium, a genus of shrubby and thorny vines of the order *Solanaceæ*, and allied to *Datura* (q.v.), about 75 species of which are scattered throughout the temperate and warm parts of the world. Of the American species none is noteworthy except one naturalized from Europe called box-thorn or matrimony-vine (*L. vulgare*), which bears funnel-form flowers, purplish changing to greenish, and red ovate berries.

Lycomedes, lik-ō-mē'dēz, legendary king of the island of Scyros. He was the son of Apollo and Parthenope, and Thetis gave to him the charge of her son Achilles, disguised in woman's apparel, to prevent his going to the Trojan war.

Lycopodaceæ, li'kō - pēr - dā'sē - ē. See FUNGI.

Lycophron, li'kōf-rōn, Greek poet and grammarian: b. Chalcis, Eubœa, 3d century B.C. He lived at Alexandria, under Ptolemy Philadelphus (283-247), whose favor he won by the invention of anagrams. Of all his writings there remains but one tragedy, 'Cassandra' (Alexandria), written in iambics. It has no pretensions to poetical merit, and is but a cumbrous store of learning and obscure allusions. It is, properly speaking, a continued soliloquy, in which Cassandra predicts the fall of Troy, and the fate of all the heroes and heroines who shared its ruin. It affords some information of value respecting antiquities and mythology.

Lycopodiales. See FERNS AND FERN-ALLIES.

Lycopo'dium, the principal genus of club-mosses (q.v.), containing many species of the northern hemisphere, of which several belong to the United States. They are low creeping evergreen plants. A common example is the ground-pine (*L. clavatum*), which creeps upon the ground in heathy tracts with long branching stems. *L. rubrum* is a violent cathartic, and has been used successfully in Spanish America in cases of elephantiasis. *L. clavatum* and *L. selago* excite vomiting. The yellow powder contained in the spore-cases of all the species is very inflammable, and is employed in the manufacture of fireworks, and in the flashing of torches or production of mimic lightning on the theatrical stage. It is also employed to cover pills, so as to prevent them being acted upon by moisture, and is known in England under the name of lycopode or vegetable brimstone, and in Germany as *Blitzmehl* or *Hexenmehl* (lightning meal or witches' meal). Many of the species are prized for their beauty, and are cultivated in hot-houses or fern-cases, where they thrive well.

Lycurgus, li-kēr'gūs, Spartan lawgiver; flourished in the 9th century B.C., according to the commonly received traditions. He was the youngest son of the Spartan king Eunomus. His eldest brother, Polydectes, succeeded his father in the government, but died soon after. His wife proposed to Lycurgus to destroy her unborn child by her late husband, if he would share the throne with her. When she gave birth to a son, Charilaus, Lycurgus proclaimed him king, and became his guardian. Being desirous of examining the political constitutions of other lands, Lycurgus left Sparta. On his return the entire community requested him to draw up a constitution for them. He undertook the task. The old constitution was completely remodeled; the highest position in the state was to be shared by two kings, whose powers were counterbalanced by a senate (*gerousia*). The people obtained a voice in public affairs. The native race or Lacedæmonians were confined to the pursuits of trade, commerce, and agriculture; the Helots or slaves to all those menial employments which a freeman would consider as a disgrace, while the Spartans became the warriors of the state. Lycurgus also introduced a redistribution of property. Obtaining from the god at Delphi an approving oracle for his institutions, he exacted a promise from his countrymen not to make any alterations in the laws before his return from a journey he was about to make. He then left Sparta, determined to finish his life in voluntary exile, in order that the Spartans might be bound by their oath to preserve his constitution inviolate for ever. The time and place of his death are unknown.

Lycurgus, one of the ten Attic orators: b. Athens 366 B.C.; d. there 325 B.C. He was a pupil of Plato and of Isocrates. In 343 he was sent with Demosthenes on an embassy to counteract the intrigues of Philip. He won his chief glory as guardian of the public revenue 338-326 B.C. The decree of the Athenians commending his administration of this trust (307 B.C.) is still extant. He was also appointed superintendent of the city, and censor, and in the latter capacity caused his own wife to be fined for violating one of his sumptuary enactments. Of the prosecutions which he conducted, the most celebrated was that against Lysicles, who had

commanded the army of Athens at Chæronea; Lysicles was condemned to death. There were 15 orations of his extant in the ages of Plutarch and Photius, but all have since perished except that against Leocrates, and some fragments.

Lydekker, Richard, English naturalist: b. 1849. He was educated at Cambridge University and was a member of the staff of the Geological Survey of India 1874-82. He prepared for the British Museum in 1884 a catalogue of the fossil mammalia, reptilia and birds therein, and was in Argentina, 1893-4, to examine the mammals in the La Plata Museum. Among his numerous publications are: 'Phases of Animal Life'; 'Geological History of Mammals'; 'The Deer of All Lands' (1898); 'Wild Oxen, Sheep, and Goats of All Lands, Living and Extinct' (1898); 'Descriptions of South American Fossil Animals.'

Lyddite, a high explosive which was adopted by the English government in 1888 for charging its torpedo-shells. Its composition has been varied from time to time, but a typical formula is picric acid 88 per cent, dinitrobenzene 8 per cent, and vaseline 4 per cent. These materials are melted and mixed together in a water-bath, and while in the fused condition they are poured into the shells, where, on cooling, they solidify to a stone-like mass. A central canal is left in the explosive charge in which is placed a detonator containing ammonium picrate by which the charge is exploded. This explosive was practically tested in the Boer war and the results were very disappointing. It is, however, still believed to be an efficient explosive for use against armor. The explosive owes its name to the fact that the first experiments made with it were carried on in the environs of the village of Lydd in England.

CHARLES E. MUNROE,

Professor of Chemistry, Columbian University, Washington, D. C.

Lydgate, lid'gāt, **John**, English monk and poet: b. Lydgate, Suffolk, about 1370; d. Bury St. Edmunds about 1450. After studying at Oxford, and visiting France and Italy, he entered the monastery of Bury St. Edmunds, and established a school for instructing the sons of the aristocracy in versification and composition. He began to write about 1400. His chief works are his 'The Falls of Princes' (1430); 'Story of Thebes' (1420); and 'Historie, Siege, and Destruction of Troye' (1430). His minor poems were published by the Percy Society in 1840. Ritson, in his 'Bibliographia Poetica,' gives a complete catalogue of his works. Lydgate was an admirer of Chaucer, whom he imitated in 'The Story of Thebes,' a Canterbury Tale in ten-syllabled couplets.

Lydia, lid'ī-a, Asia Minor, the name of an ancient large and fertile country, inhabited along the coast of the Ionian Sea by the Ionians. Toward the south it was separated from Caria by the Mæander (now Meander); toward the east it was bounded by Phrygia, and on the north by Mysia. It was in early times a kingdom, divided from Persia by the river Halys (now Kizil Irmak). Its original inhabitants were a people called Mæonians, either of Semitic or of Indo-Pelagic origin. This race was subdued by the Lydians, a Carian tribe. It attained its highest prosperity under the Mermnadæ dy-

nasty, beginning with the semi-mythological Gyges (716 B.C.), and ending with Croesus (546 B.C.), who was conquered by the Persians under Cyrus. The people were the richest and perhaps the most effeminate in all Asia. They delighted in luxurious garments, costly carpets, precious ointments, and exquisite viands; and a kind of Grecian music called the Lydian. They also laid out beautiful gardens. Their example corrupted the Ionians. The wealth of the Lydians, however, was probably, in a great measure, confined to the kings and chief men. These could fill their coffers with the gold washed down by the Hermus (now Sarabat) and the Pactolus, and that obtained from the mines; and they procured all the necessities of life by the labor of their slaves. The Lydians are said to have been the first to coin money, and to establish inns; they are credited with the invention of certain musical instruments, the art of dyeing wool (which was afterward carried to such perfection in Miletus), also the art of melting and working ore. At Sardis, the capital of the country, the Grecians, Phrygians, and even the nomadic tribes bartered their goods. There was here a great market for the slave-trade, which furnished the harems of Persia with eunuchs. The great tumuli graves of the ancient Lydian kings are still to be seen near the Gygaean Lake.

Lye, lī, a solution of an alkali; water impregnated with alkaline salt imbibed from the ashes of wood. It is largely used in soap-making.

Lyell, lī'ēl, **SIR CHARLES**, English geologist: b. Kinnordy, near Kirriemuir, Forfarshire, Scotland, 14 Nov. 1797; d. London 22 Feb. 1875. He was educated at Oxford, and on leaving Oxford he began to study for the bar and became a barrister. His life was almost wholly given, however, to geology. His first writings on the subject consisted of contributions to the 'Transactions' of the Geological Society, of which he was secretary 1823-6, and president in 1835-6 and 1849-50, and to which he continued to furnish papers throughout his life. His first important work, and the one on which his fame rests, 'The Principles of Geology,' appeared 1830-3. A portion of it subsequently formed the basis of a separate work, 'The Elements of Geology' (1838). In the prosecution of his geological studies Lyell made four visits to North America, in 1841-2, 1845-6, 1852, and 1853. His 'Travels in North America' (1845), and 'Second Visit to the United States' (1849), although mainly devoted to geological topics, contain many entertaining sketches of political and social life and institutions. On the occasion of his first American visit he lectured before the Lowell Institute in Boston and again 1845-6. In 1863 appeared Lyell's last important and most popular work, 'The Antiquity of Man,' containing a summary of all the facts and arguments that could be obtained from geology, archæology, etc., to prove that man had existed upon the earth at a period vastly more remote than usually believed. In 1864 he was president of the British Association. In 1848 he was knighted, and in 1864 was made a baronet. Lyell was a strong supporter of the "uniformitarian" theory of geology—the steady and long-continued action of forces still at work around us—as opposed to those who believe in great cataclysms or convulsions having taken place in the past. Consult 'Life, Let-

LYGODIUM—LYMAN

ters and Journals of Sir Charles Lyell' (1881); Geikie, 'The Founders of Geology' (1897).

Lygo'dium. See FERNs AND FERN-ALLIES.

Lyle, lil, William, Scottish-American poet: b. Edinburgh, Scotland, 17 Nov. 1822. He emigrated to the United States and settled in Rochester, N. Y. His poems have had a wide circulation in the United States and Canada. Among his most popular Scotch dialect poems is 'The Grave of Three Hundred.' He also wrote several English poems, including 'Diotima.' 'The Martyr Queen' appeared in 1888.

Lyly, lil'i, John, English author: b. about 1554; d. London 30 Nov. 1606. He was graduated from Magdalen College, Oxford, studied also at Cambridge, wrote plays for the children's companies of the Chapel Royal and St. Paul's, London, took side with the bishops in the Mar-Prelate controversy and sat in Parliament for Hindon in 1589, for Aylesbury in 1593 and 1601, and for Appleby in 1597. It is, however, for his 'Euphues' (Part I., 'Euphues, the Anatomy of Wit' 1579; Part II., 'Euphues and his England' 1580) that Lyly is best known. This work is a tedious narrative of the fortunes and interests of a young Athenian, and is remarkable for a prose style that exhibits a uniform and continuous affectation of epigram and antithesis. This fashion of writing, styled 'Euphuism,' was much in favor at the court of Elizabeth, influenced numerous writers, and may fairly be assumed to have been ridiculed by Shakespeare. His plays, 'Alexander and Campaspe' (1584), 'Endymion' (1591), and 'Midas' (1592), contain some worthy lyrics.

Lyman, il'man, Azel Storrs, American inventor: b. Potsdam, N. Y., 1815; d. 1885. He was graduated at the Illinois University and had intended to become a Presbyterian clergyman, but deafness prevented the fulfilment of this purpose. Removing to New York he prepared a historical chart subsequently adopted in many schools and colleges, and also contributed to scientific periodicals. His talents for invention having developed themselves he devised important systems of refrigeration, and a new process of ventilation. He also invented a fibre gun for disintegrating wood for paper pulp, which is extensively used, and among his later inventions is the multi-charge cannon known as the Lyman-Haskell gun.

Lyman, Benjamin Smith, American geologist and mining engineer: b. Northampton, Mass., 11 Dec. 1835. He was graduated at Harvard in 1855; taught for several years; in 1859-61 studied at Ecole des Mines, Paris, and then spent a year at the Mining Academy in Freiberg, Germany. In 1858 he became assistant State geologist of Iowa, and in 1870 was employed by the government of India in surveying oil-fields. From 1873 to 1879 he was chief geologist and mining engineer to the Japanese government, and served as assistant State geologist of Pennsylvania, 1877-95. His geological researches have taken him over an unusually wide area of the globe. He has published more than 100 reports and papers on geological subjects, surveying, etc., among which may be mentioned his 'Preliminary Report on the First Season's Work of the Geological Survey of Yesso' (1874); 'A General Report on the Geology of Yesso' (1877); 'A General Report on the Pun-

jaub Oil Lands' (1878); and 'Geological Survey of Japan.'

Lyman, Chester Smith, American astronomer: b. Manchester, Conn., 13 Jan. 1814; d. New Haven 29 Jan. 1890. In youth he was self-taught in astronomy and other branches of science, making for himself serviceable apparatus. He calculated eclipses 15 years ahead and computed almanacs for 1830-1. He was graduated at Yale in 1837, and studied theology there after a previous course at Union Theological Seminary. After a short pastorate (1843-5) at New Britain, Conn., he went to the Sandwich Islands, where he became instructor at the Royal School. Two years later he was surveying in California. In 1850 he returned to the East and resumed his early study of sciences; in 1858 accepted the professorship of industrial mechanics and physics at Yale; from 1871 to 1884 was professor of astronomy and physics in the Sheffield Scientific School, which he had assisted in organizing; and continued to teach astronomy alone until 1889. He made a number of useful scientific inventions, and was a contributor of papers to the 'New Englander' and the 'American Journal of Science.'

Lyman, Joseph Bardwell, American agriculturist: b. Chester, Mass., 6 Oct. 1829; d. Richmond Hill, L. I., 28 Jan. 1872. In 1867 he became agricultural editor of the New York *World*, was editor of 'Hearth and Home' in 1868, and later joined the staff of the *Tribune*. With his wife he wrote 'The Philosophy of Housekeeping' (1867). He published: 'Resources of the Pacific States' (1865); 'Women of the War' (1866); 'Cotton Culture' (1867).

Lyman, Phineas, American soldier: b. Durham, Conn., about 1716; d. West Florida, now Mississippi, near Natchez, 10 Sept. 1774. He was graduated at Yale in 1738, and subsequently practised law in Suffield. In 1755, being commander-in-chief of the Connecticut militia, he served with Sir William Johnson at the battle of Lake George, and, after his commander had been disabled, conducted the engagement to a prosperous conclusion. He was present at the attack upon Ticonderoga by Abercrombie, and at the capture of Crown Point and the surrender of Montreal; and in 1762 commanded the provincial troops in the expedition against Havana. Subsequently he passed many years in England in efforts to procure a grant of land on the Mississippi for the purpose of establishing a colony, and in 1775 embarked with his eldest son and some others for the country in question. The emigrants who followed him encountered many misfortunes, and after the subjugation of the country by the Spaniards in 1781-2 were obliged to take refuge in Savannah.

Lyman, Theodore, American philanthropist: b. Boston 20 Feb. 1792; d. Brookline, Mass., 18 July 1849. He was graduated from Harvard in 1810, studied at the University of Edinburgh in 1812-14, was for a time aide-de-camp to the governor of Massachusetts, in 1823-7 commanded the Boston brigade of the State militia with rank of brigadier-general, was a representative in the State legislature in 1821-4 and 1825, and State senator in 1824. In 1834-5 he was mayor of Boston; and on 21 Oct. 1835, at the risk of his own life, rescued William Lloyd Garrison from the 'gentlemanly mob' that had vowed to bring the Abolitionist to the tar-kettle before

LYMAN—LYMPHATIC GLANDS

dark. From 1835 he devoted himself to philanthropic work, and in 1844 removed to Brookline, Mass. In 1840-6 he was president of the Boston Farm-school. To this institution he gave \$10,000; to the Massachusetts Horticultural Society, of which he was a life-member, \$10,000; and to the State reform-school, now the Lyman school, at Westboro, \$72,500. He wrote: 'Three Weeks in Paris' (1814); 'The Political State of Italy' (1820); 'The Hartford Convention' (1823); 'The Diplomacy of the United States with Foreign Nations' (1828).

Lyman, Theodore, American naturalist: b. Waltham, Mass., 23 Aug. 1833; d. Nahant, Mass., 9 Sept. 1897. He was a son of Theodore Lyman (1792-1849) (q.v.). He was graduated from Harvard in 1855, from the Lawrence Scientific School in 1858, and was assistant in zoology at the Museum of Comparative Zoology. In 1863-5 was volunteer aide on the staff of General Meade, with rank of lieutenant-colonel. Having been mustered out on 20 April 1865, he was fish commissioner for Massachusetts in 1865-82, and in that capacity made the first experiments undertaken by any State of the Union for the cultivation and protection of food-fishes. In 1883-5 he served in Congress as an Independent representative. He was also president of the Boston Farm-school, a member of the National Academy of Sciences (from 1872), and a trustee of the Peabody education fund. He donated \$10,000 to Harvard and his library of scientific works to the Museum of Comparative Zoology. Among his publications are: 'Illustrated Catalogue of the Ophiuridæ and Astrophytidæ in the Museum of Comparative Zoology' (1865), with a 'Supplement' (1871); 'Old and New Ophiuridæ and Astrophytidæ' (1869); 'Papers Relating to the Garrison Mob' (1870); 'Prodrome of the Ophiuridæ and Astrophytidæ of the Challenger Expedition' (1878-9); and 'Report on the Ophiuridæ Dredged by H. M. S. Challenger during the Years 1873-6' (1882).

Lymph, the fluid contained in the lymphatic glands and in the lacteals (q.v.). It is elaborated primarily by the assimilation of food, and is also obtained from the blood and tissues, the system of vessels in which it is contained ramifying throughout the bodies of vertebrates. The clearest and simplest view of the nature and functions of the lymphatic vessels is that which considers them as forming a connecting-link between the digestive and circulatory systems. The matters absorbed from the alimentary canal and from the blood and tissues are converted in the lymphatic glands into lymph, which supplies initial and essential elements of the blood. The lymphatic system, concerned in absorption, is also called the absorbent system. None of the invertebrates have such a defined set of vessels; in the lower animals matters pass from the digestive system into the blood-system directly and without the intervention of any absorbent vessels. The lymphatic vessels constitute a distinctive character of the highest sub-kingdom of animals. Fresh supplies of nutritive matter are poured from the lymphatic system into the current of circulation, but it is difficult, if not impossible, to determine where the function of circulation ends and that of absorption begins.

The lymph as it exists in the lymphatic vessels is a colorless, transparent fluid, odorless,

with a slightly saline taste and an alkaline reaction. When microscopically examined, it is seen to be a clear plasma containing corpuscles. It resembles blood in being an alkaline fluid, and in that it coagulates or clots by the separation of the fibrinous part of the plasma; but it differs from blood in that its corpuscles are nearly all colorless, and because its solid matters are present in very small proportions. The lymph-corpuscles, when passed into the current of the blood, by a simple change of medium become the white blood-corpuscles, and when partially altered they give origin to red corpuscles. The lacteals absorb the chyle directly from the alimentary canal, and pour it, as rudimentary blood, into the current of the circulation. Then from the body generally the ordinary lymphatic vessels bring the lymph, which is further elaborated in the lymphatic glands, and pour it into the current of the blood. The actual termination of the lymphatic vessels is in the large veins in the neighborhood of the heart. The lymphatic circulation may thus be regarded as corresponding in its general direction to the course of the venous blood.

The lymphatic vessels resemble small veins in their general structure. They are provided with valves permitting the flow of the lymph only toward the large veins near the heart and into which the lymph is poured. The only structures in which lymphatic vessels do not exist are the non-vascular parts, such as the hair, nails, outer skin, and cartilaginous tissues. The flow of lymph toward the heart is induced partly by the general pressure and action of the muscles of the body, the valvular structure aiding its propulsion as in the veins; and to this, as well as to the absorptive power, must be added the action of the contractile muscular fibres of the lymph-vessels themselves.

The fluid employed in vaccination (q.v.) is also called lymph, of which two varieties are distinguished, human and bovine. The term has likewise been applied to various serums made from bacterial cultures for preventive or curative use in certain diseases, especially to those serums known as antitoxins (q.v.). See IMMUNITY; KOCH, ROBERT; SERUM, THERAPY; TUBERCULOSIS.

Lymphatic Glands, small organs, round and smooth and comparatively solid, which form part of the lymphatic system in vertebrates. (See LACTEALS; LYMPH.) Into these, sooner or later in their course, the other lymphatic vessels run, and from them emerge again. The lymphatic glands are highly important structures, since only after passing through them does the lymph contain, in any abundance, lymph-corpuscles. In size the glands may be compared to small almonds, and they are generally arranged in groups. Each gland is entered by a number of afferent vessels which bring lymph to it, while those (efferent vessels) which leave the gland carry lymph away from it. Externally a lymphatic gland presents an envelope of connective tissue, from which the stroma, consisting of a fibrous framework of processes, is prolonged into the interior of the gland. Within the stroma the essential gland-structure is contained. Within the stroma also, as well as within the softer portions or pulp contained in the meshes of the fibrous network, minute blood-vessels are distributed. Corpuscles are added to the lymph

LYNCH

in the glands, while in the composition of its fluid it undergoes further elaboration. The lymphatic trunks of the greater part of the body finally pour their contents into the thoracic duct, a small tube which opens into the current of the blood at the point of junction of the internal jugular and subclavian veins of the left side of the body. On the right side of the body is a still smaller duct which receives the contents of the lymphatics of the right half of the chest, the right arm, and right side of the head and neck; and this smaller lymphatic channel or right lymphatic duct opens into the angle formed by the junction of the right jugular and subclavian veins, similarly to its larger neighbor of the left side. The thoracic duct begins in the upper part of the abdomen, and runs up in front of the spine to the root of the neck, where it opens into the great veins. The receptaculum chyli, or cistern of the chyle, is the dilation at the commencement of the thoracic duct in the abdomen, which receives the contents of the lacteals or intestinal lymphatics. The orifices by which the thoracic duct and right lymphatic duct open into their respective great veins are guarded by valves which permit the lymph to flow from the ducts into the veins, but prevent the flow of blood into the ducts.

The spleen has been considered by physiologists to be merely a ductless lymphatic gland of large size, since it appears to be concerned in the elaboration of the blood, and also to be a place of disintegration of the red corpuscles and a manufactory of the white corpuscles of the blood. And the thymus, another ductless gland, has also been supposed to be connected with the function of blood-elaboration, and thus to be associated with the lymphatic system.

Lynch, Anne Charlotte. See **BORRA**, ANNE CHARLOTTE.

Lynch, Arthur, Irish journalist and author: b. Smythesdale, Ballarat, Victoria, Australia, 1861. He was educated at Melbourne University and the University of Berlin. practised as an engineer, lectured on engineering and scientific subjects at Melbourne, was for a time a journalist in London, was a war correspondent in Ashanti, and twice visited America. During the second Boer war he was colonel in the Irish brigade No. 2 of the Transvaal forces; and upon his landing in Great Britain subsequent to the war was brought to trial for high treason. He was sentenced to death; but this sentence was afterward commuted to life imprisonment. Lynch was elected M. P. for Galway in 1901. Among his books are: 'Modern Authors' (1891); 'Approaches' (1892); 'Our Poets' (1895); 'Religio Athletæ' (1895); 'Human Documents' (1896).

Lynch, Charles, American planter and soldier: b. 1736; d. 1796. He lived on the Staunton River in Virginia, and in support of the revolutionary government in that region during the early part of the war with Great Britain, joined Robert Adams and Thomas Calloway in the punishment and exile of Tories. A frequent method, so says tradition, was to suspend the disaffected by their thumbs until they were willing to exclaim "Liberty forever!" The summary acts of this self-appointed court are generally accepted as the origin of the term lynch-law (from "Lynch's Law"). But whereas the expression is now used almost exclusively of punishment

by death without legal authority, it does not appear that Lynch ever exacted the death penalty.

Lynch, George, English author and journalist: b. Cork, Ireland, 27 March 1868. He went on exploring expeditions in Western Australia and in the Pacific islands; in 1898 he was war correspondent for the London *Daily Chronicle* in the Spanish-American War. He then went to Africa as correspondent for the 'Illustrated London News' during the Boer war, and was wounded at the battle of Reitfontein. He was at Ladysmith during the first part of the siege, and, on attempting to go from there to join General Buller's forces, was captured by the Boers and kept a prisoner for a month. Shortly after obtaining his freedom he returned to England. He was war correspondent for the *Daily Express* and the *Sphere* in the China campaign for the relief of Peking, and later visited southern China and Japan. He has also been special correspondent for the London *Daily Mail* in the United States. He has written 'The War of the Civilisations'; 'Realities'; and 'The Bare Truth about War and Other Things.'

Lynch, Hannah, English novelist. She is the Paris correspondent of 'The Academy' and has published 'Prince of the Glades'; 'George Meredith: a Study'; 'Dr. Vermont's Fantasy'; 'An Odd Experiment'; 'Toledo' in 'Mediaeval Towns' series; 'French Life in Town and Country'; 'Autobiography of a Child'; etc. She has translated the dramas of Echegaray (q.v.) into English.

Lynch, John Joseph, Canadian Roman Catholic prelate: b. Ireland 1816. He was educated at Dublin and Paris, and ordained to the priesthood in 1843. Three years later he came to the United States, was first engaged in missionary work at Houston, Texas, and then became president of the Lazarist College of Saint Mary the Barren in Missouri. He next went to Canada, where he founded the Seminary of Our Lady of Angels, and in 1860 was appointed bishop of Toronto. He was later made archbishop of Toronto and Metropolitan of Ontario; in 1869 he was a member of the Vatican Council.

Lynch, Patricio, Chilean naval and military officer: b. Santiago Chile, 1824; d. at sea May 1886. He was educated at the Chilean Naval Academy; entered the English navy in 1840 and took part in the Anglo-Chinese War; in 1847 he re-entered the Chilean navy and served during the war against Spain. In 1879-80 he commanded a military and naval expedition against Peru, and ravaged the northern part of that state, destroying a large amount of property. He also took part in the attack against Lima, and was made commander-in-chief of the Chilean army; in the city of Lima he strictly observed martial law, suppressed the Peruvian government, and took Calderon, the provisional president, prisoner, though this act called forth a protest from the United States minister. In 1883 he evacuated the city, having placed Iglesias at the head of affairs. He was made vice-admiral of the navy, and in 1884 sent as minister to Spain. He died on his homeward voyage two years later.

Lynch, Thomas, Jr., American patriot, one of the signers of the Declaration of Independence: b. Prince George's parish, S. C., 5

LYNCH LAW—LYNDHURST

Aug. 1749; perished at sea in the latter part of 1779. He was educated at Eton and the university of Cambridge, and was subsequently admitted a student in the Temple, London. In 1772 he returned to South Carolina, and at the outbreak of hostilities in 1775 was appointed a captain in the first regiment of provincial regulars raised by South Carolina. Being unanimously chosen by the provincial assembly to succeed his father as a member of Congress, he took his seat in that body in 1776, but in a few months was compelled by ill health to retire from active political life. One of his last public acts was to affix his signature to the Declaration of Independence. In the latter part of 1779, as the only means of saving his life, he sailed for St. Eustatius, West Indies, intending to find there a neutral vessel which would convey him to France. The ship in which he sailed was never heard from and is supposed to have been lost in a storm.

Lynch Law, or Judge Lynch, a name for irregular punishment, especially capital, inflicted by private individuals independently of the legal authorities. The origin of the term is doubtful; by some it is said to be from James Lynch Fitz-Stephen, warden of Galway, Ireland, who, about 1526, sentenced his son to death for murder, and to prevent a rescue by a mob, executed him with his own hands without due process of law. By others the term is said to have had its origin in the State of Virginia, where a farmer of the name of Charles Lynch (q.v.) took his own way of obtaining redress for a theft by catching the culprit, tying him to a tree, and flogging him. This mode of administering justice has always prevailed more or less in every country in times of great popular excitement, and is necessarily resorted to in newly settled territories, where the power of the civil government is not fully established. As early as 1768, in the United States the terms "regulating," "regulation," and "regulator" were in use in the Carolinas; illegal whippings were at that time inflicted by the Regulators, and it is claimed that a meeting of the Regulators took place at Lynch's Creek. Whether there is any historical connection between the Regulators of the Carolinas and the Regulators who flourished along the western frontiers where lynch law was well known, in and after 1819, is one of the many obscure points in the early history of lynch law which await elucidation. At first in the United States, "lynch law" was not mob law, as it is now understood. It was orderly, methodical, and fair in its practices, and was strongly opposed to violence or mob rule. Its distinctive feature was simply that its decrees and findings were executed sternly and swiftly on the spot where they had been decided upon. This was true of the conditions in California in 1849 when Judge Lynch held frequent court, and hundreds of culprits were executed between 1849 and 1860, in an orderly manner, with nothing of the mob violence or excitement common in recent years. During the Civil War and afterward, lynching was practised in the Southern States at the instigation of the Ku Klux Klan (q.v.). From 1870 it became an unwritten law in the South to lynch by mob rule every negro charged with rape or assault, or with the murder of a white person. Gradually this practice spread to Northern States, and negroes were not only

"lynched," or hung, but were burned at the stake in Indiana, Illinois, Ohio, and other States. In 1892, there were 241 lynchings in the United States, and of this number 162 were negroes. During 1902 there were 100 lynchings in this country. Rarely is there conviction or punishment of persons who participate in lynchings, owing largely to the sympathy of jurors for the accused. In Kansas and Indiana laws have been passed providing for the suspension from office of sheriffs who fail to protect prisoners from the violence of the mob. The best remedy for lynch law is prompt action by the courts and the prompt execution of sentence after a culprit has been convicted.

Lynchburg, lynch'berg, Va., city, Campbell County; on the James River, and on the Norfolk & W., the Southern, and the Chesapeake & O. R.R.'s; about 125 miles west by south of Richmond. The city is situated in a river valley which forms a pass through the mountains. The irregularity of the surface upon which stands the city, the hills, the numerous terraces, the many trees along the streets, the well-built, handsome houses with neatly kept grounds, all make the place most attractive. In the distance mountain peaks are visible, and around and near the city are many fertile farms. Granite quarries are nearby, and large coal-fields and iron ore are in Campbell and neighboring counties. The river furnishes extensive water power which aids in the development of the manufacturing interests of the city.

Lynchburg was founded in 1786 by John Lynch, but it was not incorporated until 1823. It was early in the 19th century, as now, a distributing centre for places above on the river, and for many settlements and towns south of the James. The Confederates used it as a supply depot during the Civil War. On 18 June 1864 General Hunter, of the Federal army, attacked the city, but was defeated.

The chief manufactures are iron and brass products, tobacco, cotton goods, plows, wagons, shoes, dyes, bark extract, hardware, flour, and lumber. It has extensive tobacco interests, as a manufacturing and jobbing centre. The trade is principally in tobacco, raw and manufactured; coal, granite, and its own manufactures. Lynchburg is the seat of a Woman's College, and it has two hospitals, and the Miller Female Orphan Asylum. The government of the city is vested in a mayor, who holds office two years, and a council. The city treasurer, clerk of the courts, and commissioner of revenue are chosen by popular election, and the other officers are appointed. The waterworks plant is owned and operated by the city. Pop. (1900) 18,891. Consult: Cabell, 'Sketches and Recollections of Lynchburg.'

Lynde, Francis, American novelist: b. Lewiston, N. Y., 12 Nov. 1856. He removed in boyhood to western Missouri with his parents. After many years in the railway service in various capacities, he turned to literature in 1893 and besides contributions to magazines, has published 'A Case in Equity'; 'A Question of Courage'; 'A Romance in Transit' (1898); 'The Helpers: a novel of Colorado Life' (1899); 'A Private Chivalry' (1900); 'The Master of Appleby' (1902). His home is on Lookout Mountain, Tenn.

LYNE—LYON

Boston 21 May 1772; d. London 12 Oct. 1863. His father (q.v.) was the well-known painter of the same name. He was taken to England in early infancy, his parents having gone to reside in London. He was educated at the University of Cambridge, became a fellow of Trinity College, traveled in the United States, was called to the bar at Lincoln's Inn in 1804, and soon gained a high position. In 1817 he ably defended Watson and Thistlewood for high treason, and obtained their acquittal. In 1818 he entered Parliament for Yarmouth, Isle of Wight, which he soon exchanged for Ashburton. In 1819 he became solicitor-general and was knighted. He conducted the prosecution in the trial of Queen Caroline. In 1824 he succeeded to the post of attorney-general, in 1826 was elected for Cambridge, and became master of the rolls. He succeeded Lord Eldon as chancellor in 1827, which post he retained until 1830, and was raised to the peerage as Baron Lyndhurst. In March 1829, he delivered a great speech against Catholic emancipation. During the ministry of Earl Grey (1830-4) he was chief baron of the exchequer. He was a formidable opponent of the reform bill, and in 1834 became a second time chancellor, but in 1835 retired with the Peel ministry. Lyndhurst's speeches and annual reviews of the session contributed greatly to the return to power of the Conservatives in 1841, on which occasion he was a third time raised to the woolsack. He retired in 1846, from which time he took little part in home politics, confining his attention more to matters of foreign policy. For a long time he was virtually the Tory leader in the upper house. Brougham said: "Lyndhurst was so immeasurably superior to his contemporaries . . . that he might well be pardoned for looking down rather than praising." Consult: Sir Theodore Martin's 'Life' (1883).

Lyne, lin, Joseph Leycester, commonly known as "FATHER IGNATIUS," or "IGNATIUS OF JESUS," English clergyman and author: b. London, England, 23 Nov. 1837. After taking deacon's orders, and doing some mission work in London, he conceived the idea of reviving the Benedictine rule in a modern monastic foundation. With this view he built Llanthony Abbey in Wales, where he was joined by a few enthusiasts, though his movement has made no progress at all commensurate with his programme. He is a striking preacher and has visited the United States as a missionary. Among his published works are: 'The Catholic Church of England' (1864); 'Brother Placidus' (1870); 'Leonard Morris, or the Benedictine Monk' (1871); 'Mission Sermons and Orations' (1886); 'Tales of the Monastery.'

Lynn, lin, Mass., city, in Essex County; on Massachusetts Bay, and on the Boston & M., the Boston, Revere Beach & L. R.R.'s; about 10 miles northeast of Boston, and five miles southwest of Salem. Area, nearly 12 square miles. Lynn was first settled in 1629 by Edmund and Francis Ingalls and for a time was called Saugus. It was incorporated in 1630 and chartered as a city in 1850. The city includes what were several independent villages: Glenmere, Highlands, East Lynn, West Lynn, Linwood, Lynmere, and Wyoma. The Lynn harbor is shallow, but it is considered safe. The

three-mile shore-line adds to its attractions. The city is noted for its shoe factories. The annual amount of shoe business is \$40,000,000; and the number of persons employed, 25,000. The General Electric Company's annual business amounts to over \$40,000,000, and the number of employees is about 20,000, over 6,000 of whom are in Lynn. The chief manufactures are shoes, cut leather, shoe machinery, electrical supplies, meters, arc lamps, morocco, and patent medicines. There are 11 banks, six national, three savings banks, and two trust company banks. The combined capital is \$1,600,000. The total deposits in the savings banks amount to \$10,000,000; total in the national and trust company banks, \$6,000,000. The city has the following churches: Methodist, 12; Baptist, 7; Congregationalist, 7; Roman Catholic, 4; Protestant Episcopal, 2; Universalist, 2; Friends, 2; Presbyterian, Adventist, Wesley Evangelical, Pentecostal, Swedish, Lutheran, and Hebrew, each one church.

Some of the principal buildings are Lynn Public Library, which has about 65,000 volumes; Lynn Hospital, the city hall, Lynn Home for Aged Women, and an orphanage. There are two high schools, 101 grammar schools, 120 primary schools, four large parish schools, containing primary, grammar and high school departments.

The annual expenditure for municipal maintenance and operation is about \$1,348,000; the chief items are, schools, about \$245,000; for poor, sick, homeless, and other charities, \$106,000; for police department, \$84,500; for fire department, \$96,000; for waterworks, \$64,500; for city lighting, \$56,000. The waterworks plant opened in 1870, and costing about \$2,500,000, is owned and operated by the city.

The government is vested in a mayor, a board of aldermen (11 members), and a common council of 25 members, who are elected annually. The large majority of the people were born in the United States. Pop. (1890) 55,727; (1900) 68,513. Consult: Newhall, 'History of Lynn, Mass.'

W. R. HASTINGS.

Lynx, a wildcat, distinguished from the larger members of the family *Felida* chiefly by the shortness of the tail, and the presence of a pencil-like arrangement of hairs at the tips of the ears. It was long customary to regard these cats as constituting a separate genus *Lynx*, to which the North American wildcats, the caracal, and some others, were assigned, but modern zoologists include them with the general genus *Felis*. See WILDCAT. The fur known to trade as "lynx" is furnished by the Canadian lynx, and is described as of a light-brown color, with a light silvery top on the back, that on the under part long, soft, and spotted; about 30,000 to 80,000 are exported yearly from the Dominion of Canada, California, and Alaska to Liverpool, besides what is consumed in domestic trade.

Lyon, li'on, David Gordon, American Assyriologist: b. Benton, Ala., 24 May 1852. He was graduated from Howard College, Ala., and from the University of Leipzig in 1882, and since the latter date has been Hollis professor of divinity at Harvard. He was recording secretary of the American Oriental Society, 1886-95, and corresponding secretary of the Society of Biblical Literature, 1894-9. He has published 'Keilschrifttexte Sargons, König von

LYON — LYONS

Assyrien' (1883); 'An Assyrian Manual' (1886).

Lyon, Mary, American educator: b. Buckland, Mass., 28 Feb. 1797; d. South Hadley, Mass., 5 March 1849. She began teaching at 18, and later studied at the Sanderson Academy, Ashfield, and at the Byfield Academy, near Newburyport, continuing to teach at intervals. In 1821 she began teaching at the Sanderson Academy, and in 1824 became associate principal of the Adams Female Academy at Londonderry, N. H. In 1828, with the principal of this school, she moved to Ipswich, Mass., where they were followed by a number of their pupils, and established a seminary of which Miss Lyon had practically the entire charge for several years. The establishment of a seminary for girls, embodying the same principles of education as the Ipswich school, and at the same time offering its advantages at a low price, became the main purpose of her life; and in 1834 she resigned her position at Ipswich, and, amid great discouragements, undertook the work of founding such a seminary. Aided to some extent by clergy-men and others, she succeeded in obtaining contributions, and on 8 Nov. 1837 a part of the buildings having been completed, the school was opened in South Hadley with about 80 pupils, under the name of the Mount Holyoke Female Seminary. She was president of this school for 12 years, during which time it was enlarged, and gained a national reputation for its high intellectual and moral standard. (See MOUNT HOLYOKE COLLEGE.) She wrote 'Tendencies of the Principles embraced and the System adopted in the Mount Holyoke Female Seminary' (1840), and the 'Missionary Offering' (1843). Consult: Hitchcock, 'Life and Labors of Mary Lyon.'

Lyon, Matthew, American politician: b. Wicklow County, Ireland, 1746; d. Spadra Bluff, Ark., 1 Aug. 1822. He went to New York in 1755, and, being too poor to pay for his passage, was bound out by the captain of the ship to a farmer in Connecticut, in whose service he remained a number of years. Subsequently he became a citizen of Vermont, and in July 1776 was commissioned as lieutenant in one of the companies of "Green Mountain boys." He served later as commissary-general, and eventually rose to the rank of colonel of militia. He was one of the founders of Fairhaven (1783), where he engaged in paper-making, iron casting, and other occupations, and at one time edited a newspaper of an ultra democratic character, entitled 'The Scourge of Aristocracy and Repository of Important Political Truth,' of which the types and paper were manufactured by himself. Becoming an active political leader, he was elected in 1797 to Congress by the Anti-Federal Party. In October 1798 he was convicted of a libel on President Adams, and imprisoned for four months, a fine of \$1,000 which had also been imposed upon him being paid by his friends. An attempt to expel him from Congress as a convicted felon failed for want of a two thirds vote. During this congressional term he had a violent altercation on the floor of the House with Mr. Griswold of Connecticut, ending in blows; but the motion to expel them was defeated. In 1799, while a prisoner, he was re-elected to Congress from Vermont. After the expiration of his term he removed to Ken-

tucky, where at the next Congressional election (1803) he was returned to the House, of which he continued a member until 1811. Subsequently he held the office of United States factor for the Cherokee Indians by the appointment of President Monroe, and removed to Arkansas, of which he was the territorial delegate-elect to Congress at the time of his death. Though rough and impetuous in manner, he was an able debater, and to the end of his life continued a man of active business habits.

Lyon, Nathaniel, American soldier: b. Ashford, Conn., 14 July 1818; d. Wilson's Creek, Mo., 7 Aug. 1861. He was graduated from West Point in 1841; served in the Mexican War, 1846-7, being present at the siege of Vera Cruz, and the assault on the City of Mexico; and was on duty in Kansas during the Free State agitation. In February 1861 he was assigned to St. Louis, Mo., where he had charge of the arsenal; he was most active and efficient in the Union cause, organized the Home Guard, and on 10 June 1861 captured Camp Jackson, a rendezvous of the secessionists. Soon afterward he was made brigadier-general of volunteers, and given command of the department. He refused all compromise with Governor Jackson, who sympathized with the secessionists, and in June occupied Jefferson City, the capital of the State, and defeated the Governor's troops at Boonville on the 17th. He then went to Springfield, whence he advanced on 1 August to meet a part of the Confederate army, which was advancing into Missouri under McCulloch; he defeated them at Dug Spring, and returned to Springfield. But the Confederate forces were soon increased by the arrival of the troops under Price, and General Lyon was opposed by an army considerably greater than his own. Unwilling to surrender southwestern Missouri without a struggle, he decided to risk a battle, and accordingly advanced from Springfield to Wilson's Creek, where his troops were defeated, and he himself killed, after a gallant fight. He bequeathed nearly all his property, about \$30,000, to the government to aid in the preservation of the Union. In 1862 a collection of his letters in favor of the Republican party and the election of Lincoln (1860) was published under the title 'The Last Political Writings of General Nathaniel Lyon.' Consult 'Life' by Woodward; Peckham, 'General Nathaniel Lyon and Missouri in 1861'; and Churchill's novel, 'The Crisis.'

Lyons, l'ônz, or **Lyon**, lê-ôn, France, the capital of the department of the Rhône, 311 miles by rail southeast of Paris, and 170 miles north of Marseilles, is the second city of industrial importance, and the third in point of population in the country. It is situated at the confluence of the Saône and Rhône, the central business section being on the tongue of land that projects between the rivers to their junction, and extends northward to the hill of La Croix Rousse; while the ancient mediæval town is on the steep slopes of the Fourvières hill, rising from the west bank of the Saône, and the modern industrial suburb of La Guillotière, with its numerous factories, is on the east bank of the Rhône. Thirteen bridges span the Saône at this point, varying from 250 to 450 feet wide, and nine bridges the Rhône, over 600 feet wide. A series of detached forts crown different heights within a circuit of

LYONS

43 miles, making Lyons, with its extensive barracks and considerable garrison, a defensive position of great strategic importance. The older quarters of the town are crowded, dirty and unhealthy, with narrow, irregular streets, lined by tall, ungainly buildings. The best parts are the 13 miles of magnificent quays, built since the 18th century as a protection against the periodical river floods, and now laid out with finely planted walks, stately mansions, municipal buildings, railroad depots, capacious warehouses, etc. Among the notable squares and open places are the Place des Terreaux, facing which stands the Hôtel de Ville, and the large and handsome Place Bellecour, the fashionable promenade. The chief public edifices are more remarkable for their antiquity than for the beauty of their architecture. The cathedral of St. John on the slope of the Fourvières, on the right bank of the Saône, is in the Gothic style of the 12th century, and has four towers, two of which flank the west front, while the other two, shorter but more massive, form the transepts. Higher up the slope is the modern church of Notre Dame, an imposing composite edifice occupying the site of the *Forum Vetus* built by Trajan. Beside it is a tower or Belvedere 680 feet above the Saône. On the other side of the Fourvières is the church of St. Irenæus, the second bishop of Lyons. The church itself is an uninteresting modern structure, but it stands on the grave of the martyred bishop, and has beneath it the reputed crypt in which Polycarp preached, and 19,000 Christians at a later period were massacred by orders of Septimius Severus, 202 A.D. A little above the cathedral is the Palais de Justice, and lower down on the opposite bank of the Saône is the church of the Abbey of Ainay, beneath whose sacristy, and penetrating below the bed of the river, are dungeons without light or air, in which many of the early Christians were immured previous to martyrdom. Other noteworthy churches are the Church of St. Nizier, of the 14th century, one of the largest in the town; that of St. Bonaventure, the patron saint of Lyons; and the Church of the Chartroux, surmounted by a superb dome seen from all quarters of the city. The archiepiscopal palace, situated near the cathedral, is a large edifice of no architectural merit. The Hôtel de Ville is considered one of the finest edifices of the kind in France. It is an isolated square, and is surmounted by a dome 164 feet high. The public library, occupying part of the buildings of the college on the Quai de Retz, is the best provincial collection in France. The Palais des Arts, facing the Place des Terreaux, is a fine majestic edifice. It contains a picture-gallery, a cabinet of medals, a gallery for statues, and another for ancient stuccoes, a depot of mechanical inventions for the fabrication of silks, with a library attached; a free school of design, and a large hall used as the exchange.

The chief educational establishments are the college, or university, occupying a fine modern building and attended by over 2,000 students in the different faculties; the Martinière, a great school of science and the industrial arts with 500 students; a free Catholic university; various institutions of a special character, such as schools of chemistry and chemical industry, schools of design, of commerce, of weaving; a celebrated veterinary school, the botanic garden, etc. Charitable establishments are large and

numerous. The most important are the Hôtel-Dieu, the Maison de la Charité, the Mont de Piété, occupying the Manécanterie or deanery attached to the cathedral; and the Hospice de l'Antiquaille, on the site of the ancient Roman palace or prætorium, now used partly as a lunatic and partly as a Magdalen asylum, and general penitentiary. There are several prisons—the New Prison, an extensive building, well arranged; the Maison des Recluses, now employed as a military prison; and the prison of Roanne, regarded as a model in its kind.

As a manufacturing town Lyons early acquired and has long maintained a first place. It is the most important centre of silk manufacture in the world, employing directly and indirectly over 200,000 persons. Other manufactures are hats, boots, jewelry, and liqueurs; besides dye-works, foundries, glass-houses, potteries, tanneries, breweries, and chemical works. Lyons is admirably situated for trade, on two navigable rivers, which make it a great entrepot both for the north and the south. It forms the common centre where the highways and railroads from Paris, Marseilles, Bordeaux, from Switzerland, and Italy, all meet; it communicates with the Rhine by the Rhône and Rhine Canal, while several other canals, branching off from its rivers, give it ample means of transport over a great part of the interior of the country. The chief imports are raw silk, wine, brandy, oil, soap, flax, hemp, rice, salt, cotton, wool, coffee, dyes, earthenware, and timber; and the exports, spun-silk and silk-goods ribbons, hats, straw-bonnets, woollens, flannels, linens, corn, flour, chestnuts, liqueurs, paper, hemp, ironware, etc.

As Lugdunum, Lyons was an early Gallic town, and when Cæsar invaded Gaul was a place of some importance; it figures more or less in the subsequent history of the Roman Empire, several emperors in succession making it their occasional residence and vying with each other in adorning it. It early received Christianity, and toward the end of the 2d century numbered thousands of Christians among its inhabitants. Its first bishop, Pothinus, died a martyr in 197, and his successor Irenæus died also a martyr in 202. Lyons was afterward sacked by the Huns and Visigoths, who destroyed many of its noblest Roman structures. In the 8th century it fell for a time into the hands of an army of Saracens from Spain, and suffered severely; but recovered its prosperity under Charlemagne, on the dissolution of whose empire it became the capital of the kingdom of Provence. Subsequently it fell under ecclesiastical domination, and was long governed by a succession of archbishops. In 1312 Lyons was annexed to the crown of France. It owes its new quays and several of its finest edifices to Louis XIV. The revolution of 1793 occasioned fearful reverses. The inhabitants, finding their industry paralyzed and their trade destroyed, rebelled against revolutionary violence, and the convention let loose its forces upon them; wholesale butcheries for many days deluged the town with blood. Since that period questions of an economical, or rather socialist nature, culminated in the sanguinary revolts of 1831, 1834, 1849 and 1871. Several important figures in history were natives of Lyons, among them the Roman emperors Marcus Aurelius, Claudius, and Caracalla, and the celebrated general Germanicus. Pop. (1901) 459,099.

LYONS — LYSANDER

Lyons, Iowa, formerly an independent city in Clinton County, but incorporated with the city of Clinton in 1895. See CLINTON.

Lyons, Kan., city, county-seat of Rice County; on the Atchison, T. & S. Fe, the Missouri P., the St. Louis & S. F. R.R.'s; about 180 miles west by south of Topeka and 25 miles north by west of Hutchinson. It is situated in a fertile agricultural region in which stock-raising is a prominent industry. Nearby are salt deposits, like that at Hutchinson in Reno County, a remarkably fine salt, obtained from a considerable depth below the surface. Some of its industrial establishments are salt works, grain elevators, gas-engine works, and flour-mills. Its trade is chiefly in grain, salt, livestock, flour, and corn. The city owns and operates the waterworks. Pop. (1900) 1,736.

Lyons, N. Y., village, county-seat of Wayne County; on the Erie Canal, and on the West Shore and the New York C. & H. R. R.R.'s; about 40 miles east by south of Rochester. Lyons was founded in 1795 and incorporated as a village in 1854. It is situated in a fertile agricultural region, and its extensive water power has contributed to its development as a manufacturing village. Its chief manufacturing establishments are a beet-sugar factory, barrel factory, distilleries of peppermint oil, a pottery, and machine-shops. Slipper-soles and silverware are also manufactured. The Union School Library has about 4,000 volumes. Pop. (1900) 4,300.

Lyons, Councils of, two synods held at the city in France from which they derive their name and considered ecumenical by the Roman Catholic Church. When the quarrel between the Emperor Frederick II. and Innocent IV. had resulted in the banishment of the latter from Rome, the pope summoned a council in 1245 at which the patriarchs of Aquileia, Antioch and Constantinople, as well as the Emperor Baldwin II., were present with several royal delegates. Thaddæus of Susa represented Baldwin, who was, in spite of that delegate's emphatic protests, solemnly deposed, and his subjects released from their allegiance. When Gregory X. took the tiara, his first step was to attempt a reunion of Christendom, as represented by the Greek and Latin churches, which had been parted by schism mainly on the question of the *filioque* (q.v.), and Latin accretions to the doctrine of purgatory. The second Council of Lyons met 1274 under his presidency and the desired union was apparently effected, for both Greek and Latin prelates sang the creed including the clause asserting the double procession. The tie that bound them, however, proved a rope of sand, and the schism has continued to this day. See GREEK CHURCH.

Lyons, Gulf of. See LION OR LYONS, GULF OF.

Lyre, the most ancient of stringed instruments, which originally had but three strings. The Egyptian and Grecian lyres were at first strung with the sinews of animals. The number of the strings was at last increased to sixteen. It was played with a stick of ivory or polished wood, also with the fingers. The body of the lyre was hollow, to increase the sound. Few objects are so graceful in form and susceptible of such various application in the fine arts. As a musical instrument it has now gone out of use

among the civilized nations, though a rude form of it is still to be met with in the hands of the shepherds of Greece and among the negro tribes of Africa. It is the symbol of Apollo.

Lyre-bird, a remarkable Australian bird which derives its name from the form of the tail in the male, which much resembles that of the conventional Apollo's lyre; the tail of the female is rather long, but simply wedge-shaped. There are two species, about the size of chickens, both reddish brown and called "native pheasants" by the colonists, constituting the genus *Menura* and family *Menuridae*, and regarded as the lowliest of the *Passeres*, and of very ancient origin. They dwell in the "scrub" or open woods, and rarely leave the ground, avoiding their enemies by swift running. Their nests are placed upon the ground, are well woven of sticks and plant-stems, and are covered by a dome-like roof, leaving an entrance only at the sides. In the mating season the males scrape up mounds of leaves and rubbish upon which they strut about, sing and do their best to display their long and handsome tails to the hens. The better known species is the long-tailed one (*M. superba*), but both are now rare.

Lyric Poetry, that species of poetry by which the poet directly expresses his emotions. The predominance of feeling in lyric poetry is what chiefly distinguishes it from dramatic poetry, in which action and character, independent of the individual emotion of the poet, predominate; and from epic poetry, of which a series of actions and characters, as contemplated and exhibited by the poet, is the characteristic. It is necessary that the feeling represented should be itself poetical, and not only worthy to be preserved, but accompanied by a variety of ideas, beauty of imagery, and an eloquent flow of language. Milton, Chatterton and Burns are among the better known English writers of lyric poetry.

Lys, îles, or Leye, li-ě, Belgium, an affluent of the Scheldt, which rises near Lysbourg, Pas-de-Calais, France, and after a northeasterly course of 130 miles, unites with the Scheldt at Ghent, Belgium.

Lysander, li-săn'dér, Spartan general: d. 395. His father was Aristocritus, a Lacedæmonian of the purest blood, being of Heracleidan descent, his mother a Helot who brought him up in poverty. His fine qualities, however, procured him the command of the Spartan fleet off the coasts of Asia Minor (408). He established his headquarters at Ephesus, which he raised to prosperity. Next year he was succeeded by Callicratidas. In a short time his reputation had so increased that the Asiatic allies of Sparta requested the Lacedæmonians to invest him a second time with the command. Accordingly, Lysander with the title of vice-admiral (405 B.C.), defeated and captured the Athenian fleet off Egospotamos. This decisive victory put an end to the Peloponnesian war. Shortly afterward he set sail for Athens, which he blockaded. The city was starved into capitulation (404), the long walls and the fortifications of the Piræus were demolished; and the oligarchy of the Thirty Tyrants was established, which governed with terrible cruelty. Lysander then returned to Lacedæmon, where his ambitious and unscrupulous character made itself more palpable than ever. He was excessively

LYRE BIRD

LYSIAS—LYTTON

fond of praise, and was the first of their own countrymen to whom the Greeks erected altars, offered sacrifices as to a god, and celebrated festivals. On his return to Sparta Lysander, stung by the ingratitude of Agesilaus, whose succession to the throne he had secured, resolved to destroy the constitution of his country by abolishing hereditary monarchy, making the throne elective, but the Delphic and other oracles were unfavorable, in spite even of his bribes. On the outbreak of the Boeotian war (395 B.C.) he marched against Haliartus and was killed in battle under its walls.

Lysias, *lîs'i-as*, Athenian orator: b. about 458 B.C.; d. about 380. He was a son of Cephalus, an orator, of whom Plato makes honorable mention in his 'Republic.' Lysias, at 14 went to Thurium, in Magna Graecia, to study philosophy and eloquence under Tisias and Nicias of Syracuse. Having settled in Thurium, he was employed in the government; but on the defeat of the Athenians in Sicily was banished with many of his countrymen. After Athens had recovered its freedom he exerted himself for the advantage of the city, and sacrificed much of his property for the public welfare. At first he gave instruction in eloquence; but finding himself surpassed by Theodorus, another teacher of oratory, he devoted his time to writing orations for others. He wrote more than 200, some say 400 orations, but only 223, however, were regarded as genuine. His style is applauded as a perfect example of the simple Attic eloquence. Only 34 of his orations have come down to our times. They have been published in various collections of the Attic orators; among the best separate editions of them are those by Baier and Sauppe (1850); Cobet (1863); Thalheim (1901). See Jebb, 'Attic Orators,' Vol. I. (1880).

Lysicrates, *lî-sîk'ra-têz*, Monument of, located in Athens; one of the earliest examples of Corinthian architecture. It was dedicated 334 B.C. to Dionysus, by Lysicrates, as a trophy for winning the Dionysian games. The monument, which was built in the form of a round temple was surmounted by a bronze tripod and stood on a cubical base 13 feet high. The building on account of its shape was popularly known as the "Lantern of Demosthenes."

Lysima'chia. See LOOSESTRIFF.

Lysimachus, *lî-sîm'a-kûs*, general and one of the diadochoi of Alexander the Great: b. Pella, Thessaly, 361 B.C.; d. near Corus 281 B.C. He was a low born Macedonian of great physical strength and courage. On the death of Alexander, 323 B.C., Thrace fell to the share of Lysimachus, who became also satrap of Macedonia in 286. The murder of his son Agathocles, a great favorite of the people, at the instigation of his Egyptian wife Arsinoe, provoked a revolt in Asia; Seleucus, satrap of Syria, took up the cause of the widow of Agathocles, Lysandra, and Lysimachus was killed in the battle near Corus which ensued. He founded a city on the Hellespont, named after him Lysimachi.

Lysippus, *lî-sîp'ûs*, Greek sculptor who flourished in Sicyon between 360 and 316 B.C. Alexander the Great would permit no one but Apelles to paint his portrait, and no one but Lysippus to make his statue. Lysippus was first a smith, and afterward devoted himself to sculpture, adopting the canon of Polycletus, as

exemplified in that artist's 'Doryphorus.' This canon, or standard of beauty, presents the human form with the head smaller, and the limbs longer and slenderer than in life. His statues were wrought with much greater ideal beauty than those of his predecessors. They were almost all, if not all, in bronze, and he is said to have left behind him some 1,500 works. Several of his more celebrated statues were those of Alexander, the most noted of which represented the Macedonian hero bearing a lance. This was considered as a sort of companion to the picture of Apelles in which Alexander was seen, like a second Zeus, launching a thunderbolt. Among his principal ideal works are the colossal 'Zeus' at Tarentum; 'Phoebus Apollo in his four horse Chariot' at Rhodes; the bronze statue of 'Opportunity' at the entrance of a temple in Sicyon, of which several copies are extant; the colossal bronze statue of 'Hercules' at Tarentum, and the famous 'Athlete,' of which the 'Apoxyomenus' of the Vatican is a copy.

Lysol, a brown, oily liquid, having an odor resembling creosote. It is prepared from tar oil by saponification; is a useful antiseptic for the hands in a 1 or 2 per cent solution, and is chiefly used in obstetrical operations.

Lyte, *lit*, **Eliphalet Oram**, American educator: b. Bird-in-Hand, Pa., 29 June 1842. In his youth he served in the Union army during the Civil War. He was graduated from the State Normal School at Millersville, Pa., in 1868, was professor of English and pedagogics there, 1868-87, and has been principal of that institution from 1887. He was president of the National Educational Association 1890-9, and has published 'Practical Bookkeeping' (1883); 'Grammar and Composition' (1886); and other text-books.

Lyte, Henry Francis, English Anglican clergyman and hymn writer: b. Ednam, near Kelso, Scotland, 1 June 1793; d. Nice, France, 20 Nov. 1847. He was graduated from Trinity College, Dublin, and took orders in the Anglican Church, 1815. He was curate of Lower Brixham, Devonshire, 1823-47. He published 'Tales Illustrative of the Lord's Prayer' (1826); 'Poems, Chiefly Religious' (1833); 'Miscellaneous Poems' (1868); 'Mémoir of Henry Vaughan'; 'Abide With Me'; 'Pleasant Are Thy Courts'; 'Jesus, I My Cross Have Taken'; and other hymns of his have become widely popular both in America and England.

Lytle, *lit'l*, **William Haines**, American general and poet: b. Cincinnati, Ohio, 2 Nov. 1826; d. Chickamauga, Tenn., 20 Sept. 1863. He was graduated at Cincinnati College, studied law and practised for a short time. He served as a captain in the Mexican War, and later was a member of the Ohio Legislature. During the Civil War he was colonel of the 10th Ohio regiment and was brigadier-general of volunteers, having been promoted to that rank for gallant conduct. He was killed at the battle of Chickamauga. His best-known poem is the famous 'Address of Antony to Cleopatra,' the opening line of which is 'I am dying, Egypt, dying.' Consult 'Poems' with 'Mémoir' by Venable (1884). No complete collection of his works was published.

Lytton, *lit'on*, **Edward Robert Bulwer-Lytton**, **EARL OF**, English poet and diploma-

LYTTON

tist: b. London 8 Nov. 1831; d. Paris 29 Nov. 1891. He was the only son of the well-known novelist, Bulwer-Lytton (q.v.). He was educated at Harrow and Bonn, and entered the diplomatic service in 1849, being appointed attaché at Washington, where his uncle, Lord Dalling, was minister. Subsequently he held diplomatic posts at Florence (1852) and other European capitals, and was secretary of legation successively at Copenhagen, Athens, Lisbon, and Madrid. In 1874 he was appointed minister at Lisbon, and was made viceroy of India by Disraeli in 1876. At a great durbar held at Delhi in 1877, he proclaimed Queen Victoria Empress of India. In the great famine of 1877-8 he conducted admirably the work of relief. He adopted an active policy in Afghanistan, which brought about the second Afghan war (1879). His administration was marked by notable internal reforms, such as the abolition of the inland customs, the repeal of duties on cottons, and the promulgation of new civil service rules. In 1880 he was created Earl of Lytton, and when the Conservative government retired in that year he sent in his

resignation as viceroy. In 1887 he was appointed British ambassador at Paris. For many years Lytton was better known as a poet than as a diplomatist, under the pseudonym of "Owen Meredith." His published works include: 'Clytemnestra, and Other Poems' (1855); 'The Wanderers' (1859); 'Lucile' (1860), a story in rimed anapæstic couplets, which met with a very great popular success; 'The Ring of Amasis' (1863); 'Orval, or the Fool of Time,' which is the solitary representative in English of the great Polish school of mystic verse (1869); 'Fables, in Song' (1874); 'Speeches of Edward Lord Lytton,' with a memoir (1874); 'The Life and Letters of Edward Bulwer, Lord Lytton' (1883, the narrative comes down only to 1832); 'Glenaveril' (1885); 'After Paradise' (1887); 'King Poppy,' his best poetical work, abounding in lofty poetry and gay irony, appeared posthumously (1892). As a prose writer Lytton takes high rank.

Lytton, Lord. See BULWER-LYTTON, EDWARD.

M

M the thirteenth letter of the English and most of the other West European languages, is one of the four liquids, or semi-vowels; it is also classed as a labio-nasal, its sound being produced when with lips closed and the whole uvula lowered, the breath makes a humming noise as it issues through the nostrils. The lips play the same part in the pronunciation of m as in that of b, but in pronouncing b the nasal passage has no part. Hence when that passage is obstructed or closed the sound produced is that of b not of m.

The M as a capital letter has the same form in the Greek and the Latin alphabets and in all the alphabets derived from them, and in all those alphabets generally the same sound value.

In English there are a few words of Greek origin, mostly technical, in which mn begins a syllable or a word: in such cases the m is silent, for example, mnemonic, nemonic.

In many words derived from other languages the m of the original word is changed to n in English, examples: Comitatus (Lat.) county, or contrariwise n is changed to m; Anglo-Saxon henep becomes hemp. Often p is added after m to give that letter greater distinctness, for example, exemptus, exemptus, unkenmed, unkenmpt.

M. Quad. See LEWIS, CHARLES BERTRAND.

Maartens, Maarten, mār'tēn mār-tēnz, pseudonym of the Dutch author, J. M. W. VAN DER POORTEN SCHWARTZ: b. Amsterdam 15 Aug. 1858. He passed his early life in England; was educated in Germany and at the University of Utrecht, was admitted a barrister, but chose literature as a profession, and in 1890 published his first work, 'The Sin of Joost Avelingh,' which at once arrested the attention alike of critics and of reading public. This, like all his volumes, was written at first hand in English, not, as has been sometimes supposed, translated from Dutch MS. Maartens thus presents the curious instance of an author electing to address wholly a foreign public. Indeed, only with reluctance, to safeguard himself against unsatisfactory translations, did he consent to the publication of his books in Dutch. His further works are: 'An Old Maid's Love' (1891); 'A Question of Taste' (1891); 'God's Fool' (1892); 'The Greater Glory' (1894); and 'My Lady Nobody' (1895). In America 'The Greater Glory' first appeared serially in 'The Outlook.' 'God's Fool' is perhaps Maartens' best, but 'The Sin of Joost Avelingh' and 'The Greater Glory' have had the greatest popular success. These books afford a by no means flattering picture of the Dutch bourgeoisie, but are admittedly accurate.

Maasin, mā-ä'sin. Philippines, (1) a pueblo of the province of Leyte, island of Visayas.

situated on the extreme southwestern coast, 75 miles southwest of Tacloban. It is a handsome, well-built city, and has a large trade, mostly in hemp. Pop. 18,500; (2) a town of the province of Iloilo, Panay, on a tributary of the Sague branch of the Jalaur River, 18 miles northwest of Iloilo. Pop. 9,700.

Maastricht. See MAESTRICHT.

Maat, or **Mat,** in ancient Egypt, the goddess of truth and justice. She is said to have guided the souls of the dead to Osiris (q.v.).

Mab, the fairy queen of Connaught and a familiar name in Celtic folk-lore. Mab has been celebrated by Shakespeare and other English poets. The name is of uncertain origin, being variously derived from the Midgard of the Eddas, the Habundia or Dame Abonde of Norman fairy lore, and from the Cymric *mab*, a child. According to Voss, Mab was not the fairy queen, the same as Titania, this dignity having been ascribed to her only by mistaking the use of the old English word *queen*, which originally meant only a woman. Queen Mab is mentioned in Shakespeare's 'Romeo and Juliet,' Ben Jonson's 'Satyr,' Randolph's pastoral of 'Amyntas,' Drayton's 'Nymphidia,' and Milton's 'L'Allegro.'

Mabalacat, mā-bā-lā'kāt, a pueblo of the province of Pampanga. Luzon, 16 miles north of Bacolor, the provincial capital. It is on the main road, and on the Manila and Dagupan railroad. Pop. 10,600.

Ma'bery, mā'bér-ī, Charles Frederic, American chemist: b. North Gorham, Maine, 13 Jan. 1850. He was graduated at the Lawrence Scientific School, Harvard, in 1876, and was assistant instructor in chemistry there from 1875 to 1883, since when he has been professor of chemistry in the Case School of Applied Science of Cleveland, Ohio. In the investigation of the composition of American petroleum his work has brought him into special prominence. He has also done valuable work in connection with the production of aluminum by means of electricity. The results of his original investigations at Harvard were largely published by him in papers appearing in the 'American Chemical Journal.'

Mabie, Hamilton Wright, American editor and author: b. Cold Spring, N. Y., 13 Dec. 1845. He was graduated from Williams College in 1867, from the Columbia Law School in 1869, practised law in New York in 1869-79, in 1879 became connected with the 'Christian Union' (now 'The Outlook'), and in 1884 formally entered its editorial staff. He became known as a contributor of essays to periodicals, and as an occasional speaker and lecturer on educational and literary subjects. Among his public ad-

dresses was that at the dedication of the Zolnay bust of Poe in the University of Virginia. He also became president of the New York Kindergarten Association. His works are: 'Norse Stories Retold from the Eddas' (1882); 'Nature in New England' (1890); 'My Study Fire' (1st series, 1890; 2d, 1894; 3d, 1899); 'Under the Trees and Elsewhere' (1891); 'Short Studies in Literature' (1891); 'Essays in Literary Interpretation' (1892); 'Nature and Culture' (1897); 'Books and Culture' (1897); 'Work and Culture' (1898); 'In the Forest of Arden' (1898); 'The Life of the Spirit' (1899); 'Shakespeare: Poet, Dramatist and Man' (1900); 'Works and Days' (1902); 'Parables of Life' (1902).

Mabillon, Jean, zhōn mā-bē-yōn, French ecclesiastic and author; b. St. Pierre du Mont, Champagne, 23 Nov. 1632; d. Paris 27 Dec. 1707. Having joined the Benedictines of Saint Maur, he was chosen to assist Dom Jean d'Achery in the compilation of his 'Spicilegium Vetus Scriptorum,' and subsequently edited the works of St. Bernard (1690) in the series of the fathers published by his congregation. In 1683 he was sent to Germany by Louis XIV. to collect documents relating to French history; and the applause with which his 'Iter Germanicum,' a narrative of the journey, was received, induced the king to send him to Italy in 1685 to make purchases for the royal library. A result of this tour was his 'Museum Italicum' (1687-9), a work of great value. Later he was selected by his superiors to refute Rancé, abbot of La Trappe, who had condemned the custom of permitting monks to study. His 'Essay on Monastic Studies,' which appeared in consequence in 1691, was equally remarkable for sound argument and good temper. His most important other works are: 'Vetera Analecta' (1675-85); 'De Re Diplomatica' (1681); and 'De Liturgia Gallicana' (1685). He edited and published with Ruinart 'Acta Sanctorum Ordinis Sancti Benedicti,' and published the first four volumes of the 'Annales Ordinis Benedictini' (1703-39). A collection of his 'Ouvrages posthumes' appeared in 1724, and his 'Inedited Correspondence with Montfaucon, Magliabecchi, etc.,' was edited by Valéry (1847).

Mabini, mā-bē'nē, Apollinario, Filipino insurgent; d. Philippine Islands 1903. He was educated in the Catholic College of Manila, entered the public service under Spanish rule, became advocate of the treasury, resigned in 1896, and entered the insurrection. He became privy councillor of Aguinaldo, and for a time was minister of foreign affairs and chief of the supreme court in the latter's so-called government. In 1899 he surrendered to the United States, was sent into exile, but allowed to return in 1903. He was the brains of the Malolos government while it lasted.

Mabinogion, māb-i-nō'g'i ōn, The, the name generally but incorrectly applied to all mediæval Welsh stories. Of the general title 'Mabinogion,' which Lady Charlotte Guest's English version (1838-49) has made familiar, John Rhys gives an explanation. "An idea prevails," says Principal Rhys, "that any Welsh tale of respectable antiquity may be called a mabinogi; but there is no warrant for extending the use of the term. . . . For, strictly speaking, the word mabinog is a technical term belonging to the

bardic system, and it means a literary apprentice. In other words, a mabinog was a young man who had not yet acquired the art of making verse, but who received instruction from a qualified bard. The inference is that the 'Mabinogion' meant the collection of things which formed the mabinog's literary training; his stock in trade, so to speak; for he was probably allowed to relate the tales forming the 'four branches of the Mabinogion' at a fixed price established by law or custom. If he aspired to a place in the hierarchy of letters, he must acquire the poetic art." In Lady Charlotte Guest's later edition in one volume (1877),—the most convenient edition for reference,—12 tales in all will be found. Of these, the most natively and characteristically Welsh in character are such tales as the vivid, thrice romantic 'Dream of Rhonabwy,' which owes little to outside sources. 'The Lady of the Fountain,' on the other hand, shows in a very striking way the influence of the French chivalric romances that Sir Thomas Malory drew upon so freely in his 'Morte d'Arthur.' In the admirably edited Oxford text of the Welsh originals by Rhys and Evans' (1887-90), 'The Lady of the Fountain' appears under the title of 'Owain and Lunet'; and Lunet's name at once recalls Tennyson's 'Idylls of the King.' The old manuscript volume of the 'Mabinogion,' known as the 'Llyfr Coch o Hergest,'—the 'Red Book of Hergest,'—is in the famous library of Jesus College, Oxford, the one college in the older English universities which has a time-honored connection with Welsh scholarship and Welsh literature.

Mably, Gabriel Bonnot de, gā-brē-ēl hōn-ō dē mā-blē, French ecclesiastic and publicist; b. Grenoble 14 March 1709; d. Paris 23 April 1785. His family name was Bonnot. Like his younger brother, the philosopher Condillac (q.v.), he was destined for the Church, and after studying at the seminary of Saint Sulpice in Paris was ordained subdeacon. He showed little liking for theology, and for some time was secretly employed in affairs of state by his relative Cardinal de Tencin, minister of Louis XV., conducting the most difficult negotiations and writing elaborate reports with an ability for which the minister received all the credit. Later he applied himself to literature, and in 1748 published his 'Droit publique de l'Europe,' which achieved a remarkable success. It was followed by 'Observations sur les Grecs' (1749); 'Observations sur les Romains' (1751); 'Entretiens de Phocion' (1753); 'Observations sur l'Histoire de France' (1755); 'Principes des Négociations' (1757); 'De la Manière d'écrire l'Histoire' (1773); 'De la Législation' (1776); 'De l'Idée de l'Histoire' (1778); and 'Principes de Morale' (1784). Having been requested by the government of Poland to prepare for them a code of laws, he visited that country in 1771, and published in 1781 a work 'Du Gouvernement de la Pologne.' He was also consulted by the American congress in 1783 on the preparation of the Constitution, and embodied his views in his 'Observations sur le Gouvernement et les Lois des Etats Unis d'Amerique' (1784). In this work he foretold the speedy downfall of the United States. Consult: Guervier, 'L'Abbé Mably, Moraliste et Politique' (1886).

Mabuchi, mā-boo'chē, Japanese writer and religious teacher; b. 1693; d. 1769. He was dis-

MAC — McALLISTER

tinguished as a scholar, and utilized his great learning in the endeavor to purify the native religion, Shinto, from the accretions of Chinese and Buddhist philosophy, etc., whereby he regarded it as having been corrupted. His love and knowledge of antiquity enabled him to present the native faith in its original simplicity, and his teachings were exemplified in his own life. To him modern students are largely indebted for direct success to ancient Japanese poetry.

Mac, or **Mc**, a Gaelic prefix, as MacGregor, MacDonald, McKinley, etc. It corresponds with son in surnames of Teutonic origin, Fitz in those of Romance origin, or Ap or Ab in Welsh surnames.

Macabebe, mā-kā-bā'bā, Philippines, a pueblo of the province of Pampanga, Luzon, situated at the head of the Pampanga River delta, 9 miles from Manila Bay and 7 miles southeast of Bacolor. Pop. 10,400.

Macaber (mā-kā'bēr) **Dance**. See DANCE OF DEATH.

Macadam, māk-ād'am, **John Loudon**, Scottish engineer: b. Ayr 21 Sept. 1756; d. Moffat, Dumfriesshire, 26 Nov. 1836. In 1770 he was sent to an uncle at New York, where he remained during the War of Independence, and realized a considerable fortune as agent for the sale of prizes. At the close of the War he returned to Scotland, and in 1798 was appointed agent for revictualing the navy in the western ports of Great Britain, and took up his residence at Falmouth. He afterward resided for many years at Bristol. It was here, in 1815, on being appointed surveyor-general of the Bristol roads, that he first had full scope for putting in practice the important improvements in road-making which had long before occupied his thoughts. By 1823 his general success was admitted; and in 1827 he was made general surveyor of roads. In carrying out his improvement he had expended several thousand pounds from his private resources; and the House of Commons, having been satisfied of the fact by the investigation of a committee, both reimbursed the actual outlay, and presented him with an honorary tribute of £2,000, presenting to him a total of £10,000. His invention was rapidly introduced throughout the civilized world, and his own name was made synonymous with it.

Macadam, a modern system of road-making invented by J. L. Macadam (q.v.), which consists in forming the roads out of hard materials such as granite, or basalt broken into pieces, none of which are too large to pass through an iron ring 2½ inches in diameter, and then deposited evenly in a bed of from 6 to 12 inches in thickness. The bed thus laid becomes perfectly compact and smooth; and in proportion as it is worn away, or cut into ruts by traffic, can easily be restored by a new coating of materials. See ROADS AND ROAD-MAKING.

McAdoo, māk-a-doo', **William Gibbs**, American jurist: b. near Knoxville, Tenn., 4 April 1820; d. 1894. He was graduated in 1845 from the East Tennessee University at Knoxville, sat in the Tennessee Legislature 1845-6, and served in the Mexican War in 1847. He was afterward admitted to the bar and was attorney-general of the Knoxville judicial dis-

trict, 1851-60. He removed to Georgia in 1862, served in the Confederate army during the Civil War and in 1871 became judge of the 20th judicial district of Georgia. With H. C. White he published 'Elementary Geology of Tennessee.'

MAfee, mā-kā'fē, **Robert Breckinridge**, American historian: b. Mercer County, Ky., February 1784; d. there 12 March 1849. From 1833 to 1837 he was United States *chargé d'affaires* at Bogota, Colombia, and he was a member of the Royal Antiquarian Society of Denmark. He published 'History of the War of 1812' (1816), and much important information has been gleaned from his private journals relating to the early history of his native State.

MAlester, mā-kāl'ēs-tēr, **Miles Daniel**, American general: b. New York 1833; d. 1869. He was graduated from the United States Military Academy in 1856, and entering the engineer service became chief engineer of the department of the Ohio in 1862. In 1864 he was brevetted colonel and a year later brigadier-general.

MAlester College, a coeducational institution in St. Paul, Minn.; founded in 1885 under the auspices of the Presbyterian Church. Its departments are academic, collegiate, and musical. It also conducts a summer school with brief courses connected with the three departments. The degrees granted are A.B. and Lit B. In 1903 there were connected with the school 15 teachers and nearly 200 students. The library contained about 8,000 volumes, and the income from tuitions and other sources was about \$14,000.

McAll (ma-kāl') **Mission**, a Protestant association founded in 1871 by Robert Whitaker McAll (q.v.), and his wife, for religious work among the working people of France. On 17 Jan. 1872 the first station was opened in Belleville, one of the manufacturing suburbs of Paris. The work consists largely in striving to interest people in the questions pertaining to salvation of souls, and then urging them to affiliate with some one of the nearby Protestant churches. No effort is made by the Mission to establish churches, but some educational work has been begun in the large cities. Reports of the work for the year 1902 give in France 72 stations there the meetings are held in halls, and two mission boats. Friends of the movement in America, founded an American McAll Mission in 1883 with Philadelphia as headquarters. There are now in the United States about 65 auxiliary associations that collect and send to the French missions about one half of the whole amount of annual expenditures. The expense of the French work, in 1902, was \$68,302. Great Britain has 22 auxiliary associations and Canada 10. Friends in other countries contribute to the support of the missions.

McAllister, **Samuel Ward**, American society leader: b. Savannah, Ga., about 1830; d. 1895. He came of a family several of whose members were conspicuous at the bar. With his father, in 1850, he went to California, where he remained two years, and whence he removed to Newport, R. I., and afterward to New York city. Becoming possessed by marriage of a considerable fortune, he was able, by means of influential connections through his mother and wife, to enter into social life with the advantages of

personal qualification and family prestige. As a raconteur as well as an accomplished gourmet he had already attained prominence within a select circle when, by a well-turned remark, he became the leader of leaders in New York society, which, according to his strict limitation, included but 400 persons. The popular expression "The Four Hundred" originated from this assertion of McAllister's. He made contributions to the press, which, however, impaired rather than strengthened his unique position, as did also his volume 'Society as I have Found It' (1890).

McAllister, Fort. See FORT McALLISTER.

McAlpine, mā-kal'pin, **William Jarvis**, American engineer: b. New York 1812; d. New Brighton, Staten Island, N. Y., 16 Feb. 1890. He took up engineering in 1827 under J. B. Jarvis, with whom he continued till 1839, and succeeded him as engineer of the Erie Canal enlargement. In 1851 he became State engineer of New York and State Railroad Commissioner 1855-7. He was subsequently engineer of several important railways, constructed the city waterworks at Albany and Chicago, and in 1870 his plans for improvement of the Cataracts of the Danube were accepted by the Austrian government. While engineer of the department of parks 1879-80, he constructed the Riverside Drive in New York.

Macao, mā-kow' or mā-kā'ō, China, a Portuguese settlement and seaport on the west shore of the mouth of the Canton River, 40 miles west of Hong-Kong. It occupies a high peninsula, formerly the island of Macao, but now united by a narrow isthmus north of the town with the island of Hiang-shan. The settlement is about eight miles in circuit; and its limits landward are defined by a barrier wall stretching across the isthmus, where a guard of Chinese troops is stationed to prevent foreigners from trespassing on the Inner Land. The town occupies a slope gradually descending to the sea, backed by a range of lofty hills, and having an extensive plain stretching east. It is nearly surrounded with water, and is open to the sea-breezes on every side. The houses occupied by the foreign population are large, roomy, and open; and the shops are numerous. The quay or "Praya Grande" is commodious, forms a pleasant drive, and is protected by a battery. The harbor is formed between the peninsula on which the town stands and the large island of Twee-lien-shan, to the west. Macao is considered the healthiest residence in southeast Asia. Near it, in a beautiful garden, is the grotto in which the poet Camoens is said to have finished the 'Lusiad.' The principal exports are tea, cassia and cassia oil, anise and anise oil, and opium. The commerce, which is chiefly carried on with Hong-Kong, Canton, Batavia, and Goa, has greatly declined since the opening of the rival free ports, and a considerable part of the colonial revenue, which amounts to about \$375,000, is drawn from a tax on the gambling tables for which Macao is notorious. The Portuguese first obtained permission to form a settlement and to trade at Macao in 1557. From 1563 they were required to pay a yearly tribute to the Chinese government, and their trading privileges were much restricted till 1844, when they were allowed to carry on commerce with the five ports then open to foreigners. Ma-

cao was then declared a free port, but the Chinese continue to ignore the territorial claims of the Portuguese. Pop. (1896) 78,627, inclusive of 74,568 Chinese, 3,898 Portuguese and 116 foreigners.

Macaque, ma-kāk', one of the small, short-tailed Asiatic monkeys of the genus *Macacus* and family *Cercopithecidae*, which are so docile, intelligent and interesting as a rule that they are common in menageries and frequently kept as pets; their gentleness and playfulness disappears as they grow old, however, and they are then likely to become morose and savage. They go about in troops, keeping by themselves, and differing from other monkeys in most of their actions and cries. Some of the best known are the quaintly crested capuchin, or bonnet-monkey (*M. sinicus*), excessively common and pestiferous in southern India; the entellus monkey (q.v.) of northern India; the large pig-tailed (*M. leoninus*) of Japan, whose likeness is seen in numberless Japanese drawings and carvings. Ranging over so wide a variety of countries their habits and food differ greatly. Besides the fruit, juicy leaves and insects eaten by most monkeys they devour small reptiles, young birds, frogs, and crabs, the last-named forming the principal diet of a Malayan species (*M. cynomolgus*). One species is isolated in the mountains of Algeria and Morocco, whence they were long ago carried, no doubt, to the island of Gibraltar, where they are known to the English of the garrison as "Barbary apes" (*M. inuus*), and the small band upon the Rock are carefully protected from harm.

Macaroni (Ital. *maccheroni*), a peculiar paste or dough prepared from wheat flour and manufactured into tubes or ribbons. It is an Italian invention, and, though made by a simple process, has never been produced with so great success in any other country. The grain grown in the more southern countries of Europe is said to possess a greater amount of gluten, and is therefore better adapted to this manufacture. The wheat, after being washed, is freed from the husks and ground in water mills, when hot water is added till it is of the consistency of stiff dough. Five different qualities of flour are obtained by an equal number of siftings, the last giving the finest and most delicate that can be made. To reduce the dough to tubes or ribbons, a hollow cylindrical cast iron vessel is used, having the bottom perforated with holes or slits. When this is filled with the paste, a heavy iron plate is driven in by a powerful press, which forces the paste through the holes, and gives it the shape of the perforations, the workman cutting off the pieces of the desired length as they come through. During this process it is partially baked by a fire made under the cylinder. Sometimes the flat pieces are formed into tubes by uniting the edges before they are thoroughly dry. After being hung up for a few days they are ready for use. The largest tubes are called *maccheroni*, the smaller *vermicelli*, and the smallest *fedelini*. Macaroni is prepared for the table by boiling and baking with grated cheese, and is in common with vermicelli and the other varieties much used in the preparation of soups. Since about 1880 the use of macaroni in the United States has largely increased, and where it was once only consumed by Italians in this country, it is now eaten by all classes. Numcr-

MACARONIC VERSE—MACAULAY

ous macaroni factories have been established in New York and elsewhere. The United States imports annually from Italy over 500,000 boxes of macaroni.

Macaronic Verse, a kind of facetious poetry in which foreign words are distorted and jumbled together; so called by Teofilo Folengo, a Mantuan monk of noble family, who published a book entitled 'Liber Macaronicorum,' a poetical rhapsody, made up of words of different languages. His principal poem was called macaronic, because it was mixed up of Latin and Italian, as macaroni is mixed with cheese. Consult Morgan, 'Macaronic Poetry' (1872).

Macaroon, a popular pastry or confection made from the meal of sweet almonds, mixed with a paste of sugar and the whites of eggs. When thoroughly mixed the material is cut into round cakes and baked in an oven.

MacArthur, Arthur, American general: b. Massachusetts 1 June 1845. Having enlisted in the United States volunteer service in Wisconsin he served through the Civil War period, being promoted lieutenant-colonel and brevet-colonel in May 1865, for gallant and meritorious conduct in the battles of Perryville, Ky., Stone River, Tenn., Mission Ridge and Danridge, Ga., Franklin, Tenn., and in the Atlantic campaign. He was mustered out of the volunteer service in June 1865, and entered the regular army with the rank of lieutenant in the 17th United States infantry the following year. In the Spanish-American War he was appointed a brigadier-general of volunteers, and assigned to the Philippine expeditionary forces. He was promoted brigadier-general in the regular army, 2 Jan. 1900; commander of the Military Division of the Philippines and promoted major-general U. S. A., 1901. He returned to the United States in 1901, and in 1902 had command of the land forces in the combined military and naval maneuvers along the Atlantic coast.

MacArthur, Duncan, American pioneer: b. Dutchess County, N. Y., 14 June 1772; d. Ohio 1839. His family removed in 1780 to the western frontier of Pennsylvania, where he was early inured to the labors and privations of border life. At 18 years he went to seek his fortune in the wilderness, and participated as a ranger or scout in the warfare with the Indians in Kentucky and Ohio, until the victory of Gen. Wayne in 1797 gave peace to the western country. About the commencement of the present century he settled in Ohio as a surveyor, and in 1805 became a member of the Ohio legislature, and was appointed major-general of the territorial militia. In the War of 1812 he received the commission of brigadier-general in the army, and succeeded General Harrison in 1814 in command of the army of the West. After the peace, as a joint commissioner with Gen. Cass, he negotiated the treaty with the Indians of Ohio for the sale of their lands in that State, which was ratified in 1818. He served again in the Ohio legislature 1815-21, and in 1823-5 was a representative in congress from that State. In 1830 he was elected governor of Ohio, which position he occupied until 1832.

MacArthur, Robert Stuart, American Baptist clergyman: b. Dalesville, Quebec, 31 July 1841. He was graduated from the University of

Rochester, N. Y., in 1867, and from the Rochester Theological Seminary there in 1870, and since May of the last named year has been pastor of Calvary Baptist Church, New York. He was for a long period connected editorially with the 'Christian Inquirer' and 'Baptist Review,' has lectured on foreign travel, and published, among many other works, 'Calvary Pulpit'; 'Current Questions for Thinking Men' (1898); 'Lectures on the Land and the Book'; 'Around the World' (1899); 'Old Testament Difficulties.'

Macartney, ma-kärt'ni, **George Macartney**, 1st EARL of, British administrator and diplomatist: b. Lissanoure, Ireland, 14 May 1737; d. Chiswick, England, 31 March 1806. He was graduated from Trinity College, Dublin, studied law, and having been named envoy-extraordinary to Russia, he concluded (1767) a commercial treaty with that country. From 1769 to 1772 he was chief-secretary of Ireland; and from 1775 to 1779 governor of Grenada, W. I. The East India Company, in December 1780, appointed him governor of Madras, which post he retained for six years. The first English diplomatic mission to China was headed by Macartney, now an Irish viscount, in 1792, and before his return home he was made an Irish earl (1794). He went out governor of the new colony of the Cape of Good Hope in 1796, but ill health compelled his return in November 1798. In 1796 he was made Baron Macartney in the British peerage. Consult: Stanton, 'Macartney's Embassy to China' (1797); Barrow, 'Life and Writings of Lord Macartney' (1807).

Macassar-oil, so named from Macassar, from which it is imported, is a kind of vegetable butter, of an ash-gray color and rancid smell. The same name is given to an English cosmetic, which is used to promote the growth of the hair, and consists essentially of castor-oil, mixed with a little olive or almond oil, and highly perfumed.

Macassar, Straits of, southern Asia, the channel or narrow sea between Celebes and Borneo, about 350 miles long, and from 110 to 140 wide, except at the north entrance, where it is contracted to 50 miles.

Macatō, mā-kā-tō', a pueblo of the province of Capiz, Panay, situated on a river, three miles from the northern coast and 30 miles northwest of Capiz, the provincial capital. It is a military station. Pop. 10,200.

Macaulay, ma-kā'li, **Catharine Sawbridge**, English historian: b. Wye, Kent, 2 April 1731; d. Binfield, Berkshire, 22 June 1791. In 1760 she was married to George Macaulay, a London physician. She was an ardent Republican, and a great admirer of Washington, with whom she corresponded, and whom she visited in 1785. She published a 'History of England from the Accession of James I. to the Revolution' (8 vols. 1763-71), once very popular, and eulogized by Pitt in the House of Commons, but now neglected. Among other works of hers are: 'A Modest Plea for the Property of Copyright' (1774); 'Letters on English History from the Revolution to the Resignation of Walpole' (1778); 'Treatise on the Immutability of Moral Truth' (1783).

Macaulay, James, Scottish novelist: b. Edinburgh 22 May 1817; d. there 20 June 1902.

MACAULAY

He was educated at the University of Edinburgh, and for 35 years was in the service of the Religious Tract Society as editor-in-chief. In 1851-7 he was joint editor of the 'Literary Gazette,' and in 1858 became editor of the 'Leisure Hour Sunday at Home.' 'The Boy's Own Paper' and 'The Girl's Own Paper' were founded by him. He was a voluminous writer, and among his published works the following may be mentioned: 'Across the Ferry' (1871); 'Memory Helps in British History' (1873); 'All True: Records of Adventure' (1879); 'Luther Anecdotes' (1883); 'Gordon Anecdotes' (1885); 'Livingstone Anecdotes' (1886); 'Wonderful Stories of Daring, Peril and Adventure' (1887); and 'Victoria, Her Life and Reign' (1887).

Macaulay, Sir James Buchanan, Canadian jurist: b. Niagara, Ont., 3 Dec. 1793; d. Toronto 26 Nov. 1859. He was an ensign in the British army during the War of 1812, and subsequently studying law was admitted to the bar in 1812. In 1829 he was appointed a judge of the king's bench, from 1849 to 1856 he was chief justice of the court of common pleas, and just prior to his death became judge of the court of error and appeal. He was knighted in 1859.

Macaulay, Thomas Babington, English essayist and historian: b. Rothley, Leicestershire, 25 Oct. 1800; d. Kensington, London, 28 Dec. 1859. His early education was received at private schools; but in 1818 he went into residence at Trinity College, Cambridge, graduated with honor, and was elected a fellow in 1824. Out of deference to the wishes of his father he read law, and was called to the bar in 1826. But the labors of the profession were little to his liking; no business of consequence came to him, and he was soon deep in literature and politics.

While still a lad Macaulay displayed in a high degree many of the mental characteristics which later in life made him famous. The eagerness with which he devoured books of every sort; the marvelous memory which enabled him to recall for years whole pages and poems, read but once; the quickness of perception by the aid of which he could at a glance extract the contents of a printed page; his love of novels and poetry; his volubility, his positiveness of assertion, and the astonishing amount of information he could pour out on matters of even trivial importance — were as characteristic of the boy as of the man.

His first printed piece was an anonymous letter defending novel-reading and lauding Fielding and Smollett. It was written at 16; was addressed to his father, then editor of the 'Christian Observer,' was inserted in utter ignorance of the author, and brought down on the periodical the wrath of a host of subscribers. One declared that he had given the obnoxious number to the flames, and should never again read the magazine. At 23 Macaulay began to write for Knight's 'Quarterly Magazine,' and contributed to it articles some of which — as 'The Conversation between Mr. Abraham Cowley and Mr. John Milton touching the Great Civil War'; his criticism of Dante and Petrarch; that on 'Athenian Orators'; and the 'Fragments of a Roman Tale' — are still given a place in his collected writings. They served to draw attention to the author at the time when Jeffrey, editor of the 'Edinburg Review,' was eagerly and anx-

iously searching for "some clever young man" to write for it. Macaulay was such a clever young man. Overtures were therefore made to him; and in 1825, in the August number of the 'Review,' appeared his essay on John Milton. The effect was immediate. He was praised and complimented on every hand, and day after day saw his table covered with cards of invitation to dinner from every part of London. And well he might be praised; for no English magazine had ever before published so readable, so eloquent, so entertaining an essay. Its very faults are pleasing. Its merits are of high order; but the passage which will best bear selection as a specimen of the writing of Macaulay at 25 is the description of the Puritan.

Macaulay had now found his true vocation, and entered on it eagerly and with delight. In March 1827 came the essay on Machiavelli; and during 1828 those on John Dryden, on History, and on Hallam's 'Constitutional History.' During 1829 he wrote and published reviews of James Mill's 'Essay on Government' (which involved him in an unseemly wrangle with the Westminster 'Review,' and called forth two more essays on the 'Utilitarian Theory of Government'), Southey's 'Colloquies on Society,' Sadler's 'Law of Population,' and the reviews of Robert Montgomery's Poems. The reviews of Moore's 'Life of Byron' and of Southey's edition of the 'Pilgrim's Progress' appeared during 1830. In that same year Macaulay entered Parliament, and for a time the essays came less frequently. A reply to a pamphlet by Mr. Sadler written in reply to Macaulay's review, the famous article in which Croker's edition of Boswell's Johnson was pilloried, and the essay on John Hampden, were all he wrote in 1831. In 1832 came 'Burleigh and his Times,' and 'Mirabeau'; in 1833 'The War of the Succession in Spain,' and 'Horace Walpole'; in 1834 'William Pitt, Earl of Chatham'; in 1835 'Sir James Mackintosh'; in 1837 'Lord Bacon,' the finest yet produced; in 1838 'Sir William Temple'; in 1839 'Gladstone on Church and State'; and in 1840 the greatest of all his essays, those on Von Ranke's 'History of the Popes' and on Lord Clive. 'The Comic Dramatists of the Restoration'; 'Warren Hastings,' and a short sketch of Lord Holland, were written in 1841; 'Frederick the Great' in 1842; 'Madame D'Arlblay' and 'Addison' in 1843; 'Barère' and 'The Earl of Chatham' in 1844; and with these the long list closes.

Never before had the British reading public been instructed and amused by so splendid a series of essays. Whoever will take the pains to read the essays we have mentioned — and he will be richly repaid for his pains — cannot fail to perceive that sympathy with the past is Macaulay's ruling passion. Concerning the present he knew little and cared less. The range of topics covered by him was enormous; art, science, theology, history, literature, poetry, the drama, philosophy — all were passed in review. Yet he has never once failed to treat his subject historically. We look in vain for the faintest approach to a philosophical or analytical treatment. He reviewed Mill's essay on 'Government' and Hallam's 'Constitutional History'; but made no observations on government in the abstract, nor expressed opinions as to what sort of government is best suited for civilized communities in general. He wrote about Bacon; yet never

MACAULAY

attempted to expound the principles or describe the influence of the Baconian philosophy. He wrote about Addison and Johnson, Hastings and Clive, Machiavelli and Horace Walpole and Madame D'Arblay; yet in no case did he analyze the works, or fully examine the characteristics, or set forth exhaustively the ideas, of one of them. They are to him mere pegs on which to hang a splendid historical picture of the times in which these people lived. Thus the essay on Milton is a review of the Cromwellian period; Machiavelli, of Italian morals in the 16th century; that on Dryden, of the state of poetry and the drama in the days of Charles II; that on Johnson, of the state of English literature in the days of Walpole. In the essays on Clive and Hastings, we find little of the founders of British India beyond the enumeration of their acts. But the Mogul empire, and the rivalries and struggles which overthrew it, are all depicted in gorgeous detail. No other writer has ever given so fine an account of the foreign policy of Charles II. as Macaulay has done in the essay on Sir William Temple; nor of the Parliamentary history of England for the forty years preceding our Revolution, as is to be found in the essays on Lord Chatham. In each case the image of the man whose name stands at the head of the essay is blurred and indistinct. We are told of the trial of John Hampden; but we do not see the fearless champion of popular liberty as he stood before the judges of King Charles. We are introduced to Frederick the Great, and are given a summary of his characteristics and a glowing narrative of the wars in which he won fame; but the real Frederick, the man contending "against the greatest superiority of power and the utmost spite of fortune," is lost in the mass of accessories. He describes the outward man admirably; the inner man is never touched.

But however faulty the Essays in respect to the treatment accorded to individual men, they display a prodigious knowledge of the facts and events of the periods they cover. His wonderful memory, stored with information gathered from a thousand sources, his astonishing power of arranging facts and bringing them to bear on any subject, whether it called for description or illustration, joined with a clear and vigorous style, enabled him to produce historical scenes with a grouping, a finish, and a splendor to which no other writer can approach. His picture of the Puritan in the essay on Milton, and of Loyola and the Jesuits in the essay on the Popes; his description of the trial of Warren Hastings; of the power and magnificence of Spain under Philip II.; of the destiny of the Church of Rome; of the character of Charles II. in the essay on Sir James Mackintosh—are but a few of many of his bits of word-painting which cannot be surpassed.

While Macaulay was writing two and three essays a year, he won renown in a new field by the publication of 'The Lays of Ancient Rome.' They consist of four ballads—'Horatius'; 'The Battle of the Lake Regillus'; 'Virginius'; and 'The Prophecy of Capys'—which are supposed to have been sung by Roman minstrels, and to belong to a very early period in the history of the city. In them are repeated all the merits and all the defects of the Essays. The men and women are mere enumerations of qualities; the battle-pieces are masses of uncombined incidents; but the characteristics of the periods

treated have been caught and reproduced with perfect accuracy. The setting of 'Horatius,' which belongs to the earliest days of Rome, is totally different from the setting of the 'Prophecy of Capys,' which belongs to the time when Rome was fast acquiring the mastery over Italy; and in each case the setting is studiously and remarkably exact. In these poems, again, there is the same prodigious learning, the same richness of illustration, which distinguish the Essays; and they are adorned with a profusion of metaphor and aptness of epithets which is most admirable. The 'Lays' (1842) at once found their way into popular favor. In 10 years 18,000 copies were sold in Great Britain; 40,000 copies in 20 years; and before 1875 nearly 100,000 had passed into the hands of readers.

The same popularity attended the 'Essays.' Again and again Macaulay had been urged to collect and publish them in book form, and had refused. But when an enterprising publisher in Philadelphia not only reprinted them but shipped copies to England, Macaulay gave way; and in the early months of 1843 a volume was issued. Like the 'Lays' the 'Essays' rose at once into popular favor, and in the course of 30 years 120,000 copies were sold in the United Kingdom by one publisher.

But the work on which he was now intent was the 'History of England from the accession of King James. The Second down to a time which is within the memory of men still living.' The idea of such a narrative had long been in his mind; but it was not till 1841 that he began seriously to write, and not till 1848 that he published the first and second volumes. Again his success was instant. Nothing like it had been known since the days of Waverley. The publishers sold 13,000 copies of Macaulay in four months. In the United States the success was greater yet. Astonishing as was the success, it never flagged; and year after year the London publisher disposed of the work at the rate of 70 sets a week. In November 1855, the third and fourth volumes were issued. Confident of an immense sale, 25,000 copies were printed as a first edition, and were taken by the trade before a copy was bound. In the United States the sale, he was assured by Everett, was greater than that of any book ever printed, save the Bible and a few school-books in universal use. Prior to 1875, 140,000 copies of the 'History' were sold in the United Kingdom. In ten weeks from the day of the issue 26,500 copies were taken, and in March 1856 \$100,000 was paid him as a part of the royalty due in December.

Honors of every sort were now showered on him. He was raised to the peerage; he was rich, famous and great. But the enjoyment of his honors was short-lived; for in December 1859 he was found in his library, seated in his easy-chair, dead.

All that has been said regarding the 'Essays' and the 'Lays' applies with equal force to the 'History of England.' No historian who has yet written has shown such familiarity with the facts of English history, no matter what the subject in hand may be; the extinction of villeinage, the Bloody Assizes, the appearance of the newspaper, the origin of the national debt, or the state of England in 1685. Macaulay is absolutely unrivaled in the art of arranging and combining his facts, and of presenting in a clear and vigorous narrative the spirit of the epoch he treats.

Nor should we fail to mention that both 'Es-says' and 'History' abound in remarks, general observations, and comment always clear, vigorous, and shrewd, and in the main very just.

Consult Milman, 'Life,' prefixed to Vol. VIII. of the 'History of England' (1858-62); Arnold, 'Public Life of Lord Macaulay' (1862); Trevelyan, 'Life and Letters of Lord Macaulay' (1876); Morison 'Macaulay' (1882).

JOHN BACH McMASTER.

McAuley, Catherine, Irish founder and first superior of the Sisters of Mercy: b. Stormont House, County Dublin, Ireland, 29 Sept. 1787; d. Dublin, 11 Nov. 1841. In childhood she was adopted by a wealthy Protestant family who allowed her to remain in the church of her father, the Roman Catholic, and left her a large fortune which she wished to use for the benefit of the poor. She first erected a commodious house wherein might be taught a number of poor children, and where homeless young women might find lodging and board. This institution was opened in Dublin, 24 Sept. 1827, but the religious order was not established until 12 Dec. 1831. The members of the order take the vows of poverty, chastity, and obedience; and the works which they perform are visiting the poor, sick, and imprisoned, teaching, establishing hospitals, orphanages, homes for the friendless and other works of mercy. There are houses of her order in nearly all parts of the world. In the United States it comprises about 6,000 members. The order includes a college for young women, at Mount Washington, Md., a large number of academies, high and elementary schools, and hospitals and orphanages in nearly every State in the Union. Consult: Hartnett, 'Mémorial of Mother McAuley'; Murphy, 'Sketches of Irish Nunneries'; Member of Order of Mercy, 'Life of Catherine McAuley.'

Macaw, mā-kā', or **Arara**, a large South American parrot, of the family *Arina*. They are arrayed in plumages of scarlet, deep red, brilliant green, and deep yellow, or a combination of these gaudy colors, so that a flock of them in the sunshine is one of the gayest sights the tropics afford. They have long pointed wings, very long pointed tails, and are powerful fliers. Dwelling mainly in the forests, they feed on seeds and fruits, as a rule, but often descend in flocks upon plantations and do great damage, especially to coffee and maize. These birds are easily domesticated, and become very friendly, but they do not talk well, cannot be taught to restrain their shrill screaming, and so are not desirable except as outdoor ornaments for a large lawn. See PARROT.

Macaw-tree, or **Macaw-palm** (also called gru-gru), a tropical American palm (*Acrocomia sclerocarpa*), known by still other names in different countries of South America. It attains a height of about 25 feet, and has pinnated leaves, sometimes 12 or 15 feet in length. It is allied to the coconut, and its fruit yields a sweetish oil resembling butter in color and consistence, used as a remedy in rheumatism, etc., and as palm-oil exported for scenting.

Maçayo, mā-si-ô', Brazil. See MACAO.

Macbeth', or **Macbethad**, **MacFinlegh**, king of Scotland who reigned from 1040 to 1057. The facts of his life, so far as known, are these. During the reign of Duncan he was "normaer"

of Moray by inheritance, and by his marriage with Gruoch, grand-daughter of Kenneth IV. Duncan, in his attempt to subdue the independent chiefs of the north, was slain by Macbeth at Bothgowan, supposed to be near Elgin. By this means Macbeth became king, and, according to accounts, his reign was fairly successful. He was finally defeated in battle and slain by the sons of Duncan at Lumphanan, Aberdeen (1057). The legends which gradually gathered round the name of Macbeth were collected by John of Fordun and Hector Boece, and reproduced by Holinshed in his 'Chronicle.' These writers appear to have overlooked the excellent qualities of Macbeth as king, and regarded him with horror as a usurper. Consult: Robertson, 'Scotland under her Early Kings' (1862); Skene, 'Celtic Scotland' (1876-80).

Macbeth, a tragedy by Shakespeare, written about 1605, and printed in the first folio edition of Shakespeare 1623. See preceding.

McBurney, māk-bēr'nī, **Charles**, American surgeon: b. Roxbury, Mass., 17 Feb. 1845. He was graduated at Harvard in 1866; and from the Columbia Medical School in 1870, and has since practised his profession in New York. He was professor of surgery in the College of Physicians and Surgeons, New York, and has been visiting and consulting surgeon at St. Luke's, the Presbyterian, Roosevelt, New York Orthopedic, and other hospitals. When President McKinley was shot, Dr. McBurney was summoned to Buffalo as consulting surgeon.

McBurney, **Robert Raikes**, American religious worker: b. Castleblaney, Ireland, 31 March 1837; d. Clifton Springs 27 Dec. 1898. He came to the United States in 1854, and from 1862 was the general secretary of the New York Young Men's Christian Association. He was devoted to his work, and with the progress of years came to be recognized as the leading Y. M. C. A. secretary in the world.

McCabe, mā-kāb', **Charles Cardwell**, American Methodist bishop: b. Athens, Ohio, 11 Oct. 1836. He was educated at Ohio Wesleyan University. In 1860 he entered the Methodist Episcopal ministry, and in 1862 was appointed chaplain of the 122d Ohio Infantry. At the battle of Winchester he was captured, and held in Libby prison for four months, and soon after his release entered the service of the United States Christian Commission and succeeded in raising a large amount of money for its work. Later he became financial agent for Wesleyan University; and in 1884 was made secretary of the Methodist Episcopal Missionary Society. He has been remarkably successful in raising large amounts of money for missionary purposes. He became a bishop of his Church in 1896, and in December 1902 was elected chancellor of the American University at Washington, D. C.

Maccabees, māk'a-bēz, two books of the Scriptures considered by the Roman Catholic Church as inspired, and therefore included in the canon. The Protestant bodies hold them to be of high historic value, but at the Reformation they were excluded from the canon as not to be considered a part of the inspired Word of God. They are, therefore, classed in the Apocrypha (q.v.). They were also excluded from the Jewish canon, as well as from that of the

Greek Church, and while the Church of England allows them to be read aloud in public worship, it declares in Article VI. these "books" . . . "the Church doth read for example of life and instruction of manners; but yet doth not apply them to establish any doctrine." The main objection made by Protestants to their canonicity seems to be that they favor prayers for the dead, as in the passage Macc. xii. 45.

The books of the Maccabees are of high interest, and record in a tone of lofty enthusiasm the heroic struggle of the Jewish people to maintain their independence against overwhelming odds. The political object of this struggle was ever of less importance to them than their religious object, namely, to vindicate the sanctity of the temple and the integrity of Jewish Levitical worship. The circumstances under which this struggle took place may be summarized as follows: When the whole East as far as the Punjab and the Indus had fallen subject to the arms of Alexander the Great, it is related that after conquering Syria in its northern and Phœnician territories, and taking Tyre and Sidon, he projected a southern campaign against the Jews, whose fertile territory and wealth had attracted his notice. Then, it is said, he saw a vision of the high priest Jaddua coming out to meet him on his march. He persisted, says Josephus, in continuing this expedition against Jerusalem, but when he approached the sacred city his vision came true, which so impressed him with superstitious awe that he made a treaty with the Jews, and turned back from his purpose of sacking the city of Zion, and wasting the country. In 323 Alexander died at Babylon and the Diadochi divided among themselves the area of his conquest. Syria fell to the lot of the Seleucidæ, one of whom, Antiochus Epiphanes, formed a design to extend his kingdom by the conquest of Palestine. On completing this design he showed himself as hostile to the Hebrew religion as he had been to their national independence.

The Hebrews might have tolerated the introduction of the Greek language into their homes and markets, or even of some Greek customs and laws. But when Antiochus proceeded to a high handed defiance of their religious beliefs and observances, they felt that the honor of God, the sacredness of the law, the sanctity of the temple, were to be vindicated. Their deep-seated and hereditary fanaticism was awakened and when they saw the image of Zeus set up in the holiest place, and the Jewish ritual abolished they entered upon that struggle which is related in the books of the Maccabees.

The date of that act of desecration by which pagan worship was instituted in the temple of Jehovah is the 25th of the month Chisleu (December) 168 B.C. Soon after this a champion of Jehovah arose in the village of Modin. A certain priest named Mattathias refused to sacrifice according to the Greek rite, and actually headed an insurrection against the officials of the government. A long series of patriotic wars ensued. The Syrian king found stubborn antagonists in the five sons of Mattathias, John, Simon, Judas, Eleazar and Jonathan, who were the generals of the Jewish armies. But although they are collectively styled Maccabees, the name is only proper to one, the greatest of them, Judas, who by his skill and intrepidity led on his countrymen from night attacks and sudden sur-

prises to more open and important operations; and at length defeated Apollonius and Seron, who had marched to the attack with greatly superior forces, at Bethhoron, in the plain of Esdraelon, the battle-field of Palestine and the scene of some of the most glorious victories in Jewish annals. Lysias, the lieutenant of Antiochus, headed an expedition against the patriots, but Judas encountered him, and defeated him with signal loss. Judas now occupied Jerusalem, purified the temple three years after its profanation, and re-inaugurated the holy service. The anniversary day of this re-inauguration was afterward called the "Feast of the Dedication," and kept with solemn observances (John x. 22). Despite his successes the position of Judas was anything but secure, and in 163 B.C. Lysias took Bethsura, and laid siege to Jerusalem. He had guaranteed to the Jews the liberty of their religion; but he was put to death by Demetrius, a new claimant of the crown, who sent Nicanor against Judas. The Jewish leader defeated him first in a battle at Capharsalama, and then with total ruin at Adasa, but feeling the difficulty of continuing the contest against the whole power of the Syrian empire, solicited an alliance with the Romans. A Syrian army again invaded Palestine, before aid could reach him from his new allies. To 22,000 Syrian troops, led by Bacchides, Judas could oppose only 3,000. Though these had gradually diminished to 800 he resolved to attack the invaders, and after a desperate struggle he fell fighting with useless valor, 161 B.C. Judas derived his name from *Makkava*, a hammer, for he dealt many heavy blows to Syrian paganism. So Charles Duke of Austria, son of Pepin d'Heristal, was styled Charles the Hammer (Martel) for his defeat of the Saracens between Tours and Poitiers. The Maccabees have always been looked upon as the national heroes of the Jews, and Christians have joined in venerating their names; the writer of the Epistle to the Hebrews includes them among the heroes of faith, and they are reckoned as saints on the calendar of the Greek Church.

Maccabees, Ladies of the, a fraternal and social organization founded in the United States in March 1886, and made a beneficiary society in 1890. In 1902, it had a central body called the Great Hive, and 853 lodges. During 1902, the amount paid in benefits was \$256,725.

Maccabees, Order of Knights of the. See KNIGHTS OF THE MACCABEES.

McCall, ma-kâl', **George Archibald**, American soldier: b. Philadelphia 16 March 1802; d. 25 Feb. 1868. He was graduated at West Point in 1822; in 1846 reached the rank of captain, and that of colonel in 1850. Having served against the Seminoles in Florida, he won distinction in the Mexican War; in 1850 he became inspector-general, resigning from the army three years later. In 1861 he was given command of the Pennsylvania Reserves, with the rank of brigadier-general of volunteers, and participated in the work of the Army of the Potomac, particularly in the Peninsular campaign of 1862, in which he was engaged with his troops at Mechanicsville, Gaines' Mill, and Frazier's Farm (qq.v.). At Frazier's Farm, 30 June, he was taken prisoner, and was confined for several weeks in Libby prison. In August he was exchanged, but impaired health prevented him from returning to the army, and in 1863 he re-

McCALLA — McCAUSLAND'S RAID

signed. He wrote 'Letters From the Frontier' (1868).

McCalla, Bowman Hendry, American naval officer: b. Camden, N. J., 19 June 1844. He was graduated at the United States Naval Academy in 1864, and rose by promotion through the ordinary grades to captain in 1898. In 1890 he was court-martialed on charges of cruelty to his subordinates and was suspended for three years, but in consideration of previous acts of gallantry was restored to active service in 1891. He commanded the Marblehead during the war with Spain in 1898 and was subsequently restored to the place he held on the list of officers previous to his suspension. In 1899 he commanded the Newark and aided in the pacification of the Philippines. In 1900 he co-operated with Vice-Admiral Seymour in putting a stop to the Boxer troubles at Peking in a manner which gained him the congratulations of the Navy Department. In 1901 he was given command of the Kearsarge.

McCammon, Joseph Kay, American lawyer: b. Philadelphia 13 Oct. 1845. He was graduated at Princeton in 1865; studied law in Philadelphia; became register in bankruptcy in 1870; was special counsel of the United States in Washington, 1871; president of the board for investigation of the Indian service, 1877; assistant attorney-general of the United States, 1880-5; and in 1881 was appointed United States commissioner of railroads. Under Presidents Garfield and Arthur, he conducted treaties with various Indian tribes. Among his writings are a 'Report on Indian Service' (1878); 'Report of Councils with Bannock and Shoshone Indians' (1881); 'Report of Councils with Flathead and Other Indians' (1882); 'Arguments in Cases Affecting Pacific and Other Railroads.'

McCarthy, ma-kär'thí, Justin, Irish author and politician: b. Cork, Ireland, 22 Nov. 1830. He became connected with the Liverpool press in 1853 and in 1864 was made editor-in-chief of the *Morning Star*. Since 1879 he represented the Home-Rule party in Parliament. His stay in the United States extended from 1868 to 1870, during which period he was for some time connected editorially with the New York 'Independent.' Sixteen years later he again visited New York. His main work is 'History of Our Own Times' (1879-80); but he has also written: 'History of the Four Georges' (1889), and his novels include: 'Lady Judith' (1871); 'A Fair Saxon' (1873); 'Dear Lady Disdain' (1875); 'The Right Honorable' (1886 with Mrs. Campbell-Praed). Later he has published 'The Story of Gladstone's Life' (1897); 'Modern England' (1898); and 'Reminiscences' (1898). He enjoys a pension from the British Government for his "services to literature."

McCarthy, Justin Huntley, Irish journalist and author: b. 1860. He was graduated at University College and in 1884 was elected to Parliament. He has been a prolific and versatile author, following in the footsteps of his father Justin McCarthy (q.v.). Among his works are 'Outline of Irish History' (1883); 'Serapion, and Other Poems' (1883); 'England Under Gladstone' (1884); 'Camiola, a Girl with a Fortune' (1885); 'History of the French Revolution' (1897). He has also written plays, such as 'The Candidate'; 'The White Carnation,' and 'If I Were King.'

McCaul, ma-kál', John, Canadian scholar: b. Dublin, Ireland, 1807. He was elected president of Toronto University in 1849 and was interested for many years in educational matters in Canada. He edited Horace, Longinus, Lucian and Thucydides as college text-books, and among his valuable archaeological works are 'Britanno-Roman Inscriptions' (1863); and 'Christian Epitaphs of the First Six Centuries.'

MacCauley, ma kál'y, Clay, American Unitarian clergyman and author: b. Chambersburg, Pa., 8 May 1843. He was graduated at Princeton in 1864, and at the Theological Seminary of the Northwest, Chicago, in 1867, and read philosophy and divinity at Heidelberg, 1872. In the Civil War, 1862-3, he was a lieutenant in the 126th Pennsylvania regiment, and served on the staff of Gen. S. D. Sturgis, and in 1864-5 was a member of the Christian Commission in the United States army. In 1880-1 he was a collaborator of the Bureau of Ethnology among Indians east of the Mississippi. Entering the Unitarian ministry, he was pastor of the First Church, Waltham, Mass., 1869-72, and of All Souls Church, Washington, D. C., 1876-81. From 1890 to 1900 he served as director of the Japan mission of the Unitarian Association, and from 1891 to 1899 was president of the College for Advanced Learning at Tokyo and professor there of philosophic and historic theology. He has written: 'Christianity in History' (1891); 'The Religious Problem of Japan—How Solve It?' (1894); 'Introductory Course in Japanese' (1896); 'Japanese Literature' (1899); 'A Day in the Very Noble City, Manila' (1899); and has published 'Single Songs of a Hundred Poets' (1899) and other translations from the Japanese.

McCausland's Raid, an incursion of the Confederate general McCausland into Maryland and Pennsylvania, the chief incident of which was the burning of Chambersburg, Pa. Gen. Early having defeated Gen. Crook in the battle of Kernstown (q.v.), 24 July 1864, and driven him and Averell across the Potomac at Williamsport, ordered Gen. McCausland with his brigade and that of Bradley T. Johnson, with four guns, in all about 2,500 men, across the Potomac to raid Pennsylvania and then move to Cumberland, Md., to destroy the machinery of the Cumberland coal-pits and the repair-shops, stations, and bridges of the Baltimore & Ohio Railroad. Early says he wished to open the eyes of the people of the North to the enormities of its armies, by an example in the way of retaliation, and that Chambersburg, Pa., was selected as the town on which retaliation should be made. The sum of \$100,000 in gold, or \$500,000 in currency was to be demanded of it, in default of which McCausland was ordered to burn the town. Under cover of demonstrations at Williamsport and other points along the Potomac, McCausland crossed the river at McCoy's Ferry, near Clear Spring, above Williamsport, on the 29th, and made straight for Chambersburg, about 25 miles northeast. He met with but little opposition and, on the morning of the 30th, rode into the fated town and demanded the sum fixed by Early. It could not immediately be raised; he knew that Gen. Averell was close upon him; and setting fire to the place, laying a greater part of it in ashes, he hastily marched westward to Mc-

MacCHESNEY — McCLELLAN

Connellsburg and encamped. Averell, who was in Hagerstown when he heard that McCausland had crossed the Potomac, started in pursuit with about 2,600 cavalry, went through the burning town and, a few miles from McConnellsburg, struck McCausland's rear, diverting him from his intended march on Bedford and forcing him back to the Potomac at Hancock, which was reached by noon of the 31st. Here McCausland formed for battle, but upon Averell's appearance and prompt attack he withdrew westward by the National road to Cumberland, where, 1 August, he found Gen. Kelley to oppose him, whom he attacked in the afternoon, and skirmished until night, when he retreated toward Old Town, on the Potomac, leaving 30 of his killed and wounded on the field. At Old Town he forced a crossing at daylight 2 August, capturing or dispersing a regiment of new troops from Ohio, and then moved south into the Valley of the South Branch of the Potomac, by way of Springfield and Romney. From Romney, 4 August, he moved on New Creek and attacked the garrison, but after a stubborn fight was repulsed, leaving 25 dead on the field, the Union loss being 36 killed and wounded. McCausland then withdrew to near Moorefield, where the South Fork joins the South Branch of the Potomac, and considering himself safe from pursuit, went into camp. Averell, who had remained at Hancock when McCausland drew off toward Cumberland, crossed the Potomac on the 4th, and, after a forced march through Bath, Springfield, and Romney, before sunrise of the 7th surprised McCausland in his camp and routed him, capturing his four guns, nearly all his wagons, several hundred horses, three battle-flags, many small arms, and 420 prisoners, including 38 officers. McCausland's loss in killed and wounded was about 100. Averell's loss was 41 killed and wounded. McCausland's shattered command fled to the mountains, and made its way in squads to the Shenandoah Valley, finally assembling at Mount Jackson. "This affair," says Early, "had a very damaging effect upon my cavalry for the rest of the campaign." Consult: 'Official Records,' Vols. XXXVII, XLIII.; Pond, 'The Shenandoah Valley in 1864'; Early, 'The Last Year of the War for Independence.'

E. A. CARMAN.

MacChesney, Clara T., American artist: b. Brownsville, Cal., 1861. She studied at the San Francisco Art School, at the Gotham Art School, New York, and at the Colarossi School in Paris. Her genre work has received favorable recognition. At the World's Columbian Exposition in 1893 she was awarded two medals and she received the Dodge prize, New York, in 1894. Since then she has also received three medals from the Colarossi School, a gold medal from the Philadelphia Art Club, and the second Hallgarten prize from the National Academy of Design, New York. At the Paris Exposition of 1900 she exhibited 'Pomegranates' and 'The Old Blind Fiddler.'

MacChesney, Dora Greenwell, American author: b. Chicago 1 Oct. 1871. She was privately educated, chiefly by her mother, in whose company she traveled and read widely, making special acquaintance with German literature, Italian art, and Roman antiquities, also becoming deeply interested in studying the English civil war, with characters and incidents of which

her writings largely have to do. Among these are: 'Kathleen Clare, Her Book, 1637-1641' (1895); 'Miriam Cromwell, Royalist: a Romance of the Great Rebellion' (1897); 'Beatrice Infelix: a Summer Tragedy in Rome' (1898); 'Rupert, by the Grace of God: the Story of an Unrecorded Plot' (1899).

Macchiavelli, Niccolo. See MACHIAVELLI, NICCOLO.

McClellan, ma-klél'an, George Brinton, American soldier: b. Philadelphia 3 Dec. 1826; d. Orange, N. J., 29 Oct. 1885. He was educated at the University of Pennsylvania and at West Point where he was graduated in 1846. He was brevetted 2d lieutenant of engineers, and immediately ordered to Mexico, where as lieutenant of a company of sappers, miners, and pontoniers he rendered valuable service. He was at the siege of Vera Cruz, at Cerro Gordo, and in the attack on the City of Mexico; at Contreras and Churubusco he won the brevet of 1st lieutenant, and was brevetted captain for gallantry at Chapultepec. After the war he was ordered to West Point as captain of field labors and instructor in bayonet exercise. In 1851 he was ordered to Fort Delaware to superintend its construction. The next year he accompanied Capt. Randolph B. Marcy (later his father-in-law) on an expedition to explore the Red River, and in September 1852 was ordered as senior engineer to Texas, to survey the rivers and harbors of that State. In 1853 he was detailed for the examination of the western part of the proposed route for a Pacific railroad; and explored the Yakima pass and various portions of the Cascade range, and the most direct route to Puget Sound, his report forming the 1st volume of the 'Pacific Railroad Surveys' published by the government. He was soon afterward detailed to investigate the railroad system of the United States, with a view to obtain all the necessary data on construction, equipment, and management for the successful operation of the Pacific railroad. Of the result of his proceedings he presented a full report in November 1854. In March 1854 he was promoted to be captain in the 1st cavalry. In the spring of 1855 he was sent to Europe to study the organization of European armies, and observe the war in the Crimea. He wrote one volume of the report of this commission, which was republished in Philadelphia under the title of 'The Armies of Europe' (1861). He resigned his commission in January 1857, and was for three years vice-president and engineer of the Illinois Central Railroad, at the end of which time he became general superintendent of the Ohio and Mississippi Railroad, and two months later president of the eastern division of the same road. He held this office when the Civil War broke out in 1861. He then received a commission as major-general from the governor of Ohio and proceeded to organize the volunteers of the State: the States of Ohio, Illinois, Indiana, the western part of Pennsylvania and western part of Virginia were united to form the department of the Ohio under his command. About 1 June his army began to cross the Ohio River into Virginia; on the 18th McClellan himself left Cincinnati to take the field, and by the middle of July the whole northwestern part of the State had been cleared of Confederate troops and the Wheeling legislature left free to organize a loyal government.

McCLELLAN — McCLELLAN

On 22 July, McClellan was summoned to Washington to take command of the Army of the Potomac, and commissioned as major-general of the United States army. On his arrival at Washington, he found everything in disorder and the troops badly demoralized in consequence of the defeat at the first battle of Bull Run, and devoting himself to the organizing and disciplining of his army, he soon brought order out of chaos, and had his troops well equipped and in excellent condition. On the retirement of General Scott from active service, McClellan was appointed general-in-chief of the armies of the United States. Plans were then taken under discussion for an attack upon Richmond, and here difference of opinion arose between the President and the Secretary of War and McClellan; the plan finally accepted made the base of supplies on Chesapeake Bay, with line of march upon Richmond from the Peninsula. The army did not move until March 1862, and in the meantime discontent had arisen at Washington on account of the delay. On 10 March the army advanced toward Manassas, but as the Confederates had evacuated that place and had fallen back upon Richmond, the real campaign was begun by transporting the troops to Fortress Monroe. Just after leaving Washington, McClellan was informed that he had been deprived of the chief command, leaving him the command of only the Army of the Potomac; McDowell's corps and other reinforcements on which he had relied were also removed from his army for the defense of Washington. He besieged Yorktown for a month, though opposed by a much inferior Confederate force, whose numbers he greatly overestimated; when Yorktown was evacuated 4 May, he advanced toward Richmond, defeating the Confederates at Williamsburg and Hanover Court House. After reaching the Chickahominy, he found his lines too extended to protect from attack and advance upon Richmond, and decided to retreat to the James River; then followed the Seven Days' Battles which ended when the Federal Forces reached Hampton's Ferry. From here McClellan had planned a new advance, but dissatisfaction against him was so strong that he was relieved from his command, and ordered to evacuate the peninsula. (See *PENINSULAR CAMPAIGN*.) He was then put in command of the fortifications of Washington, till after the second battle of Bull Run, when he succeeded General Pope, again taking command of the Army of the Potomac. On Lee's invasion of Maryland, McClellan marched to attack him, and fought the battle of Antietam (q.v.) forcing the Confederates to retreat from their position and following them as far as the Potomac. He did not, however, cross the Potomac in pursuit, as he was awaiting supplies; this failure to follow up his victory caused him to be deprived of his command, and he was ordered to Trenton, N. J. He took no further part in the war.

In 1864 he was Democratic nominee for President of the United States, and was defeated, the electoral vote stood 212 for Lincoln against 21 for McClellan, but McClellan's popular vote was 1,800,000. He remained abroad from 1864-8, and on his return had charge of the construction of the Stevens' floating battery, which, however, was not completed on account of financial difficulties. In 1870 he was appointed chief engineer of the department of

docks for New York city, in 1877 he was elected governor of New Jersey, and during his administration reduced and finally abolished the State tax, improved the system of public education, and built up an effective militia; he declined a renomination. As a general, McClellan won the confidence and aroused the enthusiasm of his soldiers to an unusual degree; he excelled as an organizer of armies, and had a thorough knowledge of the science of tactics, as shown in his plans of campaign, but in actual campaigning lacked aggressiveness and the power to act quickly and take advantage of his enemy's mistakes. He wrote besides the reports mentioned 'Manual of Bayonet Exercise' (1852) and 'Report on the Organization and Campaigns of the Army of the Potomac' (1864). Consult: 'McClellan's Own Story,' edited by W. C. Preine, and Michie, 'General McClellan' ('Great Commander' series).

McClellan, George Brinton, American politician: b. Dresden, Saxony, 23 Nov. 1865. He is the son of General G. B. McClellan (q.v.). He was graduated from Princeton in 1886; and took up journalism, working as a reporter and in editorial positions for several of the New York city dailies. He studied law, and was admitted to the bar in 1892. From 1889 to 1892 he was treasurer of Brooklyn Bridge. Early active in politics as a Democrat, he was elected to the board of aldermen, and was president of that board in 1893 and 1894. He was elected to Congress in 1894, and for four succeeding terms, and was a member of the House Committee of Ways and Means. In Congress he has been an advocate of tariff reform and free trade, and though opposed to an imperialistic policy, did not sympathize with the attacks on the conduct of the United States army in the Philippines. In 1903 he was nominated for Mayor of Greater New York by the regular Democratic organization (Tammany Hall), and after a vigorous campaign in which he took active part, was elected by 63,000 majority.

McClelland, Robert, American lawyer: b. Franklin County, Pa., 1807; d. Detroit, Mich., 30 Aug. 1880. He was graduated at Dickinson College, Pa., and subsequently practised law at Pittsburg, Pa., but in 1833 emigrated to Michigan, and entered into commercial business in Monroe. His political life was soon afterward begun, for in 1835 he was elected to the State legislature, and to Congress in 1843. He became governor of Michigan in 1852, and in 1868 was a member of the Democratic National Convention which nominated Seymour and Blair.

McClelland, ma-klér'nand, Edward John, American soldier: b. Jacksonville, Ill., 29 Dec. 1848. In 1870 he was graduated at West Point and stationed on the Western frontier for the nine following years, in which he did rescue work after the destruction of Custer's command, and had a share in the capture of Chief Joseph and the Nez Percés Indians. In 1898 he was appointed lieutenant-colonel and adjutant-general of volunteers, served with the Army of Santiago de Cuba in 1898, and was ordered to the Philippine Islands, where he routed the insurgents at Cebu, 8 Jan. 1900. He was subsequently put in command of the 2d district in the Department of the Visayas, including the is-

lands of Cebu, Mactan, Baulayan and the Camotes.

McClernand, John Alexander, American lawyer: b. Breckinridge County, Ky., 30 May 1812; d. Springfield, Ill., 20 Sept. 1900. He was admitted to the Kentucky bar in 1832, but in the same year volunteered for military service against the Sac and Fox Indians. Five years later he was elected to the Illinois legislature, and subsequently sat for two terms in Congress. During the Civil War he served with distinction at the battle of Fort Donelson as brigadier-general of volunteers, and was promoted major-general. He led a division at the battle of Shiloh, relieved Sherman before Vicksburg in 1863 and was in command of the 13th Army corps until 1864, when he resigned. In 1870 he was appointed circuit judge for the Sangamon, Ill., district. He presided at the National Democratic convention in St. Louis, 1876, and was appointed by President Cleveland member of the Utah Commission.

Macclesfield, māk'lz-fēld, England, a town of Cheshire on the Bollin, 17½ miles by rail southeast of Manchester. The principal buildings are the church of St. Michael, an ancient structure, founded by Eleanor, queen of Edward I., in 1278; St. Peter's, and St. Paul's; a spacious town-hall, subscription library, theatre, etc. The staple manufacture is silk, and the cotton manufacture has also made some progress. In the vicinity are extensive coal-pits and stone and slate quarries. Pop. (1901) 34,635.

McClintock, ma-klīn'tók, Sir **Francis Leopold**, English admiral: b. Dundalk, Ireland, 1819. He entered the navy in 1831 and was commissioned lieutenant in 1845. He sailed on four Arctic voyages, being sent out in 1848 to search for Sir John Franklin, and again in 1850 and 1852 without discovering any traces of the explorer. In 1857 he renewed the search as commander of the *Fox* and brought back documentary and other evidence of Franklin's death. For his services as an Arctic explorer he was knighted in 1860, and in 1884 made admiral. His work 'Voyage of the *Fox*' has gone through several editions.

McClintock, John, American scholar: b. Philadelphia, Pa., 27 Oct. 1814; d. Madison, N. Y., 4 March 1870. He was joint editor and compiler with James Strong of the 'Cyclopedia of Biblical, Theological and Ecclesiastical Literature' which goes by their name, the last volume of which was published in 1895. Among his other works are 'An Analysis of Watson's Theological Institutes' (1850); and 'Temporal Power of the Pope' (1853). For the last three years of his life he was president of the Drew Theological Seminary.

McCloskey, ma-klōs'kī, **John**, American Roman Catholic prelate: b. Brooklyn, N. Y., 20 March 1810; d. New York, 10 Oct. 1885. His secondary and collegiate studies were made at Mount Saint Mary's College, Emmitsburg, Md., and his post-graduate studies in France and Rome. At 24 he was ordained priest and on returning to America was assigned to Saint Joseph's Church, New York city. When Saint John's College, at Fordham (now a part of New York city), was opened in 1841, he was made its first president, but in the next year he returned to parish work. In 1844 he was ap-

pointed coadjutor to Bishop Hughes of the diocese of New York, and consecrated titular bishop of Axieren; and three years later was appointed bishop of Albany, a diocese just created from a part of the diocese of New York. For 17 years he worked for the upbuilding of the Albany diocese, and the good of his people. He built the Cathedral of the Immaculate Conception at Albany, Saint Joseph's Theological Seminary at Troy, established several new parishes, and founded educational and charitable institutions, including hospitals, orphanages, homes for the aged, and reformatories. He succeeded Archbishop Hughes in the archiepiscopal see of New York, 6 May 1864. The result of his labors in the archdiocese of New York remains his greatest monument. He was made a cardinal in 1875, under the title of Santa Maria supra Minervam. He was in attendance at the Vatican Council (q.v.) and a member of the committee on discipline. He was summoned to Rome February 1878 to attend the conclave for the election of a pope but was too late to cast a vote, Leo XIII. having been elected a few hours before his arrival. Cardinal McCloskey was noted for his gentleness, firmness, profound scholarship, and great executive ability.

McClure, ma-kloor', **Alexander Kelly**, American journalist: b. Sherman's Valley, Perry County, Pa., 9 Jan. 1828. He was reared on a farm, educated at home, and apprenticed to a tanner in 1842, soon after began to write for the *Perry Freeman*, and edited and published the *Juniata Sentinel* at Mifflin, Pa., in the Whig interest, 1846-50. He then published (1850-6) the *Chambersburg Repository*, which he made influential in the cause of anti-slavery. He was State superintendent of printing in 1855; a member of the State convention of 1855, which met at Pittsburg to organize the Republican party; in 1856 was admitted to the bar, and was a delegate to the first Republican national convention in Philadelphia. In 1857-8 he sat in the legislature as a Republican, and was State senator in 1859. As leader of the Pennsylvania delegation in the Republican national convention of 1860 he aided in the nomination of Abraham Lincoln. In 1862-4 he again published the *Chambersburg Repository*, and in the latter year served as assistant adjutant-general in charge of the draft in Pennsylvania. Two years later he was again a member of the legislature, and in 1868-73 practised law in Philadelphia. He was chairman of the State delegation to the Liberal Republican convention in 1872, and of the Liberal Republican State Committee, and in that year entered the State senate. In a close election in 1873 he was defeated as an independent candidate for mayor of Philadelphia. In 1875 he established the *Philadelphia Times*, of which he was editor-in-chief till 1891. He has published 'Three Thousand Miles Through the Rocky Mountains'; 'Our Presidents and How We Make Them' (1901); 'Recollections of Half a Century' (1902); etc.

McClure, James Gore King, American Presbyterian clergyman: b. Albany, N. Y., 24 Nov. 1848. He was graduated at Yale in 1870, at the Princeton Theological Seminary in 1873, and ordained as a Presbyterian minister in 1874. He was settled (1874-9) at New Scotland, N. Y., and has been pastor at Lake Forest, Ill., since 1881. From 1897 to 1901 he was presi-

dent of Lake Forest University. He has written 'Possibilities' (1896); 'The Man Who Wanted to Help' (1897); 'The Great Appeal' (1898); 'Environment' (1899); 'For Hearts that Hope' (1900); and 'A Mighty Means of Usefulness' (1901); etc.

McClure, Sir Robert John Le Mesurier, English admiral: b. Wexford, Ireland, 28 Jan. 1807; d. London 17 Oct. 1873. He began his naval career in 1824, and in 1836 under Sir John Ross made his first voyage to the Arctic regions. Again he joined an expedition sent to discover the North-West Passage in 1848. Two years later he was placed in command of an Arctic expedition and discovered Prince of Wales Strait, which connects the Atlantic and Pacific. On his return he was knighted. From his journals was published 'The Discovery of the North-West Passage' (by Captain Sherard Osborne, 1856).

McClure, Samuel Sidney, American editor and publisher: b. in County Antrim, Ireland, 17 Feb. 1857. He was graduated at Knox College, Galesburg, Ill., in 1882. In 1884 he established a newspaper syndicate which has grown to great proportions and assumed distinctive importance in the publishing world. In 1893 he founded 'McClure's Magazine,' and in 1899 established the publishing house of McClure, Phillips & Company, New York. He is also president of the S. S. McClure Company in the same city. Since 1894 he has been a trustee of Knox College.

McClurg, ma-kloorg', Alexander Caldwell, American publisher: b. Philadelphia 1834; d. St. Augustine, Fla., 15 April 1901. He was graduated at Miami University, Oxford, Ohio, in 1853, engaged in business with S. C. Griggs & Company, publishers, in Chicago, and in 1862 entered the Union army. He was captain in the 88th Illinois regiment of infantry, rose to the rank of colonel, was made brevet brigadier-general, and in the Atlanta campaign and during Sherman's great march served as chief of staff to the 14th corps. Returning from the war, he was admitted to partnership in the publishing house above mentioned, and some years later established the firm of Jansen, McClurg & Company, afterward A. C. McClurg & Company. The business of the house prospered, and in 1899 the company was reorganized, the co-operative principle adopted, and the employees, among whom the stock was largely distributed, were granted easy terms for increasing their investments.

MacColl, ma-köl', Evan, Canadian poet: b. Kenmore, Argyleshire, Scotland, 21 Sept. 1808; d. Toronto 1898. He emigrated to Canada in his forty-second year and became known as the poet of the Scottish colony at Kingston. He wrote with fluency in Gaelic and his 'Clàreach nam Beann' created much enthusiasm among his compatriots. He is also author of many English poems, such as 'My Rowan Tree'; 'The Mountain Minstrel' (1887); and 'Poems and Songs' (1888).

MacComb, ma-köm', William, American business man and soldier: b. Mercer County, Pa., 21 Nov. 1828. He was educated at Westminster College, New Wilmington, Pa.; and took special courses in engineering and mechanics. In 1854 he went to Tennessee and was ac-

tive in developing manufacturing interests there and in Kentucky. At the outbreak of the Civil War, he entered the Confederate army, as a private, and was rapidly promoted, becoming colonel in September 1862, and brigadier-general in December 1864. After the war he settled in Virginia and engaged in farming.

McComb, Miss., town, in Pike County, on the Illinois Central Railroad; about 75 miles south by west of Jackson. McComb is situated in a fertile agricultural region in which cotton is cultivated extensively. The chief manufacturing plants are cotton-mills, cotton compresses, and railroad shops. It has the McComb Female Institute, opened in 1894, a public high school connected with which is a library of about 11,000 volumes. The town owns and operates the waterworks. Pop. (1890) 2,383; (1900) 4,477.

McConnell, ma-kön'el, Samuel D., American Protestant Episcopal clergyman and author: b. in Westmoreland County, Pa., in 1846. He was graduated at Washington and Jefferson College in 1868, and was ordained a priest in 1873; was rector of Saint John's Church, Erie, Pa., 1872-3; held rectorships at Watertown, Conn. (1873-6) and Middletown, Conn. (1876-82); became rector of Saint Stephen's Church, Philadelphia, in 1882; of Holy Trinity Church, Brooklyn, N. Y., in 1896; and since 1902 has been rector of All Souls Church, New York city. He has published a 'History of the American Episcopal Church' (1890); 'Sons of God' (1891); 'Sermon Stuff' (1888, 1895); 'A Year's Sermons' (1896); 'The Open Secret'; 'The Next Step in Christianity'; 'Essays, Practical and Speculative' (1900); and 'The Evolution of Immorality' (1901).

McCon'nelsville, Ohio, town, county-seat of Morgan County; on the Muskingum River, and on the Baltimore & Ohio Railroad; about 80 miles southeast of Columbus. It is situated in an agricultural region in the natural gas belt and near large coal fields. Its chief manufacturing establishments are the government workshops for the improvement of the Muskingum River, flour mills, coal and brickyards. Pop. (1900) 1,825.

McCook, ma-kük', Alexander McDowell, American soldier: b. Columbiana County, Ohio, 22 April 1831; d. Dayton, Ohio, 12 June 1903. He was graduated at West Point in 1853, and with the commission of second lieutenant of the 3d infantry was ordered to New Mexico. In 1861 he gained his captaincy and saw much service during the Civil War. He commanded the Ohio volunteers at Bull Run and rapidly gained promotion, being appointed major-general of volunteers in 1862. His brilliant military reputation was made at the battles of Shiloh, Murfreesboro, Chickamauga, etc., and in 1865 he was brevetted brigadier-general in the regular army. He was subsequently placed in command of the military school at Fort Leavenworth, was commissioned major-general in 1894 and retired the following year. General McCook came of a fighting family. He was the son of Daniel McCook (q.v.) who was killed by Morgan's guerillas in 1863. Seven of the general's brothers took part in the War for the Union, three of whom, like their father, were killed. Four of the eight McCook brothers attained the rank of general.

CYRUS HALL MCCORMICK
INVENTOR OF THE REAPING MACHINE

McCOOK — McCORMICK THEOLOGICAL SEMINARY

McCook, Anson George, American soldier and politician: b. Steubenville, Ohio, 10 Oct. 1835. He took part in the Civil War as captain in an Ohio regiment, and was colonel of a regiment in the Army of the Cumberland. At the end of the war he was brevetted brigadier-general. In 1873 he was elected from New York as a Republican member of Congress, and became secretary to the United States Senate from 1887 to 1889, and city chamberlain of New York from 1893 to 1897.

McCook, Daniel, American soldier: b. Canonsburg, Pa., 20 June 1798; d. near Buffington's Island, Ohio, 21 July 1863. Having received a college education, he removed from Pennsylvania to Ohio and settled at Carrollton. Although 63 years old at the outbreak of the Civil War, he entered the Union army, in which he served as major of volunteers. During one of the Morgan raids (q.v.) he received a wound from which he died shortly after. Eight sons of his served as officers in the Federal army, three of whom were killed in battle.

McCook, Henry Christopher, American clergyman and entomologist: b. New Lisbon, Ohio, 3 July 1837. He was graduated at Jefferson College (now Washington and Jefferson) in 1859, studied at the Western Theological Seminary, and in the Civil War he served as 1st lieutenant and chaplain in the 41st Illinois regiment, 1861-2. In 1862-3 he was minister of a church at Clinton, Ill.; from 1863 to 1870 labored in St. Louis as a home missionary; and subsequently became pastor of the Tabernacle Presbyterian Church in Philadelphia, a charge he still retains. He served as chaplain of the 2d regiment of Pennsylvania volunteers in the Spanish-American war, and is chaplain of the Pennsylvania Commandery of the Loyal Legion, president of the American Entomological Society, vice-president of the Academy of Natural Sciences, Philadelphia, and president of the American Presbyterian Historical Association. His writings include: 'The Gospel in Nature'; 'The Mound-Making Ants of the Alleghanies' (1877); 'The Agricultural Ants of Texas' (1879); 'Honey Ants and Occident Ants' (1882); 'Tenants of an Old Farm' (1884); 'The Women Friends of Jesus' (1885); 'American Spiders and Their Spinning-Work' (1889-93); 'The Latimers, a Scotch-Irish Historic Romance of the Western Insurrection' (1898); and 'Martial Graves of Our Fellow Heroes in Santiago de Cuba: a Record of the Spanish-American War.'

McCook, Neb., city, county-seat of Red Willow County; on the Republican River, and on the Burlington & Missouri River Railroad; about 230 miles west by south of Lincoln, the capital of the State. It is in a rich agricultural region. McCook owes much of its prosperity to the fact that it is the headquarters of a railroad division, and has railroad shops. The sugar beet, alfalfa, wheat, and corn are the principal productions of the surrounding farms. A number of cattle are raised and a large number of live stock from Willow County and vicinity is shipped from McCook. Pop. (1900) 2,445.

McCormick, ma-kôr'mík, Alexander Hugh, American naval officer: b. in the District of Columbia, 9 May 1842. He was acting midship-

man at the United States Naval Academy in 1859; in April 1861 entered into active service, and served in blockading squadrons throughout the Civil War. He became captain in 1892. Since the Civil War he has performed various sea duties, and has served in the department of mathematics and in that of astronomy and navigation at the Naval Academy. He was inspector of ordnance, 1876-81; made a cruise around the world, 1881-5; was assigned to the ordnance department, 1885-92; to the Asiatic station, 1892-4; was captain of the Norfolk Navy-Yard, 1894-7; member of the armor and personnel board, 1897-8; and commandant of the Washington Navy-Yard in 1898. In 1899 he was raised to the rank of rear-admiral, and was retired 26 March 1900.

McCormick, Cyrus Hall, American inventor and manufacturer: b. in Virginia 1809; d. Chicago 13 May 1884. He removed from his native State to Cincinnati in 1845, and two years later went to Chicago. In 1831 he invented an improved reaping-machine, which was patented and further improved, and which brought him great wealth and world-wide fame, with many decorations, medals, etc. He contributed liberally in 1859 to the establishment of the Presbyterian Theological Seminary of the Northwest, in Chicago. He also endowed a chair in Washington and Lee University, Virginia.

McCormick, Leander James, American inventor: b. in Virginia 1819; d. Chicago, 20 Feb. 1900. In early life he worked with his father in manufacturing reaping-machines; removed to Chicago in 1848, and entered into partnership with his brother, Cyrus Hall McCormick (q.v.), and superintended the manufacturing department of their reaping-machine plant until 1879, when the firm was incorporated as the McCormick Harvesting-Machine Company. Ten years later he retired from active business. Many of the improvements in the famous McCormick reaping-machine were made by him. In 1871 he gave an observatory with a powerful telescope to the University of Virginia.

McCormick Observatory, an astronomical station connected with the University of Virginia, near Charlottesville, Va. The funds for the construction of the observatory were principally the gift of Leander J. McCormick, and it was built in 1883-4. The principal instrument is an equatorial of 26 inches aperture, a companion instrument to the Washington 26-inch, both being the work of Alvan Clark & Sons, of Cambridgeport, Mass. The position of the observatory is lat. 38° 2' 1.2" N.; lon. 5° 14' 5.2" W.

McCormick Theological Seminary, in Chicago, Ill.; opened in 1830, under the auspices of the Presbyterians, as a department of Hanover Academy, at Hanover, Ind. Ten years after its opening, the school was removed to New Albany, Ind. Cyrus H. McCormick (q.v.) offered the institution a liberal endowment, which generous gift caused the removal of the school to Chicago, in 1859. It was for a time known as the Presbyterian Theological Seminary of the Northwest. In 1886 the present name was taken in honor of its liberal benefactor. No fees are charged for lodging or tuition, and some of its income is used in assisting worthy and needy students. In 1903 there were con-

nected with the seminary 10 professors and instructors and 130 students. The library contained about 25,000 volumes. The total income on productive funds and from other sources, but excluding benefactions, was about \$35,000. Its buildings and grounds were valued at nearly \$1,000,000 and its endowment funds at about \$1,000,000.

McCosh, ma-kōsh', James, Scotch-American author and educator: b. in Ayrshire 1 April 1811; d. Princeton, N. J., 16 Nov. 1894. He was educated at the University of Glasgow, which he entered at 13, and at the University of Edinburgh, where he went in 1829. He became a minister of the Church of Scotland; was settled at Arbroath in 1835, and at Brechin in 1839; but at the disruption of the Scottish Church joined the Free Church, whose organization he was active in promoting. In 1850 he published 'The Method of the Divine Government, Physical and Moral,' in which he applied the philosophy of Sir William Hamilton to questions of theology with such skill as to elicit from him the highest commendation. This work at once gave McCosh wide fame as a philosophical thinker, and in 1851 he was appointed professor of logic and metaphysics in Queen's College, Belfast, where he remained 18 years, not only discharging his professional duties, but also entering earnestly into work of religious and social improvement, through which his spirit of benevolence and his enlightened zeal for general education accomplished lasting results. In 1868 he was elected president of the College of New Jersey (now Princeton University), having previously visited this country and become impressed with its educational promise. This promise was especially bright when he assumed the presidency of Princeton, but the conditions of transition in the sphere of higher education were such as to demand consummate powers of leadership. Such powers McCosh, although a foreigner, brought to his work with most satisfying success. During the 20 years of his administration at Princeton he saw the number of students and professors more than doubled and prosperity increased in all departments. His resignation in 1888 was due to the advance of years, and he was able to continue in the chair of philosophy beyond that period. As a philosopher he maintained the principles of the Scottish metaphysicians against all empirical methods, but went beyond his predecessors in the direction of intuitionism, although he once declared that this "rose out of rationalism as fogs rise out of the melted ice," and few orthodox theologians were abreast of him in welcoming the evolutionary features of the new biology. His writings on theology, philosophy, and psychology are very numerous and include 'Typical Forms and Special Ends in Creation,' in collaboration with Dickie (1856); 'The Intuitions of the Mind Inductively Investigated' (1860); 'The Supernatural in Relation to the Natural' (1862); 'An Examination of Mill's Philosophy' (1866); 'Laws of Discursive Thought' (1869); 'Christianity and Positivism' (1871); 'The Scottish Philosophy, Biographical and Critical' (1874); 'The Development of Hypothesis' (1876); 'The Emotions' (1880); 'Psychology of the Cognitive Powers' (1886); 'Psychology of the Motive Powers' (1887); 'Realistic Philosophy Defended'

(1877); and 'Our Moral Nature' (1892). Consult Sloane, 'The Life of James McCosh' (1896).

McCown', John P., American soldier: b. Tennessee 1820. He was graduated from West Point in 1840, and was assigned to the 4th artillery; he served in the Mexican War, and was brevetted captain for gallantry at Cerro Gordo in 1847. In 1861 he resigned from the United States army to join the Confederate service, and was made brigadier-general. He commanded at New Madrid, Mo., evacuating the town when besieged by General Pope, and later served in the Tennessee campaign.

McCrackan, ma-krāk'an, William Denison, American author and lecturer: b. Munich, Germany, 12 Feb. 1864. He is of American parentage, but received his earliest education at the Latin Gymnasium, Stuttgart, Germany, and was afterward graduated at Trinity College, Hartford, Conn., in 1885. He has written 'The Rise of the Swiss Republic' (1892); 'Romance and Teutonic Switzerland' (1894); 'Swiss Solutions of American Problems'; 'Little Idyls of the Big World' (1895); and 'The Huntington Letters' (1897).

McCrack'en, Henry Mitchell, American Presbyterian clergyman and educator: b. Oxford, Ohio, 28 Sept. 1840. He was graduated at Miami University in 1857; for four years was a teacher and school superintendent; studied at the United Presbyterian Theological Seminary, Xenia, Ohio, and at the Princeton Theological Seminary, and later at Tübingen and Berlin universities. He was minister of the Westminster Church, Columbus, Ohio, 1863-7, and of the First Presbyterian Church at Toledo, Ohio, 1869-81. In 1867 he was deputy to the General Assembly of the Free Church of Scotland, and to that of the Presbyterian Church of Ireland in 1884. From 1880 to 1884 he was chancellor of the Western University, Pittsburg, Pa., and in the latter year became vice-chancellor and professor of philosophy in the University of the City of New York, of which he was made chancellor in 1891. Since then the name of the institution has been changed to New York University, and the seat of the University College and School of Applied Science has been removed to University Heights, New York city. Under his administration the Hall of Fame for Great Americans (q.v.) has been added to the university, its growth and prosperity have greatly increased, and the extension of its work and influence has given it a leading position in the field of American education. Besides numerous papers on subjects of education, religion, and philosophy, he has published 'Kant and Lotze'; 'Popular Sermons' (1875); 'Leaders of the Church Universal' (1879); 'John Calvin' (1888); 'A Metropolitan University' (1892); 'Lives of Church Leaders: or Heroes of the Cross' (1900).

McCrady, ma-krā'di, Edward, American soldier and historian: b. Charleston, S. C., 8 April 1833; d. there Oct. 1903. He was graduated at Charleston College, admitted to the bar in 1855, and joined earnestly in the movement which led to the secession of his State. He took part in the capture of Castle Pinckney 27 Dec. 1860, and was present at the bombardment of Fort Sumter in the following April. As captain of the first military company raised in

McCRRY — McCULLOCH

South Carolina for the whole war, he entered the Confederate army, 27 June 1861, was made major and then lieutenant-colonel, was badly wounded at the second battle of Bull Run (or Manassas), 30 Aug. 1862, and in January 1863 received an injury in camp from a falling tree, in consequence of which he was transferred from field service to the command of a camp of instruction at Madison, Fla., in 1864. He remained at that post until the end of the war. Later he became major-general of State troops and a member of the South Carolina legislature (1880-90). Among his more important writings may be mentioned: 'The History of South Carolina Under the Proprietary Government, 1670-1719' (1807); 'The History of South Carolina Under the Royal Government, 1719-1776' (1899); 'The History of South Carolina in the Revolution, 1775-1780' (1901); and 'The History of South Carolina in the Revolution, 1780-3' (1902).

McCrary, ma-krā'ri, George Washington, American lawyer; b. Evansville, Ind., 29 Aug. 1835; d. St. Joseph, Mo., 23 June 1890. His parents removed with him in 1836 to that part of Wisconsin Territory which is now the State of Iowa. He received a public school education, studied law, was admitted to the bar in 1856 and began practice in Keokuk, where he soon became prominent. Elected to the State legislature in 1857 he became State senator in 1861-5, and member of Congress 1868-77. In Congress introduced the law under which the judiciary of the United States was reorganized; proposed appointment of joint committee to count electoral vote in Hayes-Tilden controversy; was prominent in furthering passage of Electoral bill. He served on committees on revision of laws, naval affairs, and judiciary; was secretary of war under President Hayes 1876-9 and was judge of the 8th judicial district in 1879-84. He then resigned and settled in Kansas City, Mo., where he became general consulting attorney of the Atchison, Topeka and Santa Fe Railroad Company. He was the author of 'American Law of Elections' (1875).

McCrea, ma-krā', Jane, American woman: b. Bedminster (now Lamington), N. J., 1753; d. near Fort Edward, N. Y., 27 July 1777. She was the daughter of a Scotch Presbyterian clergyman at whose death she went to live with her brother near Fort Edward, N. Y. At the commencement of the Revolution she was betrothed to David Jones, an officer of the crown. When Burgoyne's army was advancing from the north she was visiting a Mrs. MacNeil at Fort Edward. Her brother, sharing the general alarm felt throughout the region, sent for his sister, intending to remove to a safer locality. On the morning fixed upon for her departure, a band of Indians in the employ of Burgoyne suddenly swooped down upon the MacNeil household and they, together with Miss McCrea, were made prisoners. Mrs. MacNeil and her party arrived in safety at Burgoyne's camp, but half an hour later another party of Indians arrived, bearing a number of freshly severed scalps, one of which bore the long glossy hair of Miss McCrea, whose body was later found by a roadside. The precise manner of her death never became known. The Indians claimed that she was killed by a random shot from an American detachment, whereupon her captors determined to secure the

reward for her scalp. It has been surmised that a quarrel arose among the Indians as to whose captive she was and that one of them in a frenzy tomahawked her. Other authorities credit the story that Lieutenant Jones hired the Indians to bring his betrothed to camp where they were to be married and that she was killed in a controversy which arose as to whose captive she was. Lieutenant Jones denied this story; he lived to old age, a morose and gloomy man. At all events the tragedy caused a general feeling of horror throughout America and England. Burgoyne called a council of his Indian chiefs in order to reprove them, but as his allies would have deserted him the offender was allowed to go unpunished. A blasted pine long marked the spot where tradition relates that the beautiful young girl was murdered, and her grave may be seen in a small cemetery near the ruins of Fort Edward.

McCreary, ma-krē'ri, James Bennett, American lawyer: b. Madison County, Ky., 8 July 1838. He was graduated at Centre College, Danville, Ky., in 1857, and from the Law School of Cumberland University, Tenn., 1859. He entered the Confederate army in 1862 as major of cavalry, and served until close of war. He was a member of the Kentucky House of Representatives in 1869, 1871, and 1873 (being Speaker 1871-3); governor of Kentucky 1875-79, and a member of Congress in 1885-97. He was a delegate to the International Monetary Conference at Brussels, Belgium, in 1891, and in 1903 became United States Senator.

McCreery, James, American merchant: b. Ireland; d. Aiken, S. C., 1893. He came to the United States when about 20 and engaged in the dry goods business in Baltimore, and at the beginning of the Civil War removed to New York, where he soon established a business of his own which made him ultimately one of New York's leading merchants. He was a member of many public boards, one of the founders of the silk industry in America, and director of numerous commercial enterprises. He was one of the Chamber of Commerce delegation sent to England two years before his death, and was a leading member of various clubs chiefly of an educational or public character.

McCulloch, ma-kūl'ō, Benjamin, American soldier: b. Rutherford County, Tenn., 11 Nov. 1811, d. 7 March 1862. He became a skilled hunter and boatman, and joined other frontiersmen in settling Texas. In 1835 he served in the Texan war for independence, being in the battle of San Jacinto. He also commanded a company of rangers in the Mexican War under Taylor and Scott, did important work as a scout, and was specially distinguished at the battles of Monterey and Buena Vista, and in the siege of the City of Mexico. In 1853 he was appointed United States marshal in Texas. During the Civil War he served in the Confederate army, was appointed brigadier-general, and sent into Missouri, where he was defeated at the battle of Dug Spring, but later united his forces with those of General Price and then defeated the Federals under General Lyon (q.v.) at Wilson's Creek. He commanded a corps at the battle of Pea Ridge, Ark., where he was killed.

McCulloch, ma-kūl'ōn, Hugh, American financier: b. Kennebunk, Maine, 7 Dec. 1808; d. near Washington, D. C., 24 May 1895. He was

educated at Bowdoin College and went in 1833 to Fort Wayne, Ind., where he established a law practice which he continued until 1835 when he entered a branch of the State bank of Indiana. He was chosen director in 1836 and in 1857 became president of the newly incorporated State bank of Indiana. He was appointed Comptroller of the Currency in 1863 and in 1865 became Secretary of the Treasury under President Lincoln. Owing to the enormous expenses incurred by the Civil War, the finances of the country were in a critical condition; in six months the large sum due 500,000 soldiers and sailors was paid together with other heavy expenses, and a reduction of the National debt was begun. McCulloch converted more than \$1,000,000,000 of short-time obligations into a funded debt, and in less than two years had succeeded in putting the finances of the country on a sound basis. Congress approved his course and his plan for a speedy resumption of specie payment, but he met with opposition in his purpose to retire the legal-tender notes. He occupied the office until 1869 and in 1871 opened a banking business in London where he remained until 1878. He was reappointed to the secretaryship of the treasury by President Arthur in 1884 and continued in office until the close of the administration. He wrote 'Men and Measures of Half a Century,' and many of his speeches together with a large share of his correspondence have been published. He was the last living member of Lincoln's distinguished cabinet.

McCulloch, John Ramsay, English political economist: b. Isle of Whithorn, Wigtownshire, 1 March 1789; d. London, England, 11 Nov. 1864. He was educated at Edinburgh; became editor of 'The Scotsman,' an Edinburgh newspaper, and from 1818 wrote many articles for the 'Edinburgh Review.' He was professor of political economy in London University, 1828-32, and in 1838 was appointed comptroller of the stationery office. Among his many books may be mentioned: 'The Principles of Political Economy' (1825); 'Historical Sketch of the Bank of England' (1831); 'Dictionary of Commerce' (1832); 'Geographical Dictionary' (1841); 'A Treatise on the Principles and Practical Influence of Taxation and the Funding System' (1845); 'The Literature of Political Economy' (1845); etc. He also published a new edition of the works of Adam Smith (1828) and those of Ricardo (1846), both of which were accompanied by a biographical sketch. He was one of the earliest advocates of free-trade in Great Britain.

McCullough, ma-kül'ók, John Edward, American tragedian: b. Coleraine, Ireland, 2 Nov. 1837; d. Philadelphia 8 Nov. 1885. He came to the United States in 1853, studied for the stage and made his debut in Philadelphia, 1857. He played with Edwin Forrest, who left him at his death all his manuscript plays. In 1869 he managed, with Lawrence Barrett, the Bush Street Theatre in San Francisco, Cal. His appearance in England in 1881 was not successful, but his popularity in America remained unbroken. Despite his lack of literary education, a serious handicap, he won high rank in his profession. He played De Mauprat to Edwin Booth's Richelieu, and Richmond to his Richard III. His interpretation of Virginius was un-

excelled during his day. Among his leading roles were Hamlet, Macduff, Richelieu, Spartacus, etc. In 1884, at the height of his brilliant career, he suddenly collapsed, both physically and mentally; he died a year later in an insane asylum in Philadelphia.

McCullough, John Griffith, American politician: b. Welsh Tract, near Newark, Del., 16 Sept. 1835. He was graduated from Delaware College in 1855 and from the law department of the University of Pennsylvania in 1858. He removed to California in 1859, engaged in law practice in Mariposa County, was elected to the State legislature in 1861, to the senate in 1862 and in 1863-7 was attorney-general. In 1867-73 he practised law in San Francisco and then removed to Bennington, Vt., since when he has been director and president of several railway systems and prominently connected with various banking and commercial enterprises. He was elected to the Vermont senate in 1898 and in 1902 was elected governor of the State.

MacCunn, ma-kün', Hamish, Scottish composer: b. Greenock, Scotland, 22 March 1868. He was educated in Greenock and at the Royal College of Music, London, made his debut in the musical world in 1887, and in 1888 became a junior professor of harmony in the Royal Academy of Music, which position he resigned in 1894. He was director of the Hampstead Conservatory Orchestra Society in 1892. As a composer he has attained high rank; his productions are rich in melody, and his command of the orchestra is remarkable. His work is typically Scottish in character and in choice of subject. Among the more important of his numerous works are overtures, etc., 'The land of the Mountain and the Sun'; 'Chior Mhor'; 'The Dowie Dens o' Yarrow'; 'The Ship o' the Fiend'; and the operas, 'Jeannie Deans' and 'Diarmid.'

McCurdy, ma-kér'dí, James Frederick, Canadian Orientalist: b. Chatham, N. B., 18 Feb. 1847. He was educated at the University of New Brunswick, Princeton Theological Seminary, and in Germany. He was assistant professor in Oriental languages at Princeton, 1873-82; and Stone lecturer there in 1885-6. In 1886 he was appointed lecturer in University College of Toronto, and since 1888 has been professor of Oriental languages in that college. Among his best-known works are: 'Aryo-Semitic Speech' (1881); 'History, Prophecy, and the Monuments,' (3 vols. 1894-1901); 'Life and Work of D. J. Macdonnell' (1897); an original commentary on Haggai, and various translations for the American edition of 'Lange's Commentary'; etc.

McCutcheon, ma-kut'chón, George Barr, American novelist: b. Tippecanoe County, Ind., 26 July 1866. He was educated at Purdue University and began his career as reporter on the *Lafayette Journal* in 1889. At present (1903) he is city editor of the *Lafayette Courier*. He has published 'Graustark' (1900); 'Castle Cranecrow' (1902); 'The Sherrards' (1903).

McCutcheon, John Tinney, American cartoonist: b. near South Raub, Ind., 6 May 1870. He is a brother of G. B. McCutcheon (q.v.). He was graduated from Purdue University in 1889 and has been connected with the leading newspapers of Chicago since 1889, his work as

JOHN G. McCULLOUGH

GOVERNOR OF VERMONT

a cartoonist becoming famous in the campaign of 1866. He was special correspondent during the Spanish-American War, Chinese troubles, and Boer war. He has published in book form 'Cartoons by McCutcheon' (1903).

McDaniel, Henry Dickerson, American lawyer: b. Monroe, Ga., 4 Sept. 1837. He was graduated from Mercer University, Macon, Ga., and admitted to the bar in 1856. He attended as delegate the Georgia Secession Convention in 1861; and served in the Confederate Army until the end of the war, attaining the rank of major in the 11th Georgia infantry. In 1865 he was a member of the Georgia Constitutional Convention. His disability to hold office having been removed in 1872 by the United States Congress, he served in the State legislature, 1873-4; was State senator, 1874-83, and in 1883 he was elected governor of Georgia, which office he occupied for three years. He is trustee in several universities and seminaries in Georgia and is connected with numerous railroad, banking, and manufacturing interests.

McDonald, Alexander, American politician: b. Clinton County, Pa., 10 April 1832; d. Norwood Park, N. J., 13 Dec. 1903. He was educated at Lewisburg University, Pa., and removed to Kansas in 1857. At the outbreak of the Civil War he was active in raising troops for the Federal army, supporting three regiments at his own expense for a time. He was elected to Congress from Arkansas on the re-admission of that State to the Union. While in Congress he served on various important committees.

Macdonald, Etienne Jacques Joseph Alexandre, à-tè-èn zhàk zhò-zef àl-èks-àndr màk-dō-nāl, DUC DE TARENTE, French soldier: b. Saucerre, France, 17 Nov. 1765; d. Courcelles, France, 24 Sept. 1840. He served in the French Revolution as colonel, brigadier-general, and general, and in 1798 was made governor of the Roman States, and of Naples in 1799. He was made a marshal of France for his services at Wagram 6 July 1809. He commanded the left wing in the Russian invasion in 1812, and served in the campaigns of 1813-14.

Macdonald, màk dōn'ald, Flora, Scottish heroine: b. Milton, South Uist, Scotland, 1722; d. Kingsburgh 5 March 1790. After the defeat of the young Pretender, Prince Charles Edward, at Culloden, in April 1746, she aided him to escape from his pursuers. She had the prince dressed in women's clothes, and giving him out as her maid-servant, succeeded in conveying him safely to the Isle of Skye, whence, after many wanderings, he escaped to France. Flora was afterward imprisoned for a short time in the Tower of London. In 1750 she married Allen Macdonald, and in 1775 they settled in Fayetteville, N. C. In 1790 she returned to Scotland.

Macdonald, George, Scottish poet and novelist: b. Huntly, Aberdeenshire, 1824. He was educated at Aberdeen University and at King's College, London, and entered the Independent ministry, from which he retired and became a lay member of the English Church and adopting literature as his profession. Macdonald's work comprises poetry, novels, religious, and juvenile books and is marked by deep religious feeling and devotion to lofty ideals of

life. His novels deal chiefly with Scottish character and scenery. The best-known of his many books are: 'David Elginbrod' (1862); 'Alec Forbes of Howglen' (1865); 'Annals of a Quiet Neighborhood' (1866); 'Robert Falconer,' his best work (1868); 'The Miracles of Our Lord' (1870); 'At the Back of the North Wind' (1871); 'The Marquis of Lossie' (1877); 'Lilith' (1895); 'Salted with Fire' (1897). A collected edition of his poems appeared in 1893.

Macdonald, Sir Hector, British general: b. Scotland 1853; d. Paris, France, 25 March 1903. In 1870 he enlisted and served in the ranks nine years. He was with Sir F. Roberts at Cabul, and for brilliant service at Candahar was made 2d lieutenant. He served in the Boer war of 1881 and was captured at Majuba Hill. He was conspicuous for bravery at Suakim in 1888; was at the capture of Takar in 1891; and was placed in command of the forces in Egypt, 1897-8. He was in command at Magersfontein in 1899 and was then transferred to South Africa, where he commanded the Highland Brigade, 1899-1901. He was made K.C.B. and in 1902 was placed in command at Ceylon. Summoned home in 1903 on a charge of immoral conduct, he went to a hotel in Paris and committed suicide. The committee of inquiry reported (October 1903) that there was not a scintilla of evidence to substantiate the charges preferred against him and reported virtually that it was an instance of a proud, sensitive man assassinated by slander.

MacDonald, James Wilson Alexander, American sculptor: b. Steubenville, Ohio, 25 Aug. 1824. He studied in St. Louis and in New York. Among his works are statues of 'Joan of Arc'; 'Italia'; Edward Bates (1876) in Forest Park, St. Louis; Gen. Custer, at West Point; Fitz-Greene Halleck in Central Park, New York; an equestrian statue of Gen. Nathaniel Lyon; numerous busts, etc.

Macdonald, Sir John Alexander, Canadian statesman: b. Glasgow, Scotland, 11 Jan. 1815; d. Ottawa, Ont., 6 June 1891. His parents having settled in Canada, Macdonald was educated at the Kingston grammar-school and later studied law. Admitted to the bar in 1836, he soon became noted for sound legal knowledge and fluent oratory. He was elected to Parliament in 1844 and was made a member of the executive council. In 1847 he was receiver-general, and successively filled the posts of commissioner of crown lands, attorney-general, prime minister, leader of the assembly, and minister of militia. When the new constitution was adopted in 1867 he formed the first government and was appointed attorney-general, a position which he held until 1873, when the government resigned in consequence of certain charges against the ministry connected with the Canadian Pacific Railway, a scheme which Macdonald had actively promoted. He was then elected leader of the opposition and again entered office in 1878 as premier and minister of the interior. When in 1884 he visited England he was recognized as one of the most powerful advocates of imperial unity, and he was active in the formation of the Imperial Federation League. Consult Collins, 'Life and Career of Sir John Macdonald' (1891); Macpherson, 'Life of Sir John Macdonald' (1892); Pope, 'Memoirs of Sir John Alexander Macdonald' (1894).

McDONALD — MACDOUGAL

McDonald, John Bartholemew, American contractor and railroad constructor: b. Ireland 7 Nov. 1844. He was brought to this country in 1847, and received his education in the public schools of New York. As a boy, he was possessed of energy and thrift, rapidly working his way from the humblest clerkship to be recognized through his achievements as the foremost contractor of his time. He is a type of the American self-made man. Among his successful undertakings may be mentioned the 4th Avenue improvement for sinking the New York Central Railroad tracks in New York city from 42d Street to Harlem; important extensions on the Delaware, Lackawanna & Western from Binghamton to Buffalo, N. Y.; West Shore Railroad from Weehawken to Buffalo; Baltimore & Ohio Railroad from Baltimore to Philadelphia; Illinois Central Railroad from Elgin, Ill., to Dolgeville, Wis.; the Georgian Bay branch of the Canadian Pacific Railroad; the Trenton "cut-off" of the Pennsylvania Railroad; the Potomac Valley Railroad from Cherry Run to Williamsport, Pa., and the Boston & Hoosac Tunnel Railroad. He also built the Baltimore Belt Railroad, which carried the great Baltimore & Ohio Railroad under the city of Baltimore, which was a very difficult undertaking. He constructed the Jerome Park Reservoir, a part of the water storage system of New York city, and the largest artificial storage reservoir in the world. His greatest contract was for the construction, equipment, operation and maintenance of the Rapid Transit Railroad in New York city, which was built mostly underground, and which involved the expenditure of nearly a hundred millions of dollars. This stupendous work will forever testify to his genius and ability. His upright principles and unusual skillfulness are widely and favorably known, and he is regarded as a loyal friend, a charitable, domestic man and a generous but just employer.

Macdonald, John Sandfield, Canadian statesman: b. St. Raphael's, Canada, 12 Dec. 1812; d. Cornwall, Ont., 1 June 1872. He was self-educated and admitted to the bar in 1840, practising successfully in Cornwall. In 1841 he was elected to the Canadian parliament as member from Cornwall and re-elected in 1848, 1852, and 1854. Macdonald was solicitor-general in 1849-51 and premier for Cornwall in 1862-4; in 1867-71 he was premier for Ontario.

McDonald, Joseph Ewing, American lawyer: b. Butler County, Ohio, 29 Aug. 1819; d. Indianapolis, Ind., 21 June 1891. He was educated at Asbury University; studied law and was admitted to the bar and established a practice in Crawfordsville, where he was county prosecuting attorney, 1845-7. In 1848 he was member of Congress and from 1856-60 attorney-general of Indiana. He then practised law in Indianapolis and in 1864 was an unsuccessful candidate for governor. In 1872 he was chairman of the Democratic State Committee and in 1875 was elected to the United States Senate, serving until 1881, when he returned to Indianapolis where he resumed the practice of his profession.

Macdonell, māk-dōn'ēl, Alexander, Canadian Roman Catholic prelate; b. Invernesshire, Scotland, 1762; d. Dumfries, Scotland, 14 Jan. 1840. He was educated at the Scots College,

Spain, and entered the priesthood in 1787. He assisted in the organization of the Glengarry Fencibles and was their chaplain, and in 1803 established for its disbanded members a colony in Canada. In 1820 he was made Apostolic Vicar of Upper Canada and through his influence 48 parishes were established in Canada. He was the first Roman Catholic bishop in Upper Canada and died in Scotland while on a mission to obtain funds for the founding of a seminary in his see.

McDonogh, māk-dōn'ō, John, American philanthropist: b. Baltimore, Md., 29 Sept. 1779; d. McDonogh, La., 26 Oct. 1850. He was educated at an academy in Baltimore and entered the mercantile business there, removing in 1800 to New Orleans, where he rapidly acquired great wealth. He was deeply interested in the problem of slavery and devised a system through which his slaves were enabled to earn their freedom; he educated those among them who desired it and sent to Africa shiploads of those who had earned their freedom. He was president of the American Colonization Society and was a generous contributor to its support. The bulk of his fortune of more than \$2,000,000 he bequeathed to the cities of New Orleans and Baltimore for the establishment of free schools. The will was adjudged valid after years of litigation and Baltimore established the McDonogh schools while New Orleans invested its portion of the bequest in its public schools.

Macdonough, māk-dōn'ō, Thomas, American naval officer: b. Newcastle County, Del., 23 Dec. 1783; d. at sea 18 Nov. 1815. He entered the navy as midshipman in 1800 and in 1803 was attached to the frigate Philadelphia, one of the squadron employed against Tripoli. On 26 Aug. 1803 the Philadelphia captured off the coast of Spain the Moorish frigate Meshoa and Macdonough, being left at Gibraltar with the prize, escaped the subsequent capture which befell the officers and crew of the Philadelphia. In 1804 he participated in the various attacks made upon Tripoli and under Decatur assisted in the capture and destruction of the Philadelphia, 16 Feb. 1804. In 1814 he had command of the squadron on Lake Champlain which gained an important victory over the British squadron commanded by Commodore George Downie. For his valuable services on this occasion he was promoted to the rank of captain, then the highest in the United States navy, and received from Congress a gold medal. He was in active service until his death, his last command being that of the Mediterranean squadron.

Macdougal, mak-doo'gal, Daniel Trembly, American botanist: b. Liberty, Ind., 16 March 1805. He was graduated at De Pauw University in 1830 and studied in Germany. In 1891-2 he was engaged in explorations in Arizona and Idaho for the United States government, and in 1893-9 was instructor in plant physiology at the University of Minnesota. He was appointed director of the laboratories of the New York Botanical Gardens in 1899. Among his books are: 'Nature and Work of Plants' (1900); 'Practical Text-book of Plant Physiology' (1902); etc. He has also contributed extensively to the leading scientific periodicals of the day.

Macdougal, Sir Patrick, British soldier: b. Scotland 1819; d. 1894. He was educated at the

McDOUGALL — McDOWELL

Royal Military College at Sandhurst and entered the army in 1836. He served in the Crimea and on the Kerch expedition, and was appointed commander of the British forces in Canada in 1878. In 1885 he retired from active service. He wrote: 'The Theory of War' (1856); 'Campaigns of Hannibal' (1858); 'Modern Warfare as Influenced by Modern Artillery' (1864); etc.

McDougall, Alexander, American soldier: b. Island of Islay, Scotland, 1731; d. New York 8 June 1786. He emigrated with his father to America in 1755 and later became a merchant in New York. He devoted himself to the cause of the colonies and was imprisoned for a time. At the outbreak of the Revolution he enlisted in the American army, serving as colonel, brigadier-general, and in 1777 was promoted major-general. He commanded at White Plains and also attained distinction in the action at Germantown. He was elected member of the Continental Congress in 1781 and was for a time minister of marine. Re-elected in 1784-5 he served for a time and then resigned, preferring active service in the field. He was a member of the New York State senate at his death.

McDougall, Walter Hugh, American artist: b. Newark, N. J., 10 Feb. 1858. He attended a military academy, and from the age of 16 was self-educated, beginning his artistic work in 1876. He entered upon a distinct career in 1884 by the introduction of newspaper illustration and cartooning in the daily press. His writings include 'The Hidden City' (1886); 'Number 11' (1890); 'History of Christopher Columbus' (1892); 'The Ramblicus and His Friends'; and 'A Marvellous Journey' (in the *New York World*, 1880).

MacDougall, William, Canadian journalist and statesman: b. Toronto 1822. He pursued a course of study at Victoria College, Cobourg; was admitted to the bar in 1847; in the following year established the 'Canada Farmer'; in 1850 founded the 'North American,' afterward united with the *Toronto Daily Globe*, for which he wrote until 1870. He was a member of the Executive Council, 1862-4, serving also as commissioner of the crown lands; provincial secretary, 1864-9; and acting minister of marine in 1866-7. In 1867 he became minister of public works, and was made lieutenant-governor of Rupert's Land, Northwest Territories, in 1869. In 1865-6, as chairman of a commission, he did efficient work for the extension of Canadian trade, and in 1873 represented Canada as special fisheries commissioner in London. He published 'Six Letters on the Amendment of the Provincial Constitution' (1872).

MacDowell, Edward Alexander, American composer: b. New York city 19 Dec. 1861. He was educated at the Paris Conservatory and in Germany, and in 1881 was head of the Darmstadt Conservatory, his specialty being the pianoforte and composition. He resigned his position in 1884 and in 1896 was appointed professor of music at Columbia University. In 1896-8 he was director of the Mendelssohn Glee Club of New York and in 1897-8 president of the American Society of Musicians. He is well-known as a pianist and his work as a composer is justly famous. His compositions are marked for their delicate charm, their beauty of expres-

sion and poetry of movement, and include concertos, sonatas, symphonies, songs, and pianoforte pieces, among which are: 'Woodland Sketches'; 'Forest Idylls'; 'Lancelot and Elaine'; etc.

McDowell, Irvin, American soldier: b. near Columbus, Ohio, 15 Oct. 1818; d. San Francisco, Cal., 5 May 1885. He studied in France and was graduated from West Point in 1838. During the Canadian troubles he was stationed on the Niagara and on the Maine frontiers, and in 1841 served at West Point as assistant instructor in tactics, becoming adjutant in 1845. In 1845 he went to Mexico as aide-de-camp to Gen. Wood and for gallant conduct at Buena Vista in 1847 was promoted brevet captain, shortly afterward attaining the rank of assistant adjutant-general. Subsequently he was stationed at the War Department in Washington and in 1856 was raised to the rank of brevet-major. He was on Gen. Wood's staff at the outbreak of the Civil War and assisted in inspecting and organizing the volunteer troops at Washington. In May 1861 he was made brigadier-general of the volunteers and given command of the Army of the Potomac. Constrained by the impatience of the North, McDowell moved in July to meet the enemy and despite his carefully laid plan met a disastrous defeat at Bull Run, 21 July 1861, owing to the imperfect organization of his raw recruits. Shortly after McClellan was given command of the army and McDowell was retained at the head of one of its divisions. In 1862 he was promoted major-general of volunteers and placed in command of the First corps, which became the Army of the Rappahannock, stationed to guard Washington. In August 1862 he received command of the Third corps of the Army of Virginia and fought under Gen. Pope at the battles of Cedar Mountain, Rappahannock Station, and the second battle of Bull Run, where he performed especially good service. He was removed from the field in September 1862. Considering this action of the War Department a direct reflection upon his military services, he asked for an investigation, the result of which was favorable to him. In July 1864 he was placed in command of the Department of the Pacific Coast, and in March 1865 was made brevet major-general in recognition of his gallant services at Cedar Mountain. In 1872 he succeeded Gen. Meade as major-general in the regular army. The last years of his life were spent in California.

McDowell, James, American politician: b. in Rockbridge County, Va., 1796; d. 1851. He was graduated at Princeton in 1817; in 1831 was elected to the Virginia legislature; was governor of that State, 1842-4, and from 1847 to 1851 represented it in Congress. He favored the gradual abolition of slavery, although advocating the claims of State rights. As orator and debater in Congress he bore a prominent part in the proceedings of that body.

McDowell, Battle of. When Gen. Banks marched up the Shenandoah Valley from Winchester to Strasburg and Harrisonburg in April 1862, Gen. Jackson fell back and took position at Swift Run Gap in the Blue Ridge, on the 19th. Banks occupied Harrisonburg on the 26th where he was stopped by President Lincoln's order, and 1 May was ordered back to Stras-

MACDUFF — MACÉ

burg. Jackson thought Banks' intention when at Harrisonburg was to advance on Staunton, 25 miles distant, and watched an opportunity to strike him in flank, when he should make the movement; but Banks did not give him the opportunity, and meanwhile Staunton was threatened from another direction. Edward Johnson's command of about 3,000 men, with three batteries, which had held Monterey 50 miles from Staunton, on the road to West Virginia, was being driven back by the brigades of Milroy and Schenck, Milroy arriving at McDowell, 12 miles east of Monterey, 1 May, where he awaited a junction with Schenck, who had been ordered to march from Romney and Moorefield, thence to join Milroy by way of Franklin. Edward Johnson pressed by Milroy in front and threatened by Banks in rear, had fallen back to West View, seven miles from Staunton, 20 April. On the afternoon of the 30th Jackson, leaving Ewell's division at Swift Run Gap to watch Banks, marched with 8,000 men and a good supply of artillery to Mechum's River Station of the Virginia Central Railroad, from which point the troops were taken by train to Staunton, his artillery and trains taking the road through Rockfish Gap. By the evening of 5 May all his troops had arrived, and on the afternoon of the 6th Edward Johnson advanced through Buffalo Gap, pushed back Milroy's advance parties on the 7th, and on the morning of the 8th reached Sitlington's Hill, where, two miles distant in the valley beyond he saw Milroy drawn up to receive him. Schenck, by a forced march from Franklin, joined Milroy at 10 A.M., with about 1,500 men. He was not impressed with the advantages of the position for an engagement, but as Milroy had prepared for it he let him fight the battle, which was opened by the artillery against the hill where Johnson was forming his command. A desultory artillery fire and skirmishing was kept up until late in the afternoon, when Milroy advanced and made a determined effort to drive Johnson from position. Jackson had now come up, and in quick succession he sent in his regiments to Johnson's assistance. The fighting was close and sanguinary, Milroy's men gaining partial advantages and reaching at points the crest of the hill; but Jackson's position was too good and his numbers too great to be overcome, and as it was growing dark, Milroy withdrew to McDowell. The Union forces engaged numbered about 2,500 men; their loss was 28 killed and 225 wounded. The Confederates had about 6,000 engaged and lost 75 killed, and 424 wounded. Schenck buried his dead, on the morning of the 9th withdrew from McDowell, and by easy marches reached Franklin on the 11th. Jackson remained at McDowell on the 9th and marching on the 10th, overtook Schenck at Franklin on the 12th, where he was found so strongly posted that he deemed attack inadvisable, and that afternoon set out on his return march to McDowell, thence to Mount Solon in the Shenandoah Valley, where he prepared for the campaign that began with the defeat of one of Banks' detachments in an engagement at Front Royal (q.v.), 23 May, his expulsion from Strasburg on the 24th and ended with his defeat at Winchester (q.v.), 25 May 1862, and his retreat across the Potomac. Consult: 'Official Records,' Vol. XII.; Allan, 'Jackson's Valley Cam-

paign'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Macduff, mäk-dūf', Scottish thane, or Earl of Fife, commemorated in Shakespeare's play 'Macbeth'; d. Lumphanan, Aberdeenshire, in 1057. He was the principal agent in the overthrow of the usurper Macbeth, and the restoration of Malcolm Canmore to the throne of Scotland. For this he was granted many privileges, among them that of a place of refuge to which he and his descendants could flee in case of committing unpremeditated murder. This sanctuary, in the form of a cross, stood till 1559 in the pass leading to Strathearn. It was then demolished by the Reformers, but its pedestal yet remains.

McDuffie, mäk-dūf'i, **George**, American statesman and orator: b. in Columbia (now Warren) County, Ga., 1778; d. in Sumter District, S. C., 11 March 1851. He was graduated at South Carolina College in 1813, admitted to the bar in 1814, and in 1818 elected to the South Carolina legislature. From 1821 to 1834 he was a member of Congress, and from 1834 to 1836 governor of South Carolina. In 1843 he took his seat in the United States Senate, resigning on account of impaired health in 1846. In his political views and in his congressional career, he was a close follower of J. C. Calhoun (q.v.), being at the outset a liberal constructionist in constitutional questions, but afterward becoming a strong opponent of the tariff and other economic policies of the government, and also a bold advocate of nullification. Although a supporter of Andrew Jackson (q.v.) in 1828, he became bitterly antagonistic to him, not only in respect to the tariff and State rights, but especially so on the question of the United States Bank, which, as chairman of the committee on ways and means, he strongly defended against the hostile policy of the President. In 1832, as a member of the South Carolina Nullification Convention, he drafted the address of South Carolina to the people of the United States. He was one of the ablest orators of his day, and his prominence in public affairs was maintained in spite of an early wound received in a duel, from which he suffered for the remainder of his life.

Mace, Frances Parker Laughton, American poet: b. Orono, Maine, 15 Jan. 1836; d. Los Gatos, Cal., 20 July 1899. She was graduated from the Bangor High School, Maine, in 1852 and in 1855 was married to B. H. Mace, a Bangor lawyer. After 1885 she resided in California. She published 'Legends, Lyrics, and Sonnets' (1883); 'Under Pine and Palm,' poems (1887); 'Only Waiting,' her best known poem, attained great popularity.

Macé, Jean, zhôn mã-sã, French educator and writer: b. Paris, France, 22 April 1815; d. there 13 Dec. 1894. He was educated at the Collège Stanislas, served in the French army, 1842-45, was editor of 'La République' in 1848, and subsequently taught school in Alsace for 10 years. In 1866 he founded a league of instruction in the Belgian manner. He was decorated with the Legion of Honor in 1880, and elected senator in 1883. He was the author of many popular books for young people, the aim of which was mainly educational, among them

MACE — MACEDONIA

his best known work, 'Contes de Petit-Chateau' (1862), called in the English translation 'Home Fairy Tales'; 'History of a Mouthful of Bread' (1861); 'Servants of the Stomach' (1866); 'France Before the Franks' (1881).

Mace, an aromatic spice made from the arillode or false aril which covers the seed of a nutmeg (*Myristica fragrans*). The yellow external covering of the nutmeg (q.v.) being removed, the red, rather fleshy, arillode which partially conceals the nutmeg is encountered. After drying in the sun for several days this becomes more or less translucent and usually orange yellow and waxy. In this form it is largely exported from the Spice Islands, where it is native, and from the West Indies, where it has been introduced into cultivation. The powerful but agreeable nutmeg-like odor and flavor characteristic of it are due to a volatile oil which is obtained by distillation for use in perfumery and culinary articles. A buttery fixed oil obtained by expression is used after the admixture of the volatile oil under the names nutmeg balsam and nutmeg butter. White mace is obtained from *M. oboea* and red mace from *M. tingens*; also a low grade from *M. fatua*, but this is rarely found in the market. Mace is also largely used whole or ground in cookery.

Mace, a weapon of war formerly in use in Europe, chiefly among the cavalry, as late as the 16th century, and still used among savage tribes. It consists merely of a staff about five feet long, with a knob at the end made of iron or some other heavy substance. The knob was sometimes covered with spikes. In England the mace is used as an emblem of the officers of state, before whom it is carried. It is made of the precious metals, or of copper, gilt, and ornamented with a crown, globe, and cross.

Macedo, Joaquim Manuel de, hō-ä-kên' mā'noo-el dā ma-sā'dō, Brazilian poet, novelist, and statesman: b. province of São João d'Iaborahi 24 June 1820; d. Rio de Janeiro 11 April 1882. He studied medicine, but presently began to write and became professor of national history in the College of Rio Janeiro. He was one of the most prominent of Brazilian authors in the 19th century, and being keenly interested in politics was elected to the Brazilian Chamber in 1854. His works include: 'Moreninha,' a novel (1844; 5th ed., revised, 1877); 'O Moço Louro,' a novel of the early stages of the Portuguese conquest (1845); 'O Dous Amores' (1848); 'Vicentina' (1853); 'A Nebulosa,' a poem (1857), his greatest work, consisting of six cantos in unrhymed hendecasyllables; 'Cotic,' a drama; 'Fantasma Branco,' a comedy (1856); 'Corógraphia do Brasil' (1873); etc.

Macedonia, mäs-e-dō'nī-a, Turkey, an ancient monarchical territory now comprised in the Turkish vilayets or provinces of Monastir and Salonika, and inhabited by a turbulent, heterogeneous population of Turks, Greeks, Bulgarians, Servians, Wallachians, Albanians, and Jews. Its earliest name was Emathia, which remained the name of the district between the Haliacmon and the Axios, two rivers falling into the Thermaic Gulf, now the Gulf of Saloniki. This district was the earliest seat of the Macedonian monarchy. There was also an older form of the name Macedonia, namely Macetia, whence the Macedonians were sometimes called Macetæ, even after the name Macetia had come

to be disused. In the time of Herodotus the name Macedonia was applied only to the district situated south and west of the Lydias, another river which falls into the Thermaic Gulf, and which flows between the two already mentioned. Philip of Macedonia extended his kingdom as far as the Lake of Lynchitis, in Illyria, in the west, Mount Scardus and Mount Orbelus in the north (so as to include the whole of Pæonia), and the River Nestus on the northeast. He added also the peninsula of Chalcidice. The part which he conquered from Thrace, lying between the Strymon and Nestus, was called *Macedonia adjecta*. The provinces of Macedonia were, in general, known by name before the time of Herodotus. In the time of Philip there were 19. Macedonia was inhabited by two different races—the Thracians, to whom belonged the Pæonians and Pelagonians, and the Illyrians. The language of the southern Macedonians shows that there must have been a large admixture of Dorian settlers among them. Pliny speaks of 150 different tribes who dwell here at an early period. They were divided into several small states, which were incessantly at war with the Thracians and Illyrians, till Philip and Alexander gave the ascendancy to one, and made it the most powerful in the world. The first of these princes, who came to the throne in 359 B.C., taking advantage of the strength of the country and the warlike disposition of its inhabitants, reduced Greece, which was distracted by internecine broils, in the battle of Cheronea, 338 B.C. His son, Alexander, subdued Asia, and by an uninterrupted series of victories for 10 successive years made Macedonia in a short time the mistress of half the world. After his death this immense empire was divided. Macedonia received anew its ancient limits, and after several battles lost its dominion over Greece. The alliance of Philip V. with Carthage during the second Punic war gave occasion to this catastrophe. The Romans delayed their revenge for a season; but when Hannibal was conquered they sent over T. Quintius Flamininus, who defeated Philip at the battle of Cynoscephalæ (197 B.C.), and compelled Philip to sue for peace, which was only granted upon his agreeing to acknowledge the independence of Greece, to surrender his vessels, to reduce his army to 500 men, and defray the expenses of the war. Perseus, the successor of Philip, having taken up arms against Rome, was totally defeated at Pydna by Paulus Æmilius, 168 B.C., and the Romans took possession of the country. Indignant at their acts of oppression, the Macedonian nobility and the whole nation rebelled under Andriscus. But after a long struggle they were overcome by Quintus Cæcilius Macedonicus; the nobility were exiled, and the country became a Roman province, 148 B.C. As such it is mentioned in the New Testament, and St. Paul's letters to the Thessalonians and Philippians are addressed to Macedonian Christians. In 395 A.D., after the dissolution of the Roman Empire, Macedonia became part of the Byzantine Empire. It came under Turkish domination in the 15th century. While the name has no modern territorial significance, it has come into considerable political prominence in connection with the conflict of nationalities in European Turkey, among whom the only object in common is a desire to throw off Turkish rule, the Bulgarians there desiring to be governed from Sofia, the Servians from

MACEDONIANS — MACEO

Belgrade, the Greeks from Athens, and the Turks by the Young Turk Party when it shall be established in Constantinople.

In addition to this question of nationality is one of religion, which complicates matters considerably. There are seven chief religious sects in Macedonia, the adherents of the original Greek Church, those of the schismatic Bulgarian Church, those of the New Greek Church, who recognize the Patriarch in Constantinople, those Bulgarians and Servians, converts of American missionaries, who call themselves Protestants; the Wallacks, who are an offshoot of the ancient Greek Church; those who practise the Jewish faith, and the Mohammedans.

The Turkish government, in administering the affairs of Macedonia, adopted the principle of assisting and protecting the weak and of snubbing and persecuting the strong or predominating party; thus, in a certain district where the Greek is strongest he is least popular with the Turkish authorities. Near the Bulgarian frontier, where the Bulgarian element is practically held in subjection, several public offices are held by Greeks, and so on.

This mode of government led in 1895 to a Bulgarian uprising and in 1896 to a Greek revolt, but would probably long since have proved its success from a Turkish point of view were it not for the fact that the Macedonian Committee in Sofia, a society formed for the purpose of conducting a nationalist campaign in Macedonia to effect freedom from Turkish rule, discovered its real nature and set about to disrupt it. The result was the insurrection in 1903 headed by Boris Sarafoff, the avowed aim of which was to provoke the Turks to massacre Christians and to commit acts that would arouse Christendom and compel the Great Powers to expel them from Europe. The insurrection was crushed by the Porte, with a comparative absence of the atrocities and cruelties that formerly characterized Turkish warfare. Autonomous institutions had been provided for Macedonian Christians by the Berlin Congress of 1878, and Austria and Russia, acting with the authority of Europe, now drew up a drastic reform scheme which provided that civilian agents of the two governments must accompany the Turkish inspector-general, to direct his attention to the needs of the population, and to report to their governments what is done and what left undone. The reorganization of the police in the disturbed vilayets is to be put under the charge of a foreign officer. Mixed commissions of Mohammedans and Christians are to report on crimes and outrages. The sultan is to be "requested" to allot funds for the repatriation of exiles, for the immediate needs of the populations, and for the rebuilding of their homes. Taxation of the expelled Christians is to be remitted for a year, while the formation of bands of Bashi-Bazouks is to be absolutely prevented.

Macedonians, followers of Macedonius, author of the Macedonian heresy. The Macedonians came into existence toward the decline of the Arian controversy, when Macedonius became Patriarch of Constantinople (341), and taught that the Holy Ghost was "subordinate to the Father and to the Son, unlike to them in substance, and a creature." He was a semi-Arian, was deposed by the Arians in 360; and his special tenets condemned at the Council of

Constantinople in 381. In that council the clauses defining the nature of the Holy Ghost were added to the Nicene Creed.

Maceio, mǎ-sǎ-yô', Brazil, formerly MACAYO, city and capital of the state of Alagoas, on the Atlantic coast, 135 miles from Pernambuco. The city has a cathedral, lyceum, government, and other buildings. It has manufactures of machinery and cotton goods, and considerable ship-building is carried on here. Pop. 12,000.

McEntee, mǎk'ĕn-tē, **Jervis**, American landscape painter: b. Rondout, N. Y., 14 July 1828; d. there 1891. He studied with F. E. Church (q.v.), and opened a studio in New York in 1858. His reputation was soon established, and he attained high rank among American artists. He became a member of the American Academy of Design in 1861. As a painter of mountain scenery and of autumn and winter landscapes he especially excelled, although in figure painting he also achieved some notable successes. Among his principal works are: 'Indian Summer' (1861); 'October Snow' (1870); 'Cape Ann' (1874); 'Winter in the Mountains' (1878); 'The Kaatskills in Winter' (1884); and 'Shadows of Autumn' (1886).

Maceo, mǎ-sǎ'ô, **Antonio**, Cuban patriot: b. Santiago de Cuba 14 July 1848; d. near Mariel 2 Dec. 1896. He joined the insurgent army as a private in 1868 and though without martial training his natural military ability and personal magnetism as a leader soon brought him to the front, making him second only to Gomez. Under his skillful leadership Martinez Campos was defeated at Demajagua and at La Galleta; his campaign in Baracoa in 1878 evidenced masterly generalship, as did also his utter rout of Santacles at San Ulpiano. Maceo alone of all the Cuban generals refused to sign the peace of Zanjón and made for two months a brave effort to reanimate the exhausted revolutionary spirit. Finding his copatriots thoroughly discouraged, he abandoned the struggle and still refusing to sign the peace, made a tour of the United States and other countries in America seeking support for the cause of Cuban independence. He was the first of the Cuban leaders to land in 1895, and in the revolution which followed took a prominent part. His achievements in the campaign in Pinar del Rio Province, and his battles at Paralijo, Jobito, Mal Tiempo, and Candelaria are among the most brilliant feats in the history of Cuba's long struggle for independence. While crossing the trocha between Majana and Mariel, attended only by his staff, he was surrounded by a Spanish force and killed.

Maceo, José, hō-sǎ', Cuban patriot: b. Santiago de Cuba 1846; d. La Loma del Gata, Cuba, 5 July 1896. He was a brother of Antonio Maceo (q.v.) and took a conspicuous part in the rebellion of 1868-78. He remained in Santiago de Cuba after the peace of Zanjón, which he with his brother refused to sign. He was prominently connected with the uprising of 1879 in which he was captured and sent to Spain. An attempted escape to Gibraltar resulted in his deportation to the fortress La Mola at Mahón, in the Balearic Isles, whence he succeeded in making his escape to Algiers. He lived in Costa Rica from 1885 until the outbreak of the

rebellion in Cuba in 1895, when he at once joined the insurrectionary army. He raised a large force which he commanded with signal success at Jobito and later was victorious over Canellas at Sao del Indio. He was killed in a furious engagement at La Lama del Gata in which the Cubans were finally victorious.

Macerata, mǎ-chā-rǎ-tǎ, Central Italy, (1) an episcopal city, capital of the province of the same name, picturesquely situated on an eminence 1,207 feet high, between the Apennines and the sea, 21 miles south of Ancona. It is encircled by walls, pierced by six gates, has a cathedral, provincial palace, and theatre on the central public square, a college founded in 1290, museum, etc. Pop. of commune (1901) 22,784. (2) The province has an area of 1,087 square miles, is generally mountainous, but well wooded, and on its lower slopes produces much corn, fruit, and hemp, and rears great numbers of sheep and cattle. Pop. (1901) 259,429.

MacFadden, Bernarr Adolphus, American editor and athlete: b. near Mill Springs, Mo., 16 Aug. 1868. He is editor and proprietor of 'Physical Culture,' and of 'Macfadden's Physical Development,' and 'Beauty and Health' (monthly magazines), etc. From 1890 to 1893 he was an athlete of some prominence in the wrestling arena, and he has invented various devices for physical exercise. Among his many publications are: 'The Athlete's Conquest'; 'The Strenuous Lover' (a physical-culture novel); 'Macfadden's Physical Training'; 'The Virile Powers of Superb Manhood'; 'Strength From Eating'; 'Fasting, Hydropathy, and Exercise'; 'Strong Eyes'; 'Physical Culture Cook-Book'; 'Power and Beauty — Superb Womanhood'; etc.

MacFarren, Sir George Alexander, English composer: b. London, England, 2 March 1813; d. there 31 Oct. 1887. He was educated at the Royal Academy of Music, where in 1837 he became a professor of symphony and harmony, and in 1875 principal. In the same year he was elected professor of music in Cambridge University. Among his compositions are the operas 'The Devil's Opera' (1838); 'Robin Hood' (1860); and the oratorios 'St. John the Baptist' (1873); 'King David' (1883); etc. He also wrote several valuable treatises: 'Harmony' (1860); 'Counterpoint' (1869); etc. He was knighted in 1883. After 1860 he was blind and his wife wrote his compositions from his dictation.

McFaul, mǎk-fāl', James Augustine, Roman Catholic prelate: b. near Larne, County Antrim, Ireland, 6 June 1850. He was educated at the College of Saint Francis Xavier, New York, and Seton Hall, South Orange, N. J., where he was graduated in 1873. He was pastor of churches at Long Branch, N. J., 1883-90; chancellor of the diocese of Trenton, 1890-2; vicar-general, 1892-4; and on the death of Bishop O'Farrell was appointed to succeed him, being consecrated bishop of Trenton in October 1894. He is widely known in connection with the reorganization of the Ancient Order of Hibernians, the establishment of the Federation of American Catholic Societies, and has published noteworthy articles and addresses on 'American Citizenship.'

McFingal, mǎk fīng'gal, a political satire in verse by John Trumbull, 1774-82. The poem aims to give in Hudibrastic verse a general account of the Revolutionary War, and a humorous description of the manners and customs of the time, satirizing the follies and extravagances of the author's own Whig Party as well as those of the British and Loyalists. McFingal is a Scotchman who represents the Tories; Honorious being the representative and champion of the patriotic Whigs. The first canto was published in 1774, and the poem finally appeared complete in four cantos in 1782. The work is now comparatively unknown, but its popularity at the time of its issue was very great; and more than 30 pirated editions in pamphlet and other forms were printed. It contains many couplets famous at the time, some of which are still quoted. Two that are perhaps the most famous, and are often attributed to Samuel Butler, the author of 'Hudibras,' are —

"No man e'er felt the halter draw
With good opinion of the law;"

and

"But optics sharp it needs, I ween,
To see what is not to be seen."

McFlimsey, mǎk-flīm'zī, Flora, the heroine of the once famous poem 'Nothing to Wear,' by William Allen Butler (q.v.). It was published in 1857 and became immediately popular.

McGaffey, Ernest, American poet and critic: b. in Ohio, August 1861. For several years he was a contributor in prose and verse to Chicago newspapers, and afterward became critic on the Saturday literary edition of the *Chicago American*, then private secretary to Carter H. Harrison, mayor of Chicago. He has published 'Poems of Gun and Rod' (1892); 'Poems' (1895); 'Poems of the Town' (1900); and 'Sonnets to a Wife' (1901).

McGahan, mǎ-gǎn', Barbara Elagine, ('VLAD KASHIRIN'), Russo-American journalist: b. near Tula, Russia, April 1850. She was graduated from the Tula Female Seminary in 1866 and was correspondent for several leading journals in Russia, being sent as special correspondent to the United States in 1870, where she was married to J. A. MacGahan (q.v.). Since then she has been correspondent for many important newspapers of the United States and Russia, and through her contributions to various magazines her name has become widely known. She has made translations into Russian of several American works and has published in English a novel entitled 'Xenia Repnina' (1889).

McGahan, Januarius Aloysius, American journalist and war correspondent: b. near New Lexington, Ohio, 12 June 1844; d. Constantinople 9 June 1878. He followed different callings in Western States, then went to Europe and studied law in Brussels. Upon the outbreak of the Franco-German war in 1870 he went to the field as correspondent of the *New York Herald*, and thenceforth devoted himself to journalism. In 1873, after heroic exertions, with extreme hardships, he reached the Russian army before Khiva and sent to the *Herald* reports of the campaign which won for him high admiration both here and in Europe, his account of the capitulation of the city being regarded as "a masterpiece of military journalism." Returning to America, he went to Cuba to report on the Virginius affair, then to Spain, upon the Carlist

uprising, where he spent 10 months with the army of Don Carlos, was captured by the Republicans, mistaken for a Carlist, condemned to death, and saved by the intervention of the United States minister. He then went to England, and in 1875 accompanied the Arctic expedition on the Pandora. In 1876 he joined the Turkish army, in the service of the London *Daily News*, and did memorable work in his description of the Bulgarian atrocities, his accounts standing approved before the world in face of all attempts to discredit them. In behalf of Bulgaria he appealed to Russia, was at the front in the Russo-Turkish war that followed, and was hailed as a chief instrument of Bulgaria's resulting independence. While nursing a friend he contracted a fever which in a few days caused his death. In 1884 the Ohio legislature secured the removal of his body from its foreign grave to its final resting-place at New Lexington. He wrote 'Campaigning on the Oxus, and the Fall of Khiva' (1874); 'Under the Northern Lights' (1876); and 'Turkish Atrocities in Bulgaria' (1876).

McGarvey, John William, American educator: b. Hopkinsville, Ky., 1 March 1829. He was graduated at Bethany College, West Virginia, in 1850; for 12 years preached at Fayette and Dover, Mo., and in 1863 at Lexington, Ky.; and since 1865 has been professor of sacred history at the College of the Bible, Lexington. Of this college, a department of Kentucky University, he has been president since 1895. He is a clergyman of the Christian (Disciples) Church, and for 40 years has been connected with religious journalism. He has written: 'Commentaries on the Acts of the Apostles' (1863-93); 'Commentaries on Matthew and Mark' (1875); 'Lands of the Bible' (1881); 'Text and Canon of the New Testament' (1886); 'Credibility and Inspiration of the New Testament' (1891); 'McGarvey's Sermons' (1894); 'Jesus and Jonah' (1897); and 'The Authorship of Deuteronomy' (1902).

McGee, ma-gē', Anita Newcomb, American physician: b. Washington, D. C., 1864. She is a daughter of Simon Newcomb (q.v.); was educated at Newnham College, Cambridge, England, at the University of Geneva, and at other institutions in Europe; also graduated in medicine at Columbian University, 1892, and took a post-graduate course in gynecology at the Johns Hopkins Hospital. From 1892 to 1896 she practised in Washington. In 1888 she married W. J. McGee (q.v.). She has held prominent positions in the National Society of the Daughters of the American Revolution, and from April to September 1898 was director of its Hospital Corps, which selected women nurses for army and navy. In August 1898 to December 1899 she was acting assistant surgeon in the United States army, being the first woman to hold such a position, and was assigned to duty in the surgeon-general's office, where she organized the army nurse corps.

McGee, Thomas D'Arcy, Canadian journalist and politician: b. Carlingford, Ireland, 13 April 1825; d. Ottawa, Ontario, 7 April 1868. He was connected with the Young Ireland party and was obliged to flee to the United States at 17, where he engaged in journalism. In 1845 he returned to Ireland, but his journalistic writings compelled him to again escape to the United

States in 1848. McGee then edited the New York 'Nation' for two years, after which he became a Royalist and went to Canada, where he was editor of 'The New Era.' He entered Parliament in 1857 and was a member until his assassination, which was the result of his opposition to the Fenian movement. He published: 'History of Ireland' (1862); 'Speeches and Addresses of the British-American Union' (1865); etc.

McGee, W. J., American scientist: b. in Dubuque County, Ia., 17 April 1853. He was self-educated, and from 1873 to 1875 surveyed land and practised in the courts. In 1877-81 he made geologic and topographic surveys of north-eastern Iowa, and for the United States Geological Survey he surveyed and mapped 300,000 square miles in the southeastern part of the country, and has performed many other important services in the departments of geology, ethnology, and anthropology. From 1893 to 1903 he was ethnologist in charge of the Bureau of American Ethnology. He is president of the American Anthropological Association, chief of the Department of Anthropology and Ethnology of the Louisiana Purchase Exposition, and associate editor of the 'National Geographic Magazine.' He has written: 'Geology of Chesapeake Bay' (1888); 'Pleistocene History of Northeastern Iowa' (1891); 'The Lafayette Formation' (1892); 'Potable Waters of the Eastern United States' (1894); 'The Siouan Indians' (1897); 'Primitive Trephining in Peru' (1898); and many scientific memoirs.

McGiffert, ma-gif'ert, Arthur Cushman, American theologian and author: b. Sauquoit, N. Y., 4 March 1861. He was graduated at the Western Reserve College in 1882, and at Union Theological Seminary in 1885; and at Union studies at the universities of Berlin and Marburg, Germany, and in France and Italy. In 1888-90 he was instructor in Church history at Lane Theological Seminary, Cincinnati, and professor there 1890-3, since when he has been professor of Church history at Union Theological Seminary, New York. In 1897 he published 'A History of Christianity in the Apostolic Age,' and in consequence of criticism and threatened denominational disturbance, involving his own probable trial for heresy, to which this book gave rise, he withdrew from the Presbyterian ministry, and later, while still retaining his professorship, joined the Congregational Church. His other publications include 'Dialogue Between a Christian and a Jew,' Doctor's thesis (1888), and a translation of Eusebius' 'Church History,' with prolegomena and notes (1890).

McGiffin, ma-gif'in, Philo Norton, American naval officer: b. Washington County, Pa., 1860; d. New York 11 Feb. 1897. He was graduated in 1882 at the United States Naval Academy, and was stationed in China, and at the outbreak of the war between China and France was permitted to resign from the United States navy to enter the service of China. He established a naval academy at Wei-hai-wei, of which he had charge. When the China-Japan war broke out he was placed in command of the Chen Yuen, and was the first American or European to command a modern warship in action. He was in command at the battle of Yalu River, in which action he was so severely injured that he afterward shot himself at a hospital in New York.

McGill, ma-gil', James, Canadian philanthropist: b. Glasgow, Scotland, 6 Oct. 1744; d. Montreal, P. Q., 19 Dec. 1813. He was educated in Glasgow and in 1770 removed to Canada, where he engaged in the northwest fur-trade, afterwards becoming a merchant in Montreal. McGill was a member of the lower Canadian parliament, also of various councils, and was a brigadier-general in the War of 1812. He used much of his wealth in philanthropic work and at his death founded McGill College in Montreal.

McGill College and University, in Montreal, Canada, was founded in 1811 by James McGill (q.v.). By will he left an estate known as the "Burnside Estate," which contained 47 acres of land and a fine Manor House, near Montreal, and £10,000 to the "Royal Institution for the Advancement of Learning," for the establishment of a university in Lower Canada (province of Quebec). The bequest was valued at the time as worth about \$120,000. It was stipulated that one of the colleges of the university should be known in perpetuity as McGill College.

McGill College and University stands at the head of a group of schools and colleges and is affiliated with Cambridge, Oxford, and Dublin universities. Many generous benefactors have supplied means for the foundation of various schools. Lord Strathcona and Mount Royal erected and endowed the Royal College for Women. This school is a residential college, and is only one of many gifts from the same donor. Sir William Macdonald erected, equipped, and endowed the Macdonald Chemistry and Mining Building, the Macdonald Physics Building, and the Macdonald Engineering Building. He also gave \$200,000 endowment to the Law School. Peter Redpath gave the University Library and the Peter Redpath Museum.

The degrees conferred by its five faculties are B.A., M.A., B.Sc., M.Sc., D.Sc., and D.Litt., in the Arts, and to both men and women. The faculty of law confers degrees of B.C.L. and D.C.L.; the schools of applied science confer degrees of B.Sc., D.Sc., and M.Sc.; and the medical course leads to degrees of M.D. and C.M. There are five applied theological colleges which adjoin the university grounds. The supreme authority rests with the Crown and is exercised by the Governor-general of Canada. Fifteen members of the "Royal Institution for the Advancement of Learning" are selected as governors. The president of the Board of Governors is ex-officio the chancellor. The vice-chancellor is the principal, who is the head of the academic department and chief administrative officer. He is ex-officio the vice-chancellor. The Fellows number 43 and are chosen from all the faculties of affiliated colleges and other bodies, and with reference to representation from all bodies. In 1902 there were connected with the university, 1,222 students and 78 professors and instructors. The library contained about 100,000 volumes. The grounds and buildings, at the beginning of 1903 were valued at \$2,300,000; the endowment fund was about \$3,000,000, and the income \$411,000.

MacGillivuddy (ma-gil-i-küd't) Reeks, Ireland, a picturesque mountain-range, in County Kerry, extending for 13½ miles from the lakes of Killarney on the east to Lough Carra

on the west, and covering an area of 28 square miles. It is the loftiest mountain range in Ireland; Carranall, the highest peak, rises 3,404 feet above sea-level; Caper, 3,200 feet, while several others exceed 2,500 feet.

McGillivray, ma-gil'-vrä, Alexander, chief of the Creek Indians; b. in Alabama about 1740; d. Pensacola, Fla., 17 Feb. 1793. His father was a Scotsman of good family and his mother a half-breed. He received a good education at Charleston, S. C.: was placed in a mercantile establishment at Savannah; but soon returned to the Creek country, where he became partner in a large trading house, and rose to a high position among the Indians. After the death of his mother he became chief of the Creeks, styling himself their emperor. During the Revolution the McGillivrays, father and son, were zealous adherents of the royal cause, the former holding the rank of a colonel in the British service. After the war Alexander McGillivray, in behalf of the Creek confederacy, entered into an alliance with Spain, of which government he was made a commissary, with the rank and pay of colonel. The trade of the Creeks, under his influence, was directed to Pensacola, and for several years he baffled the most persevering efforts of the governments of the United States and Georgia to open up intercourse with the Creeks, and obtain a cession of certain disputed lands lying on the Oconee. In 1790 he was induced by Washington to visit New York, where he was received with high honors, and where he eventually signed a treaty yielding the disputed territory. He was rewarded with an appointment as agent for the United States, with the rank and pay of brigadier-general. He was shrewd enough to keep in favor with the governments of England, Spain, and the United States, and to find profitable employment under each. Until his death he held the principal chieftainship of the Creek Nation. Although he showed some military talent, he was most distinguished for his adroitness in political and business matters, and for the skill with which he controlled his subchiefs. He was noted for his hospitality; his manners were polished; and his intelligence and education are well shown in his published correspondence.

MacGillivray, William, Scottish naturalist: b. Old Aberdeen, Scotland, 25 Jan. 1796; d. there 5 Sept. 1852. He was graduated at King's College, and in 1823 was assistant professor of natural history at the University of Edinburgh; later was conservator of the museum of the Royal College of Surgeons in Edinburgh, and in 1841 was appointed professor of natural history at Marischal College, Aberdeen. He published: 'Lives of Eminent Zoologists' (1834); 'A History of British Birds' (5 vols. 1837-62); etc.

McGlynn, ma-glin', Edward, American clergyman: b. New York 27 Sept. 1837; d. Newburg, N. Y., 7 Jan. 1900. He was educated at the College of the Propaganda in Rome, and from 1866 was pastor of St. Stephen's Church in New York. He favored the education of children by the State rather than in parochial schools, and in 1886 warmly supported the candidacy of Henry George for the mayoralty, thereby bringing upon himself the censure of the church. He was summoned to Rome to exculpate himself, but refused to go, pleading his

ill-health. Persisting in his refusal he was excommunicated in 1887. He was one of the founders of the Anti-Poverty Society and was its president. In 1893, after a hearing before the Pope's delegate, Mgr. Satolli, the ban of excommunication was removed, after signing a document drawn up by the apostolic delegate to the effect that his economic views were not in conflict with the Catholic faith. He was in charge of St. Mary's parish in Newburg at his death.

McGovern, ma-gōv'ern, John, American author: b. Troy, N. Y., 18 Feb. 1850. He was connected for 16 years with the Chicago *Tribune*, and since 1880 has been engaged in literary work and lecturing, chiefly on great writers and historical characters. In the action of S. E. Gross, author of the play 'The Merchant Prince of Cornville,' against Edmond Rostand, author of 'Cyrano de Bergerac,' he acted as literary expert for the former, furnishing in the case over 700 exhibits containing innumerable parallels between the two dramas. The United States Court at Chicago issued a decree in 1902 sustaining the claim of Gross to priority of authorship and forbidding the representation of 'Cyrano de Bergerac' in this country. McGovern's numerous writings include: 'The Empire of Information' (1880); 'A Pastoral Poem' (1882); 'The Toiler's Diadem' (1885); 'Under the Open Sky' (1890); 'King Darwin,' a novel (1894); 'American Statesmen' (1898); 'Famous Women of the World' (1898); 'John McGovern's Poems' (1902); etc.

MacGowan, John E., American journalist: b. Mahoning County, Ohio, 30 Sept. 1831; d. Chattanooga, Tenn., 12 April 1903. He was educated at Hiram College and practised law in Iowa and Ohio until the outbreak of the Rebellion in 1861, when he enlisted in the Federal army and served through the war; he was mustered out of service brevet brigadier-general. MacGowan's career as a journalist began in 1872 and he was prominently connected with the leading newspapers of Tennessee. He was a forceful writer and exerted a wide influence throughout the South. From 1878 until his death he was editor-in-chief of the Chattanooga *Times*.

MacGrady, ma-grā'dī, Thomas, American Roman Catholic clergyman: b. Lexington, Ky., 11 June 1863. He was educated at Saint Joseph's College, Bardonia, Ky., and after theological studies at Kankakee, Ill., was ordained to the priesthood April 1887. He served at the cathedral in Galveston, Texas, for a short time, and was then rector at Houston, Texas (1888-90); at Dallas, Texas; at Lexington and Cynthiana, Ky.; and at Saint Anthony's Church, Bellevue, Ky. (1895-1902). Besides attending to his clerical duties, he wrote and lectured frequently on economic and social subjects, and his views were so radical that he was severely criticised, and was requested by the ecclesiastical authorities to retract his writings, but refused to do so, and resigned from his position in December 1902, though not withdrawing from the priesthood. His writings are avowedly socialistic, and several of them are approved and sold by the Socialist party; they include 'The Mistakes of Ingersoll' (1898); 'The Two Kingdoms' (1899); 'Beyond the Black Ocean' (1901), a

story; 'City of Angels' (1901); 'A Voice from England' (1902); and 'The Clerical Capitalist' (1902).

McGrath', Harold, American journalist and novelist: b. Syracuse, N. Y., 4 Sept. 1871. He was educated in Syracuse, and has been engaged in journalism since 1890. He has written 'Arms and the Woman' (1899); 'The Puppet Crown' (1901); and 'The Grey Cloak' (1903).

McGready, ma-grā'dī, James, American Presbyterian clergyman: b. in Pennsylvania about 1760; d. 1817. He studied for the ministry in the school of John McMillan, of Cannonsburg, Pa., and in 1778 was licensed to preach. After some years of work in North Carolina, in 1796 he removed to southwestern Kentucky, and under his direction began the great revival of religion which culminated in 1800 and became memorable in the religious history of the country. He organized and conducted the first camp-meeting, and employed as preachers unordained young men without special theological training, thereby provoking dissension in the Presbyterian Church. Out of this disagreement arose the Cumberland Presbyterian Church (see PRESBYTERIAN CHURCH), organized in 1810. McGready, however, afterward became reconciled to the older church and resumed his fellowship in it. Two volumes of his sermons were published years after his death, the first at Louisville, Ky., in 1831, the second at Nashville, Tenn., in 1833. Consult: Davidson, 'History of the Presbyterian Church in the State of Kentucky' (1847); Foote, 'Sketches of North Carolina, Historical and Biographical' (1850; 2d series, 1855); Smith, 'History of the Cumberland Presbyterian Church'; Edson, 'Early Presbyterianism in Indiana' (1898).

Machærodus, mā-kē'rō-dūs, a genus of huge extinct cats, fossil in the Miocene and subsequent formations, and including the largest of the *Nimravidae*. See SABRE-TOOTHED TIGER.

McHenry, James, American politician: b. Ballymena, Ireland, 1753; d. 1816. He had studied at Dublin, when, about 1771, he came to this country, and in Philadelphia soon entered upon the study of medicine under Dr. Benjamin Rush (q.v.). On the outbreak of the Revolution he became surgeon of the 5th Pennsylvania battalion; in November 1776 was taken prisoner at Fort Mifflin; was paroled in the following January, and in March 1778 exchanged. In May of that year he was made assistant private secretary to Washington, and held that position until October 1780, when as major he was appointed to a place on the staff of Lafayette. Elected in 1781 to the Maryland Senate, he continued a member of that body until 1786, being also during the second half of that period a delegate to the Confederation Congress. In 1787 he was made a member of the Constitutional Convention; in 1789 was elected to the General Assembly of Maryland, and sat in the Senate of that State, 1791-6, when he was appointed by Washington secretary of war, retaining that position in the Cabinet under John Adams' administration until 1800. As an ardent Federalist he used his influence in favor of a strong national defense, and was a zealous partisan of Alexander Hamilton. After resigning from Adams' Cabinet he spent the rest of his life in Maryland. Fort McHenry (q.v.) was named after him.

McHenry, mǎk-hén'ri, James, American physician and author: b. Larne, Ireland, 20 Dec. 1785; d. there 21 July 1845. He was educated in Dublin and Glasgow and in 1817 emigrated to the United States and finally settled in Philadelphia, where he practised medicine and was engaged in mercantile business. In 1842 he was appointed United States consul at Londonderry and held that post until his death. Among his works are: 'The Usurper: an Historical Tragedy' (played in Philadelphia 1820); 'O'Halloran, or the Insurgent' (1824); 'The Betrothed of Wyoming' (2d ed., 1830); etc.

McHenry, Fort. See FORT McHENRY.

Machete, ma-chā'tā, a short sword-like tool, half knife, half cleaver, used in Cuba and other countries of tropical America for cutting cane and as a weapon in war. It was first brought into prominence during the Cuban revolution.

Machias, mā-chī'as, Maine, town, county-seat of Washington County; on the Machias River, and on the Washington County railroad; about 120 miles east by north of Augusta. It is about 12 miles from the mouth of Machias River. A trading post was established here in 1633, by Englishmen, but after a few months they were forced by the French to abandon the place. The first permanent settlement was made in 1763, and in 1784 it was incorporated as a town. It was besieged by the British from 1 August to 1 November 1777, and other attacks were made later. The original township of Machias was divided into East Machias, Machiasport, Marshfield, and Whitneyville.

The chief industries are ship-building, lumbering, and fishing. It has considerable coast trade. The principal buildings are the Government building, the court-house, the United States Marine Hospital, and the Porter Memorial Library. Pop. (1900) 2,082. Consult; 'Memorial of the Centennial Anniversary of the Settlement of Machias.'

Machiavelli, Niccolo, nē-kō-lō' mǎ-kē-ā-vē'lē or mǎk-ī-a-vel'li, Italian historian and statesman, possibly the greatest prose writer of the Italian Renaissance: b. Florence 3 May, 1469; d. there 22 June 1527. Of Niccolo's early life and education we know nothing. No trace of him remains previous to his 26th year. But of his times and the scenes amid which he grew up, we know much. It was the calm but demoralizing era of Lorenzo the Magnificent. Machiavelli was a true child of his time. He too was thoroughly imbued with the spirit of the Renaissance; and looked back, fascinated, on the ideals of that ancient world that was being revived for the men of his day. But philosophy, letters, and art were not the only heritage that the bygone age had handed down; politics—the building of states and of empire—this also had engaged the minds of the men of that age, and it was this aspect of their activity that fired the imagination of the young Florentine. From his writings we know he was widely read in the Latin and Italian classics. But Virgil and Horace appealed to him less than Livy, and Dante the poet was less to him than Dante the politician; for he read his classics, not as others, to drink in their music or be led captive by their beauty; but to derive lessons in statecraft, and penetrate into the secrets of the successful em-

pire-builders of the past. It is equally certain, from a study of his works, that he had not mastered Greek. Like Ariosto, Machiavelli was indebted for his superb literary technique solely to the study of the literature of his own nation.

With the expulsion of the Medici from Florence, Machiavelli, at 30, emerged from obscurity to play a most important role in the Florentine politics of the succeeding decade and a half. In 1498 he was elected secretary to the Ten of War and Peace, and from 1498 to 1512 was a zealous, patriotic, and indefatigable servant of the republic. His energy was untiring, his activity ceaseless and many-sided. He conducted the voluminous diplomatic correspondence devolving upon his bureau, drew up memorials and plans in affairs of state for the use and guidance of the Ten, undertook the reorganization of the Florentine troops, and went himself on a constant succession of embassies, ranging in importance from those to petty Italian states up to those to the court of France and of the Emperor. He was by nature well adapted to the peculiar needs of the diplomacy of that day; and the training he received in that school must in turn have reacted on him to confirm his native bent, and accentuate it until it became the distinguishing characteristic of the man. His first lessons in politics and statecraft were derived from Livy's history of the not over-scrupulous Romans; and when he comes to take his lessons at first hand, it is in the midst of the intrigues of republican Florence, or at the court of a Caterina Sforza, or in the camp of a Cesare Borgia. Small wonder that his conception of politics should have omitted to take account of honesty and the moral law; and that he conceived "the idea of giving to politics an assured and scientific basis, treating them as having a proper and distinct value of their own, entirely apart from their moral value."

During this period of his political activity we have a large number of state papers and private letters from his pen; and two works of literary cast. These are his 'Decennale': historic narratives, cast into poetic form, of Italian events. The first treats of the decade beginning 1494; and the second, an unfinished fragment, of the decade beginning 1504. They are written in easy *terzine*; and are noteworthy as expressing the sentiment for a united Italy.

When in 1512 the Medici returned to Florence in the train of her invader, Machiavelli was dismissed from his office and banished for a year from the confines of the city. Later, on suspicion of being concerned in a plot against the Medici, he was thrown into prison and tortured. He was afterward included in a general pardon granted by Leo X. But Machiavelli did not return to public life until 1525; and this interval of enforced leisure from affairs of state was the period of his literary activity. A number of comedies, minor poems, and short prose compositions did not rise above mediocrity. But in one dramatic effort he rose to the stature of genius. His 'Mandragola' achieved a flattering success, both at Rome and in Florence. It has been pronounced the finest comedy of the Italian stage, and Macaulay rated it as inferior only to the greatest of Molière's. In its form, its spontaneity, vivacity, and wit, it is not surpassed by Shakespeare; but it is a biting satire on religion and morality, with not even a hint of a moral to redeem it.

His lesser prose works are the 'Life of Castruccio Castracani,' and the 'Art of War,' a treatise anticipating much of our modern tactics. A more ambitious undertaking, and his largest work, is the 'History of Florence.' At the suggestion of the Cardinal de' Medici, the directors of the studio of Florence commissioned Machiavelli to employ himself in writing a history of Florence, "from whatever period he might think fit to select, and either in the Latin or the Tuscan tongue, according to his taste." He was to receive one hundred florins a year for two years to enable him to pursue the work. He chose his native tongue; and revised and polished his work until it became a model of style, and in its best passages justifies his claim to the title of the best and most finished of Italian prose writers.

But though Machiavelli had the historical style, he lacked historical perspective; he arranged his matter not according to objective value, but placed in the boldest relief those events that best lent support to his own theories of politics and statecraft. He makes his facts to be as he wishes them, rather than as he knows them to be. To Machiavelli history was largely to be written as a *Tendenzroman*,—manufactured to point a preconceived moral. Though Machiavelli wrote history, poetry, and comedy, it is not by these he is remembered. The works that have made his name a synonym, and given it a place in every tongue, were written almost in the first year of his retirement from political life: 'The Prince' and the 'Discourses on the First Ten Books of Titus Livius.' Each is a treatise on statecraft; together they form a complete and unified treatise, and represent an attempt to formulate inductively a science of politics. The 'Discourses' study republican institutions, 'The Prince' monarchical ones. The first is the more elementary and would come first in logical arrangement. But in the writing of them Machiavelli had in view more than the foundation of a science of politics. He was anxious to win the favor of the Medici; and as these were not so much interested in how republics are best built up, he completed 'The Prince' first, and sent it forth dedicated "to the magnificent Lorenzo, son of Piero de' Medici." In the 'Discourses,' the author essays "a new science of statesmanship, based on the experience of human events and history." In that day of worship of the ancient world, Machiavelli endeavors to draw men to a study of its politics as well as its art. In Livy he finds the field for this study.

In his commentary on the course of Romulus in the founding of Rome, we find the keynote of Machiavelli's system of political science. His one aim is the building of a state; his one thought, how best to accomplish his aim. Means are therefore to be selected, and to be judged, solely as regards their effectiveness to the business in hand. Ordinary means are of course to be preferred; but extraordinary must be used when needed.

In 'The Prince,' a short treatise of 26 chapters, and making little more than a hundred octavo pages, Machiavelli gives more succinct and emphatic expression to the principles of his new political science. It is the best known of all his works. It is the one always connected with his name, and which has made his name famous. For the model of his prince, Machiavelli took Cesare Borgia, and cites him as an

example worthy of imitation; and he has shared in the execration that posterity has heaped upon Borgia. The strangest moral contradictions abound throughout 'The Prince,' as they do in all Machiavelli's writings. He is saint or devil according as you select your extracts from his writings.

Shakespeare, reflecting English thought, uses his name as the superlative for craft and murderous treachery. But later years have raised up defenders for him, and his rehabilitation is still going on. He has been lauded as "the noblest and purest of patriots"; and more ardent admirers could "even praise his generosity, nobility, and exquisite delicacy of mind, and go so far as to declare him an incomparable model of public and private virtue."

His rehabilitation proceeds from two causes. Later research has shown that perhaps he only reflected his time; and his works breathe a passionate longing for that Italian unity which in our day has been realized. He may be worthy canonization as a national saint; but those who are more interested in the integrity of moral standards than in Italian unity will doubtless continue to refuse beatification to one who indeed knew the Roman *virtus*, but was insensible to the nature of virtue as understood by the followers of Christ. And no amount of research into the history of his age can make his principles less vicious in themselves. A better understanding of his day can only lessen the boldness of the relief in which he has heretofore stood out in history. He was probably no worse than many of his fellows. He only gave a scientific formulation to their practices. He dared openly to avow and justify the principles that their actions implied. They paid to virtue the court of hypocrisy, and like the Pharisee of the earlier time, preached righteousness and did evil; but Machiavelli was more daring, and when he served the devil, disdained to go about his business in the livery of heaven. Among the editions of the collective works of Machiavelli may be mentioned those of Milan, 1810-11; Florence, 1813; Milan, 1821-2; Florence, 1826, 1843; and Florence (6 vols., 1873-7); Boston English translation (1891). Consult Villari, 'Niccolo Machiavelli e i suoi tempi (1877-82), English translation (1892); Tommasini, 'La vita e gli scritti di Niccolo Machiavelli (1882); Mourrisson, 'Machiavel' (1883).

Machine Composition. See COMPOSING MACHINES.

Machine Engraving, a mechanical process for engraving on wood, metal or stone. Since 1880 numerous machines have been invented to produce regular tints, geometrical and other designs and patterns, far more rapidly than by hand work. The most complex engraving is now executed wholly by machinery. Engraving by mechanical means is now generally employed in the making of bank-notes, diplomas, stock certificates and other papers and documents, where special designs are required. Elaborate gearing systems have been introduced whereby the cutting tools execute a certain number of symmetrical motions and thus produce elaborate geometrical patterns.

Machine Gun. See ORDNANCE.

Machinery Manufacturing Industry in America. There was practically no machinery in America at the outbreak of the

MACHINERY MANUFACTURING INDUSTRY

Revolutionary War. The jealous policy of Great Britain, which aimed to concentrate within her borders all the improvements in the arts, prompted legislation from 1750 to the close of the century, first to prevent the manufacture of iron in this country beyond the stage of pig and bar, then to prevent the exportation from Great Britain of any "tool or utensil used in working up or finishing cotton or linen, woolen or silk manufactures, and of any other tool or utensil which now is, or at any time or times hereafter may be, used in working, finishing, or completing of the iron or steel manufactures of this kingdom," under penalty of forfeiture of such tools or utensils, a fine of £200, and imprisonment for twelve months. Foreigners were forbidden by British law, under penalty of £500 and imprisonment in the common jail for twelve months, "from seducing artificers, and others employed in the manufactories, to depart out of this kingdom; and if any artificer has promised or contracted to go into foreign parts to practise or teach his trade, such artificer may be obliged to give security, at the discretion of the court, that he shall not go beyond the seas, and may be committed to prison until he give such security." These acts were rigidly enforced for a time and were not rescinded until 1845. In consequence of this legislation machinery could not be obtained from England, and the only alternative was to rely upon our own mechanical ability and construct what was needed at home.

The first textile mill in this country to use the Arkwright system was built in Pawtucket, R. I., in 1790, by Samuel Slater. All of its machinery was built by him on the premises, although he brought with him from England no plans or models of the machinery. What expedients he must have resorted to, and what a school it was for his workmen! At this period woolen cloth fabricated in the household was the only domestic source of the supply of that article; but in 1793 John Schofield and his brother Arthur, both Englishmen immigrated to this country, and constructed, with the aid of some persons of wealth in Newburyport, Mass., the first carding machine that was worked in the United States. This apparatus was first turned by hand; but when the remaining machinery was completed the factory was put into operation by water-power, the business thenceforth being conducted prosperously. Like the cotton-mill of Slater, the machinery of this first woolen-mill was built by Schofield on the premises. At this time the lathe had but lately advanced beyond the first stage of its existence, that of two dead-centres, which supported the work as it was rotated backward and forward by a hand around it, one end attached to a spring-pole above it, the other end to the foot of the operator, while the turning-tool was held in his hand. Even when the lathe had advanced beyond this first stage, and was provided with a revoluble spindle and centre, by which the work was axially supported and rotated, the tools for turning either wood or iron were still held and manipulated by hand. Because of the demand for large numbers of cylindrical iron pieces exactly parallel and of like diameter, which manual skill could not produce, the slide rest, which had been found only in the workshop of the optician and the mathematical-instrument maker, now came into common use as an adjunct of the lathe. From this time the capacity of the lathe

to produce cylindrical work of the required exactitude was unlimited, but the workman had to manipulate the slide-rest to enable the cutting-tool which it carried to perform its work. As a consequence the slide-lathe was introduced, whereby the advance of the cutting-tool, and the rotation of the work, were automatically performed. The facilities for producing the long, flat, and straight surfaces best adapted for such a machine were limited to the hammer and the cold-chisel, the file and the straight-edge, so that the slide-lathe had a curious development. The hand-lathe, with its wooden bed and short slide-rest, could produce cylinders economically, and these were utilized for slide-lathe beds; but lacking stability, as well as security for the slide-rest, the cast-iron bed dressed by the cold-chisel and the file was finally adopted. The form of the guiding surfaces of the slide-rest was, however, modified in the lathe to save hand-labor, and this distinctive form has maintained an existence to the present day. The next development of the slide-rest was the planing-machine, whereby the rough and irregular surface of the castings and forgings, traveling slowly under a cutting-tool movable at right angles to the travel of the work, was smoothed and reduced to a true plane. The advent of this machine was an era in the life of the machinist, as great, perhaps, as that of the slide-rest. It is uncertain when the first one was started, but in 1838 there were only four of these machines in the United States. The drill, which before that had been limited to a revolving vertical spindle, had an iron frame, and a table at right angles to it, upon which the work might be rigidly supported and adjusted with ease and certainty. The boring-mill or vertical lathe was then economically possible, and took its place in the machine-shop to execute a large class of turned work that did not require to be supported upon centres. Much of this work consisted of wheels that had to be keyed upon their shafts. The seats for these keys were chipped and filed, and the first development of the planing-machine was the key-seating machine, in which the tool moved while the work was fed against it. The capacity of such a machine for other work was soon developed, and when provided with compound slide-rests and a revoluble table mounted thereon, it took its place as a standard tool in the machine-shop, under the name of the slotting-machine. This planer, with its vertically movable tool, was the progenitor of a machine with similar attachments, but with its tool moving horizontally, upon which work could be conveniently shaped in a great variety of forms; and the shaping-machine, as it was called, soon became one of the standard tools of the machine-shop. With the advent of these tools the art of driving the cold-chisel and of guiding the file, once the criterion of a good workman, was rarely exercised. In the meantime, however, the vertical spindle-drill, with its compound tables, movable vertically and adjustable horizontally, in two directions at right angles with each other, had been supplemented by the horizontal drill, with similar tables, but with its drill-spindle parallel to the tables; and the further requirements in this direction had been supplied by the radial drill, in which the vertical drill-spindle is movable about a vertical axis, toward and from which it is adjustable radially.

The development of the machine-shop was

MACHINERY MANUFACTURING INDUSTRY

not, however, exactly in the order above indicated; it had other requirements which these tools supplied inadequately, if at all, among which were the screw-bolts and nuts for securing the parts of the machines together, a want which had been imperfectly supplied before even the original lathe had an existence. The iron screw-bolt was then formed by compressing a split die upon it, provided with spiral threads, and rotating the bolt or the die backward and forward until the thread was partly cut and partly raised to its completed form, while a taper-tap was screwed into the nut from one side and then from the other, until by trial the nut was found to enter upon the bolt. The apex of the thread was always larger than the diameter of the bolt, and bolts and nuts were only interchangeable by accident. The slide-lathe made it possible to cut out the thread without raising it, but for the great mass of bolts this was far too expensive, so that the split die continued to produce its imperfect product in this country until the solid die patented by Philetus W. Gates, 8 May 1847, with sectional threads, was introduced. After this die had cut the thread at one pass, its direction of rotation was reversed to unscrew it from the bolt, which not only left a mark upon the thread, but was liable to injure the die, and no compensation for wear was possible. It was not until 1857 that a bolt machine was devised by William Sellers, and constructed by his firm in which dies to cut the thread at one pass, and adjustable to size, could be opened and closed while running continuously in one direction, and thereafter ordinary screw-bolts could be made interchangeable. In 1860 this tool was introduced into England, and subsequently upon the continent of Europe. Another of the early machine-shop tools was the gear-cutter, simply a revolving milling-cutter against which the wheel was forced, mounted upon a spindle above the dividing-plate on the same spindle. The only power used was that required to rotate the cutter; the movement against the cutter and its reverse, and the division or adjustment for the next tooth, were performed by the workman. The cost of such work was so great that the teeth of nearly all wheels, even for fine machines, were cast, until a machine was devised by William Sellers, and constructed by his firm in 1867, and exhibited at the Paris Exposition in the same year, in which the work of the operative was limited to adjusting the wheel to be cut to the cutter. After that the machine proceeded with the work of cutting each tooth, retracting the cutter, turning the wheel for the next tooth, and so on, until the wheel was completed in less time than it could be done when these movements were effected by hand; so that now one man can easily attend several machines, and cast teeth are no longer admissible in good machines. One other typical machine-tool which has received its greatest development in this country must be referred to—the milling machine, by which the various shapes in firearms are fashioned. It must not be supposed, however, that the above comprise all or nearly all of the machine-tools now in common use; they are but types, upon which an infinite variety of changes have been wrought to adapt them to special requirements. Their development marked the first stage of the machinist's art, when machine-tools were only required to perform the simple operations of

turning and planing, drilling and milling, to make other machines.

Along with the development of these tools for general purposes came a development of the system of interchangeability as an economical principle in manufacturing machinery, requiring in some instances special machines, but more commonly special tools or appliances for use in connection with the ordinary machine-tools. While it cannot be claimed that this country was the first to attempt manufacturing machinery upon this principle, it must be admitted that the system was in successful use here very many years in advance of any other nation, and that its success here brought about its adoption abroad. For the economical manufacture of machinery or of apparatus in which large numbers of the parts shall be interchangeable there are certain preliminary conditions which must be observed: first, reference standards must be provided, with which to compare the several parts and determine the tolerance—that is to say, the amount of variation permissible between the standard and the product; second, every part of the finished piece must be completed without the intervention of hand labor; and third, for every piece a base must be established, to which each and every succeeding operation must refer; consequently every piece must form a separate study to determine the best appliances for each operation, so that the efficiency of the operation shall not be dependent upon the skill of the operator. The first application of these principles was made upon firearms in our government arsenals, under the direction of Eli Whitney, the inventor of the cotton-gin. The growth of the system must have been slow, and confined for a long period to a few of the principal parts; but from the first it had proved economical, for in 1822 Calhoun, then Secretary of War, admitted to Whitney that the government was saving \$25,000 per year at the two public armories alone by the use of his improvements. The drop forging-press, with its dies conforming to the shape desired, served to produce expeditiously in red-hot metal all of the smaller parts of the gun, closely approximating the finished size and shape. The milling-machine, when its capacity was developed, accurately finished these forged parts, however varied the shape; and the drill, when the order of procedure had been determined and the guiding templates were provided, fashioned the bearings for the working parts and the holes for securing the parts in position. The wooden gun-stock, of irregular form, was rapidly and automatically shaped exteriorly as it and its model revolved in a lathe designed by Thomas Blanchard, and patented by him 20 Jan. 1820. Other special tools routed the groove for the gun-barrel and the cavity for the lock, with the other details required to receive the guards and fastenings of the gun, with such accuracy that the several parts could be assembled as they came from the machines. The accuracy then attainable, however, was far short of that now demanded; the gun then produced did not require it. The machine-tools were limited in variety and comparatively rude of structure, so that the quality of their work could not be depended upon. The vernier caliper was the most delicate instrument of measurement, and a thousandth of an inch was its extreme limit of accuracy, while the form of the screw-thread did not admit of

MACHINERY MANUFACTURING INDUSTRY

very accurate determination. As the quality of machine-tools improved, appliances necessary to detect with certainty an error of the twenty thousandth of an inch were supplied by the Pratt & Whitney Company, after designs by Professor W. A. Rogers and Mr. George M. Bond; and the form of screw-threads advocated by Mr. William Sellers in a paper read before the Franklin Institute, 21 April 1864, soon became the standard for the United States; so that now a degree of accuracy is easily attainable which, at the introduction of the system, was impossible. From the first the method of working the interchangeable system had proved economical, and, with the growth of excellence in every detail of machinery, the system had been so extended and improved that the knowledge of its advantages reached to foreign countries, and various commissions were appointed to investigate it. In 1870 the German government contracted with the Pratt & Whitney Company for gun machinery to the value of \$350,000, and within the next three years for \$1,250,000 more; and until 1875 the company was kept busy on European orders. By a supplemental contract with the German government the Pratt & Whitney Company agreed to superintend the erection of the machinery they had furnished, and to instruct native workmen how to operate it. The results were entirely satisfactory, and about the same time other manufacturers of gun-making tools, notably Brown & Sharpe, of Providence, R. I., received large orders for such machinery from other foreign countries, and our system for the manufacture of this class of interchangeable parts was thus established in England and on the continent of Europe.

In brief, for more than half a century this country has been in possession of a system of manufacture peculiar to itself, developed first in the manufacture of the larger class of firearms, then extended to pistols, and subsequently to a great variety of products, such as the sewing-machine, the typewriter, the bicycle, and the watch, all of which stand to-day unrivaled. The improvement in agricultural machinery (q.v.) doubtless contributed quite as much to our agricultural supremacy as did the fertility of American soil. And an equally large part has been played by American machinery in textile manufactures, shoe- and garment-making, and even in carpentering and joinery.

The same changes have occurred in the fabrication of metals, and the blast-furnace, whose maximum product was 25 to 30 tons per week, now produces 500 tons per day. In transportation the team of horses has long since been displaced by the locomotive, and present indications point to another and more efficient substitute.

The immense number of similar parts which the automatic machinery of these and other industries demanded afforded opportunity for the introduction of machine-tools to manufacture machinery, as distinguished from those designed simply for making it. The difference may be illustrated in the two processes of making a turned bolt with a square or hexagonal head, the one after the introduction of the slide-lathe, and the other at the present time. Then, a bar of iron of suitable size was heated and forged by the smith to a size and shape approximating that of the finished article; this was centred; a carrier was secured upon one end whereby it

could be rotated; the end opposite the carrier was squared in the slide-lathe by a side-tool, the carrier was transferred to the other end of the bolt, and the opposite end was squared, the side-tool was changed for another tool, adapted to turning the body of the bolt, and this again for another, adapted to cutting the thread. At each change of carrier and of tool the lathe was stopped that the workman might release the one tool and secure the other. Now, the iron bar, square or hexagonal, and of the size and shape of the head of the bolt, is delivered from the rolling-mill to the attendant of the machine, who thrusts it into the machine against a stop; the machine grips it, squares off the projecting end, turns up the body of the bolt, cuts the thread, bevels the end, and finally cuts off the bar beyond the last turning, to make a head, and the bolt drops, a finished product. The machine releases the bar, moves it forward the distance required for another similar bolt, and repeats its operations, until the bar is converted into bolts; and it could, if desirable, inform its attendant that it was out of work, or notify him of the fact by stopping its movement. The attendant is no longer of necessity a machinist, for his only occupation is to provide his machine with bars, to remove its product, and to keep it clean, duties which attendance upon a number of such machines does not make onerous. The turned bolt so manufactured is as good as, but no better than, that which was first forged and then finished upon the simple slide-lathe; but the product of the workman is vastly greater, and the skill required for it is far less. For such apparatus quantity of like product is the first requisite. Given this, and the skill of the engineer and the machinist is demanded to produce by successive automatic operations the desired result. These operations without the intervention of human intelligence may at first be few in number, but they will be extended from time to time as experience warrants or as future discoveries may render possible.

The field, then, for machinery and for manufacturing interests is forever widening. Every secret of nature that is unfolded, every discovery in the arts, every combination that produces new results, only opens other avenues of progress, which must become more rapid and more diverse with the growth of the centuries. It would be interesting to determine accurately, if that were possible, what is now the annual product of this new industry; but the census gives only the aggregate value of the machinery, tools, and implements in use, and the annual production of all manufacturing industries. The last census gives the number of foundries and machine-shop establishments at 9,234, the capital employed at \$665,058,245 and the number of employees at 350,327, and if we assume the annual product per employee to be \$1,500, we shall have an annual production of machinery equal to \$525,490,500, which is probably a moderate estimate. The importation of machinery is so small compared with our own production that the cost has but little effect upon our market, particularly so as its design and construction are generally regarded as inferior to our own. See **HARDWARE INDUSTRY; AGRICULTURAL MACHINERY AND IMPLEMENTS.**

WM. SELLERS,
William Sellers & Co., Philadelphia

MACHOL — MACKAY

Machol', or **Mahhol'** (Hebrew), a word in the Old Testament, associated with "toph" (timbrel), and almost always rendered in the English version by "dances" or "dancing." It is not improbable that *machol* and *toph* may mean "pipe and tabor," as these two instruments are often associated with dancing.

McIlhenney, māk-il-hēn'ī, **Charles Morgan**, American landscape painter: b. Philadelphia 4 April 1858. Having studied under Frank Briscoe, he continued his course of training at the Academy of Fine Arts in Philadelphia, and soon began to win recognition in his chosen field. Among his best known works are 'A Gray Summer Noon' (1884), and 'The Passing Storm' (1887). In 1893 he was awarded medals at the Columbian Exposition and won the first Hallgarten prize.

McIlvaine, **Charles Pettit**, American Protestant Episcopal bishop: b. Burlington, N. J., 18 Jan. 1799; d. Florence, Italy, 13 March 1873. He was graduated at the College of New Jersey (now Princeton University), in 1816; entered the Princeton Theological Seminary in the same year, and was ordained deacon in 1820 and priest in 1821. His first pastoral charge was at Georgetown, D. C., which he left in 1825 to become professor of ethics at the United States Military Academy, West Point. He became rector of St. Ann's Church, Brooklyn, in 1830, and in 1831 undertook the duties of the professorship of the evidences of religion and sacred antiquities in the University of the City of New York. He did not long hold the chair, however, as he was the next year elected bishop of Ohio, to succeed Bishop Chase, who had resigned the see. The question of the legality of such a resignation excited considerable interest in the General Convention of that year, but in the interest of the diocese both houses agreed in approving Dr. McIlvaine's testimonials, and he was accordingly consecrated in St. Paul's Chapel, New York. Upon his removal to Ohio he was elected president of Kenyon College, Gambier, founded by Bishop Chase, and held the position until 1840, acting also for some years as president of the Theological Seminary in the same place. During his long episcopate he came to be recognized as one of the most influential leaders of the Evangelical or Low Church party in America, and his ability and courtesy were cordially recognized by those who differed from him most widely. During the Civil War he was one of the four ambassadors informally appointed by President Lincoln to set before the English people what was considered in the North the real significance of the War. He published various sermons, addresses, and more important theological works, mainly directed to defending the positions of his party in the Church.

McIntosh, māk'in-tōsh, **Lachlan**, American soldier: b. near Inverness, Scotland, 17 March 1725; d. Savannah, Ga., 20 Feb. 1806. He came with his father to Georgia in 1736, received there an ordinary English education, became a clerk in the mercantile establishment of Henry Laurens at Charleston, S. C., and was later employed as a land surveyor. At the opening of the Revolution he was made colonel of the 1st Georgia battalion, and became a brigadier-general in 1776. In 1777 he fought a duel with But-

ton Gwinnett (q.v.), who was fatally wounded. In 1778 McIntosh was selected by Washington to lead a small force against the Western Indians, whom he subdued. In the siege of Savannah, 1779, he bore an active part. When Charleston surrendered to Sir Henry Clinton 12 May 1780 McIntosh was taken prisoner, and he never resumed his command. He was a member of the Continental Congress in 1784, and the next year as commissioner to the Indians he finished his public services.

MacIntosh, **Maria Jane**, American author: b. Sunbury, Ga., 1803; d. Morristown, N. J., 28 Feb. 1878. In 1835 she removed to New York; and having suffered pecuniary reverses resorted to her pen for support, publishing in 1841 'Blind Alice,' under the pseudonym of "Aunt Kitty," by which she continued subsequently to be known. It was followed by 'Conquest and Self-Conquest,' 'Praise and Principle,' and other tales between 1841 and 1846, each designed to inculcate some moral sentiment. In 1846 she published a work entitled 'Two Lives, or to Seem and to Be,' and in 1847 her stories were collected in a single volume as 'Aunt Kitty's Tales.' Other works are: 'Charms and Counter-Charms' (1848); 'Donaldson Manor' (1849); 'Woman in America' (1850); 'The Lofly and the Lowly' (1853); 'Violet, or the Cross and the Crown' (1856); 'Meta Gray' (1858); 'Two Pictures' (1863).

McIver, **Charles Duncan**, American educator: b. Moore County, N. C., 27 Sept. 1860. He was graduated from the University of North Carolina in 1881, adopted teaching as a profession and after organizing the public schools of Winston and Raleigh, became one of the faculty of Peace Institute, Raleigh, in 1886. He was State Institute conductor, 1889-92, and has held important educational posts in his native State, as chairman of the committee of the Teachers' Assembly in 1891 assisting in securing the establishment of the North Carolina Normal and Industrial College. In 1892 he became the first president of this institution, the only college for women in the State receiving an annual appropriation from the public funds. He is a member of the Southern Educational Board, which controls the Peabody Fund.

Mack von Leiberich, māk fōn lī'bē'rīt, **Karl**, BARON, Austrian military officer: b. Nennslingen, Franconia, 24 Aug. 1752; d. Saint Polten, Austria, 22 Oct. 1828. He entered the army of Austria in 1770, and was in 1797 created field-marshal. After the peace of Campo Formio, he was appointed by the King of Naples to the command of his troops, and took the field against the French and occupied Rome; but a riot in Naples, caused by his having concluded an armistice with the French, forced him to take refuge in the French camp. He was carried prisoner to Paris, but escaped in 1800 and in 1805 was sent to check the French advance along the line of the Iller. But the enemy shut him up in Ulm, and on Oct. 17 Mack capitulated with his army. He was tried by court-martial, but the sentence of death was commuted by the Austrian emperor to expulsion from the army and 20 years' imprisonment. In 1808 Mack was liberated, and in 1819 fully pardoned.

Mackay, mā-kā' or mā-kī', **Charles**, English poet, journalist, and miscellaneous writer: b. Perth, Scotland, 27 March 1814; d. London

24 Dec. 1889. He was editor of the 'Illustrated London News,' 1852-9, lectured in the United States, 1857-8, and was a special correspondent of the *London Times* in New York during the Civil War (1862-5). He was famous for his songs, many of which he set to music of his own. 'Cheer, Boys, Cheer,' is the best known of these. Among his many books are: 'The Salamandrine, or Love and Immortality' (1842); 'Voices from the Crowd' (1846); 'Voices from the Mountains' (1847); 'History of the Mormons' (1851); 'Lost Beauties of the English Language' (1874); 'Forty Years' Recollections' (1878); 'Through the Long Day' (1887); 'A Dictionary of Lowland Scotch' (1888).

Mackay, Clarence Hungerford, American capitalist: b. San Francisco 17 April 1874. The son of J. W. Mackay (q.v.), he succeeded on the death of his father to his vast business interests. Much of his boyhood was spent in France, and he was educated at Vaugirard College, afterward studying at Beaumont College, Windsor, England. He became proficient in modern languages, several of which he speaks fluently.

McKay, Donald, American shipbuilder: b. Nova Scotia 1810; d. 1880. He went to New York and learned ship-building, and began the business at Newburyport, Mass. At East Boston, in 1845, he established a shipyard where he built many large trading ships of the clipper model, in which he made great improvements. The *Great Republic*, which he built, a ship of 4,500 tonnage, was a larger vessel than had ever before been seen.

Mackay, George Eric, English poet, son of Charles Mackay (q.v.): b. London 25 Jan. 1851; d. 2 June 1898. Among his works are: 'Songs of Love and Death' (1865); 'Ad Reginam' (1881); the popular 'Love Letters of a Violinist' (1886); 'A Lover's Litanies' (1888); 'Nero and Actæa,' a tragedy (1891); 'My Lady of Dreams' (1895); 'Arrows of Song' (3d ed. 1896); 'A Lover's Missal' (1898).

McKay, Gordon, American inventor and manufacturer: b. Pittsfield, Mass., 1821; d. Newport, R. I., 19 Oct. 1903. He was the son of a cotton manufacturer, and at 12, on the death of his father, learned civil engineering, at which he worked for some time. Before he was 21 he built a machine-shop in Pittsfield which employed 100 men, and later became treasurer and manager of the Lawrence Machine Company. He was the first successful inventor of machinery for making boots and shoes; he perfected a shoe sewing-machine, invented, but not made practicable, by L. R. Blake, of Abington, Mass.; afterward invented the heeler, lasting-machine, nailing-machine, etc., which came into general use; and by these inventions revolutionized the boot and shoe industry of the world. At the outbreak of the Civil War he offered to make the shoes for the Union army, and within three years had leased his machines to more than 60 firms, and shortly became a millionaire. In 1878 he formed the McKay Sewing-Machine Association, a strict monopoly which exacted commissions on all shoes made in the United States by the aid of his inventions, and also brought profit through European royalties. In 1893 he placed \$4,000,000 in a trust fund for Harvard University. He made many other liberal donations for benevolent and educational

objects, and established near Kingston, R. I., the McKay Institute for the manual training of colored youth. By his will the greater part of his estate was left to Harvard.

Mackay, John William, American capitalist: b. Dublin, Ireland, 28 Nov. 1831; d. London 20 July 1902. His parents brought him to New York in 1840, and he learned ship-building. He went to California as a miner in 1851, and afterward to Nevada, where he continued mining with great perseverance in the face of many disappointments. In 1872 he was one of the discoverers of the Bonanza mines of the Comstock Lode (q.v.), in which mines he obtained a two fifths share, and became very wealthy. He and his partners, Fair, Flood, and O'Brien, founded the Bank of Nevada, of which Mackay was president for years. His relations with Jay Gould being unfriendly, in a spirit of opposition to him, and to the Western Union Telegraph Company, Mackay in 1884 joined with James Gordon Bennett in forming the Commercial Cable Company and the Postal Telegraph Company. He succeeded in laying two cables, overcoming great obstacles, and afterward won in a long rate-war with the old lines. The Roman Catholic Orphan Asylum at Virginia City, Nev., founded by him, is noteworthy among his many public benefactions.

Mackay-Smith, Alexander, American Protestant Episcopal bishop: b. New Haven, Conn., 2 June 1850. He was graduated from Trinity College, Hartford, in 1872, entered the Episcopal ministry and took priest's orders in 1877. After holding rectorships in South Boston, Mass., and New York successively, he was rector of St. John's, Washington, D. C., 1893-1902. In the year last named he was consecrated coadjutor-bishop of Pennsylvania.

Mackaye, ma-kä', James Steele, American playwright: b. Buffalo, N. Y., 1844; d. Timpas, Colo., 25 Feb. 1894. In 1868 he went to Paris to study painting; but having there met Delsarte (q.v.) became interested in the latter's theories, and studied dramatic expression. In 1870-1 he gave in New York and Boston lectures on the art of expression. He opened the St. James Theatre at New York in 1872, and appeared there in 'Monaldi,' adapted by himself from the French. In 1873-5 he was studying the drama in Paris and England, and at the Crystal Palace, London, he played the title-role in 'Hamlet.' His adaptation of Blum's 'Rose Michel' in 1872 ran for 122 nights at the Union Square Theatre, New York. He established in New York the Lyceum School of Acting, which later became the American Academy of Dramatic Arts. For several years he was manager of the Madison Square theatre, and in 1885 built the Lyceum. Among his further plays were: 'Won at Last'; 'Through the Dark'; 'Hazel Kirke'; 'A Fool's Errand'; 'In Spite of All'; 'Paul Kauvar.'

McKean, ma-kën', Thomas, American patriot and jurist, signer of the Declaration of Independence: b. New London, Chester County, Pa., 19 March 1734; d. Philadelphia 24 June 1817. He was privately educated at Newcastle, Del.; having settled there, he studied law and was admitted to the bar in 1755; at once became register of probate, and was soon made assistant attorney for Sussex County. With Cæsar Rodney (q.v.), in 1762, he entered upon

a revision of Delaware laws up to 1752, and was chosen in the same year to the Delaware Assembly, in which his membership continued till 1779. Elected in 1765 to the Stamp Act Congress (see STAMP ACT), he took a strong position in defense of colonial rights, and as judge of the common pleas in the same year permitted no stamped paper to be used in his court. About 1771 he began to practise law in Philadelphia, although retaining a Delaware residence, and from Delaware, in 1774, he was elected to the Continental Congress, in which he served nine years, including the entire period of the Revolution, and took a prominent part in its proceedings, being president of the Congress in 1781. He was not present at the signing of the Declaration of Independence, which he had advocated, but added his signature some years afterward. The Articles of Confederation, which he aided in drafting, were also signed by him. In Pennsylvania, where he had become well known, he was made chairman of the Committee of Safety in 1776, and from 1777 to 1799 was chief justice of the State. He became a strong supporter of Jefferson, and a leader of the Republican party of that day, and was governor of Pennsylvania from 1779 to 1808. With James Wilson he wrote 'Commentaries on the Constitution of the United States' (1790).

McKean, Thomas, American philanthropist: b. Philadelphia, Pa., 23 Nov. 1842; d. there 16 March 1898. In 1862 he was graduated at the University of Pennsylvania and entered upon a successful business career, becoming an officer in many railroad and financial corporations. He acquired a large fortune, which he spent freely in endowing educational and charitable enterprises, his various gifts to the University of Pennsylvania alone amounting to \$300,000.

McKean, William Vincent, American editor: b. Philadelphia 15 Oct. 1820; d. there 29 March 1903. He was a type-founder's apprentice in 1830-46, held a government post in Philadelphia in 1846-50, studied law and was associate of John W. Forney (q.v.) in the editorship of 'The Pennsylvanian' in 1850-3. In 1853-6 he was chief-clerk and disbursing officer of the House of Representatives, and became secretary to James Buchanan. He was editor-in-chief of the Philadelphia *Inquirer* 1860-4, and from 1864 until 1891 editor-in-chief and general manager of the *Public Ledger*.

McKees (ma-kêz') **Rocks**, Pa., borough, in Allegheny County; on the Ohio River, and on the Pittsburgh, C. & Y., and the Pittsburgh & L. E. R.R.'s; opposite the city of Allegheny. The first permanent settlement was made about 1830 by John McKee. It was incorporated as a borough in 1892. It is situated in a bituminous coal region, and in the vicinity of a fertile agricultural section. The chief industrial establishments are railroad shops, iron and steel works, car works, wire mills, tannery, chain works, rolling-mills, glassworks, flour and lumber mills. The shops and mills employ about 5,500 men. The borough has nine churches, four public and two parish schools. The principal public buildings are the churches, schools, a Y. M. C. A. building, and a hospital. There are three banks having a combined capital of \$325,000; and the

business transacted amounts annually to over \$1,000,000. The government is vested in a burgess and a council of seven members. There are a number of foreign-born inhabitants, chiefly Germans, Hungarians, Italians, and Russians; the native born predominate. Pop. (1890) 1,687; (1900) 6,352. A large number of the employees in the machine shops and steel works reside outside the borough limits.

JOHN E. SCHRAMM,
Editor McKees Rocks 'Gazette.'

McKeesport, Pa., city, in Allegheny County; at the junction of the Monongahela and the Youghiogheny rivers, and on the Pennsylvania, the Pittsburgh & L. E., and the Baltimore & O. R.R.'s; about 10 miles southeast of Pittsburgh. The first permanent settlement was made in 1795 by David McKee, after whom the place was named. It was only a small village until 1820, when coal mining began on an extensive scale. It was incorporated as a borough 3 Sept. 1842, and chartered as a city 1 April 1890.

McKeesport is situated in a region noted for its extensive fields of bituminous coal and its natural gas. The chief industrial establishments are steel and iron works, one of which, the National Tube Company, has 10,000 employees. There are about a dozen smaller establishments; railroad shops, glass works, locomotive works, and others, all together employing about 8,000 men. The city has a large trade in its own manufactures and in coal and lumber. The principal educational institutions are the public and parish schools, the Douglass Industrial College, the Gessley Business College, and the Carnegie Library. Some of its principal buildings are those of the schools mentioned (the high school cost about \$168,000), the Young Men's Christian Association Hall, and 30 churches. There are 18 different religious denominations and 40 congregations in the city.

There are five banks, the combined capital of which is \$1,100,000. The city officials are a mayor, who holds office three years, a council composed of 11 select and 22 common council members. The select members hold office four years, the common council members are elected every two years. The mayor appoints, subject to approval of the council, the board of health, the police and the street commissioners. The council elect the chief of the fire department, the water commissioners, and the city solicitor, and the board of education, the board of assessors, the treasurer, and comptroller are chosen by popular election.

The city owns and operates the waterworks. The annual municipal expenditures are about \$320,000; the chief items of expense are, for schools about \$155,000; waterworks, \$55,000; police department, \$55,000; fire department, \$35,000. Pop. (1890) 20,741; (1900) 34,227. A large number of the people are foreign born, chiefly from Austria, Sweden, Germany, and Italy; but the native born predominate.

A. N. LAWSON,
Managing Editor 'Daily News.'

MacKellar, ma-kêl'ar, **Thomas**, American poet: b. New York 12 Aug. 1812; d. 29 Dec. 1890. Having learned the printer's trade in the publishing house of the Harpers, he went to Philadelphia as a proofreader in the stereotype foundry of Lawrence Johnson & Co., in time became a partner in the business, and finally its

McKELWAY—MACKENZIE

head, the new firm being styled MacKellar, Smiths & Jordan. Among his works may be mentioned: 'Droppings from the Heart' (1844); 'Tam's Fortnight Ramble' (1847); 'Lines for the Gentle and Loving' (1853); 'The American Printer' (1866); 'Rhymes Atween-Times,' containing 'Let Me Kiss Him for His Mother' (1873); and 'Hymns and Metrical Psalms' (1883).

McKelway, Saint Clair, American journalist: b. Columbia, Mo., 15 March 1845. He was educated in Trenton, N. J., was admitted to the bar in 1866 but has never practised. He is prominent as a writer and speaker on educational and other topics, and has been editor-in-chief of the Brooklyn *Eagle* from December 1884.

McKendree, ma-kën'drī, William, American Methodist bishop: b. King William County, Va., 6 July 1757; d. near Nashville, Tenn., 5 March 1835. He served in the Continental army during the American Revolution, entered the Methodist ministry in 1787 and became a presiding elder nine years later. In 1801 he made a missionary tour beyond the Alleghanies and was an important factor in the evangelizing of that region. In 1808 he was elected bishop, being the first American born person to hold that office in the Methodist church. McKendree College (q.v.) was named in his honor. Consult 'Life' by Paine (1869).

McKendree College, in Lebanon, Ill., founded in 1828 under the auspices of the Methodist Episcopal Church, and first called Lebanon Seminary. In 1830 the name was changed, in honor of William McKendree, who gave his estate to the college and in many ways aided and encouraged its founders. In 1839 a new charter was obtained whereby the school was granted university privileges. Abraham Lincoln rendered valuable services in securing the new charter. Students are admitted on certificates from approved schools or on examinations. It has classical, scientific, music, law, and graduate departments. The degrees to which the courses lead are A.B. and B.S. In 1903 there were connected with the school 12 professors, and 150 students in the academic and college departments, and 80 students in music. The library contained about 12,000 volumes. The endowment fund was about \$50,000, and the annual income, \$6,500. The estimated value of the college grounds and buildings was nearly \$70,000.

McKenna, ma-kën'a. Joseph, American jurist: b. Philadelphia 10 Aug. 1843. In 1855 he went to California and was graduated from the Benicia Collegiate Institute in 1865. He was admitted to the bar the same year, and he soon became a leading lawyer of Suisun, the county-seat of Benicia County. He was district attorney of Solano County in 1866-8, and in the sessions of 1875 and 1876 served as a Republican in the lower house of the California legislature. In 1885-93 he was a California representative in the 49th, 50th, 51st and 52d Congresses, resigning from the House in 1893 to accept the appointment to the office of United States circuit judge in the 9th Federal judicial district. This post he resigned to become attorney-general in the cabinet of President McKinley in 1897. On 16 Dec. 1897 he was made an associate justice of the United States Supreme

Court to succeed Justice Field, retired, and on 26 Jan. 1898 took his seat. As circuit judge at San Francisco McKenna displayed much skill in the exposition of international law and the construing of treaties, at a time when there were numerous disputes as to the status and treatment of Chinese immigrants. His opinions as an appeal judge are marked by precision, breadth, and a succinct style.

Mackenzie, ma-kën'zī, Sir Alexander, Scottish explorer: b. Inverness, Scotland, 1755; d. near Dunkeld 12 March 1820. He went to Canada when young, where he entered the employ of the Northwest Fur Company. In 1789 he explored the great river named after him from the western end of Great Slave Lake to the Arctic Ocean made another expedition to the western coast (1792), and was the first white man to cross the Rocky Mountains and reach the Pacific coast. He returned to Britain in 1801, and for his explorations received the honor of knighthood in 1802. He published 'Voyages from Montreal through the Continent of North America to the Frozen and Pacific Oceans in 1789 and 1793.'

Mackenzie, Alexander, Canadian statesman: b. Logierait, Perthshire, Scotland, 28 Jan. 1822; d. Toronto, Ontario, 17 April 1892. He removed to Canada in 1842, where he became a builder and contractor. In 1852 he became editor of a reform newspaper and sat in the Canada Assembly and subsequently in the Dominion Parliament. From 1867 he led the Reform opposition in Parliament, and in 1873-80 was leader of the Liberal party in Canada. In 1873 he succeeded Macdonald as premier, resigning in 1878. He thrice declined the honor of knighthood.

McKenzie, Alexander, American Congregational clergyman: b. New Bedford, Mass., 14 Dec. 1830. He was graduated from Harvard in 1859 and from the Andover Theological Seminary in 1861, was pastor of the South Church, Augusta, Maine, 1861-7, and has been pastor of the Shepard Church, Cambridge, Mass., from the last named date. He has published 'Two Boys' (1870); 'Cambridge Sermons' (1884); 'Christ Himself' (1891); 'The Divine Force in the Life of the World' (1898); 'Now' (1899); etc.

Mackenzie, Sir Alexander Campbell, Scottish composer: b. Edinburgh 22 Aug. 1847. He received his earlier musical education in Germany, and from 1865 to 1881 was a conductor and teacher of music in his native city. He became principal of the Royal Academy of Music in London in 1888, and holds the degree of doctor of music from St. Andrews, Cambridge, and Edinburgh. His first notable composition was an opera 'Colomba' (1883), followed by 'The Troubadour' (1886). His chief work, however, is his oratorio 'The Rose of Sharon' (1884). Other works of his are the oratorio 'The Lord of Life' (1891); the cantatas 'Story of Sayid' (1886) and 'Dream of Jubal' (1889). He was knighted in 1895.

Mackenzie, Alexander Slidell (originally Slidell), American naval officer: b. New York 6 April 1803; d. Tarrytown, N. Y., 13 Sept. 1848. He was a brother of John Slidell (q.v.) and assumed the name 'Mackenzie' for an uncle

MACKENZIE

in 1837. He entered the navy in 1815 and became a commander in 1841. While in command of the Somers the next year a mutiny among the naval apprentices on board was supposed to have been detected, and three of them, including a son of the secretary of war, were hung from the yardarm on 1 Dec. 1842. Mackenzie's summary action in the affair was bitterly criticised, but he was acquitted of blame by court-martial, though attacks upon him continued for the rest of his career. He was a popular writer, and among his works are: 'A Year in Spain by a Young American' (1829-1831; enlarged ed. 1836), which attained great popularity in England and the United States; 'Popular Essays on Naval Subjects' (1833); 'The American in England' (1835); 'Life of John Paul Jones' (1841); etc. Consult: 'The Case of the Somers: defense of A. S. Mackenzie' (1843); J. F. Cooper, 'The Cruise of the Somers' (1844).

Mackenzie, Henry, Scottish novelist and essayist: b. Edinburgh 25 Aug. 1745; d. there 14 Jan. 1831. He was a lawyer at Edinburgh; and in 1771 published anonymously 'The Man of Feeling' (1771), which gained him a conspicuous place among 18th century writers. Other novels of his are 'Man of the World' (1773); and 'Julia de Roubigné' (1777). He edited 'The Mirror' 1779-80, and 'The Lounger' 1785-87, papers on the plan of 'The Spectator.' His home in Edinburgh was long the resort of the most prominent persons in literature and politics in Scotland.

Mackenzie, Sir Morell, English laryngologist: b. Leytonstone, Essex, 7 July 1837; d. London 3 Feb. 1902. He was educated at the London Medical College, Paris and Vienna. In 1859 he met Czermak in Budapest and learning from him the use of the laryngoscope he introduced its use into London. Later he became physician to the London Hospital, and lecturer on diseases of the throat. In 1863 he founded the Throat Hospital in London. In 1887-8 he was associated with specialists of Berlin and Vienna in the treatment of the larynx disease of the Crown Prince, subsequently Emperor Frederick of Germany, and for these services was knighted by Queen Victoria, and received the Grand Cross and Star of the Hohenzollern Order of Germany. He was the author of 'The Use of the Laryngoscope' (1866); 'Diseases of the Throat and Nose' (1880); etc.

Mackenzie, Ranald Slidell, American soldier: b. Westchester County, N. Y., 27 July 1840; d. Staten Island, N. Y., 19 Jan. 1889. He was son of Alexander S. Mackenzie (q.v.). Graduated from West Point in 1862, he was assigned to the engineer corps, was wounded at Manassas and brevetted 1st lieutenant for services in that action. He was engineer of Sumner's division at Fredericksburg (13 Dec. 1862), and received the successive brevets of captain and major for his conduct at Chancellorsville and Gettysburg. Promoted captain of engineers 6 Nov. 1863, he took part in the Richmond campaign as commander of the 2d Connecticut artillery. On 18 June 1864 was brevetted lieutenant-colonel for services in the Petersburg siege, and commanded the 2d Connecticut heavy artillery in the Shenandoah campaign. He was present at Lee's surrender at Appomattox (9 April 1865), and was mustered out of the volunteer service 15 Jan. 1866. Throughout the war

he participated in numerous other battles and was frequently employed in the construction of works of military engineering. In 1882 he was made brigadier-general, and in 1884 placed on the retired list.

Mackenzie, Robert Shelton, American miscellaneous writer: b. Drews Court, County Limerick, Ireland, 22 June 1809; d. Philadelphia 30 Nov. 1880. He came to the United States in 1852 and settling in Philadelphia was long prominent there in literary circles. Among his works are: 'Lays of Palestine' (1828), 'Titian: A Venetian Art-Novel'; 'Life of Guizot' (1846); 'Life of Charles Dickens' (1870); 'Sir Walter Scott: The Story of his Life' (1871). He edited the 'Noctes Ambrosianæ' (1854).

Mackenzie, William Douglas, American Congregational clergyman; b. Fauresmith, Orange River Colony, South Africa, 16 July 1859. He was graduated from Edinburgh University in 1881, studied divinity in Edinburgh and Göttingen and is now professor of theology in the Chicago Theological Seminary. He has published 'Ethics of Gambling' (1893); 'The Revelation of the Christ' (1896); 'Christianity and the Progress of Man' (1897); 'South Africa: its History, Heroes and Wars' (1900).

Mackenzie, William Lyon, Canadian journalist and political reformer: b. Dundee, Forfarshire, Scotland, 12 March 1795; d. Toronto 28 Aug. 1861. In 1820 he came to Canada, and conducted a drug and book store at Little York (now Toronto), and later at Queenstown, where in 1824-6 he published the 'Colonial Advocate.' He transferred the 'Advocate' office to Toronto in 1826, and there continued the paper until 1833, attacking the office-holding class and demanding governmental reforms. In 1828 he entered the provincial parliament; and having been expelled for alleged libel against that assembly, was five times re-elected and as often re-expelled, until the government refused to issue another writ of election. In 1832 he went to England, and having presented to the home government a petition of grievances from the Canadian reformers, was successful in obtaining the dismissal of the attorney-general and the solicitor-general of Upper Canada and the veto of the Upper Canada bank bill. In 1834 he was elected first mayor of Toronto, in 1836 began the publication of 'The Constitution,' and, in 1837 published in that journal a bold manifesto which was practically a declaration of independence of the provincial government. Soon afterward he undertook armed rebellion. An encounter took place between his followers and the government forces at Montgomery's hill, in the vicinity of Toronto (7 Dec. 1837), and the insurgents fled to Navy Island in the Niagara, where they were joined by about 500 Americans. The island was bombarded by Canadian royalists, and as a result of this and the strong opposition of General Scott of the United States army, the insurgents broke camp and Mackenzie was imprisoned for a year in Rochester jail. Later he was a journalist in the United States, in 1840 took advantage of the amnesty to return to Canada, was there a member of parliament in 1850-8, and at Toronto published the weekly 'Mackenzie's Messenger' from 1858 until shortly before his death. The reforms for which he so persistently contended have since been achieved. He wrote: 'Sketches of Canada

MACKENZIE — MACKEREL

and the United States' (1833). Consult the 'Life' by Lindsey (1862); Dent, 'Story of the Upper Canadian Rebellion' (1885); Read, 'The Canadian Rebellion of 1837' (1896).

Mackenzie, Canada, a district in the Northwest Territories, bounded north by the Arctic Ocean, east by Keewatin, south by Athabasca, and separated on the west from Yukon, by the northernmost spur of the Rocky Mountains. The district created in 1895 and administered by the government of the Northwest Territories, is the largest in Canada, having an estimated area of 563,200 square miles, of which 82,000 square miles are water. The surface generally is diversified; in the northwest it is a sterile waste; along the river valleys and on the western mountain slopes it is well forested with fir, pine, spruce, and other northern trees, while coal and other minerals, although unexploited, are found. The chief rivers are the Mackenzie, the Coppermine, and the Great Fish or Black River (qq.v.). The soil is comparatively unproductive, the climate being arctic and inhospitable except for the few summer months. The population (1901) 5,216, inhabit the trading settlements of the Hudson's Bay Company, along the Mackenzie and its tributaries. The pelts of the fur-bearing animals of the region are practically the only developed item of commerce.

Mackenzie River, Canada, a large river in the Northwest Territories, which flows from the Great Slave Lake, and after a northwesterly course of about 1,000 miles, enters the Arctic Ocean by numerous mouths at the island-studded Mackenzie Bay. Its tributary head-streams are the Great Peace River, which rises in British Columbia beyond the Rocky Mountains, and the Athabasca or Elk River, which has its source in the Rockies; these two rivers flowing into Lake Athabasca are discharged by the Great Slave River into Great Slave Lake, whence issues the Mackenzie. The principal affluent of the Mackenzie is the Liard or Mountain River. With the exception of a slight obstruction in the rapids near Fort Good Hope, in lat. 66° N., the Mackenzie and its tributaries are navigable for a distance of over 1,800 miles, and from June to October steamboats of the Hudson's Bay Company ply from Great Slave Lake almost to the Arctic Ocean. Forts Providence, Norman, and Good Hope are trading stations along its banks, while Forts McPherson, Franklin, Enterprise, Reliance, Resolution, Chippewyan, Nelson, and Graham are along its tributaries. The valley is well-wooded with spruce, pine, poplar, and birch, while coal, salt and other minerals abound in the region. The river is named after Alexander Mackenzie (q.v.), who first explored it in 1789.

Mackerel, māk'ê-rêl. The common mackerel (*Scomber scombrus*) is the best known and most important member of the family *Scombridae* and one of the most valuable of food-fishes, ranking in this respect behind the cod and herrings only. The mackerel is a compactly built fish of smooth and regular outline, the fusiform figure tapering accurately to the pointed snout, so that it cleaves the water easily. The large, deeply-forked tail is supported on a slender peduncle, provided with two small keels on each side, and preceded by a dorsal and a ventral series of finlets of five each. A soft dorsal

and a counterpart anal fin are placed exactly opposite each other and behind the level of the vent, and the anterior dorsal fin is supported by usually 11 delicate spines. Very numerous and small scales cover the body nearly uniformly, but are absent from the head. The large mouth is provided with numerous small sharp teeth. The gill-rakers are long and the air-bladder is wanting. The color of the back is deep blue, marked by about 35 nearly vertical wavy black lines; below, the fish is silvery white. A recent close study of the species on the European side of the Atlantic establishes the existence there of local races, as in the herring, but it appears that the American representatives, while constituting a race distinct from the European, are more homogeneous.

The mackerel is an abundant fish on both sides of the North Atlantic, on the American side ranging from Cape Hatteras to the Straits of Belle Isle, and on the European from northern Norway to the Canary Islands and throughout the Mediterranean. While a true pelagic fish of wandering and migratory habits and, like most such, capricious in its movements, the great body of mackerel approaches the American coast and moves along it northward as the temperature of the water rises to about 45° F. On the approach of winter they retire to a greater distance from the land, but a few remain throughout the year near the coast. Mackerel swim in great schools at or near the surface; one such covering an area of 10 square miles, and another estimated as containing 1,000,000 barrels, have been observed. The local movements of the schools are largely regulated by the food-supply, which consists of small pelagic fishes, various kinds of small crustaceans, etc., which are pursued with great eagerness. On the other hand, the bluefish and other carnivorous fishes, porpoises, squids and fish-eating birds, are relentless enemies. Spawning takes place in the open sea, not far from the coast, from Vineyard Sound to the Gulf of St. Lawrence, and during the months of May, June and early July. The eggs are about one millimetre in diameter, contain an oil-drop and float at the surface, where the young fish develop and live. They grow rapidly and are about five inches long by the end of the first half year, when they are known as "spikes"; "blinkers" are about one year old and six or seven inches long; "tinkers" are seven to nine inches long and are supposed to be two years old. At the age of three or four years the mackerel is mature and from 12 to 18 inches long. The very largest specimens weigh about four pounds and have a length of 22 to 23 inches.

The mackerel fishery is of the greatest importance in the New England States and Nova Scotia, and in Norway, Ireland and Great Britain. In Europe the fishery is prosecuted almost exclusively by means of small boats and hand lines, but in America is chiefly carried on in staunch sea-going schooners, most of which hail from Gloucester, Mass., and which are equipped with purse-seines, by means of which entire schools are surrounded and captured. The fishing begins off Cape Hatteras in March or April and the schools are followed northward as they appear successively on the New Jersey, New England and Canadian coasts. In addition to the operations of this mackerel fleet, local fisheries are carried on along much of the coast

MACKEREL SHARK — McKIM

with pound-nets, gill-nets and hand-lines. The spring and local catches are generally sold fresh, the summer catch being split and salted. The product of the fishery has been peculiarly subject to fluctuations, due in large part to alternating periods of abundance and scarcity of the fish. Colonial writers refer to its great plenty, and statistics of the catch inspected in Massachusetts show a somewhat regular recurrence of such periods at intervals of about 20 years. From 350,000 barrels in 1880 and 395,000 in 1881, the catch has steadily declined to 75,000 in 1886, and 18,000 in 1891, since which time it has sometimes been larger, sometimes smaller, but an abundance of young fish and other signs may indicate the approach of another period of plenty. The number of vessels employed in 1903 was about 250, or less than one fourth what it formerly was. In 1901 the total value of the mackerel, both fresh and salted, landed at Gloucester and Boston, was \$713,100.

An elaborate account of the American mackerel fishery will be found in Brown-Goode's 'Materials for a History of the Mackerel Fishery,' Report U. S. Fish Com. (1884); for some recent views see Moore, 'Report National Fishery Congress' (Washington, 1898); and for methods of preservation, Stevenson, 'The Preservation of Fishery Products for Food,' Bull. U. S. Fish Com. (1898).

Mackerel Shark, or **Porbeagle**, a shark of the family *Lamnida*, allied to the man-eater (q.v.), and like it sometimes called blue shark, on account of its color, which is frequently seen on both sides of the northern Atlantic Ocean; it is the *Lamna cornubica* of ichthyologists. The ordinary length is about 10 feet, and they become very abundant in summer, when the mackerel are running, along the New England coast, and also about Great Britain, where they are called porbeagles. They are a nuisance to fishermen by destroying their nets, through which several will often tear their way (for they roam about in bands) in pursuit of captured fish. Formerly considerable quantities of oil were saved from their livers, but at present the value of this commodity does not pay for the trouble of taking them.

Mack'ey, Albert Gallatin, American writer on Freemasonry: b. Charleston, S. C., 12 March 1807; d. Fortress Monroe, Va., 20 June 1881. He was graduated from the Medical College of South Carolina in 1832 and was demonstrator of anatomy there in 1838, but after 1844 devoted himself to studies of Freemasonry and became a standard authority on the subject. Among his works are: 'A Lexicon of Freemasonry' (1845); 'The Mystic Tie' (1849); 'Book of the Chapter' (1858); 'A Manual of the Lodge' (1862); 'A Text-Book of Masonic Jurisprudence' (1869); 'Encyclopædia of Freemasonry' (1874).

McKibbin, ma-kīb'in, Chambers, American soldier: b. Pittsburg, Pa., 2 Nov. 1841. He enlisted as a private in the volunteer service 22 Sept. 1862, was brevetted captain for gallant services in the battle of North Anna River (Va.) and in the operations on the Weldon railway, and on 1 May 1896 attained the rank of lieutenant-colonel of the 21st United States infantry. At the beginning of the war with Spain he went to Cuba with Shafter's army, fought at Santiago (1 July 1898), and was made briga-

dier-general of volunteers and appointed military governor of Santiago. On 12 May 1899 he was mustered out of the volunteer service, and on 6 June 1899 assumed command of the department of Texas with rank of colonel of infantry (commissioned colonel 12th United States infantry 1 April 1899).

Mackie, Pauline Bradford. See HOPKINS, PAULINE BRADFORD.

McKim, ma-kim', Charles Follen, American architect: b. Chester County, Pa., 24 Aug. 1847. He studied at the Lawrence Scientific School in 1866, at the Beaux-Arts of Paris in 1867-70, and shortly afterward entered into partnership with Stanford White and William R. Meade. This firm became known in connection with some of the finest triumphs of recent American architecture. Among notable examples of its work are the buildings of Columbia University, and the Public Library of Boston. In 1903 McKim received the royal gold medal from the Royal Institute of British Architects in recognition of his services to architecture. He is the second American to obtain this honor, R. M. Hunt (q.v.) having been the first. On the occasion of the presentation he made an able speech reviewing the progress of his profession in the United States. He was elected president of the American Institute of Architects.

McKim, James Miller, American abolitionist: b. near Carlisle, Pa., 14 Nov. 1810; d. Llewellyn Park, West Orange, N. J., 13 June 1874. He was graduated from Dickinson College (Carlisle, Pa.) in 1828, studied medicine at the University of Pennsylvania and theology at Princeton (1831) and Andover (1832), and in 1835 was ordained a Presbyterian pastor in Womelsdorf, Pa. An original member of the American Anti-Slavery Society, he became its lecturing agent in October 1836, and spoke throughout Pennsylvania, often at great personal danger. In 1840 he removed to Philadelphia, where he was publishing agent of the Pennsylvania Anti-Slavery Society and later corresponding secretary until 1862. In November 1862 he called a public meeting in Philadelphia to provide for 10,000 slaves suddenly liberated by the capture of Port Royal, S. C. As a result, the Philadelphia Port Royal relief committee was formed. This committee was expanded in November 1863 into the Pennsylvania Freedman's Relief Association, of which McKim became the corresponding secretary. In that capacity he was active in the establishment of negro schools in the South. In 1865-9 he was corresponding secretary of the American Freedman's Commission, which on his motion was disbanded in July 1869. In 1865 he assisted in founding and became a proprietor of the New York weekly 'Nation.' During the Civil War he was an advocate of the enlistment of negro troops, and as a member of the Union League of Philadelphia assisted in the recruiting of 11 colored regiments.

McKim, Randolph Harrison, American Episcopal clergyman: b. Baltimore 15 April 1842. He was graduated from the University of Virginia, served in the Confederate army 1851-65, subsequently entered the Episcopal ministry, and after holding rectorships in Portsmouth and Alexandria, Va., and those of Holy Trinity, Harlem, N. Y., and Trinity, New Orleans, became rector of Epiphany Church,

MACKINAC ISLAND—McKINLEY

Washington, D. C., in 1889. He has published: 'A Vindication of Protestant Principles' (1879); 'Future Punishment' (1883); 'Present Day Problems of Christian Thought' (1900); etc.

Mackinac (măk'ī-năk or măk'ī-nă) **Island**, Mich., in Mackinac County, at the entrance to Straits of Mackinac, in the northwest part of Lake Huron; about 255 miles north by west of Detroit. The island is about three miles long and two wide. It is rocky, and covered with trees, shrubs, and flowers. Its cool climate in summer, and the scenery make it a favorite summer resort. The island has been prominent since the early missionaries and explorers mentioned it in connection with its command of the channel entering the Straits. The city of Mackinac (the post-office is Mackinac Island), on the southeast shore, was chartered in 1900. On a hill just back of the city is Fort Mackinac. Pop. of the city (1900) 665.

Mackinaw Trout. See LAND-LOCKED SALMON.

McKinley, mə-kīn'lē, **William**, American statesman, 24th President of the United States; b. Niles, Trumbull County, Ohio, 29 Jan. 1843; d. Buffalo, N. Y., 14 Sept. 1901. He was educated at Union Seminary, Poland, Mahoning County, Ohio, and Allegheny College (Meadville, Pa.) (1860-1), was forced by illness to discontinue his college course, taught in the public schools, was a clerk in the Poland post-office, and on 11 June 1861 enlisted for the Civil War as a private in company E of the 23d Ohio volunteer infantry. His first battle was that of Carnifex Ferry (10 Sept. 1861), and on 15 April 1862, while in camp at Fayetteville, western Virginia, he was promoted commissary sergeant. For conspicuous service at Antietam (17 Sept. 1862) he was made 2d lieutenant of company D. His subsequent appointments were, 1st lieutenant company E (7 Feb. 1863), captain company G (25 July 1864), and brevet major (14 March 1865). When mustered out on 26 July 1865 he was acting assistant adjutant-general on the staff of General S. C. Carroll, commanding the veteran reserve-corps stationed at Washington. Among other actions in which he participated were those of South Mountain (14 Sept. 1862), Lexington (10 June 1864), Kernstown (24 July 1864), Opequan Creek (Winchester) (19 Sept. 1864), Fisher's Hill (22 Sept. 1864), and Cedar Creek (19 Oct. 1864). During his subsequent political career he was generally known, especially in Ohio, as Major McKinley. At the close of the war he began the study of law at Youngstown, Ohio (1865-6), continued it at the Albany (N. Y.) law school (1866-7), in March 1867 was admitted to the bar at Warren, Trumbull County, Ohio, and at once entered practice at Canton. In 1870-1 he was prosecuting attorney of Stark County, and during the campaign between R. B. Hayes and William Allen for the governorship of the State, spoke effectively against the "greenback" craze. He was elected to Congress as Republican representative from the 17th Ohio district in 1877, and served continuously in the 45th, 46th and 47th Congresses (1877-83). It was asserted by the Republicans that he was elected in 1882 to the 48th Congress by a majority of eight ballots; but, although he had received the certificate

of election, his seat was successfully contested by J. H. Wallace, who was not, however, seated until June 1884. He represented the 20th district in the 49th Congress (1885-7), and the 18th in the 50th and 51st Congresses; but in 1890 was defeated in the 16th for the 52d Congress by 300 ballots by J. G. Warwick, Democrat, lieutenant-governor of the State a short time previously. His defeat was attributed to the gerrymandering of the district by a Democratic legislature. His service in Congress was notable. In 1877 he was appointed a member of the judiciary committee, and in December 1880 of the ways and means committee to succeed James A. Garfield; and in 1881 was chairman of the committee in charge of the Garfield memorial exercises in the House. In 1889-90 he was chairman of the ways and means committee. He was a candidate for speaker of the 51st Congress, but was defeated by T. B. Reed on the third ballot in the Republican caucus. He was known among the foremost orators of the House; and his speeches on arbitration as a solution of labor troubles (2 April 1886) and in support of the civil-service laws (24 April 1890) were most favorably received. But his principal efforts were made in connection with the tariff, which, from his first appearance in the House, was the chief object of his study. On 6 April 1882 he spoke in advocacy of protection; on 30 April 1884 in opposition to the Morrison tariff bill, making what was esteemed the ablest argument against that measure; and on 7 May 1890 in support of the general tariff bill, now known by his name, which, as chairman of the ways and means committee, he had introduced before the House on 16 April. The bill was passed by the House on 21 May, by the Senate on 11 September, and on 6 October became a law. His bill obtained for him an international reputation, and eventually the presidency. In 1884 he was delegate-at-large from Ohio to the Republican national convention at Chicago, where he supported Blaine's candidacy, and where, as chairman of the committee on resolutions, he helped to determine the platform of his party, which he read before the convention. In the Republican national convention at Chicago in 1888, he was again a delegate and chairman of the committee on resolutions. He supported the candidacy of John Sherman, although, when it was finally learned that Blaine would decline the nomination, he was himself the choice of many delegates and was strongly urged to permit the use of his name. At the Minneapolis convention of 1892 he was once more a delegate and was elected permanent chairman of the assembly. He supported the renomination of President Harrison, and though refusing the use of his own name, received the ballots of 182 delegates. He then left the chair and moved to make Harrison's nomination unanimous, which was accordingly done. In the ensuing campaign he took a very active part, traveling, it was estimated, more than 16,000 miles and speaking to more than 2,000,000 voters. In 1892-6 he was governor of Ohio, having been elected in 1891 by 21,500 plurality, and in 1893 by the unusual plurality of 80,995. Labor riots occurred during his administration, necessitating the placing of 3,000 militia troops in active service, but the difficulties were successfully adjusted. McKinley also personally directed the relief work for the

MCKINLEY ACT — MACKLIN

starving miners of the Hocking Valley district. He was nominated for the presidency by the Republican national convention which met at St. Louis 16 June 1896, and was elected by a plurality of 601,854 over W. J. Bryan, receiving a popular vote of 7,104,779, and in the electoral college a vote of 271 to 176 for Bryan. Throughout the campaign he remained in Canton, where he made over 300 speeches to more than 750,000 visitors. Under his administration decided increase in business prosperity followed the passage of the Dingley tariff measure. The most important event of his term was the Spanish-American war (q.v.), which he had believed might be prevented and had done all in his power to avert. When hostilities broke out on the part of certain inhabitants of the Philippine Islands, the President appointed a commission to study the situation and report on the most suitable mode of government for the new territory. On 7 July 1898 he approved the joint resolution of Congress for the annexation of the Hawaiian Islands, and in 1898 he also selected a delegation to represent the United States in the Hague peace conference which convened in May 1899. The original Philippine commission having rendered a report (31 Jan. 1900), the President appointed a new commission, known from its head, Judge W. H. Taft, as the Taft commission, under whose direction civil government was instituted in the islands on 1 Sept. 1900. (See *PHILIPPINES, History*.) In 1900 the President stood conspicuously for justice in the settlement of the difficulties in China which marked that summer. He was renominated for the presidency by the Republican national convention which met at Philadelphia on 25 June 1900, receiving the entire vote of the 930 delegates. He was elected by a popular vote of 7,206,677 to 6,374,397 for W. J. Bryan, receiving it is said, the largest popular majority ever given a candidate for the presidency. He obtained 292 electoral votes and carried 28 States. On 5 Sept. 1901 he delivered at the Pan-American Exposition, Buffalo, N. Y., an important address, summarizing at once the problems then before the nation and his policy for their solution. On 6 September, while holding a reception in the Music Hall of the Exposition, he was twice shot by Leon Czolgosz (q.v.), an anarchist. He died on 14 September; and 19 September was appointed by his successor, President Roosevelt, a day of mourning and prayer throughout the United States. Unprecedented honors were paid to McKinley's memory in foreign capitals, notably in London, where memorial services were held in Westminster Abbey and St. Paul's Cathedral. For five minutes on the day of the funeral all motive power in the United States remained still. Consult: Smith (editor), 'Speeches and Addresses of William McKinley' (1893); Porter, 'The Life of Major McKinley' (1896); and 'Speeches and Addresses of William McKinley from 1897 to 1901' (1900). See also *UNITED STATES, History*.

McKinley Act, a name popularly given to a tariff bill reported to Congress, 21 May 1890, by the Ways and Means Committee of the House of Representatives, of which William McKinley was chairman. It became a law in October 1890, and was repealed in 1894. It increased the duties on wool, woolen manufactures, on tin-plate, barley, and some other agri-

cultural products, and remitted the duty on raw sugar. The reciprocity feature was an important part of the bill, providing for the remission of duty on certain products from those countries which should remove duties on American imported products. See *TARIFF*.

McKinley, Mount, United States, a peak of the Rocky Mountains, the highest in North America, south of the central part of Alaska; about 155 miles north of Cook Inlet. The Indian name for this peak is Traleyka, and the Russian name, Bolshaya. The fact that this is the highest land on the continent was not known till 1896 when Mr. Dickey explored the Sushitna River and the land near its source. He estimated the height of the peak at 20,000 feet, and named it McKinley, in honor of William McKinley (q.v.). In 1903 it was visited by members of the United States Geological Survey. The mountain is a great dome-shaped mass, over 20,000 feet above the sea.

McKinney, ma-kin'ī, Texas, city, county-seat of Collin County, on the Missouri, K. & T. and the Houston & T. C. R.R.'s; about 30 miles north by east of Dallas. It is situated in a rich agricultural region, in which cotton is cultivated quite extensively. The chief industrial establishments are cottonseed-oil mills, cotton gins, cotton compresses, wagon and carriage shops, and flour mills. It is the seat of the McKinney Collegiate Institute. The court-house is a fine building and cost \$100,000. The waterworks are owned and operated by the city. Pop. (1890) 2,489; (1900) 4,342.

Mackintosh, māk'in-tōsh, Sir James, Scottish historian and philosophical writer: b. Aldourie, Aberdeenshire, 24 Oct. 1765; d. London 30 May 1832. He was educated at Aberdeen and Edinburgh; studied medicine and took the M.D. degree in 1787; published his 'Vindiciæ Gallicæ' in answer to Burke's 'Reflections on the French Revolution'; quitted the medical profession and was called to the English bar in 1795. By reason of his brilliant lectures on the 'Law of Nature and Nations,' and his defense of Peltier, who was prosecuted for a libel on Napoleon Bonaparte, he acquired fame at the bar, was knighted, and in 1804 appointed recorder of Bombay. After an honorable career in India he returned to England; entered Parliament for Nairn, and afterward for Naresborough; was professor of law at Haileybury College (1818-24), a member of privy council, and in 1830 commissioner of Indian affairs. Among his writings may be mentioned his 'History of England,' a fragment extending only to the reign of Elizabeth; 'Dissertation on the Progress of Ethical Philosophy' in the *Encyclopædia Britannica*; a 'Life of Sir Thomas More' in Lardner's *Cyclopædia*; and nine chapters of an unfinished work on the revolution of 1688.

Mackintosh, a water-proof overcoat, or outer garment, one of the products of modern rubber manufacture. It derives its name from the inventor. See *INDIA RUBBER*.

Macklin, māk'līn, Charles, Irish actor and dramatist: b. Ireland 1 May 1697; d. London 11 July 1797. He was the son of an Irish gentleman named McLaughlin and in 1733 appeared in minor parts at Drury Lane, London. He steadily rose in public favor, till 1741 he appeared in his greatest role, Shylock. He was

WILLIAM MCKINLEY
TWENTY-FIFTH PRESIDENT OF THE UNITED STATES

accounted from this period among the best actors of the time, appearing with nearly equal success in tragedy or comedy, in passion, or buffoonery, for nearly half a century. His last performance was at Covent Garden in May 1789, at past the age of 90. In 1735 he accidentally killed a brother actor in a quarrel and was tried for murder; and was frequently afterward engaged in disputes and actions at law. Of his own plays only 'The Trueborn Irishman'; 'Love a-la-Mode' (1759); and 'The Man of the World' (1781) have been printed. Consult 'Life' by Parry (1891).

MacLagan, William Dalrymple, English archbishop: b. Edinburgh 1826. He was educated at Edinburgh and was graduated in mathematical honors at Cambridge University. He served in the Indian army (1847-52); was ordained deacon (1856) and priest (1857). He was appointed bishop of Lichfield (1878) and archbishop of York in 1891. He has published 'Pastoral Letters and Synodal Classes' (1891).

McLane, māk-lān', Allan, American soldier and jurist: b. 8 Aug. 1746; d. Wilmington, Del., 22 May 1829. In 1774 he settled in Kent County, Del., and in the Revolution he took a prominent part. He became a lieutenant in Thomas Rodney's regiment of Delaware militia, participated with distinction in the actions of Long Island, White Plains, Princeton, Monmouth, and Yorktown, attained colonel's rank, and at the close of the war was appointed judge of the Delaware court of appeals. In 1790-8 he was United States marshal of Delaware under Washington's appointment, and from 1808 until his death, collector of Wilmington (Del.) port. He also served in the Delaware legislature, being for a time speaker of the lower house.

McLane, Louis, American statesman: b. Smyrna, Kent County, Del., 28 May 1786; d. Baltimore 7 Oct. 1857. He was the son of Allan McLane (q.v.), and entered the navy at an early age, served as a midshipman under the elder Decatur. Quitting the navy in 1801 he studied law, was admitted to the bar in 1808, and rose to eminence in the profession. He represented Delaware in Congress, 1816-27, when he was chosen United States senator. In 1829-31 he was minister to Great Britain, and on his return home was made secretary of the treasury. In 1833 he declined to sanction the removal of the deposits from the United States Bank, and was consequently transferred by the President to the State Department. He held the office of secretary of state till June 1834, when he resigned and retired from political life. In 1837 he accepted the presidency of the Baltimore & Ohio Railroad, which he held till 1847. In June 1845 he was appointed by President Polk ambassador to London during the Oregon negotiations, after the settlement of which he resigned. In 1850 he was a member of the convention to reform the constitution of Maryland.

McLane, Robert Milligan, American politician and diplomat: b. Wilmington, Del., 23 June 1815; d. Paris, France, 16 April 1868. He studied at the Collège Bourbon of Paris (1829-31), was graduated from West Point in 1837, took active part in the Seminole War in Florida (1837), and served under Gen. Scott in the Cherokee country (Georgia). He resigned from the army in 1843, and having already been

admitted to the bar in the District of Columbia, began practice at Baltimore, Md. In 1847-51 he was a Democratic member of the House of Representatives in the 30th and 31st Congresses. In 1853 he was appointed commissioner, with powers of minister plenipotentiary, to China, Japan, Siam, Korea, and Cochin China; and from this mission he returned in 1856, having with Commodore Perry concluded important treaties. In 1859-61 he was minister to Mexico, in which capacity he signed the treaty of 1860. In 1861 he returned to Baltimore and there took a prominent part in the discussions attending the secession of the cotton States. He was one of the committee appointed by the Maryland legislature (May 1861) assembled in extra session, to confer with Lincoln in regard to alleged unconstitutional proceedings on the part of the Federal government within the State of Maryland. Upon the decision of the State legislature, based on the committee's report, that it was inexpedient for Maryland to secede, McLane retired from public affairs for a time. In 1877-8 he was State senator; in 1879-83 a representative in the 46th and 47th Congresses; and in 1883-5 governor of Maryland. He was minister to France in 1885-9 by appointment of President Cleveland.

Maclaren, mǎ-klār'ēn, Ian. See WATSON, JOHN.

McLaren, William Edward, American bishop: b. Geneva, Ontario County, N. Y., 13 Dec. 1831. He was graduated at Jefferson College, 1851, ordained to the Presbyterian ministry, 1860, and entered that of the Protestant Episcopal Church in 1872. Three years later he was appointed bishop of Illinois; after the subsequent division of the diocese became bishop of Chicago. Among his writings may be mentioned 'Catholic Dogma the Antidote of Doubt' (1884).

McLaughlin, māk-lāk'līn, Andrew Cunningham, American historical writer: b. Beardstown, Ill., 14 Feb. 1861. He was graduated from the University of Michigan in 1882 and from its law school in 1885, and has been professor of history in that university from 1891. He has written 'Lewis Cass' in 'American Statesmen' series (1891); 'History of Higher Education in Michigan'; 'Civil Government in Michigan' (1892); 'History of the American Nation' (1899); and edited Cooley's 'Principles of Constitutional Law' (1898).

McLaughlin, Mary Louise, American artist: b. Cincinnati. She began to decorate pottery in 1877 and made Losanti porcelain (1898), exhibiting for the first time in the Paris Exposition of 1900. She has been awarded several public honors for her beautiful work. Among her published writings are: 'China Painting'; 'Pottery Decoration'; 'Suggestions to China Painters'; 'Painting in Oil'; 'The Second Madame.'

Maclaurin, māk-lā'rīn, Colin, Scottish mathematician and philosopher: b. Kilmoran, Argyshire, February 1698; d. 14 June 1746. He was educated at Glasgow University, and in 1717 became professor of mathematics in Marischal College, Aberdeen, and two years after was chosen fellow of the Royal Society. In 1720 he published 'Geometria Organica,' a work on curves. In 1725 he was elected professor

MACLAWS — MACLEAN

of mathematics at Edinburgh, where his lectures contributed much to raise the character of that university as a school of science. A controversy with Bishop Berkeley led to the publication of Maclaurin's great 'Treatise on Fluxions' (1742). He also wrote a 'Treatise on Algebra'; 'Account of Sir Isaac Newton's Philosophical Discoveries'; etc.

MacLaws, māk-lāz', Lafayette, American military officer: b. Augusta, Ga., 15 Jan. 1821; d. Savannah, Ga., 24 July 1897. He was graduated at West Point in 1842; served in the Mexican War till the surrender of Vera Cruz; and at the beginning of the Civil War was commissioned a brigadier-general in the Confederate army. He was promoted major-general 23 May 1862, and during the march of Sherman to the sea commanded the defenses of Savannah and had charge of the Military District of Georgia. He was appointed collector of internal revenue at Savannah in 1875 and postmaster there in 1876.

Maclay, ma-klā', Edgar Stanton, American author: b. Foochow, China, 18 April 1863. He was graduated at Syracuse University in 1885; was reporter on the Brooklyn *Times*, 1886-90, and on the New York *Tribune*, 1891-3; served on the editorial staff of the *Tribune*, 1893-5, and on that of the New York *Sun*, 1895-6. In 1896 he was appointed lighthouse-keeper at Old Field Point, and in 1901 received an appointment at the New York Navy-Yard. He edited the 'Journal' of William Maclay (q.v.), and is the author of a 'History of the United States Navy,' which occasioned much controversy and brought about his dismissal from government employ, by order of President Roosevelt, in 1901. The ground of this action, following Maclay's refusal of an official request for his resignation, was a passage in the 'History' stigmatizing Rear-Admiral Schley as a "caitiff, poltroon, and coward" for his conduct in the naval fight off Santiago, Cuba, 3 July 1898. Maclay has also written 'Reminiscences of the Old Navy' and 'The History of American Privateers.'

Maclay, William, American soldier and politician: b. New Garden, Chester County, Pa., 1737; d. 1804. He was educated in his native place; was a lieutenant in the French and Indian War, taking part in the expedition against Fort Duquesne in 1758, and afterward serving under Gen. Bouquet. He studied law, was admitted to the bar, went to England on behalf of militia officers serving in the French and Indian War, to confer upon their claims for land-grants with the proprietors of Pennsylvania, and on his return became attorney to the Penn family. In the Revolution he raised troops and equipped them, was assistant commissary of purchase, and performed some field service. In 1781 he was elected to the Pennsylvania Assembly, afterward held other offices in the State, and with Robert Morris (q.v.) was elected to the United States Senate, they being Pennsylvania's first representatives in that body. His service there ended in 1791, but in the Senate he had shown deep-seated hostility to Washington and his administration, which was the chief distinction of Maclay's senatorial career. In his later years he was a member of the Pennsylvania legislature and his last public office was that of a county

judge. Consult his 'Journal,' edited by Edgar Stanton Maclay (q.v.).

Macle, māk'l, in mineralogy, a variety of andalusite, occurring in long, tapering crystals in clay-slate. They have the axes and angles of a different color from the rest of the crystals, owing to a regular arrangement of impurities in the interior.

MacLean, George Edwin, American educator: b. Rockville, Conn., 31 Aug. 1850. He was graduated at Williams College in 1871 and at Yale Theological Seminary in 1874; from 1877 to 1881 was pastor at Troy, N. Y.; studied in Germany; and in 1883 became professor of English language and literature at the University of Minnesota. He was chancellor of the University of Nebraska, 1895-9, and since 1899 has been president of the University of Iowa. His writings include: 'A Chart of English Literature' (1892); 'Old and Middle English Reader' (1893); and 'A Decade of Development in American State Universities' (1898). He has edited: 'Elfric's Anglo-Saxon Version of Alcuin Interrogationes Sigewulfi Presbyteri in Genesis' (1883); 'An Introductory Course in Old English,' by Wilkin and Bahcock (1888); and 'An Old and Middle English Reader' by Zupitza (1889).

McLean, George P., American lawyer and politician: b. Simsbury, Conn., 7 Oct. 1857. He was for a time a reporter on the Hartford *Evening Post*, then studied law, and was admitted to the bar in 1881, and immediately commenced practice in Hartford. In 1883-4 he was a member of the General Assembly, where he soon became distinguished for facility in debate and was considered one of the leaders of the Republican party. In 1888 he was elected State senator, and in 1900 nominated by his party as governor of Connecticut and elected. Though he was not widely known at the time of his election, his independent position in regard to constitutional reform soon made him prominent; both in his first governor's message and before the constitutional convention, he advocated representation in the legislature according to population instead of by towns. Though in this he opposed certain elements in his own party, he gained support from a considerable number of Democrats and great personal popularity in the cities. In 1902 he was offered renomination, but declined, in 1903-4 he was a prominent candidate for United States Senator.

MacLean, John, American jurist and statesman: b. Morris County, N. J., 11 March 1785; d. 4 April 1861. He removed with his parents to Warren County, Ohio, in 1799, later went to Cincinnati, where he studied law, and was admitted to the bar in 1807, and commenced practice at Lebanon, Warren County, Ohio. He was a member of Congress 1812-16, and from 1816-22 judge of the supreme court of Ohio. In July 1823 he was appointed postmaster-general, the Post-office Department being then in a very disordered and inefficient condition. Under his administration this branch of the public service was restored to order, and managed with a vigor, method, and economy that soon secured an almost unexampled degree of applause and public confidence. In 1829 he became associate justice of the Supreme Court of the United States. In this capacity his

McLEAN — McLEMORE'S COVE

charges to grand juries while on circuit are distinguished for ability and eloquence. In the Dred Scott case he dissented from the decision of the court as given by Chief Justice Taney, and expressed the opinion that slavery has its origin merely in power, and is against right, and in this country is sustained only by local law.

McLean, John, American educator: b. Princeton, N. J., 1800; d. there 1886. His whole life was spent in Princeton. He was graduated from the college there in 1816, became tutor in the institution in 1818, and was a member of the faculty till 1868, when he resigned the presidency, which he had held from 1854. He published 'Lecture on a Common School System for New Jersey' (1829), which in later years had much influence in the establishment of such a system; 'History of the College of New Jersey' (1877); etc.

McLean, Sarah Pratt. See GREENE, SARAH PRATT McLEAN.

McLean, Simon James, American sociologist: b. Brooklyn, N. Y., 14 June 1871. He was graduated from the University of Toronto in 1894 and has been professor of economics and sociology in the University of Arkansas from 1897, and associate professor of economics in Leland Stanford Junior University from 1902. He has published 'Tariff History of Canada' (1895).

McLellan, māk-lēl'an, Isaac, American poet: b. Portland, Maine, 21 May 1806; d. Greenport, L. I., 20 Aug. 1899. He was graduated at Bowdoin College, practised law for several years in Boston, Mass., and in 1851 removed to New York and gave his whole attention to literature and field sports. His liking for the latter was so strong indeed, and his poems on these themes so numerous, that he gained the title of "the poet-sportsman." Some of his early poems, such as 'The Death of Napoleon' and 'New England's Dead,' attracted much attention. He was the author of 'The Fall of the Indian' (1830); 'Mount Auburn' (1843); and 'Poems of the Rod and Gun' (1886).

McLemore's Cove, Ga., Military Operations at. While there was little fighting in the cove, the operations there in September 1863 were vital to the success of Gen. Rosecrans' campaign for Chattanooga. The failure of Gen. Bragg's excellent combinations immediately increased the difficulty of interposing his army between the Union army and Chattanooga and, in the end, made it impossible.

Lookout Mountain bounds the cove on the west. Following its eastern base from Chattanooga southward, it is 24 miles to Stevens' Gap, over which the Fourteenth corps, Gen. Thomas', which constituted the centre of Rosecrans' army, crossed Lookout from the west into the cove. Eight miles beyond is Dougherty's Gap, from which point Pigeon Mountain, running northeastwardly, forms the eastern boundary of the cove. The triangular area thus enclosed is from five to eight miles wide, the mouth opening toward Chattanooga, and contains from 80 to 100 square miles. Gen. Bragg, in evacuating Chattanooga, because of Rosecrans' flank movement, had conducted his army by way of Rossville and Lee and Gordon's Mill and established it behind Pigeon Mountain, from a point near Lee and Gordon's to Lafayette, 13 miles beyond. From this position of his army

there were four gaps through which roads led into McLemore's Cove. Opposite Lafayette was Dug Gap, to the south of it Blue Bird, and to the north Cattlett's and Wrothen's. Dug Gap was directly opposite Stevens' Gap. The Chickamauga Creek rises near Dougherty's Gap and runs northward through the cove.

The right of the Union army, A. McD. McCook's Twentieth corps, with the cavalry corps, Gen. D. S. Stanley, crossed Lookout at Valley Head, 42 miles south of Chattanooga, and descended south of Dougherty's Gap. The left of this army, Crittenden's Twenty-first corps, had crossed the north point of Lookout near Chattanooga and, leaving one brigade in that city, had advanced to the vicinity of Lee and Gordon's Mill. It there formed the left of the Union army. The centre corps was at Stevens' Gap, 15 miles distant, the right corps about 25 miles beyond that point, with the cavalry still farther south. This separation of Rosecrans' army was made necessary by the fact that there were no roads practicable for wheels crossing Lookout Mountain in closer proximity.

Gen. Bragg was fully informed of the movements, and the isolation of the several Union corps. These movements, which placed each corps beyond supporting distance from either of the others, were immediately rendered still more precarious by reports received from Gen. Sheridan on the extreme right that the enemy was retreating toward Rome, which led Gen. Rosecrans to order pursuit. Gen. Thomas urged active concentrations instead, but was overruled.

Gen. Bragg, from his position behind Pigeon Mountain, commanding the four gaps opening directly upon the advance of the centre across the cove, was in most favorable position for first striking Gen. Thomas with effect, and then turning upon either of the wings before they could attain supporting distance. Had Bragg's orders been promptly and vigorously executed the situation of the Union army would have been critical.

The night of the 9th, Negley's division, forming the Union advance from Stevens' Gap along the road leading through Dug Gap to Lafayette, encountered the enemy in the gap, and later in the night it was ascertained that a strong force was concentrating there.

Gen. Bragg, in developing his plan, had advanced Hindman's division from the Lafayette side of the mountain, and ordered Gen. Hill to send Cleburne to co-operate. Late at night Hill sent word that Cleburne was sick, the gaps blocked with felled trees, and that the movement was, therefore, impracticable.

Early the next morning Gen. Buckner from the extreme right was ordered to advance into the cove to support Hindman. This junction was not effected until the afternoon of the 10th. Meantime, Negley had withdrawn his division from Dug Gap and was maneuvering in defense. Hindman, instead of attacking as ordered, sent a staff-officer to Bragg at Lafayette to suggest a change of plan. This officer reached Bragg at midnight and was at once directed to return and notify Hindman to carry out the orders he had received. Cleburne was then in Dug Gap, and had promptly cleared away obstructions. Walker's reserve corps was ordered forward to join Cleburne in the attack, and all impatiently waited for Hindman's guns. Bragg

McLENNAN — MACLEOD

had ordered seven divisions to co-operate in this movement against Thomas' three which composed the Union centre. Hindman did not attack until afternoon. At that time Baird's division had arrived from Stevens' Gap to support Negley, and by brilliant movements in retreat, with some sharp fighting by T. R. Stanley's and Starkweather's brigades, the two divisions with their trains were withdrawn in perfect order to Bailey's crossroads, a strong strategic position in front of Stevens' Gap, where Brannan's division, which had completed the crossing of Lookout, was within easy supporting distance. Thus Bragg's attempt to crush the Union centre failed. For this failure he held Hill and Hindman responsible.

Bragg then withdrew the forces operating against the Union centre to Lafayette, and at once despatched Polk's and Walker's corps with orders to attack Crittenden's corps in the vicinity of Lee and Gordon's Mill. This corps at the time was known to Bragg to be divided, with one of its three divisions near Ringgold. Polk was urged to attack with the greatest promptness. He, however, was led to believe that a general attack on his column was about to be delivered. Instead of carrying out Bragg's orders, he therefore awaited attack and sent for the whole of Buckner's corps as reinforcements. This delay enabled Crittenden to unite his forces, cross the Chickamauga, and take a strong position on the bluffs overlooking that stream at Lee and Gordon's. Thus Bragg's attempt to crush the Union left failed, as his movement on the centre had miscarried. For this Polk was held responsible.

Meantime the Union right was withdrawing under orders to join the centre at Stevens' Gap. Rosecrans had early discovered that Bragg, instead of retreating, was concentrated for battle, and that Johnston from Mississippi and Longstreet from Virginia were about to join him. Gen. Rosecrans in his report says: "It then became a matter of life and death to effect the concentration of the army." The flanks of the army were 40 miles apart by the nearest practicable roads, and the centre was obliged to remain near Stevens' Gap until the right corps arrived.

Gen. Bragg's third plan, for which orders were promptly given, was to move his army down the valley of the Chickamauga, cross at the bridges and fords below Lee and Gordon's Mill, sweep up the valley, attack Crittenden, the left of Rosecrans' army, drive it back on the centre, and thus, interposing between the Union army and Chattanooga, push it back into the mountains and regain that most important city. Rosecrans, however, by an undiscovered night march moved his centre and right from the cove to the left of Crittenden, and at sunrise of 19 September had interposed between Bragg and Chattanooga on the field of Chickamauga. These movements of the opposing armies brought on the battle of Chickamauga (q.v.).

H. V. BOYNTON.

McLennan, māk-lē'n'an, **John Ferguson**, Scottish sociologist: b. Inverness 14 Oct. 1827; d. Hayes Common, Kent, 16 June 1881. He was educated at King's College, Aberdeen, and Trinity College, Cambridge and after two years' journalism in London returned to Edinburgh, and was called to the bar in 1857. His first important publication was the article on 'Law' in

the 8th edition of the 'Encyclopædia Britannica' (1857), and in 1865 he elaborated some of its speculations in 'Primitive Marriage: an Inquiry into the Origin of the Form of Capture in Marriage Ceremonies.' In 1876 his 'Primitive Marriage' was republished with 'Kinship in Ancient Greece' and other matter under the title of 'Studies in Ancient History.' An unfinished work by him, directed against Sir H. S. Maine's patriarchal theory, was completed and published in 1885 by his brother under the title of 'The Patriarchal Theory.' In 1896 a second series of 'Studies in Ancient History,' treating of the origin of exogamy, was edited by his widow and Arthur Platt. Though his views are still and probably will remain matter of controversy, the study of primitive society received a powerful impetus from his important investigations.

McLeod, māk-lē'ōd, **Archibald Angus**, American railway official: b. Compton County, Quebec, Canada, 1848; d. 1902. Early in life he came to the United States, where he became a rodman on the docks of the Northern Pacific railway at Duluth, and in 1885 manager of the Elmira, Cortland and Northern line. He then was successively acting general manager (1886), vice-president and general manager (1887), and president (1890) of the Reading system. His consolidation of the Lehigh Valley and Jersey Central with the Reading, under Reading control, for the purpose of controlling the carrying trade of the coal fields, resulted in the Reading passing into the hands of three receivers, of whom McLeod was one.

MacLeod, māk-low'd', **Donald**, Scottish Presbyterian clergyman and author: b. Campsie, Stirlingshire, 18 March 1831. He is a brother of Norman McLeod (q.v.), whom he succeeded as editor of 'Good Words' in 1872. He was educated at the University of Glasgow. He held pastorates at Lauder (1858), Linlithgow (1862) and Glasgow (1869), and, like his brother, was chaplain to Queen Victoria. He published 'Sunday Home Service' (1885); 'Christ and Modern Society' (1893); etc.

MacLeod, **Fiona**, Scottish poet and novelist. She is a native of the Hebrides Islands and spent a large part of her youth there and in the islands of Iona and Arran. Her stories and poems illustrative of Celtic legend and fable have attracted great attention by reason of their freshness of treatment and originality of conception. Among her works are: 'Pharais' (1895), a romance; 'The Mountain Lovers' (1895); 'The Sin-Eater and Other Tales' (1895); 'The Washer of the Ford' (1896); 'Green Fire' (1896); 'From the Hills of Dream' (1896); 'The Laughter of Peterkin' (1897); 'Through the Ivory Gate' (1901); 'The Silence of Amor' (1902).

MacLeod, **Norman**, Scottish Presbyterian clergyman: b. Campbelltown, Argyleshire, 3 June 1812; d. Glasgow 16 June 1872. Educated at Glasgow, Edinburgh, and in Germany, he became minister first of Loudon and then of Dalkeith, when he published his first work, 'The Earnest Student,' and became editor of the 'Edinburgh Christian Magazine.' In 1851 he became minister of the Barony parish, Glasgow, where he labored with increasing popularity for the rest of his career. In 1854 he was appointed one of the queen's chaplains for Scotland and

dean of the order of the Thistle. He became editor of 'Good Words' in 1860 and continued in that post till his death. In 1867 he visited India, and in 1871 published 'Peeps at the Far East.' In 1869 he was elected moderator of the General Assembly of the Church of Scotland. Consult D. MacLeod, 'Mémorial of Norman MacLeod' (1872).

McLeod, Xavier Donald, American writer: b. New York 17 Nov. 1821; d. near Cincinnati, Ohio, 20 July 1865. He was graduated from Columbia and entered the Episcopal ministry in 1845. Becoming a Roman Catholic in 1852 he took priest's orders in that faith later and was professor of rhetoric in Mount Saint Mary's College. He published 'Pymnshurst' (1852); 'Life of Sir Walter Scott' (1852); 'The Blood-Stone' (1853); 'Lescure'; 'Life of Mary Queen of Scots' (1857); etc.

MacIse, Daniel, English painter: b. Cork 2 Feb. 1806; d. Cheyne Walk, Chelsea, 25 April 1870. He became a student at the Royal Academy in 1828, and began to exhibit in 1829, but it was not until 1833 that he established his reputation with his picture of 'Snap Apple Night.' Three years after he was elected an associate, and in 1840 he became a full member of the Royal Academy. MacIse was commissioned to paint for the new Houses of Parliament, and produced 'The Spirit of Chivalry'; 'The Spirit of Religion,' and the two great paintings of the 'Meeting of Wellington and Blücher after Waterloo,' and the 'Death of Nelson' (1858-64), for which patriotic paintings he refused all remuneration. Among his best known pictures are 'Merry Christmas in the Baron's Hall'; 'The Ordeal of Touch'; 'The Marriage of Strongbow and Eva'; the 'Play Scene in Hamlet'; the 'Banquet Scene in Macbeth,' etc. His sketches, book illustrations, humorous drawings, and outline portraits were very numerous. He declined the presidency of the Academy in 1866. His works show great fertility of invention, skill in composition, and excellence in drawing, but his color is coarse, and his pictures are sometimes disagreeable unless seen from a distance. Consult O'Driscoll, 'Mémorial of Daniel MacIse' (1871).

Maclure, mäk-lür', William, American geologist: b. Ayr, Scotland, 1763; d. San Angel, near the city of Mexico, 23 March 1840. In 1796 he visited the United States, and in 1803 was in Europe as one of the commissioners to settle the claims of American citizens against France for spoiliations during the revolution in that country. On returning to America he engaged with zeal in the extraordinary private undertaking of a geological survey of the whole country. Depending on his own resources and observations at a time when geology was unknown as a science, and few could appreciate his motives, he visited almost every State and Territory, crossing and recrossing the Alleghanies no fewer than 50 times. His first communication to the public was a memoir entitled 'Observations on the Geology of the United States, explanatory of a Geological Map,' read before the American Philosophical Society, 20 Jan. 1809, and published in Vol. VI. of their 'Transactions.' He still continued his explorations, and on 16 May 1817, presented another memoir to the society, published in their 'Transactions,' and also in a separate volume. The former publica-

tion was 6 years prior to that of the geological map of England prepared by William Smith, a production which gave him the title of father of English geology. To Maclure is equally due the title of father of American geology. His publications attracted much attention to the science. He now settled in Philadelphia and gave his books and collections to the Academy of Natural Sciences of which he was president from 1817 till his death. He lived in Spain, 1819-24, where he attempted to found an agricultural college, and returning in 1824 to the United States attempted to carry out a similar scheme in the New Harmony settlement in Indiana. Several distinguished naturalists from Philadelphia joined him in this enterprise, but the scheme failed. After 1828 he lived in Mexico, always, however, with the intention of returning to the United States, and with his interest in the progress of scientific education there unabated. While in Mexico he wrote 'Opinions on Various Subjects,' devoted mainly to political economy (1837).

MacMahon, mäk-mä'hon, Ella, English novelist. She has published 'A New Note' (1804); 'A Modern Man' (1805); 'A Pitiful Passion' (1806); 'The Touchstone of Life' (1807); 'An Honorable Estate' (1808); 'Fortune's Yellow' (1900); 'Such as Have Erred' (1902).

MacMahon, Marie Edme Patrick Maurice de, Duke of Magenta and Marshal of France: b. Sully, Saône et Loire, 13 June 1808; d. near Montargis 17 Oct. 1893. He was educated at the military college of St. Cyr; served with distinction in Algeria; became brigadier-general in 1848; received command of a division during the Crimean war, and assisted in storming the Malakoff; took part in the campaign of 1859 against Austria, and won the battle of Magenta by his prompt handling of the left wing; and after the war became governor-general of Algeria. At the outbreak of war between France and Germany (1870) MacMahon was placed in command of the First army corps, which was defeated at Weissenburg and Wörth, and finally fell back upon Châlons. Here he rallied his forces, and proceeded northeastward to relieve Bazaine, who was besieged in Metz, but he was pursued by the Germans, shut up by them in the town of Sedan, and wounded in the battle before the final surrender. After the armistice with Germany he was employed by the Versailles government in putting down the commune, and in 1873 was elected president of the republic, a position which he occupied until 1879. Consult Daudet, 'Le Maréchal de MacMahon' (1883); LaFarge, 'Histoire Complète de MacMahon, Maréchal de France, Duc de Magenta' (1898).

McMas'ter, Guy Humphrey, American poet and jurist: b. Clyde, N. Y., 3 Jan. 1829; d. Bath, Steuben County, N. Y., 13 Sept. 1887. He was educated at Hamilton College, Clinton, N. Y., studied law and became judge of Steuben County in 1864 and surrogate in 1884. At 19 he wrote 'Carmen Bellicosum,' better known as 'The Old Continentals,' published in the 'Knickerbocker Magazine' and still popular. Aside from this, his best-known poems are: 'A Dream of Thanksgiving Eve' (1864); 'The Professor's Guest Chamber' (1880); 'The Commanders' (1887).

McMaster, John Bach, American historian: b. Brooklyn 29 June 1852. He graduated from the College of the City of New York in 1872, studied civil engineering, and 1877 became instructor of civil engineering at Princeton. In 1883 he published the first volume of his 'History of the People of the United States,' and the same year was appointed professor of American history in the University of Pennsylvania. His 'History,' of which five volumes were published in 1900, has become a standard work. It covers a period reaching from the adoption of the Constitution in 1789 to the outbreak of the Civil War,—less than 100 years, but a crucial time for the shaping of the country. The account of the formative time, the day of the pioneer and the settler, engages his particular attention and receives his most careful treatment. He strives to give a picture of social rather than constitutional and political growth; and tells the story of national evolution with admirable lucidity and simplicity of style, and always with an appeal to fact precluding the danger of the subjective writing of history to fit a theory. His other works are: 'Benjamin Franklin as a Man of Letters' (1887); 'With the Fathers, Studies in American History' (1896); 'Origin, Meaning, and Application of the Monroe Doctrine' (1897); 'A School History of the United States' (1897); 'A Primary School History of the United States' (1901); 'Daniel Webster' (1902); 'Brief History of the United States' (1903).

Macmillan, a name for many years prominently identified with English publishing interests. Most important was DANIEL MACMILLAN: b. Upper Corrie, Isle of Arran, 13 Sept. 1813; d. 27 June 1857. He took service with a Cambridge bookseller in 1833, and with Seeley, Fleet Street, London, in 1837. He set up in business in London in 1843, but soon removed to Cambridge, and by 1856 had developed a very prosperous trade. He published Hughes' 'Tom Brown's School Days' in 1857; but he was chiefly aided by educational publications and the works of Kingsley and F. D. Maurice. Associated with him from 1843 was his brother, ALEXANDER MACMILLAN, previously a school-teacher at Nitshill, not far from Paisley. In 1863 he was made publisher to Oxford University, and in the same year removed the business to London. 'Macmillan's Magazine' made its appearance in 1859. The firm maintains a branch in New York, and publishes many university and educational works, as well as considerable fiction, by American authors.

MacMillan, Conway, American botanist: b. Hillsdale, Mich., 26 Aug. 1867. He was graduated from the University of Nebraska in 1885 and has been State botanist of Minnesota from 1891. He has published 'Twenty-two Common Insects of Nebraska'; 'The Metaspermæ of the Mississippi Valley'; 'Minnesota Plant Life'; etc.

MacMillan, Hugh, Scottish Presbyterian clergyman: b. Aberfeldy, Perthshire, Scotland, 17 Sept. 1833; d. 1903. At the time of his death he was minister of the Free West Church, Greenock, N. B. He has been noted as a brilliant writer and preacher, and among his published works may be mentioned: 'Bible Teachings in Nature' (1867); 'Holidays in High Lands' (1869); 'The Ministry of Na-

ture' (1871); 'The True Vine' (1871); 'The Garden and the City' (1872); 'The Sabbath of the Fields' (1876); 'Two Worlds are Ours' (1880); 'The Marriage in Cana' (1882); 'The Riviera' (1885); 'The Olive Leaf' (1886); 'Roman Mosaics' (1888); 'My Comfort in Sorrow' (1890); 'The Gate Beautiful' (1891); 'The Mystery of Grace' (1893); 'The Daisies of Nazareth' (1894); 'The Clock of Nature' (1896); several of which have been translated into German, Norwegian, Swedish, French, Italian, etc.

McMillan, James, American capitalist and Senator: b. Hamilton, Ont., 12 March 1838; d. Manchester, Mass., 1902. He entered business at Detroit, Mich., in 1855, since which he enjoyed a prosperous career as organizer of the Michigan Car Company, and general manufacturer in the railroad business. He was elected to the United States Senate as a Republican in 1889, and re-elected in 1895 and 1901. He was active in many commercial enterprises and was president of the Detroit Iron Furnace Company, which employed more than 3,000 men. He gave the city of Detroit a thoroughly equipped hospital, costing \$250,000, and endowed it with \$300,000; to the University of Michigan a fine Shakespearean library, and added to the college buildings McMillan Hall. He bestowed substantial benefactions on several other institutions.

McMillan, James William, American soldier: b. Clark County, western Virginia, 1826; d. 10 March 1903. At the time of his death he was a member of the board of review of the Pension Bureau. He was brevetted major-general in March 1865, commanded the 1st and 2d brigades of the Nineteenth army corps, served with Butler in the Gulf campaign, and captured the blockade runner Fox one of the richest prizes of the Civil War.

Macmillan, John, Scottish Presbyterian clergyman: b. Minnigaff, Kirkcudbrightshire, Scotland, 1670; d. Bothwell, 1753. He played a prominent part in the religious movements of his day, being founder of the Reformed Presbyterian Church, whose adherents are often called Cameronians (q.v.) or Macmillanites.

McMillan, Thomas, American Roman Catholic priest of the Missionary Society of Saint Paul the Apostle: b. Ayr, Scotland, 13 June 1851. He is of Irish descent, and when 3 years old came with his parents to America. In 1874 he entered the Missionary Society of Saint Paul the Apostle. His chief work has been in Sunday schools. In 1886 he instituted a "reading circle" movement, which has extended over all the country. In 1889 he was largely instrumental in bringing together, at New York, a large number of editors, journalists, and authors from different parts of the United States to discuss ways and means of making the press more effective in uplifting humanity. This meeting was known as that for the promotion of the "Apostolate of the Press." In 1892 he was made chairman of the board of studies of the Catholic Summer School of America, a position which he still holds (1903). In 1897 he was the prime mover in the organization of the "Child Study Congress" held in New York city.

MACMILLANITES — MACOMB

Macmillanites. See MACMILLAN, JOHN, and CAMERONIANS.

McMillen, Benton, American politician: b. Monroe County, Ky., 11 Sept. 1845. He received an academic education and in 1871 engaged in law practice. In 1874 he was elected to the State legislature of Tennessee, and in 1877 was appointed special judge of the circuit court. He was elected to Congress in 1879, and served until 1899, when he was elected governor of Tennessee, and two years later was re-elected.

McMinnville, māk-mīn'vil, Ore., city, county-seat of Yamhill County; on the Yamhill River, and on the Southern Pacific railroad; about 55 miles southwest of Portland. It is situated in an agricultural region, in which hops, wheat, and fruit are raised extensively. The city has considerable trade in agricultural products, live-stock, lumber, wool, and some dairy products. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 1,420.

McMinnville, Tenn., town, county-seat of Warren County; on the Nashville, C. & St. L. railroad; about 80 miles southeast of Nashville. It is in the midst of an agricultural region, and in the vicinity is found excellent building stone. Its manufactures are cotton and woolen goods, flour and lumber, foundry and machine-shop products, furniture, and dairy products. It is the seat of the Cumberland University Training School. Pop. (1900) 1,980.

Macmonnies, māk-mūn'iz, **Frederick William**, American sculptor: b. Brooklyn, N. Y., 20 Sept. 1863. In his 17th year he became pupil and assistant to Augustus Saint Gaudens, and going to Europe in 1884 he was admitted to the studio of Falguière, and after two years' instruction there opened a studio of his own. In 1889 his statue of 'Diana' was honorably mentioned in the Salon, and his 'Nathan Hale' in City Hall Park, New York, and 'James S. T. Stranahan' in Prospect Park, Brooklyn, were much admired in the Salon 1891. His 'Bacchante' (Salon 1894) was purchased for the Luxembourg. He has been prolific in the creations of the chisel, and his work is to be seen in Washington Memorial Arch, New York city, the Soldiers' and Sailors' Monument in Indianapolis, in the statues of Prospect Park, Brooklyn, and the Battle Monument at West Point. Since 1900 he has devoted himself more and more to painting, in which he exhibits delicacy, freshness of design, and a brilliant technique.

McMur'rick, James Playfair, American scientist: b. Toronto, Ont., 16 Oct. 1859. He was graduated from the University of Toronto in 1879, and is professor of anatomy in the University of Michigan. He has published: 'Invertebrate Morphology' (1894); 'The Development of the Human Body' (1902).

McMurtrie, māk-mēr'trī, **William**, American chemist: b. Belvidere, N. J., 10 March 1851. He was graduated from Lafayette College, Easton, Pa., in 1871 as a mining engineer, and was chemist-in-chief of the Department of Agriculture in Washington 1873-8. After serving as the special agent of that department at the Paris Exposition of 1878 he was professor of chemistry in the University of Illinois 1882-6, and chemist to the State board of agriculture

1886-8. In 1884 he received from the French government the title of Chevalier du Mérite Agricole, and in 1897 was elected president of the American Chemical Society. He has published 'Culture of the Sugar Beet' (1879); 'Culture of Sumac' (1879); 'Examination of Wools and Other Animal Fibres' (1887); etc.

McNab, Sir **Alan Napier**, Canadian statesman: b. Niagara, Ont., 19 Feb. 1798; d. 8 Aug. 1862. He entered the navy as midshipman in 1813, but soon abandoned the navy for the army; was present at the capture of Fort Niagara, and commanded the advance guard at the battle of Plattsburg. At the close of the war he studied law, and practised in Hamilton, and in 1829 was elected a member of the assembly for the County of Wentworth, and after serving three terms was returned by the electors of Hamilton. He was subsequently chosen speaker of the lower house. During the insurrection of 1837-8 he commanded the militia on the Niagara frontier, routed the insurgents near Toronto 7 Dec. 1837, and a party of American sympathizers having occupied Navy Island in the Niagara River, whence they were cannonading the village of Chippewa on the Canadian side, he sent a party to seize the steamer Caroline, employed to convey them supplies, and having driven the crew ashore, set fire to it and sent it over the Falls. Although the seizure was made on the American side of the river, the act was approved by the British government, and for his services to the crown during this insurrection McNab was knighted. In 1854 he was prime minister under the Earl of Elgin, retaining office for a few months under his successor, Sir Edmund Head. On retiring from the premiership in 1856 he was made a baronet.

MacNab, Frances. See FRASER, ALICE.

McNair, māk-nār', **Frederick Vallette**, American naval officer: b. Jenkintown, Pa., 13 Jan. 1839. He was educated at the United States Naval Academy and served in the Minnesota 1857-9. In 1861 he became lieutenant, and during the Civil War took part in the bombardment of Forts Jackson and St. Philip, the capture of New Orleans, and the destruction of the Confederate ram Arkansas. He was instructor at the naval academy 1867-8, in 1872 became commander, and in 1887 was placed in command of the Omaha in the Asiatic squadron. In 1895 he was made admiral, a member of the lighthouse board in 1898, and in July of the last named year was appointed to take charge of Admiral Cervera and other Spanish prisoners of war. Upon their return to Spain he was appointed superintendent of the Naval Academy.

Macomb, ma-koom' or ma-kōm', **Alexander**, American general: b. Detroit, Mich., 3 April 1782; d. Washington, D. C., 25 June 1841. He entered the United States army in 1799 as a cornet of cavalry, and at the commencement of the war with Great Britain in 1812 held the rank of lieutenant-colonel of engineers and adjutant-general of the army. In January 1814 he was promoted to be a brigadier-general and placed in command of that part of the northern frontier bordering on Lake Champlain. At Plattsburg, on 11 Sept. 1814, he sustained the attack of a greatly superior British force under Sir George Prevost, which, after the defeat of the British squadron on Lake Champlain on the same day,

MACOMB — MACON

retreated to Canada. For his firmness and courage on this occasion he was commissioned a major-general, and received the thanks of Congress and a gold medal. In 1835 he succeeded to the office of commander-in-chief of the army, which he held until his death. He wrote a 'Treatise on Martial Law and Courts Martial, as Practised in the United States' (1809).

Macomb, Ill., city, county-seat of McDonough County; on the Chicago, B. & Q. railroad; about 65 miles northwest of Springfield. It is situated in an agricultural region and in the vicinity are extensive deposits of fire-clay. The first permanent settlement was made about 1841, and the place was incorporated in 1857. The chief manufactures are sewer-pipe, stoneware, and pottery. There is considerable trade in farm products, coal, and lumber. The Western Illinois State Normal School is located here, and the free public library contains about 10,000 volumes. The government is administered, under a charter of 1872, by a mayor, who holds office two years, and a council. The city owns and operates the water-works. Pop. (1890) 4,052; (1900) 5,375.

Macon, mā'kōn, Nathaniel, American statesman; b. Warren County, N. C., 17 Dec. 1757; d. there 29 June 1837. He was educated at Princeton; in 1777 left college and served as a common soldier in the Continental army till the provisional treaty of peace in 1782, refusing any pay or military distinction. When the Constitution of the United States was submitted to the vote of the people of North Carolina, he firmly opposed it, on the ground that it bestowed too much power on the government, and made it in effect independent of the State. He never lost this dislike of the Constitution, and had unlimited confidence in the capacity of the people for self-government; his favorite saying being that "if left alone they would always do what was right." He was a member of the United States House of Representatives 1791-1815, and in 1816 was elected to the Senate, where he served till 1828, when he resigned his seat, having been then a member of Congress for 37 successive years.

Macon, Ga., city and county-seat of Bibb County, near the centre, one of the most important and rapidly growing business and manufacturing centres of the New South; 86 miles by rail from Atlanta, 136 from Augusta, and 197 from Savannah. It lies at the southeastern edge of the Appalachian mountain wall, on both sides of the Ocmulgee River; which pours from the upper plateau with a fall of about 90 feet in seven miles above the city, furnishing immense power soon to be developed by electric works to operate the manufactories. It is bridged here, but is navigable thence to its mouth all the year round, even at low water, for steamers of three feet draft. Macon is the greatest railroad centre in the State except Atlanta, six lines converging there,—the Southern, Central of Georgia, Georgia Southern & Florida, Macon & Birmingham, and Macon, Dublin & Savannah,—making eleven lines radiating from it. By through traffic arrangements it is also a part of the Seaboard Air Line, Atlantic Coast Line, and Louisville & Nashville, parlor and sleeping cars running from Macon to all; 60 passenger trains a day leave the union station.

Macon lies in the midst of a fast developing cotton district, as well as one of fruit and vegetables, making it a great agricultural market; near hardwood and yellow-pine forests, hills of granite, and deposits of brick and fire clays and the finest kaolin for porcelain, all, with the cotton, furnishing raw material for its important manufactures. In more detail it is the fourth inland cotton market of the United States, only Houston, Memphis, and Augusta (Ga.) exceeding it; and handles over 200,000 bales a year, valued at over \$6,500,000. It is at the edge of the Georgia peach belt, and sends away over 2,000 car-loads a season; in pears, plums, strawberries, and raspberries, besides grain and garden vegetables, it also does a great shipping as well as domestic business. But it is in manufacturing that its growth is most rapid and significant: with the attendant business accessories and banking facilities there has been a complete revolution in the past half dozen years. In 1900, it had 182 establishments, employing \$5,076,005 capital and 3,963 workmen and clerks, paying \$1,047,437 in wages, and turning out \$6,495,767 in product; in 1903 the last three items must have at least 50 per cent added, and the first be heavily increased. By far the greatest of these was then the cotton manufacture, in which Macon was taking a high place and promising to rival the great Northern seats of the manufacture: in 1900 its product was \$1,237,125, and it had increased 25 per cent within the year. Every branch of the industry is represented,—yarn, duck, cordage, twine, hosiery, and knit underwear; and it employed about a fourth of the total city wage-earners. Second only to this at present, if second, is the manufacture of cottonseed-oil for table use and packing, cottonseed meal and cake for provender and fertilizer, compound lard, plantene, and soap from the oil. This is a great and rapidly growing industry throughout the State, the seed netting the farmers half as much as the fibre; and Macon has an enormous plant started in 1896. The railroad shops which the many lines have located here turned out some \$500,000 of product. Next to these in volume were lumber and planing-mill products, sash, doors, blinds, and interior finish, with a market in all the States east of the Mississippi; the present output is fully \$500,000 a year. The largest vein of kaolin in the country, 30 miles wide and 35 to 70 feet deep, lies within seven miles of Macon; four companies, all established since 1900, are mining this to the extent of probably \$250,000 a year, and another has recently been organized. Brick and tile, paving and roofing materials, are all part of the products of the various fine clays. Foundry and machine-shop products, agricultural implements, sewing-machine findings, carriages and wagons, furniture, barrels and firkins (especially for the great oil and lard product), brooms and brushes, saddlery and harness, confectionery (a great specialty, four factories producing some \$200,000 worth a year), malt liquors, patent medicines, and artificial ice are a part of the thronging industries. The banking business for 1902 was about \$120,000,000 in the gross, and the clearing-house totals over \$40,000,000, a greater amount than in several Northern places of much greater population. The money-order business is about \$500,000 yearly, an increase of 20 per cent in three years.

MACON — McPHERSON

The city is on elevated sandy ground, with excellent drainage and sanitary conditions, and a mild even climate. It is a notably handsome place, with immensely wide streets,—100 to 180 feet,—beautifully shaded; Vineville, a part of the city, in the rear is covered with costly residences, and furnishes a noble view of the city. Central City Park with fair grounds, fully equipped, was laid out in 1870 at large cost; there are also Tatnall, Daisy, and Chickamauga parks, Rose Hill Cemetery, half a mile down the river, containing 150 acres, is of widely famed beauty. There are very interesting Indian mounds in the vicinity. It has good trolley service; and an excellent water supply from the Ocmulgee River. There are two daily papers and two public libraries; Mercer University (Baptist, 1831), Wesleyan Female College (1836, the first chartered in the country), St. Stanislaus College (Roman Catholic, preparatory for the priesthood), Mt. De Sales Academy (Roman Catholic), Home for Aged Masons, and the State Academy for the Blind (1852), with a library of several thousand volumes. There is a government building, an Academy of Music, and several charitable institutions. It is governed under the charter of 1893, with a two-year mayor and a one-chambered council. Population in 1850, 5,720; 1860, 8,247; 1870, 10,810; 1880, 12,749; 1890, 22,746; 1900, 23,272, of whom 11,561, or about half, were colored. By an act of the General Assembly at its last session, two of the principal suburbs were annexed, making the population 30,000. With other suburbs between which and the city proper is only an imaginary line, the population is 45,000.

Macon was settled about 1822, incorporated as a town in 1823, and received a city charter in 1832. It was named after Nathaniel Macon (q.v.) of North Carolina.

BRIDGES SMITH,
Mayor of Macon.

Macon, Miss., city, county-seat of Noxubee County; on the Noxubee River, and on the Mobile & Ohio railroad; about 108 miles east by north of Jackson. The agricultural lands surrounding the city are almost wholly used for the cultivation of cotton. It has cottonseed-oil mills, cotton gins, and cotton compress. Its trade is chiefly in cotton. Pop. (1900) 2,057.

Macon, Mo., city, county-seat of Macon County; on the Wabash and the Chicago, B. & Q. R.R.'s; about 20 miles north of Moberley. Surrounding the city is a fertile agricultural region, well watered and well wooded; and in the vicinity are coal fields. The industrial establishments are foundries, machine-shops, flour-mills, wagon and carriage factories, brick yards, cigar factories, and works where dishwashing machines, shears, and agricultural implements are made. Some of its public buildings are the court-house, the county insane asylum, public and private school buildings. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 3,371; (1900) 4,068.

Macoun, ma-koon', John, Canadian botanist: b. Ireland, 1832. He removed to Canada at 18 and from 1868 to 1879 was professor of botany and geology in Albert College, Belleville, Ont. In 1882 he became botanist to the Geological and Natural History Survey of Canada and

in 1887 assistant director. He has published 'Manitoba and the Great Northwest' (1882); 'The Forests of Canada and their Distribution' (1895).

Macpherson, mäk-fér'son, Sir David Lewis, Canadian statesman: b. Inverness, Scotland, 12 Sept. 1818; d. 16 Aug. 1896. He was educated at the Royal Academy in his native town, removed to Canada in 1835 and after becoming in 1842 a partner in a forwarding firm in Montreal secured in 1851, with others, a charter for a railway from Montreal to Kingston, the beginning of the Grand Trunk railway. In 1872 he became president of the Inter-oceanic Railway Company. He sat in the Legislative Council of Canada 1864-7, and in the last named year entered the Dominion Senate and was elected its Speaker in 1880. He was minister of the interior 1883-5 and was knighted in 1884.

McPherson, Edward, American journalist: b. Gettysburg, Pa., 31 July 1830; d. there 14 Dec. 1895. In 1848 he was graduated from the University of Pennsylvania, and although he studied law, soon gave it up for journalism. He sat in Congress 1858-66, was clerk of the House of Representatives 1863-73, 1881-3, and 1889-91, in 1876 permanent president of the National Republican Convention, and was chief of the bureau of engraving and printing in Washington 1877-8. He edited the *Philadelphia Press* 1877-80, was for some years the American editor of the 'Almanach de Gotha,' edited from 1872 a biennial 'Handbook of Politics,' and edited the 'New York Tribune Almanac' from 1877 till his death. He was the author of a 'Political History of the United States during the Great Rebellion' (1865); and 'The Political History of the United States during Reconstruction' (1870).

Macpherson, James, Scottish author and translator: b. Inverness-shire 1736; d. 1796. He studied at Aberdeen and Edinburgh. Having published 'Fragments of Ancient Poetry,' translated from the Gaelic or Erse language, a subscription was raised to enable him to collect additional specimens of national poetry. He produced, as the fruit of his researches, 'Fingal, an Ancient Epic Poem,' translated from the Gaelic (1762, quarto); 'Temora and other Poems' (1763), professedly translated from originals by Ossian, the son of Fingal, a Gaelic prince of the 3d century, and his contemporaries. The question of the poem's authenticity gave occasion for violent controversy. From the evidence of the contending parties it may be concluded that Macpherson's prose epics were founded on traditional narratives current among the Highlanders; but the date of the oldest of their lays is comparatively modern, and it is now impossible to ascertain the precise extent of his obligations to Gaelic bards. He had a life allowance from the government, and was agent to the Nabob of Arcot, having also a seat in the House of Commons 1780-90. He was also the author of a very inadequate prose translation of Homer's 'Iliad' and of some other works.

McPherson, James Birdseye, American soldier: b. Sandusky, Ohio, 14 Nov. 1828; d. Atlanta, Ga., 11 July 1864. He was graduated from West Point in 1853. Appointed brevet 2d lieutenant of engineers, he was assistant instructor of practical engineering at West Point,

1853-4, and after serving on fortification and construction duty, 1854-61, applied for active employment in the field at the opening of the Civil War. In May 1862 he was appointed brigadier-general of volunteers and was with Halleck at the siege of Corinth. For his services on this occasion he was made major-general of volunteers in the following November. He took an important part in the siege and capture of Vicksburg and was in consequence promoted to brigadier-general in the regular army 1 Aug. 1863. In March 1864 he was made commander of the department and army of the Tennessee and performed distinguished services in the campaign of Georgia. In the following July he commanded in the engagements around Atlanta and was killed during a reconnaissance.

McPherson, Logan Grant, American author: b. Circleville, Ohio, 11 Aug. 1863. He was educated in the public schools and embarked in a journalistic and industrial career. He has written extensively on economic questions for different periodicals and is the author of 'The Monetary and Banking Problem' (1896).

McPherson, Kan., city, county-seat of McPherson County; on the Union P., the Atchison, T. & S. F., the Missouri P., and the Chicago, R. I. & P. R.R.'s; about 150 miles west by south of Topeka. The city is the trade centre of an extensive agricultural region in which the chief products are wheat and corn. It has flour-mills, creameries, grain-elevators, brick and lumber yards. Its trade is chiefly in farm and dairy products and in live-stock. Its principal buildings are a court-house, high school, and opera house. It is the seat of the McPherson College, under the auspices of the German Baptists. Pop. (1890) 3,172; (1900) 2,996.

McQuaid, ma-kwä'd, Bernard John, American Roman Catholic bishop: b. New York city 15 Dec. 1823. He was educated in Canada and at St. John's College at Fordham, N. Y., where he was graduated in 1843, and remained there as a tutor for three years. He was ordained to the priesthood in 1848 and held a charge in Newark, where he founded the Seton Hall College and Seminary and served for ten years as its president. In 1868 he was consecrated the first Roman Catholic bishop of Rochester. He is a writer and also a lecturer and is deeply interested in educational matters.

MacQueary, ma-kwē'rī, Thomas Howard, American educator: b. Charlottesville, Va., 27 May 1861. He was graduated from the Episcopal Theological School at Alexandria, Va., in 1886, took orders in the Episcopal Church and in 1882 became rector at Canton, Ohio. His religious views having undergone a radical change he was tried by an ecclesiastical council for denial of miracles and suspended from the ministry for six months. He accordingly resigned from it in September 1891, and was for some time in the Universalist ministry. He founded Unity House Social Settlement in Minneapolis, and since 1900 has been superintendent of the Parental School in Chicago. He is the author of 'The Evolution of Man and Christianity' (1889), the immediate cause of the accusation of heresy which was brought against him, and 'Topics of the Times' (1890).

Macquoid, Katherine Sarah Thomas, English novelist: b. Kentish Town, London, 26

Jan. 1824. She was married to T. R. Macquoid, a water-color artist, in 1851. Beside many pleasing volumes of travel, such as 'Through Normandy' (1874); 'Through Brittany' (1877); 'In the Ardennes' (1881); 'About Yorkshire' (1883); 'In the Volcanic Eifel' with her son, Gilbert Macquoid (1896), she has written a long series of novels, not a few of which have been widely read in the United States. Among these may be cited: 'Patty' (1871); 'In the Sweet Spring Time' (1880); 'Little Fife' (1881); 'At the Red Glove' (1885), by some critics considered her best work; 'The Haunted Fountain' (1890); 'His Last Card' (1895). Her volumes of travel are illustrated by her husband.

Macrauchenia, māk-rā-kē'nī-a, a genus of fossil South American herbivorous animals, forming a connecting link between the palæotherium and the camel family; in form they nearly resemble the llama, but were as large as a hippopotamus. Their remains have been gathered nearly completely from the Pampas formation of Argentina and Bolivia.

Macready, ma-kre'dī, William Charles, English tragedian: b. London 3 March 1793; d. Cheltenham 27 April 1873. He received his education at Rugby, and originally had the intention of adopting one of the learned professions. The change in his career was brought about by his father, a theatrical manager, having fallen into embarrassed circumstances, to relieve which he joined his father's troupe, then acting at Birmingham. He appeared there for the first time in 1810 in the character of Romeo, in which he was successful. On 16 Sept. 1816 he made his first appearance on the London boards, acting Orestes in 'The Distressed Mother,' at Covent Garden Theatre. He did not achieve an immediate triumph in London, but gradually rose in popular favor. His Virginius was the first of his London successes. From the time when he appeared in this part he continued steadily to improve as an actor, and his successes were no longer confined to the lower walks of the profession. In 1842 he became a theatre manager at Drury Lane, but met with no success, so that he resigned at the end of the second season. His managership at Drury Lane had brought upon him considerable loss, to repair which he visited America (1849). On his return to London he gave some farewell performances, and then retired from the stage in 1851.

Macrinus, ma-kri'nūs, M. Opelius, Roman emperor: b. Cæsarea, Mauritania, 164 A.D.; d. Cappadocia 218. Of low parentage, he was admitted into the employment of Plautianus, the favorite of Septimius Severus, and received appointments in the imperial household, until he rose to be prefect of the Praetorians under Caracalla. On the death of the latter, whose assassination he had plotted, he was proclaimed emperor, gaining the favor of the Praetorians by a liberal donative and of the senate by repealing some obnoxious taxes. His conduct as a rigid martinet caused disaffection among his troops, a portion of whom renounced their allegiance to him in favor of Elagabalus. He marched against the latter, was defeated at Antioch, fled in disguise to Chalcedon, was betrayed and put to death at Cappadocia.

MACROBIUS—MADACH

Macrobius, mā-krō'bī-ūs, **Ambrosius Aurelius Theodosius**, Latin author of the 5th century A.D. The country of his birth is uncertain, but it is inferred from the fact that he speaks of Latin as a foreign tongue to him, that he was probably a Greek. He was the author of a miscellaneous work entitled 'Saturnalia,' curious for its criticisms, and valuable for the light it throws upon the manners and customs of antiquity; a commentary on Cicero's 'Somnium Scipionis,' in two books, valuable for the exposition it affords of the doctrines of Pythagoras with respect to the harmony of the spheres; and a treatise, 'De Differentiis et Societatibus Græci Latiniq. Verbi.' Consult Von Jan, 'Macrobius'; and Eyssenhardt, 'Macrobi Opera.'

Mac'rocsm. See MICROCOSM.

Macrotherium, a genus of extinct ungulate mammals, in some cases of gigantic size, found most completely in the Miocene deposits of Europe, but also known from China and western North America. It represents the primitive group *Ancylopoda*, which had a wide geographical range in the Miocene and Pliocene epochs when it became extinct. The structure of the curiously twisted feet so much resembles that of the ground-sloths that for a long time the macrotheres, as well as their companion, but more generalized genus *Homalodotherium*, were regarded as edentates. Consult Woodward, 'Vertebrate Palæontology' (1898).

Macru'ra. See DECAPODA.

MacVeagh, māk-vā', **Wayne**, American lawyer and diplomat: b. Phoenixville, Pa., 19 April 1833. He was graduated from Yale in 1853 and after studying law was admitted to the bar in 1856. He was district attorney of Chester County 1859-64, became prominent as a Republican leader, and conspicuous in his profession, and in 1870-1 was minister to Turkey. He was an active opponent of "machine politics" and in 1872 led the Republican opposition to Simon Cameron, his father-in-law. He was chairman of the "MacVeagh Commission" sent by President Hayes to Louisiana in 1877 to act as the President's unofficial representative and aid in adjusting political differences there. He was attorney-general of the United States, March to September 1881, and was ambassador to Italy 1893-7.

McVickar, māk-vik'ar, **William Neilson**, American Protestant Episcopal bishop: b. New York 19 Oct. 1843. He was graduated at Columbia College (1865); and at the General Theological Seminary (1868). He was ordained deacon (1867) and priest (1868). Being elected coadjutor bishop of Rhode Island, 19 Oct. 1897, he was consecrated 27 Jan. 1898, and on the death of Bishop Thomas March Clark, September 1903, succeeded to the see.

Ma'cy, Jesse, American historian: b. Henry County, Ind., 21 June 1842. He was graduated from Iowa College in 1873, and has been a member of the faculty there since that date, becoming professor of constitutional history and political science in 1885. He has written 'Civil Government in Iowa' (1881); 'Institutional Beginnings in a Western State' (1883); 'Our Government' (1886); 'A Government Text-Book for Iowa Schools' (1887); 'The English Constitution' (1897); 'Political

Parties in the United States, 1846-1861' (1900); and numerous magazine articles.

Mad Anthony, a nickname given to the Revolutionary general Anthony Wayne (q.v.) on account of the seeming recklessness of his brilliant military feats.

Mad Apple, the fruit of an American nightshade, especially that called Sodom apple (*Solanum sodomia*), the eating of which produces poisonous intoxication.

Mad Mul'lah, term applied to Mohammed Ali, the Mahdi, or Moslem Messiah: b. Somaliland 1843; d. 1884. In his youth Mohammed was initiated into the mysteries of the occult sciences and sorcery. These he learned among the tribe of the Danakil, which has always been renowned for its magicians. A study of the Koran and the Arab writings followed in the Marabout school. When quite young the future Mullah was taken with the idea of making the pilgrimage to Mecca, and not content with one journey made the sacred visit three or four times. His object was to obtain a greater reputation for holiness than that held by the other pilgrims.

After his last pilgrimage Mohammed returned to Berbera, but met with small success in that commercial town. Seeing no prospect before him but that of remaining a poor, begging pilgrim, he determined to strike out a new line for himself, and established himself among a powerful inland tribe. Here he made his position secure by his appearance of holiness, his impressive airs, and the assurance with which he made his prophecies. At this time and hereafter the magic learnt in his boyhood stood him in good stead whenever his holiness was not able to overawe his somewhat turbulent followers. He assumed the title of Mullah (priest and heaven-sent), and even that of Mahdi (prophet). Overwhelmed with presents by his credulous followers, he was soon among the richest of the land, and with his riches his influence grew apace.

His pride waxed very great, and one day he ordered all the Korans of the ordinary priests to be burned, saying that he himself was the living Koran, and that he was to be obeyed as a new prophet sent from Allah. Not content with persuasion, the Mullah, following the example set by Mohammed the Great, threatened with death all those who disbelieved, and in following up these threats caused the disturbances which brought about the Somaliland campaign. Possessing the power of calling forth the enthusiastic support of the tribesmen, the Mullah has not had to rely upon himself alone for the conduct of his campaigns. If report speak truly, besides the Austrian, Karl Inger, he had as lieutenant an English naval officer. In 1881 he destroyed the Egyptian army despatched against him. He died of smallpox. See EGYPT, SUDAN.

Consult Darmesteter, 'The Mahdi' (1885); Hoffmann, 'Mahdithum' (1899); E. Müller, 'Beiträge zur Mahdilehre des Islams' (1901).

Madach, mō'däch, **Emerich**, Hungarian poet: b. Also-Sztrégova 21 Jan. 1823; d. there 5 Oct. 1864. He studied law, was a notary in his native country, and was also active as an orator and journalist. He wrote on archæology and æsthetics; and both lyric and dramatic verse. His principal works are the two dramatic poems, 'Moses' (1860); and 'The Tragedy of Man'

MADAGASCAR

(1860). The latter owes much to 'Paradise Lost,' and to 'Faust,' but is yet a remarkable performance. Though strongly contemplative in character, it was successfully presented to Austria and Hungary in 1830. There is an excellent rendering in German by von der Lech (1888). Consult: Fischer in 'Auf der Höhe,' Vol. XVI. (1885).

Madagascar, mād-a-gās'kar, an island in the Indian Ocean, since 1896 a French colony. It is separated by the Mozambique Channel from the southeast coast of Africa, the nearest point being 230 miles distant. It is 975 miles long from Cape St. Mary in the south to Cape Amber in the north, has an average breadth of 250 miles, and an estimated area of 227,750 square miles, being after Greenland, New Guinea, and Borneo, the fourth largest island in the world.

Topography.—Madagascar consists of an elevated region with an average height of from 3,000 to 5,000 feet overlooked by mountains rising in some cases to nearly 9,000 feet above the sea-level. This plateau occupies a much larger proportion of the surface in the north and east than in the west and south, and the greater portion of the island south of lat. 23° S. belongs to a much lower region which does not consist entirely of plains, but is interrupted toward the west by three prominent chains of hills stretching from north to south, one of them apparently in a continuous line about 600 miles in length. The coast exhibits a number of indentations, mostly small, but few good harbors, being in great part rock, though in some places low and sandy.

Hydrography.—The rivers are numerous; few of them offer the advantages of internal navigation. The chief rivers have their courses on the west and northwest sides of the island. The Betsiboka with its affluent the Ikiopa, unitedly measuring 300 miles, may be ascended by light steamers for 100 miles; the Tsiribihina has a somewhat shorter course, but drains by its numerous tributaries a much larger area. The eastern rivers descend from the high land through magnificent gorges, forming a succession of rapids and cascades, the falls in some instances having a descent of 500 feet. There are few lakes of any size as yet known to explorers; one of the largest is Alaotra Lake, measuring 25 miles long; the others do not reach a length of 10 miles. A long chain of lagoons having very short distances between each and often expanding into wide sheets of water stretches for nearly 300 miles along the east coast.

Geology.—Geologically the elevated region consists almost entirely of granite and other igneous rocks, while the lower region is composed chiefly of secondary formations. The former region is traversed by a line of extinct volcanic craters, some of which show signs of comparatively recent activity. Among the more remarkable fossils are remains of a huge struthious bird, the Epiornis, whose egg, measuring 12 by 9 inches, is larger than that of any other known bird. The minerals include iron in abundance, gold, lead, and copper, all more or less worked, while in the northwest coal is found.

Climate.—The climate is various; the heat on the coast is often very intense, but on the high lands of the interior the temperature is more moderate. On the coast the rains are nearly constant, beginning in the evening and sometimes

lasting all night; in the interior the winter is dry and agreeable. The greatest amount of rainfall takes place on the east coast, and especially on the northeast, the part directly exposed to the summer monsoon. The elevated region of the interior and the districts on the west coast are tolerably healthy for Europeans, but owing to the large extent of marsh and lagoon on the east, malarial fever prevails, and is frequently fatal to natives from the interior as well as to Europeans. Snow is never found on even the loftiest mountains.

Ethnology.—The inhabitants, known by the name of Malagasy, belong to the Malayo-Polynesian stock and speak a Malayan language. They appear to form substantially a single race, though they have received a considerable intermixture of African blood and a certain amount of Arab intermixture. They are divided into numerous tribes, each having a distinctive name and customs. The Hovas are the predominant tribe; their proper country is the elevated region of the interior, but they extended their sway over nearly the whole island. Among the other chief tribes are the Betsimisaraka on the east coast, the Betsileo in the south central region, and the Sakalava on the west and north. The people are socially divided into three classes: Adrians or nobles, Hovas (in a special and restricted use of the word) or free commoners, and Andevos or slaves. This last section consists, or till recently consisted, partly of debtors and criminals and their descendants, partly of Africans brought over in slave-shows, and partly of the descendants of other tribes conquered by the Hovas. The Africans were, however, formally set free in 1877. In the coast districts the houses of the better class are built of framed timber with lofty roofs covered with shingles or tiles; the dwellings of the lower classes are constructed of bamboo or rushes, or even of clay. In former and more unsettled times the villages were almost always built on the tops of hills, but during the 19th century this precaution has not been deemed so indispensable.

Flora.—The most striking feature in the vegetation is a belt of dense forest with an average breadth of 15 to 20 miles passing round the whole island, and broken only by a gap in the northwest, where the two ends of the forest overlap. It is found at all levels from 6,000 feet to the water's edge, which it touches on the northeast, where it reaches its greatest breadth of 40 miles. The trees of this forest include many species of lofty palms, hardwooded exogens supplying a great variety of beautifully veined and durable timber, and a large number of trees remarkable for the splendid character of their blossoms. Of all the trees of Madagascar the most striking is the ravnala or traveler's-tree (*Urania speciosa*); it resembles a palm, its stem being crowned by a semicircle of oblong leaves spread out vertically in a fan shape. It owes its name to the fact that the traveler may supply himself with water from it by piercing or breaking the lower ends of the leaf-stalks.

Fauna.—Madagascar has a singularly local fauna which, although upon the whole related to Africa, is so peculiar to itself that with a few neighboring islets, it forms a very distinct sub-province of the African region. Its characteristics show plainly that the separation of the

MADAGASCAR

island from the continent occurred at a very ancient time. Another singular feature is the presence of various forms of animal life represented elsewhere only in Oriental Australian regions, with a marked resemblance in a few animals, for example the boas, to South America. From this it is plausibly argued that in early Tertiary times there was a land connection between Madagascar and India and the region thence to Australia, now presented only by the islands of the Malayan Archipelago. (See LEMURIA.) In its mammals Madagascar is singular in what it lacks, as well as in its possessions. It has none of the cattle, equine animals, elephants, rhinoceroses, hogs or even rodents of Africa, except a mouse or two; no lion or true cat or dog of any kind; and no monkeys. On the other hand it has several small insectivora, closely allied to tropical American species; the great majority of all the lemurs, the few outsiders being in Africa and the Orient; and several viverrine quadrupeds, which there take the place of the predatory cats. The modern birds are less striking in their peculiarities, but in the zoological era immediately preceding the present the island possessed those huge ratite birds, the *epiornis* and its relatives, which gave rise to the story of the roc. Many forms of huge land tortoises were also members of this singular fauna. The fishes, amphibians, reptiles, and lower forms are largely peculiar.

Crocodiles are numerous in the rivers and lakes, and many species of lizards, chameleons, and tree-frogs abound in the forests. Among the insects are numerous brilliantly colored beetles, butterflies, moths, flies, locusts, and spiders, venomous species of the latter as well as scorpions and centipedes being present. See ZOOGEOGRAPHY.

Agriculture.—Of the vegetable products grown for food by far the most important is rice, the staple food of the inhabitants; next in importance come manioc or cassava, sweet-potatoes, beans, tomatoes, ground-nuts, and yams. Ginger, pepper, and indigo grow wild in the woods; cotton, sugarcane, coffee, tobacco, and hemp are cultivated. Humped cattle are found in immense herds, and form a large part of the wealth of the inhabitants; they appear to have been introduced from Africa at a remote period, as the fat-tailed sheep, goats, swine, and horses have been more recently. Under French administration agriculture and cattle-raising are undergoing considerable extension. General Gallieni, the military governor, foreseeing that, for want of French colonists, Madagascar was likely to become a burden on the hands of France, devised a plan in 1899 to hasten the settlement of the country, the efficiency of which has since been proved by practical tests. The country not being thoroughly pacified, a large army of occupation is garrisoned there. Upon the expiration of their terms of enlistment these men are offered large land grants and an annual subsidy from the French government of 2,250 francs (\$434) for two consecutive years. In return for these privileges these settlers pledge themselves to reside three consecutive years on the territory allotted to them. During this period they are to cultivate the soil to the best of their ability. They are furthermore obliged to hold themselves in readiness to aid in the defense of the settlements against hostile natives. This experiment was begun with 36 men

honorably discharged from the army, their concessions aggregating 8,000 acres, and two years later the issue of the official report of the transactions of the colonial office showed that the plan was successful. Under the intelligent guidance of agricultural experts the country was planted with the staples for cultivation to which it was best adapted, and many of the successful farmers after the first year sent to France for their relatives.

Commerce and Industries.—Rice, cattle, hides, gum, india-rubber, wax, cotton, sugar, vanilla, lard, coffee, gold, gum-copal, and dye-woods are exported. The chief imports are cotton goods, wines and spirits, metals, rice, and flour. In 1901 the total value of imports was \$9,206,552, of exports \$1,995,095; the value of the gold exported being \$660,000. In general the Malagasy show much aptitude for the manual arts. As silversmiths, gunsmiths, and carpenters, they rapidly acquire the skill of Europeans; and with hand-loom of the rudest construction the only ones as yet in use, they make excellent and handsome cloths. The principal article of native dress with both sexes is the *lamba*, a piece of cloth about three yards long and two broad, which is folded round the body above the arms, one end being thrown over the shoulder.

The island is being rapidly opened up by the building of highways, a carriage road, and a railroad having been completed between Tamatave, the chief port, and Antananarivo (q.v.), the capital.

Government.—Prior to 1895 the government was a native absolute monarchy. A French Resident, however, with a military escort, resided at the court and controlled foreign relations, so that the country was virtually a French protectorate. Much friction prevailed in 1893-4, between the government and the French authorities, and finally France decided to make her protectorate of the island effective. An expedition easily overcame the resistance of the Hova troops, and after some changes in the formation of the administration the island was made a French colony, and General Gallieni was appointed resident-general and commander-in-chief in September 1896. His vigorous and determined policy made a great improvement in the condition of the country. He is assisted by an administrative council, and natives are largely employed in the civil and military administration. An educational system provides primary schools for boys and girls, four normal schools, a school of practical agriculture, two regional schools for agriculture and industries, and a school of medicine. Numerous Catholic and Protestant mission schools have long been established in the island. The religion of the great bulk of the people is a kind of fetishism or worship of charms. Many of their superstitious customs have been abolished and Christianity adopted, chiefly by the Hovas, the Catholic cult prevailing. A court of appeal and tribunals throughout the provinces provide for native justice, while there are special courts for the administration of French justice. The local revenue is derived chiefly from direct taxation, from customs and other indirect taxes, from colonial lands, posts and telegraphs, markets, etc., and from subventions granted by France. The chief branches of expenditure are general administration, public

MADAME BOVARY — MADDOX

works, post-office, and public debt, the latter being a large item.

Population.—According to the census of 1901, the population amounted to 2,505,237, of whom 2,488,689 were natives, 15,524 European, 1,006 Asiatic and African; the Hovas, the chief native tribe, numbered 850,000.

History.—Madagascar was known to the traveler Marco Polo at the end of the 13th century and had been visited for several centuries by the Arabs. In 1506 it was visited by the Portuguese, who gave it the name of St. Lorenzo. Toward the end of the 17th and during the most of the 18th century the French endeavored to form military stations on the east coast, but with no lasting results. A settlement was established at Fort Dauphin in the southeast and held for some time, but in consequence of the tyrannical behavior of the French settlers they were massacred by the natives and the place destroyed. The French, however, struggled hard and successfully to retain the islands of Ste. Marie on the east coast and Nossi-bé on the northwest. Previous to 1810 Madagascar might be said to have been divided among numerous petty chiefs, almost constantly at war with each other. In that year, however, Radama I., a prince of remarkable intelligence, became king of the Hovas, and began to enforce a claim by right of conquest to the sovereignty of the whole island. He saw that if his people were to be prosperous they must first be educated and civilized. In return for the promise of co-operation in putting down the slave-trade on the coast of Mozambique, he received arms and other assistance from the British, by which he was enabled to carry on his conquests. Christian missionaries began to teach in the capital in 1820, many converts were made, the Bible was translated into the Malagasy tongue, the language was first reduced to a systematic written form, and printing was introduced. Great improvements had taken place in the manners of the people when Radama died in 1828, and was succeeded by his chief wife, Ranavalona, a woman of cruel disposition, and opposed to all innovation. The native converts were persecuted, many of them being put to death, and the island was closed to Europeans. This reign of terror ended at last in 1861, when the queen died, and was succeeded by her son Radama II., who, himself a Christian, reopened the island to European missionaries and traders, and proclaimed the emancipation of the African slaves. He appears, however, to have been a weak prince easily swayed by native and foreign favorites, and he unwisely granted extensive territories and privileges to an enterprising French company, an act which lost him the affection of his nobles, and led to his assassination in 1863. His wife Rasoherina was placed on the throne, and the government repudiated the concessions made to the French, offering 1,000,000 francs as compensation. After a quiet and prosperous reign of five years this queen died, and was succeeded by Ranavalona II. in 1868. After she had been elected queen she and a great number of her courtiers became Christians, and many reforms favorable to enlightenment and humanity were perseveringly carried out. She was succeeded in 1882 by Ranavalona III., when the French brought forward their claims on the Malagasy territory, which being refused, led to hostilities in 1883-5. This war was termi-

nated by a treaty, under which France acquired protectorate rights over Madagascar; but hostile feeling toward the French again led to war in 1895, with the result that the queen was deposed and exiled first to the island of Réunion, and thence in 1899 to Algiers, while Madagascar became a French colony.

Consult: Dawson, 'Madagascar: its Capabilities and Resources' (1895); Keller, 'Madagascar, Mauritius and Other East African Islands' (1900).

Madame Bovary, mă-dăm bō-vă-rê, a novel by Gustave Flaubert, which appeared in 1856, when the author was 35. It was his first novel, and is regarded as the book which founded the realistic school in modern French fiction—the school of Zola and Maupassant. The novel is a powerful, unpleasant study of the steps by which a married woman descends to sin, bankruptcy, and suicide. The time is the first half of the 19th century; the action takes place in provincial French towns.

Mad'den, Frederick William, English librarian: b. London 7 April 1839. He is a son of Sir Frederick Madden, a noted antiquary, and was chief librarian of the Brighton Public Library, 1888-1902. He is a member of various numismatic societies, and among other works has published 'Handbook of Roman Numismatics' (1861); 'History of Jewish Coinage and Money in the Old and New Testaments' (1864); 'The Coins of the Jews' (1881).

Mad'der, (1) in botany, the English name of the plants of the genus *Rubia*, especially *R. tinctorum*. It is a trailing or climbing annual, supporting itself by its leaves and prickles. It is supplied chiefly from Holland, France, Italy, and Turkey. The roots, which are ready the third year, are kiln-dried, and then threshed. They are then dried a second time, and afterward pounded and stamped in a mill. Indian madder, called also madder of Bengal, is *R. cordifolia*; madder of Chile *R. augustissima* or *Relbourn*. (2) In chemistry, the root of *R. tinctorum* is extensively used in dyeing for the production of a variety of colors, namely, red, pink, purple, black, and chocolate. Other species of *Rubia* are also used. It would appear that madder contains a colorific principle—rubian—which, under the influence of a peculiar ferment, termed erythrozym, breaks up into alizarin, purpurin, etc. The colors produced from madder are very stable, the well-known Turkey-red being one of them. Madder also contains certain yellow coloring matters, but they are useless, if not injurious, in the process of dyeing. (See DYES; DYEING.) (3) In pharmacy, madder is a tonic, a diuretic, and an emmenagogue. Brown madder, a rich red-brown pigment, prepared from the roots of *R. tinctorum*.

Mad'dox, Richard Leach, English physician and chemist: b. Bath, England, 4 Aug. 1816; d. Portswood, Southampton, 11 May 1902. He studied medicine at University College, London, but was graduated M. D. at Edinburgh. In early life he settled and practised his profession in Constantinople, and here first took up the study of photography. He subsequently left the Bosphorus for Smyrna and was a civil surgeon in the military hospitals at Scutari during the Crimean war, and finally settled at Woolston, near Southampton, England. It was during his residence at Woolston, which lasted until

MADEIRA—MADISON

1874, that he worked out the process which has revolutionized the art of photography, by substituting the gelatino-bromide for the collodion plate. With him originated the gelatino-bromide dry plates to take the place of the wet collodion plates which, besides other inconveniences, sometimes produce an atmosphere which is dangerous to the operator's health. There have been more than one claimant to the credit of this discovery, but it is decided by the 'Scientific American' that Dr. Maddox is entitled to all the honor of the invention. The sub-committee of the Committee of Sciences and Arts of the Franklin Institute of the State of Pennsylvania awarded him the Scott Legacy medal and premium as the author of the invention.

Madeira, mā-dē'ra (Port. mā-dā'ē-rā), a group of Atlantic islands belonging to Portugal, opposite and about 440 miles distant from Sali, Morocco, on the west coast of Africa, and about 600 miles southwest of Lisbon. Madeira, the principal island, and the islets of Porto Santo, Dezerta Grande, and Bugio, compose the group with an area of 505 square miles, and a population (1900) 151,125. The main island (area, 313 square miles) consists of a collection of mountains of volcanic origin, the most elevated of which is upward of 6,000 feet high. Through the west half of the island runs a central ridge about 5,000 feet high, on which is an extensive plain called Paul de Serra. The east portion of the island, though elevated, is less so than the west. From the central mass steep ridges extend to the coast, where they form perpendicular precipices of from 1,000 to 2,000 feet high. These cliffs are indented by a few small bays, where a richly cultivated valley approaches the water between abrupt precipices, or surrounded by an amphitheatre of rugged hills. These narrow bays are the sites of the villages of Madeira. The most striking peculiarity in the mountain scenery of the island is the jagged outline of the ridges, and the deep precipitous gorges which cut through the highest mountains almost to their very base. The road round the island is in many places exceedingly picturesque, being led often between lofty cliffs, or along the front of precipices overhanging the sea. The Madeiras were known to the Romans under the name of *Purpuraria Insulae*. They were rediscovered by the Portuguese in 1420, and the name Madeira was given to the principal island from the magnificent forests of building timber (in Portuguese *madeira*) which then covered it. It was settled by the Portuguese in 1431. Funchal, the capital (pop. 1900 37,011), is an episcopal see. The mean annual temperature of Madeira is 65°, and the climate, from its constant and temperate warmth, is well known for its favorable effects on those suffering from pulmonary and other complaints, which renders the island a favorite resort of invalids from Britain and elsewhere. Large and well-appointed hotels exist at Funchal. The staple product of Madeira is wine, the quantity of which in good years prior to the appearance of the vine disease in 1852, amounted to 2,750,000 gallons. In 1808 there was an export of 587,000 gallons valued at about \$890,000. Sugarcane, and the cactus for the rearing of cochineal, are cultivated, fruit and vegetables are grown, fisheries are actively engaged in, linen, woollens, leather, straw hats, baskets, soap, sugar, spirits, butter, etc., are manufactured. A total of

1,635 vessels of 4,692,264 tons entered and cleared the island ports in 1899. The chief import is coal, the most important of the others being wheat, rice, Indian corn, and dry goods.

Madeira, or **Cayari**, Brazil, a large navigable affluent of the Amazon, about 800 miles long, formed by the united streams Beni, Mamore, and Guaporé, on the frontiers of Brazil and Bolivia. Just northeast of the frontier the navigation is interrupted by rapids, to avoid which a railway is being constructed. The length from the source of the Mamore is nearly 2,000 miles.

Madeleine, mād-lān, La, a church in Paris, in a square of the same name, commenced in 1764. It was remodeled and changed after the Revolution, and in 1832 was completed at a cost of \$3,000,000. The church is built in the form of a Roman temple and is 100 feet high, 354 feet long and 141 feet wide. The bronze doors by Triqueti are 35 feet high and 16 feet in width. The building, which has no windows, is lighted from above.

Madhava, mā'dha-vā, another name of the Hindu god Vishnu (q.v.).

Ma'dia Oil, oil expressed without heat from the seeds of *Madia sativa*. It is transparent, yellow, odorless, and may be used on the table as a substitute for olive oil, or for oil-cake for cattle. The plant is a composite, native to southern South America, but has long been cultivated in Europe for its oil-bearing seeds.

Madison, James, American Protestant Episcopal bishop: b. Rockingham County, Va., 27 Aug. 1749; d. 6 March 1812. He was graduated at William and Mary College in 1772, studied law, and was admitted to the bar, but soon after abandoned law for divinity. In 1773 he was chosen professor of mathematics in William and Mary College, and in 1775 went to England and was admitted to orders by the bishop of London. In 1777 he was elected president of the college, and during the American Revolution succeeded in keeping the college in active operation. Having been chosen as bishop of Virginia he was consecrated by the archbishop of Canterbury, in Lambeth palace, 19 Sept. 1790. He continued to discharge the duties of president of the college, and professor of natural and moral philosophy, international law, etc., with those of the episcopate, until his death. His only publications were several occasional discourses, and a 'Eulogy on Washington' (1800).

Madison, James, fourth President of the United States: b. Port Conway, Va., 1751; d. Montpelier, Va., 28 June 1836. Madison was the eldest son of James Madison, a Virginia planter, and of Nelly Conway, daughter of Francis Conway, of King George County, Va. His father, a man of independent means, lived on an estate now known as Montpelier in Orange County. James was born at Francis Conway's home on the Rappahannock while his mother was on a visit to her parents. His educational advantages were excellent for the times; he attended the school of a Scotchman, Donald Robertson, was well prepared for college by the clergyman of the parish, the Rev. Thomas Martin, and entered Princeton in 1769. His application to his studies was excessive, and was in part the cause of later ill health; he succeeded, however, in taking the studies of the last two years in one year and

MADISON

took his B. A. degree in 1771. He remained at Princeton for another year doing special work in Hebrew under Dr. Witherspoon, the president. After his return home he tutored his younger brothers and began a systematic course of reading in theology, philosophy, and law. At this time his study of Hebrew and theology seem to indicate a desire to enter the ministry, but he soon abandoned this and prepared himself for the legal profession and for public service. His theological studies bore good fruit later as is evidenced by the stand he took for religious liberty.

Madison was by instinct a politician and not a soldier; he took no active part in the Revolutionary War, but as early as 1774 he was appointed a member of the Committee of Public Safety for Orange County, and in 1776 was elected delegate to the convention which framed the constitution of Virginia. From that time until he retired from the Presidency he was honored with high public offices by his State and by the nation. In the Virginia Convention Madison succeeded in substituting for a clause in the Bill of Rights permitting the "fullest toleration" in religion, a clause allowing the "free exercise of religion." This was a distinct blow to religious intolerance for, as he said, toleration implies jurisdiction, and the State should have no coercive power over religious thought. He was a member of the first Virginia Assembly but failed of re-election because, as his biographer Rives tells us, he refused to conform to the universal custom of his day and "treat" his constituents; he was, however, made a member of the governor's council and so distinguished himself that in 1780 while still under thirty he was chosen as delegate to the Continental Congress. In this Congress he was conspicuous for his opposition to the issuance of paper money by the States; for his efforts to secure for Congress the right of taxing imports, and for his determined stand to retain for the States the right of navigation on the Mississippi. Madison saw clearly that a government so organically weak that it could not enforce its requisitions and could pay its debts only by increasing its debt could never be effective; hence he labored unceasingly to enlarge the power of the central government. The office of delegate was limited to one term, so Madison was not returned to Congress in 1784, but the high esteem in which he was held was shown by his immediate election to the State Assembly. Virginia was a very influential State and her attitude toward national questions was of great importance. In the Assembly Madison tried to indoctrinate the people of Virginia with his ideas concerning the Federal power. His bill to regulate trade in Virginia and to provide ports of entry led first to the conference between Virginia and Maryland with reference to trade on the Potomac and later to the Annapolis Convention which met in 1786 to consider the trade and commerce of the United States. This Convention at Annapolis urged upon the States the appointment of commissioners to meet in convention at Philadelphia "to devise such further government as shall appear to them necessary to render the Constitution of the Federal Government adequate to the exigencies of the Union." The summoning of the Philadelphia Convention was largely due to the wise bills introduced by Madison in the Virginia Assembly and to his direction of public sentiment, and it was eminently fitting that he

should be one of the delegates of the Virginia Commission at whose head was George Washington. Madison's views on government are clearly defined in his "outline system" which formed the basis of the Virginia plan proposed to the Convention. His system demanded that there should be a due supremacy of national authority without the exclusion of local authority, that the national authority should extend to the judiciary and to the militia; that the national legislature should be composed of two bodies, the larger elected for a short, the smaller for a longer term; that Congress should have certain coercive powers; that a national executive should be provided and that the basis of representation in Congress should be changed from States to population. The "Virginia plan" was the germ of the Constitution and Madison is rightly called the "Father of the Constitution." His arguments in favor of the proposed government were exhaustive and convincing, and his private notes of the work of the convention and of his debates purchased from his widow and published by Congress form a valuable addition to our knowledge of this stormy period. While the Constitution was before the people for consideration Madison, Hamilton and Jay wrote a series of papers called in collected form 'The Federalist,' in which they discussed government in general, defined the character of the proposed union, met objections, and proved the advantages to be derived from effective central government. Madison was a member of the Virginia Convention which met to consider the ratification of the Constitution and by his keen analysis and clear cut argument contributed more than any other man to secure its adoption. His chief opponent was Patrick Henry; his ablest ally, John Marshall. Owing to Henry's antagonism, Madison was defeated as candidate for the Senate, but was elected as representative to Congress and took his seat in April 1789. During this session of Congress Hamilton and Madison, who had hitherto been at one in their efforts to centralize power, drifted apart, and Madison gradually began to endorse Jefferson's position as to certain inalienable States rights. There is no reason to accuse him of bad faith; his statesmanship was never overbold, and Hamilton's commercial system, his extensive financial schemes, especially the funding of the national debt and the assumption of State debts by the general government, gave so much power to Congress that Madison withdrew his support from the Secretary of the Treasury and vigorously opposed his measures. Although Madison had now definitely cast in his fortunes with the republican opposition his moderation and good sense enabled him to retain the friendship of most of his political opponents.

From 1793 to 1796 the country was greatly agitated over the relation of the United States toward France, and on the outbreak of war between France and England the President issued a neutrality proclamation to the great disgust of the French, who had expected active friendship from the United States. Although both countries interfered shamefully with American commerce, popular sentiment and the Republican party sided with France. In 1794 Madison, supported by Jefferson, introduced a bill demanding retaliatory measures against Great Britain, and a temporary embargo was laid on British commerce. The signing of the Jay treaty by the President was a signal for an outburst of popu-

JAMES MADISON
4TH PRESIDENT OF THE UNITED STATES

MADISON

lar indignation, and Madison, as leader of the opposition in Congress, opposed the appropriation of money to carry out the terms of the treaty. In 1797 Madison retired and enjoyed for a short while the pleasures of private life. A year later he was aroused to activity by the passage of the unpopular Alien and Sedition Acts. The Virginia resolutions written by Madison denounced these laws and declared that in case of a dangerous exercise by the Federal government of powers not granted by the compact the States had the right to interfere. These resolutions still further emphasized the position of the Republican party and pledged it to the support of States rights. The year 1801 brought an overwhelming defeat to the Federalists; Jefferson was inaugurated President and Madison became Secretary of State. He was thoroughly in sympathy with the President's views and shared the popularity of that brilliant administration. The last years of Jefferson's second term were clouded by the insulting actions of England and France with reference to the American navy. The orders of the British and the decrees of Napoleon concerning the seizure of neutral vessels were ruining American commerce. Vessels were seized by the English and by the French, American seamen were impressed, and ports blockaded. Jefferson was opposed to war and in his efforts to coerce France and England by commercial restrictions he induced Congress to lay an embargo on British trade. Instead of injuring England this seriously crippled American commerce and was soon repealed. In this troubled condition of affairs Madison became President in 1809. Like Jefferson he was opposed to war and tried diplomacy. He attempted through Erskine, the British envoy, to have the British orders in Council withdrawn. Erskine agreed, but the British government repudiated the action of its envoy. Negotiations with another British Minister, James Jackson, were also fruitless. Continued insults were heaped upon American ships and men; the country demanded definite action against the aggressors; even the peace-loving President, weary of the offensive attitude of England, at last gave his consent to war. On the 18th of June 1812 war was declared and continued with varying success until the Peace of Ghent in 1814. After nearly three years of fighting, after ruinous loss of money and property, the country was practically just where it stood in 1812, "its boundary unchanged, its international rights still undefined, the people still divided." Madison lacked vigor as a war president, nor had he sufficient determination to secure advantageous terms of peace. He was far greater as a framer of the Constitution than as an executive.

In 1817 Madison retired from office and settled on his estates of Montpelier. He had married in 1796 Mrs. Todd, afterward the celebrated Dolly Madison, and with her he enjoyed 20 peaceful years in his country home. He was interested in farming, he thought and wrote much on all topics of public interest. He discussed social and moral questions, slavery and education. "Education," he maintained, "was the true foundation of civil liberty." The last public appearance of the venerable statesman was in the Virginia Convention of 1820 which met to amend the State constitution. In character Madison was thoughtful, reserved, and cautious; in a time of hard drinkers he was notably abstem-

ious. Moderation characterized all his habits. Dignified and kindly and an excellent conversationalist among those he knew well, he made and retained warm friends. His knowledge was profound and accurate, and he was considered an authority on all constitutional matters. His literary style was labored, but his arguments were keen, comprehensive and convincing.

Consult *Lives of Madison* by J. Q. Adams, *Rives* (1859-69); *Gay* (1884); also *Letters and Writings of Madison* edited by Hunt (1900); Henry Adams, *History of the United States from 1801 to 1817* (1889-90).

EMILIE McVEA,
Of the University of Tennessee.

Madison, Lucy Foster, American novelist: b. Kirksville, Mo., 8 April 1865. She was educated at the High School in Louisiana, Mo., and was married in 1890 to W. S. Madison. She has published *'A Maid of the First Century'* (1899); *'A Maid at King Alfred's Court'* (1900); *'A Colonial Maid'* (1902).

Madison, Ga., city, county-seat of Morgan County; on the Central of Georgia and the Georgia R.R.'s; about 70 miles east by south of Atlanta. It is situated in an agricultural region largely devoted to the cultivation of cotton. Its manufactures are cottonseed-oil, furniture, chairs, baled cotton, and dairy products. Madison has a large cotton trade. Pop. (1890) 2,131; (1900) 1,992.

Madison, Ind., city, county-seat of Jefferson County; on the Ohio River, and on the Pittsburg, C., C. & St. L. railroad; about 85 miles southeast of Indianapolis. Steamers ply regularly connecting Madison with river ports on the Ohio and Mississippi rivers. The city was incorporated in 1824. Its principal industrial establishments are foundries and machine-shops, lumber yards, cotton and woolen mills, flour and lumber mills, and tanneries. Madison is the trade centre for quite an extent of territory in Ohio. Its educational institutions are public and parish schools and Saint Gabriel's Academy. The government is vested in a mayor, who holds office two years, and a council. The mayor appoints the city treasurer, city clerk, and the marshal. The council elects the other administrative officials. The waterworks plant is owned and operated by the city. Pop. (1890) 8,936; (1900) 7,835.

Madison, N. J., borough, in Morris County; on the Delaware, L. & W. railroad; about 25 miles west of New York. It is a residential borough where a number of New York and Newark business men have their homes. It is one of the oldest places in the State, but was not incorporated until 1889. The principal industry is floriculture, especially the cultivation of roses. Madison is the seat of the Drew Theological Seminary; and Convent Station nearby is the seat of Saint Elizabeth's College. The park is well laid out and kept in good order. The borough is governed by a mayor and council. The term of office of the mayor is two years. The electric-light plant and the waterworks are owned and operated by the borough. Pop. (1890) 2,469; (1900) 3,754.

Madison, S. Dak., city, county-seat of Lake County; on the Chicago, M. & St. P. railroad; about 40 miles northwest of Sioux Falls. The surrounding region has good farm-

MADISON — MADRAS

ing land, wheat being the principal crop. Considerable attention is given to stock raising. The trade is chiefly in wheat and live-stock. Madison is the seat of a State Normal College which had in attendance in 1903 about 500 students. The electric-light plant and the water-works are owned and operated by the city. Pop. (1900) 2,550.

Madison, Wis., city, capital of the State, county-seat of Dane County; on the Chicago, M. & St. P., the Illinois C., and the Chicago & N. R.R.'s; about 80 miles west of Milwaukee and 120 miles northwest of Chicago. It is between Lakes Monona and Mendota and near two other beautiful lakes, Kegonsa and Waubesa; it is 790 feet above the sea and 210 feet above Lake Michigan. The place was named in honor of James Madison. The first house was erected in 1837; and after Wisconsin, in 1836, had been organized as a territory, this site was chosen for the capital, and work on the capitol was begun in 1837. The place was chartered as a city in 1856.

Madison is situated in an agricultural region, and has commercial interests with a number of the larger cities, also with the small towns and villages in Dane and adjoining counties. Its chief manufactures are boots and shoes, agricultural implements and tools, flour, electrical machinery, wagons and carriages, blank books, and law books. It is a famous summer resort, because of its climate, lakes, and scenery. The drives are remarkable,—about 30 miles of road in the vicinity are macadamized and kept in repair by popular subscription.

Madison is noted for its educational institutions, chief of which is the University of Wisconsin (q.v.). Opposite the university is the State Historical Society headquarters, the most beautiful building in the city. It is Ionic, of Indiana limestone, and the original cost was \$700,000. It contains a valuable collection of historical mementoes and the famous reference library of the society, about 245,000 volumes. It is considered one of the best historical libraries in the United States. The libraries of the Wisconsin Academy of Sciences, Arts, and Letters, and of the State University are also in this building. The State Law Library is kept in the Capitol. The city free public library is housed in a building of its own, a gift from Andrew Carnegie. Just outside the city limits is the Academy of the Sacred Heart (R. C.), a boarding school for girls, and the State Hospital for the Insane. The public and parish schools maintain a high standard. The State fish hatchery is near the city. Some of the other prominent buildings are the Capitol, already mentioned, which is surrounded by a beautiful park, the county court-house and jail, a Government building, Soldiers' Orphans' Home, and several churches. It is a favorite educational convention city. The university summer school, held each year, attracts a number of students. It was for several years the home of the Columbian Catholic Summer School, which had in attendance people from all over the United States and Canada. Summer schools under the auspices of other organizations frequently hold their July or August sessions here.

The government is vested in a mayor, whose term is two years, and a council. The city owns

and operates the waterworks. Pop. (1890) 13,426; (1900) 19,164.

Madison River, a stream in Montana which has its rise in the Rocky Mountains, at an elevation of 8,300 feet. It flows north through Madison County and unites with the Jefferson Fork of the Missouri, at Three Forks. It flows through several picturesque valleys and deep cañons; its whole course is about 230 miles.

Madison Square Garden, a large building in New York city, occupying a block or square between Madison Avenue and 4th Street, and 25th and 26th Streets. It contains an amphitheatre seating 20,000 people, and is popular for horse shows, dog shows, circuses and political and religious meetings. The building also contains a theatre, concert hall, restaurant and roof-garden. It is built of buff brick and terra-cotta and is surmounted by a great tower 300 feet in height.

Madisonville, Ky., city, county-seat of Hopkins County; on the Louisville & N. railroad; about 125 miles southwest of Louisville. It is in a rich agricultural region, tobacco being one of the principal productions. Coal and natural gas are in the near vicinity. The chief manufacturing establishments are a tobacco factory, tobacco stemmeries, lumber and planing mills, and flour mills. A coal mine nearby and the natural gas contribute to the prosperity of the city. Pop. (1890) 2,212; (1900) 3,628.

Madness. See INSANITY.

Madoc, mād'ók, Welsh prince, who, in consequence of some domestic dissensions, went to sea with 10 ships, and 300 men, in 1170, and discovered America. He made a second voyage to and from this unknown land, but finally was lost to the knowledge of his countrymen. The story is to be found in Lloyd and Powell's 'Cambria' (1584), and Hakluyt gives an account of the voyages in his collection. In Owen's 'British Remains' the legend, if it is anything more, is referred to. Later travelers have imagined that they had discovered traces of these early immigrants in different parts of the country, and we have had stories of White Indians and Welsh Indians, etc. See Humboldt's 'Personal Narrative,' Book IX., note A. Southey has made Madoc the subject of an epic poem. Stephens, in 'Madoc, an Essay on the Discovery of America in the 12th Century' (1893), proves that the story of Madoc is mere baseless fable.

Madonna, ma-dŏn'a (Italian), properly *my lady*; thus Petrarch often calls Laura *madonna*; but in art it is more particularly applied to the Virgin Mary. Many celebrated pictures are known under the name of Madonna, as the famous 'Madonna di Sisto' of Raphael in the gallery of Dresden.

Madoqua, mād'ō-kwā, a diminutive antelope (*Cephalolophus abyssinicus*), one of the duiker-boks (q.v.), common in Abyssinia. The fore-parts are rufous, but gray is the prevailing hue. The same name is sometimes applied to other very small north African antelopes, as the Beni Israel.

Madras, ma-drās', British India, a province formerly a presidency, occupying the southern portion of the Indian peninsula. It stretches from the Bay of Bengal to the Arabian Sea, almost enclosing Travancore and Mysore, while a long, narrow portion extends along the west side

MADRAS — MADRE DE DIOS

of the Bay of Bengal till it meets the Bengal province about 70 miles from the mouth of the Mahānadi. It has a total area including native states of 150,798 square miles, the area of the native states being 9,475 square miles. Jaipur and Haidarabad bound it on the northwest, while the west borders for a short distance with Bombay. The chief mountain ranges are the Western Ghāts, the Eastern Ghāts, and the Nilgiri Mountains. The principal rivers are the Godāveri, and Kistna, with their tributaries; and the North Penner, South Penner, Palar, Kaveri, Coleroon, and Vaiga. There are no lakes of any importance, but many salt lagoons or inlets of the sea. Extensive forests yield teak, ebony, and other valuable timber trees. The wild animals are those common to other parts of India, the elephant, tiger, cheetah, bear, bison, elk, spotted deer, antelope, jackal, wild hog, jungle sheep etc. The climate generally is reckoned the hottest in India, but differs widely in different localities according to elevation. The soil along the coasts, particularly those of the Carnatic, is for the most part light and sandy; inland it consists of a decomposed syenite, impregnated with salt, which in dry weather covers the ground with a saline efflorescence. The district of Tanjore on the banks of the Coleroon is esteemed the granary of southern India. The principal vegetable productions are rice, wheat, barley, maize, and all the other grains common in India; sugarcane, areca, yam, plantain, tamarind, jack-fruit, mango, melons, cocoanuts, and a variety of other fruits; ginger, turmeric, pepper, tobacco, hemp, and cotton, for the growth of which it seems to be particularly well adapted. Tea is grown to some extent. Cotton cloth, muslins, carpets, and silks continue to be manufactured to a limited extent. The government of the presidency is vested in a governor subordinate to the Governor-general of India. The finances are in a healthy condition, the revenue usually exceeding the expenditure. At the head of the educational institutions is the Madras University, an examining body, granting degrees in arts, law, medicine, and engineering. There are various schools and colleges affiliated to the university.

The province is divided into 22 districts with a population (1801) 35,630,440; (1901) 38,208,600. The native feudatory states, Travancore, Cochin, Pudukota, Karnul, and Bellary, had a total population (1801) 3,700,622; (1901) 4,100,322. The languages are Tamil, Telugu (which are spoken by the great majority of the inhabitants), Canarese, and Malayalam, with some lesser dialects spoken by the more barbaric tribes on the mountains; Mahrathi and Gujarathi prevail in the northern and north-western parts of the presidency; Uriya in the northeast; while Hindustani is the language spoken everywhere by the Mohammedans. Capital Madras (q.v.). See also INDIA.

Madras, British India, the capital of the province of Madras, on the Coromandel coast, lies on an open, sandy shore, exposed to the swell of the Bay of Bengal, which breaks upon the beach with great violence. A modern harbor formed by two piers obviates the former dangerous passage through the surf. The city is built on level ground and with its nine suburbs occupies 27 square miles. The chief commercial portion is Black Town, about a mile

square, closely and irregularly built, containing the native and East Indian (or mixed) population, with a few European merchants and their families. On the south is the ancient Portuguese settlement Saint Thomé, with a Roman Catholic cathedral. One of the chief objects of interest is Fort St. George, which commands the Black Town and the roads, and may be considered the nucleus of the city. It was built in 1639, and is admirably situated for the defense of the town and shipping. It contains a church, the barracks, and an arsenal. The government-house, the Cathedral of St. George, and some of the other churches and public buildings, are handsome structures. Besides the University, the Presidential College, and a medical college, supported by government, there are large missionary institutions. The public park, containing a small zoological collection, is the chief recreation ground of the city. From the meridian of the observatory connected with the university all India takes its time. Madras is the chief seat of the provincial government offices, of the supreme court, a board of revenue, marine board, etc. Notwithstanding the disadvantages of its position it is a place of great trade, and a new harbor has greatly tended to increase traffic. The landing and shipping of goods is effected partly by lighters to the pier-head inside the harbor, and partly by the old *massula* or surf-boats, which land their cargoes on the beach. The imports are chiefly manufactured goods from the United Kingdom, especially cottons, wines, spirits, metals, stationery, etc. Among the principal exports are cotton, grain, indigo, coffee, tea, hides, oil-seeds, dye-stuffs, pepper, etc. The chief industries are connected with the preparation of goods for export, such as coffee pressing and cotton cleaning. Cotton-spinning factories have been established at Madras. The country at a short distance round the city, presents a remarkable contrast to its barren sandy shore, having the appearance of a fine park. The city has railway communication with all the principal places of India.

Madras was founded in 1639 by the English, who obtained the grant of a piece of ground for the erection of a town and fort from the Rajah of Chandgherry. It soon became a flourishing city and the chief station of the English on the Coromandel coast. In 1746 it was taken by the French, who kept it until 1749, when peace was made and the place was restored to the English. In 1758 it was again besieged by the French under the celebrated Lally, who was obliged to retreat after a siege of two months. Pop. (1901) 509,397.

Madrazo, mā-drā'thō, **Raimundo de**, Spanish painter: b. Rome, Italy, 24 July 1841; d. Madrid, Spain, 11 June 1894. He studied art under his father, Federico de Madrazo, and Léon Cogniet in Paris. He was very successful in portrait and genre and numbered many prominent Americans among his sitters. He was equally happy in pastel and oils, and his 'Fête during the Carnival' in Mrs. W. K. Vanderbilt's collection is as brilliant in conception as in technique.

Madre de Dios, mā'drē dē dē'oos, or **Amaru-Mayu**, Bolivia, a river, the chief affluent of the Beni, rising in the Carabaya Mountains, Peru, about 50 miles east of Cuzco, and

MADREPORE — MADRID

after an easterly course, south by north, of 900 miles, chiefly through the Bolivian department of La Paz, uniting with the Beni at Rivera Alta, where it is 1,500 yards wide. It was explored in 1865 under the auspices of the London Geographical Society, and since 1881 has been the highway for the exploitation of the rubber forests along its course.

Mad'repore, a genus of coral-forming polyps (see CORAL) containing numerous species from the warmer and tropical seas of all parts of the earth. The true Madreporae increase by budding, the result being usually large branching colonies in which the coral between the cups containing the polyps is perforate and spiny. The different species frequently attain large dimensions and constitute one of the most important elements in the formation of coral reefs. The polyps have 12 septa and 12 tentacles, 6 being large, the other 6 smaller, while a peculiar feature is the presence of 6 U-shaped tubes connected with the œsophagus at either end. The term *Madreporaria* is sometimes used to include all polyps in which the parts are arranged in multiples of six, and which secrete coral on the external surface of the body.

J. S. KINGSLEY,
Tufts College.

Madrid, ma-drid' (Sp. mā-drēd'), Spain, the capital of the kingdom and of the province of Madrid, a part of New Castile, situated near the centre of the country, on the left bank of the Manzanares, a sub-affluent of the Tagus. It is built on several low and irregular sandhills on a plateau 2,450 feet above sea-level, and is surrounded by a barren and extensive plain, treeless save in the vicinity of the city, and stretching northward to the snow-capped Sierra de Guadarrama. In winter the climate is exceedingly severe, and even in summer, when the heat is excessive, piercingly cold blasts descend from the mountains. The prevailing winds are the parching southeast *Solano*, and the icy north wind from the Guadarrama. The climate is described in a Spanish proverb as "three months of winter and nine months of hell." The temperature ranges from 18° to 105° F.; is subject to frequent and sudden changes; and between the sunny and shady sides of a street the difference of temperature is sometimes as great as 20°. Madrid was until recently surrounded by a wall 20 feet high, pierced by 5 large and 11 small gates; of these gates 3 remain: the Puerta de Alcalá on the east, the Puerta de Toledo on the south, and the Portillo de San Vicente on the west. The streets are distributed somewhat irregularly around the Puerta del Sol, which is in the centre of the capital. The principal streets are broad, long, and airy; and the houses are in general well constructed, substantial, and of good appearance.

In common with most European capitals, Madrid has undergone much modern improvement; the streets are traversed by electric and horse car lines; are lighted by gas and electricity; the telephone system is efficient; and sanitation has been much improved. The former abundant and pure water supply, is, however, inadequate to the demands of the growing population. Madrid has no edifices of great antiquity. The royal palace, situated at the western extremity of Madrid, is one of the most mag-

nificent in the world. It occupies the site of the original Alcazar (castle) of the Moors, and is of enormous extent, being 470 feet each way, and 100 feet high. The architecture is a combination of Ionic and Doric. It contains a small but splendid Corinthian chapel, and a library of nearly 100,000 volumes, and the armory is one of the finest in the world. The chamber of deputies, which occupies an area of 42,700 square feet, has a hexastyle Corinthian portico on the grand façade, destined for the entrance of royalty on state occasions. On the two lateral façades are the entrances for the members. The Royal Exchange and the Bank of Spain are two modern imposing buildings. Madrid stands far behind many provincial towns as regards its churches, which are, with exception of a few attached to conventual establishments, poor, and of indifferent artistic merit. The church of the Almudena founded by King Alphonso XII. is in course of erection. The most important of the charitable institutions are the military hospital, an extensive building in the northwestern corner of the city; and the Hospicio of San Fernando, with schools for both sexes, the pupils being taught various handicrafts. At the southeastern corner of the city stands the general hospital, containing 1,200 beds. There are three founding hospitals and six for orphans.

Madrid has 72 public squares, which are generally irregular both as regards their form and their edifices, as well as deficient in decorative monuments. Of these the Plaza Mayor is one of the largest and most regular. The Plaza de Oriente is adorned with 40 statues of Gothic kings, as well as those of the Asturias, Leon, Castile, and Aragon. In the centre is a fine equestrian statue of Philip IV. Among places of amusement the most popular is the Plaza de Toros (bull-ring), a building which is about 1,100 feet in circumference, and capable of containing 12,000 spectators. The Prado, a sort of wide boulevard, about 2 miles long, running north and south on the east of the city, is the chief promenade, and beyond it is the chief public park, including the Buen Retiro gardens, near which are the new handsome building for various ministerial departments, and the new station of the Southern Railway Company. The Royal Picture Gallery which stands in the Prado, contains more than 2,000 pictures, including a great many by all the best masters, especially those of Spain. There are also good pictures in the Academy of Fine Arts. The National Library, founded by Philip V., contains 500,000 volumes, is well managed, and is open to the public daily from 10 to 3. The Library of San Isidoro consists of 66,000 volumes. The University of Madrid, which arose out of that of Alcalá de Henares, founded in the 15th century, has an average attendance of 5,000 students. There are besides numerous other schools, academies, and colleges, public and private, including a normal school, a deaf and dumb institution, a normal school for the blind, a commercial school, schools for engineers, a conservatory of music, an academy for the fine arts with a gallery of 300 pictures, a veterinary college, an academy of medicine and surgery, etc. The famous monastical and palatial Escorial (q.v.) is 27 miles northwest of the city.

The industries have shown a remarkable de-

MADRIGAL—MADVIG

velopment during the last decade, the chief manufactures being tobacco, leather goods, chocolate, beer, shoes, boots, plated ware, coaches, gloves, and fans. There is a royal carpet and tapestry factory in the Pacifico suburb. The commerce is important, as Madrid is the entrepôt for all the interior provinces. Retail business is mainly in the hands of foreigners, mostly French, but most of the wholesale trade is carried on by native houses. Madrid has railway communication with Paris and Lisbon, and the chief cities of the Peninsula.

Madrid in the Roman period probably was the insignificant hamlet Majoritum. Under the name Majorit it appears as a Moorish outpost of Toledo when captured in 932 by Ramiro II. of Leon. Henry IV. about 1461 made some additions to the older town, which was placed on the western eminence over the river. Madrid only began to be a place of importance under Charles V. Declared the seat of the court by Philip II. in 1560 the city rapidly grew up at the expense of the older and better situated capitals. It was the creation of a century, and its increase was very slow after the age of Philip IV. The gross mistake of a position which has no single advantage except the fancied geographical merit of being in the centre of Spain was soon felt, and on Philip II.'s death his son, in 1601, endeavored to move the court again to Valladolid, which, however, was found to be impracticable, such had been the creation of new interests during the outlay in the preceding reign. Madrid was entered by the French under Murat, 23 March 1808, but they were soon obliged to evacuate it. It was again held by the French from 1809 to 1812, when the Duke of Wellington entered it, and restored it to the Spaniards. After the deposition of the crown by King Amadeus in 1873, Madrid, along with the rest of Spain, suffered greatly from the anarchy caused by the struggles between the Republicans, Carlists, and Socialists. Pop. (1887) 472,228; (1900) 540,109.

Mad'rigal, a short lyric poem generally on amatory subjects. Those of Tasso represent the finest specimens of Italian poetry.

Madro'na, a large and ornamental tree of California (*Arbutus menziesii*), of the heath family, which often grows nearly 100 feet in height. It has a wide-spreading head, small evergreen leaves and the limbs and large parts of the trunk, where the thin outer bark easily peels off, are bright red. It grows in the foot hills, and up to a moderate elevation, but not naturally in the valleys. It is a near relative of the strawberry tree of Europe.

Mad'stone, a vegetable substance or stone which when applied to a wound caused by the bite of a mad dog is said to prevent hydrophobia. The most famous one in the United States is owned by the descendants of a family named Fred. in Virginia. This stone was brought over from Scotland in 1776. It is said to be the one spoken of by Sir Walter Scott in 'The Talisman' and has been religiously preserved as one of the most valuable relics of the age. It is about two inches long by one inch broad, and about half an inch thick, and is of a chocolate color. When applied to the wound it adheres till all the poison is absorbed, when it drops off. It is then soaked in warm milk or water for a time, and when removed the liquid

is found to be full of a greenish-yellow scum. It is said that of the 130 cases in which it has been applied for the bite of a mad dog, none ever suffered from hydrophobia. There are said to be three authenticated madstones in the United States.

The belief in a madstone was common hundreds of years ago in the East, and travelers in India in 1677 and 1685 make mention of it. Tradition said it grew on the head of certain snakes. George T. Kunz, a New York expert in gems, identifies the madstone, or snakestone, of the East, with the stone known as tabersheer, which is a variety of opal found in the joints of the bamboo in Hindustan and Burma. This stone is formed of juice which by evaporation becomes mucilaginous, then a solid substance, and when placed in the mouth will adhere to the palate or cause water to boil. Sir David Brewster says it is found in the joints of diseased corn-stalks and is formed by sap depositing silica.

Madura, mā-doo'rā, southeastern Asia, an island of the Malay Archipelago, off the east end of Java, from which it is separated by the Strait of Madura. The island is about 105 miles long east to west, and 30 miles broad, with an area of 1,770 square miles. Madura forms one of the 17 Dutch residencies or provinces into which Java and Madura are divided, and is administered by a governor or resident. The Dutch first landed in Madura in 1747. It is undulating, but not mountainous, and though in general well watered, in some places, especially on the coast, there is a want of water, and the soil is unfertile. The interior, however, is fertile, though not so productive as Java. Maize, coconuts, tobacco, Jamaica pepper, tamarinds, and salt are the chief products; stock-raising is an important industry; and the exports include also birds'-nests, country cloths, white and striped, poppy-oil, rattan-mats, and baskets, etc. The chief towns are Bangkalang, Pamekasan (the capital), and Sumanap. Pop. (1897) 1,652,580, of whom 4,252 were Chinese, 558 Europeans and the rest natives.

Madura, southern India, the capital of a district of Madras, 344 miles by rail southwest of Madras. It was the capital of the ancient Pandhyan kingdom, for over 2,000 years was the political and religious capital of southern India, and is noted for its interesting architectural monuments, chief of which is the Temple of Minarchi, dating from almost prehistoric times, restored and added to by Tirumulla Nayak (1622-62). It ranks fourth among the seven strongholds of Hinduism, and occupies a parallelogram of 56,000 square feet containing 50 buildings. Madura is the seat of Catholic and American Protestant and other missions, and has several high-grade educational institutions. Pop. (1901) 105,501.

Madvig, mād'vīg, Johan Nikolai, Danish scholar: b. Svanike, island of Bornholm, 7 Aug. 1804; d. Copenhagen 13 Dec. 1886. Educated at Frederiksborg and Copenhagen, he was from 1829 till 1879 professor of Latin in the University of Copenhagen. He took a profound interest in the politics of his country, and from 1848 till 1851 was minister of education and religion. He is best known by critical editions of Latin classics and by his Latin grammar translated into English and most European

tongues. His chief works are: 'Emendationes in Ciceronis Libros Philosophicos' (1828); 'Cicero's De Finibus Bonorum et Malorum' (1839, amended 1876); 'Ciceronis Orationes Selectæ Duodecim' (1830); 'Cicero's Cato Major and Lælius' (1835); 'Opuscula Academica' (1834-42; new edition 1887); 'Emendationes Livianæ' (1860); 'Livii Opera' (with Ussing, 1861-6); 'Adversaria Critica' (1871-84); 'Latin Grammar' (1841); 'Greek Syntax' (1846); 'Constitution and Administration of the Roman State' (1881-2); 'Autobiography' (1887).

Mæander, mē-än'dér, now **Mendere**, Asiatic Turkey, a river which rises in Phrygia not far from Celæne. It forms the boundary between Caria and Lydia, and flows into the Icarian Sea between Priene and Myus, opposite Miletus. It was celebrated among the ancients for its winding course, and gave its name to the intertwined purple borders on mantles and other dresses, as well as upon urns and vases.

Mæandrina, mē-än-drī'na, one of several genera of brain corals, so called from the elongate and meandering cups containing the polyps, which give a spherical mass of these corals an appearance strikingly like the human brain with its convolutions. This appearance is due to the fact that the polyps in their growth do not completely divide, but stretch out into long bands, frequently branching, with many mouths and tentacles, and a common body and digestive cavity. Brain corals occur in all tropical seas, several species being found in Florida and the West Indies. Their solid masses make them important factors in the formation of coral reefs.

J. S. KINGSLEY,
Tufts College.

Mæcenas, mē-sē'nās, **Gaius Cilnius**, Roman nobleman: b. between 73 and 63 B.C.; d. 8 B.C. He was the friend of Augustus, and patron of Virgil and Horace. Though it is unknown where he received his education, it must have been a good one, for he was intimate with the literatures both of Greece and Rome, and was himself an occasional writer in prose and verse. We first hear of him authentically (40 B.C.) as negotiating a marriage between Octavianus and Scribonia; and in the same year he contributed materially to bring about the Peace of Brundisium, by which Cæsar and Antony were reconciled. Two years later he was again employed in reconciling these self-willed potentates; and 36 B.C. he was twice despatched by Octavianus from Sicily to Rome to quell disturbances which had broken out there. He was for these services entrusted with the administration not only of Rome, but of all Italy. His palatial residence and gardens on the Esquiline were the rendezvous of all the *literati* of Rome, and of numerous parasites. But those admitted to his intimacy were the greatest geniuses and scholars of Rome, among them being Virgil and Horace. To the intercession of Mæcenas, Virgil was indebted for the recovery of his farm, and Horace also owed to him many favors.

Mælar, Lake of. See MÄLAR.

Mælstrom, mäl'ström, or **Moskoe-strom**, Norway, a rapid current or tidal whirlpool off the northwest coast immediately southwest of Moskenesøe, the southernmost of the Lofoten Isles. The current runs with the tides alternately,

six hours from north to south and six hours from south to north, producing immense whirls. The depth of the water around, supposed at one time to be too great to admit of soundings, has been ascertained not to exceed 20 fathoms, with a bottom of rocks and white sand. Immediately to the west the soundings are from 100 to 200 fathoms. The whirlpool, idealized by mediæval and later writers including Edgar Allan Poe, is greatest at high or low water. When the wind is northwest and opposed to the reflux of the waves it attains its greatest fury, and becomes extremely dangerous, but in ordinary circumstances it may be traversed without difficulty.

Maestricht, mäs'triht, Netherlands, the capital of the province of Limburg, on the left bank of the Maas, at the confluence of the Geer, lies on the Belgian frontier, 56 miles east of Brussels, and 52 miles west by south of Cologne. Among the chief buildings are the church of St. Servais, partly Romanesque and partly Gothic, dating from the 10th century; the town-hall; the courts and general prison, and the arsenal. The fortifications were dismantled between 1871 and 1878: it is, however, still a considerable garrison town. Maestricht carries on an active transit trade with Belgium, and has manufactures of glass and earthenware, firearms, shot, cloth, and paper-hangings; also iron-foundries, beet-root sugar refineries, tobacco and cigar factories, tan-pits, distilleries, and breweries, the latter producing very noted beer. About three miles from the town is the Pietersberg (Peter's Hill), on which stands the fort of St. Pierre, and under which are extensive subterranean quarries, supposed to have been excavated by the Romans. Maestricht was besieged and taken, and 8,000 of its inhabitants were massacred in 1579, by the Spaniards, under the Duke of Parma; in 1673 it was taken by Louis XIV., and again by the French in 1748 and 1794. William III. of England failed to take it; and in 1830 its garrison resisted successfully the attacks of insurgent Belgians. Pop. (1901) 34,182.

Maestricht Beds, in geology, a series of calcareous beds 100 feet thick, on the banks of the Meuse, near the Dutch city of Maestricht. The Maestricht calcareous rock contains *Belemnites*, *Utricularia*, *Pecten quadricostatus*, etc., also the genera *Brachiolella*, *Hamites*, etc., which are only Mesozoic. It is a connecting link between the Secondary and the Tertiary rocks, but in all essential respects belongs to the former.

Maeterlinck, mët'ér-link, **Maurice** (Gallized from the original MOORIS MÄTERLINCK), Belgian author: b. Ghent 29 Aug. 1862. He was educated in a Jesuit school in Belgium, then studied law, was admitted to the bar in 1887, but was from the first more interested in letters, and in 1896 settled in Paris as an author. His work may be divided into three parts,—his lyric verse, his dramas, and his philosophical essays. Of the first the two volumes 'Serres Chaudes' (1889), and 'Douze Chansons' (1896) are representative. Maeterlinck's verse is imaginative, but lacks in any strong degree the melodic quality. His dramas are: 'La Princesse Maleine' (1889); 'Les Aveugles' (1890); 'L'Intruse' (1890); 'Les Sept Princesses' (1891); 'Pélie et Mélisande' (1892); 'Alladine et Palamides' (1894); 'La

Mort de Tintagiles (1894); *'Aglavaine et Sélysette'* (1896); and *'Monna Vanna'* (1902). Several of these were translated into English by Richard Hovey (q.v.), and *'Monna Vanna'* was rendered by Alexis I. du P. Coleman. The dramas are Maeterlinck's most striking work. Their eerie symbolism can hardly be explained, but must be appreciated at first hand. Though they inaugurated a new theatric school — the *'Drame Intime'* — they are properly reading plays, and lose their mystery and impressiveness in presentation. *'Pélleas et Mélisande'* was given in the United States by Mrs. Patrick Campbell. To many the essays are the most interesting things that Maeterlinck has done. The volumes are *'Le Trésor des Humbles'* (1896); *'La Lagesse et la Destinée'* (1898), and *'La Vie des Abeilles'* (1902). The first is somewhat mystical, all are somewhat diffuse; but he has been called by virtue of them a true successor of Swedenborg and Böhme.

Mæviad and Baviad. See BAVIAD.

Mafeking, mā-fā-kīng' or mǎf'ē-king, Cape Colony, a former Bechuana settlement, now a town, the administrative seat of the Bechuana-land protectorate, close to the borders of the Transvaal, 870 miles by rail northeast of Cape Town and about 200 miles west-southwest of Pretoria. The town stands near the upper Malopo River, and contains several substantial buildings, including a Masonic temple, a town-hall and a hospital, and there is a good water-supply, a swimming-bath, and a race-course. Mafeking sustained a protracted siege during the South African War of 1899-1901. It was isolated in October of the former year, and was brilliantly defended by a small force under Colonel (now General) Baden-Powell, until relieved by Colonel Mahon in May 1901.

Maffitt, John Newland, American clergyman: b. Dublin, Ireland, 28 Dec. 1794; d. Mobile, Ala., 28 May 1850. He was a Wesleyan preacher in Ireland and in 1819 emigrated to the United States, where he became a member of the New England Methodist Episcopal conference. He founded the *'Western Methodist'* in Nashville in 1833 and conducted revivalist meetings throughout the South and West. In 1837 he became professor of elocution and belles-lettres at La Grange College, Louisiana, and in 1841 he was elected chaplain to Congress. He published several religious works, also an autobiography.

Maffitt, John Newland, American naval officer: b. at sea 1819; d. 1886. He enlisted in the United States navy in 1832 and in 1861 entered the service of the Confederacy where he took rank as commodore. In command of the Florida he rendered himself valuable to the Confederate cause, taking many prizes and damaging seriously United States commerce. Owing to ill-health he resigned before the end of the War.

Mafia, mā-fē'ā, a Sicilian secret society similar to the Camorra, which has long existed in Naples, but much more powerful. The Mafia is essentially a form of organized lawlessness, but its organization is sufficiently elastic to baffie all the attempts of the government to suppress it. It is generally said to have had its origin in the *compagni d'armi*, a kind of police organized in Sicily early in the 19th century and dissolved by Garibaldi in 1860. Its mem-

bers, who are required to prove their daring in a knife duel, are bound never to carry their suits to the regular courts or to give evidence before them. Murder and robbery are discounted under ordinary circumstances, but they are resorted to without hesitation in the case of informers or specially obnoxious persons. Blackmail is levied from land-owners, who are required to employ only *mafiosi* in certain occupations. Criminals are protected and elections controlled by this infamous society, whose authority is greater than that of the law among the lower classes in Sicily. The Chinese high-binder societies are similar to the Mafia. Within recent years these murderous organizations have secured a footing in the United States, and murders directly chargeable to the Mafia have been committed in New York, New Orleans, Chicago, and other large cities.

Magalhães, Domingos José Gonçalves de, dō-mên'gō hō-sā' gōn-sāl'vēs dā mā-gāl-yā'ōns, VISCOUNT D'ARAGUAYA, Brazilian poet and diplomat: b. Rio de Janeiro 13 Aug. 1811; d. Rome, Italy, 10 July 1882. He was admitted to the bar, but entered the Brazilian diplomatic service in 1836, and was minister at Vienna, at Washington (1868-72), and at Rome. He is rated among the foremost of Brazilian poets. His best-known work is the *'Confederação dos Tamoyos'* (1857), based on historical events in early Brazil. Among his other volumes are *'Mysterios'* (1858) and *'Urania'* (1862); and he wrote also philosophical treatises and successful tragedies. A collected edition of his works was published in 1876.

Magalhães, Fernão de. See MAGELLAN, FERDINAND.

Magallanes, mā-gāl-yā'nes, Chile, a territory lying south of the Department of Chiloe, and includes the many islands, large and small, along the western and southern coasts of Chile. Its entire area is over 80,000 square miles. Among the more prominent islands in the territory are the Wellington group, Hanover group, Queen Adelaide Archipelago, Madre de Dios and a part of Tierra del Fuego. The mainland is a narrow strip of mountainous sea-coast. Pop. about 6,000.

Mag'dala, Abyssinia, a town and fortress on a plateau nearly 9,000 feet above the level of the sea, about 120 miles southeast of Gondar, on the left bank of the Bashilo, an affluent of the Blue Nile. A wall of columnar basalt, varying from 30 to 700 feet high, surrounds it on every side. Mag'dala acquired notoriety from its having been stormed in 1868, by the British troops under Sir Robert Napier, afterward Lord Napier of Mag'dala. (See ABYSSINIA.) The Abyssinians had deemed their fortress impregnable.

Mag'dalen, mǎg'da-lēn, a name applied to one of the Marys in the Gospels, derived from her place of birth, or former residence, in order to distinguish her from other women of that name (Matt. xxvii. 56, 61; Mark xv. 40, 47; Luke vi. 2; John xix. 25).

Mag'dalen (mǎg'da-lēn or mōd'lin) College, Oxford, England, originated in Mag'dalen Hall, founded in 1448 by William Patten, commonly called William of Waynflete, from the place of his birth, Bishop of Winchester and Lord High-chancellor of England, who 10 years later added

MAGDALEN ISLANDS — MAGELLAN

the College of Saint Mary Magdalen. In some respects Magdalen is the most noteworthy college of the university. Five of the fellowships are attached to five Waynflete professorships, of moral philosophy, chemistry, mineralogy, physiology, and pure mathematics, established in lieu of the three former lectureships of divinity, moral philosophy, and natural philosophy. There is also a professorship of botany. The buildings are noted for their beauty and occupy extensive grounds. Among Magdalen's celebrated alumni are Addison, Foxe, Gibbon, Hampden, Lily, Lyly, Philpotts, Selborne, Tyndale, and Wolsey.

Magdalen (măg'də-lĕn) **Islands**, Quebec, Canada, near the centre of the Gulf of St. Lawrence, 54 miles northwest of Cape Breton, Nova Scotia, and 100 miles southwest of Newfoundland. Amherst, Alright, Coffin, Wolf, Grindstone, Deadman, Entry, and Byron islands compose the group which are politically attached to the district of Gaspé, Quebec. The inhabitants exist chiefly by the fisheries of the adjacent waters; gypsum which is found in veins and hollows, and grindstones from Grindstone island, are exported. House Harbor on Alright Island, and Amherst where there is a custom-house, are the chief settlements. Pop. 3,200.

Magdalena, mäg-dā-lā'nā, a river of Colombia, South America, which has its rise in the Andes Mountains in the southwestern part of Colombia, and flows north to the Caribbean Sea. A short distance from the sea, at the city of Barranquilla, the river divides and discharges its waters through two channels. It is about 1,000 miles in length. It is navigable for ocean steamers to Barranquilla, and for small steamers to Honda, about 600 miles from its mouth. Navigation is obstructed at Honda by a series of falls and rapids; and a railroad, about 22 miles long has been built along the river to a point above the rapids, from which the river is navigable up the stream for about 200 miles to Neiva. Magdalena River is the principal route from the sea to the interior of the country. Bogota (q.v.), the capital, is at present (1903) largely dependent upon this river for means of communication with places on the coast. The largest tributary is Cauca, whose source is near that of the Magdalena, and part of its course is almost parallel with the main river. Short railroads connect some of the interior towns with the river and its tributaries.

Magdalena (măg-də-lĕ'nā) **Bay**, an inlet on the west coast of Lower California, in Mexico, one of the best harbors on the Pacific coast. The inlet or arm of the sea is about 40 miles long and is protected by a long low sand-bar. A town of the same name is situated on the harbor.

Magdalene (măg'də-lĕn) **College**, Cambridge, England, was founded in 1519 by Thomas, Baron Audley of Walden. There are seven open fellowships on the foundation, and 12 open scholarships. There are also several exhibitions. The annual Pepsysian benefaction, value £50, is in the master's gift, and is usually bestowed upon poor and deserving students. The buildings consist of two courts, restored and altered in 1880, a chapel and hall dating from the 15th century, and the Pepsysian Library, built in 1688.

Magdeburg, mäg'dĕ-boorg, Germany, city, capital of the Prussian province of Saxony; on the Elbe, about 80 miles southwest of Berlin. The manufacturing and trade of Magdeburg are extensive, and its facilities for transportation by water and railroad are excellent. Among its industrial establishments are the Gruson Works, noted for their connection with the Krupp Works, the beet-sugar factories, and a number of other establishments. It has a large number of excellent schools, gymnasia, a pedagogical seminary, art schools, industrial schools, etc. Magdeburg is a place of great antiquity, being a trading centre in the 9th century. It early distinguished itself in the Reformation. During the Thirty Years' war the town was besieged, stormed, and sacked by Tilly, when 20,000 persons are said to have been murdered. Pop. (1902) 230,491.

Consult: Wolter, 'Geschichte der Stadt Magdeburg'; Dodge, 'Gustavus Adolphus.'

Magdeburg Hemispheres, a celebrated invention of two hollow hemispheres, made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stopcock. When the edges are rubbed over with grease, pressed tightly together, and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force. If they are one foot in diameter, they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke of Magdeburg, in 1650, at the imperial diet at Ratisbon, to the astonishment of the Emperor Ferdinand III. and the royal family.

Magellan, ma-jĕl'an, **Ferdinand** (in Portuguese FERNÃO DE MAGALHÃES or MAGALHAENS), Portuguese navigator: b. probably at Villa de Sabroza, Trazos-Montes, about 1470; d. Philippine Islands 27 April 1521. He served in the Indies with distinction, especially at Malacca, and in 1514 saw service in Morocco. In resentment at his treatment by the king, who had not, he thought, duly rewarded his services, he, with Ruy Falero, a geographer and astronomer, renounced his nationality and offered his services to Spain. Magellan's proposal to seek a western route to the Moluccas was accepted by Charles V., and on 20 Sept. 1519, he set sail from San Lucar de Barrameda in command of five vessels. He passed through the strait which bears his name (see MAGELLAN, STRAIT OF), and on 28 Nov. 1520, reached the great ocean which he called the Pacific from its calmness. With his three remaining vessels he sailed by way of the Ladrone Islands to the Philippines, discovering Samar on 16 March 1521. He caused the king of Zebu to swear allegiance to Spain, but was killed in a fight with the natives of Matan. His vessel, the Victoria, under Sebastian del Cano, completed this, the first circumnavigation of the globe. The chief authority for the voyage is a work by Pigafetta, an Italian who accompanied Magellan.

Consult: Lord Stanley, 'The First Voyage Round the World' (1875); and Guillemard, 'Ferdinand Magellan' (1891).

Magellan, Strait of, the channel which separates the continent of South America from Tierra del Fuego and thus forms a communication between the South Atlantic and the South

LAKE MAGGIORI.

Pacific Oceans. It is upward of 360 miles long, and is of difficult navigation. Its breadth varies exceedingly, the maximum being somewhat over 70 miles. There are a number of bays along the shore and at the southwestern end, a group of several small islands. Punta Arenas is the best harbor. The strait was discovered in 1520 by Fernando Magalhães or Magellan.

Magellanic Clouds, in astronomy, called the Nubeculæ, Major and Minor, from their cloud-like appearance, two oval masses of light in the southern hemisphere near the pole; often both visible to the naked eye. Sir J. Herschel describes them as consisting of swarms of stars, clusters, and nebulae of every description.

Magendie, François, frän-swä mā-zhōn-dē, French physician and physiologist: b. Bordeaux 15 Oct. 1783; d. Paris 8 Oct. 1855. He was the pupil of the celebrated surgeon Boyer, and at 20 was appointed successively *aide d'anatomie* in the faculty of medicine, and demonstrator. He, however, subsequently devoted himself principally to the practice of medicine, was in 1819 elected a member of the Academy of Sciences, and in 1831 succeeded Récamier in the chair of anatomy in the College of France, which he retained until his death. As an experimenter in physiology he occupied a high position, and his experiments on living animals were at one time so numerous and involved so much suffering to the animals, that the French government deemed it necessary to interfere. The results obtained, however, were of great importance, if they do not absolve him from the charge of cruelty. Among them may be named an original demonstration that the two roots of the spinal nerves are devoted to two separate functions; that the veins are organs of absorption; that strychnine acts upon the spinal cord and contracts by tetanic spasm the nerves of respiration, thus inducing asphyxia; that food destitute of nitrogen is not nutritious; and that prussic acid is a valuable remedy in certain forms of cough arising from irritation in the lungs. He was a prolific author of medical works, the most important of which are: 'Formulaire pour la Préparation et Emploi de plusieurs nouveaux Médicaments' (1821), containing an account of the effects of certain plants then recently introduced into the materia medica, and which has been translated into all the languages of Europe; 'Précis élémentaire de Physiologie' (1816-17), for many years an important manual for students; 'Leçons sur les Phénomènes physiques de la Vie' (1836-42); 'Leçons sur les Fonctions et les Maladies du Système nerveux' (1839); 'Leçons sur le Sang' (1839).

Magenta, mā-jěn-tā, Italy, town in the province of Milan, 14 miles east of Milan, is situated in a grape region, in which the cultivation of grapes and mulberries and the manufacture of wine are the principal industries. Considerable raw silk is exported. It was the scene of a famous engagement 4 June 1859 between the French and Sardinian forces, and the Austrians. The Austrians were defeated, largely through the superior tactics of General MacMahon (q.v.) of the French army. Pop. (1901) 7,974.

Magenta, or **Aniline Red**, a coal-tar dye, which consists of a mixture of the hydrochlorides of rosaniline and para-rosaniline. (See **ROSANILINE**.) It may be prepared from aniline

oil by digesting the aniline with arsenic acid, or with nitrobenzene and ferrous chloride. When the oxidation is complete, the rosaniline hydrochloride is precipitated by the addition of common salt in large excess, the hydrochloride being formed by double decomposition, and thrown down because it is but sparingly soluble in salt solutions. Consult Benedikt, 'Chemistry of the Coal-Tar Colors.')

Maggiore, mäd'jō-rē, **Lake**, one of the largest lakes in Italy, the *Lacus Verbanus* of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is 39 miles in length, and varies in breadth from one half mile to five and one half miles. It is 646 feet above the level of the sea and has a maximum depth of 1,158 feet. The river Ticino flows through it. In a southwestern expansion of the lake are the Borromean Isles (q.v.). On the north and west it is surrounded by granitic mountains, 7,000 feet high, on the south and east by vineyard-covered hills. On its shore are a large number of villages and cities noted for beautiful scenery and historic connections.

Maggot, the larva of a fly. (See **FLIES**).

Magi, mā'ji, an Accadian term recently brought to light by Assyrian scholars; Accadian being the language of the people of Babylon and Media. The word signifies "august," "reverend," and was the title of their learned and priestly caste. The Semitic nations afterward dominant in Babylonia and Assyria adopted the learning and many of the religious observances of the early inhabitants, as also the name for the learned caste; and out of the Semitic form the Greeks made *magos*. Under the Persian empire the magi were not only the "keepers of the sacred things, the learned of the people, the philosophers and servants of God," but also diviners and mantics, augurs and astrologers. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in both private and public life. Apart from the education of the young princes being in their hands, they were the constant companions of the ruling monarch. Zoroaster, in the course of his great religious reform, reorganized the body of the magi, chiefly by reinforcing the ancient laws as to their manner and mode of life, which was to be one of the simplest and severest, befitting their sacred station, but which had become one of luxury and indolence, and by re-instituting the original distinction of the three classes of *herbeds* ("disciples"), *mobeds* ("masters"), and *destur mobeds* ("complete masters"). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground, and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies, and was preceded by purifications of several months' duration. Gradually, however, their influence, which was all-powerful during the epoch of the Sassanian kings of Persia, began to wane, and, from being the highest caste, they fell to the rank of wandering jugglers, fortune-tellers, and quacks, and gave their name to sleight-of-hand and conjuring tricks. But the name seems to have been also current as a generic term for astrologers in the East, as is

MAGIC — MAGIC SQUARE

evidenced by the New Testament narrative of the homage of the Magi to the Infant Christ. According to the narrative (Matt. ii. 1-12) the three wise men came from the East to Jerusalem, led by a star, which at length guided them safely to the place of the Nativity at Bethlehem, where they offered their gifts of gold, frankincense, and myrrh. As the "Three Kings" their names became celebrated in the Middle Ages, and Bede distinguishes them as Kaspar, Melchior, and Balthasar. See also PARSEES; ZOROASTER.

Magic, or Black Art, was formerly the means of producing supernatural effects with the assistance of evil spirits. Supernatural effects were at an early period naturally associated with the exercise of the healing art. In the rudest stages of society this was confined to the women, and naturally arrived at the dignity of a profession in the hands of the older, whom experience had gifted with superior skill. As their art was for the most part a mystery to themselves, they gradually came to be regarded as objects of fear as much as of hope, and magic medicines became synonymous with poison. The sorceress, poisoner, and witch were in time reckoned identical. (See WITCHCRAFT.) Media, Persia, and the neighboring countries, famous for their knowledge of astronomy and astrology, are described as the chief seats of the ancient Magi, whose doctrine seems to be, in part, of great antiquity. This doctrine represented opposition or strife as the parent and original cause of all things. After the opposition between light and darkness, Ormuzd and Ahri-man, was established, the whole series of finite beings, the whole sensual world, proceeded from this constant struggle of light and darkness, good and evil. The change of day and night, light and darkness, the whole series of ages, time itself, is only a consequence of this struggle, in which sometimes light, sometimes darkness, appears victorious, until finally light shall conquer for ever. If all finite things stand under the influence of preserving and destroying powers in nature, it is clear that he who could master these powers could dispose at his pleasure of the things subject to them; and the doctrine of the Magians was that by prayer and a true knowledge of those laws of opposition, love and hatred, light and darkness, such power could be obtained; and that thus also it was possible to pry into futurity. But it was believed that as the world became sinful the light of the ancient doctrine of the Magi was obscured, and those who bore the name became at last only evil-disposed sorcerers. One important branch of their art was now the excitement of love by potions and enchantments. Their love-potions consisted partly of ingredients which are still known to the physicians as stimulants, partly of parts of animals who had died longing for food or air, or the saliva of hungry dogs, and other still more disgusting substances. Magic at this period also occupied itself with fortune-telling, calling up the dead and bewitching by the look—a superstition which we find existing in the processes against witches in modern times. It can hardly be doubted that the art of the ancient magicians was founded to a considerable degree upon a knowledge of the powers of nature superior to that of the general public. At one time magic was greatly

studied in Europe, and many distinguished names are found among its students and professors. The most famous of these are Albertus Magnus, Roger Bacon, Cornelius Agrippa, Michael Nostradamus, John Dee, William Lilly, etc. Consult: Ennemoser, 'History of Magic'; Scott, 'Demonology and Witchcraft'; Mackay, 'Memoirs of Extraordinary Popular Delusions'; Regnault, 'La Sorcellerie, ses Rapports avec les Sciences biologiques' (1897); Lehmann, 'Aberglaube und Zauberei' (1898).

Magic Lantern, an optical instrument for the enlarged representation of small figures. The instrument consists of a lantern, generally of tin, and cubical in form, having in the interior a powerful Argand lamp, the pencils of light issuing from which pass through a convex lens. It is most commonly used as a toy, but it is also valuable for the purposes of science in enlarging astronomical and other diagrams to illustrate lectures, so that they may be seen by an audience. The principle of its construction is very simple. A lamp is placed within the closed lantern with its burner in the focus of a concave mirror, the reflected light from which passes through a horizontal tube on a level with the flame. This tube contains two lenses, the one a hemispherical illuminating lens, of short focus, to condense a strong light on the picture, and the other a double convex lens, which receives the rays after they have passed through the picture, and throws them on the screen. The picture is inserted through a transverse slit into the tube between the lenses. That the representation may appear erect the picture must be inserted into the tube in an inverted position. The screen must not be too far removed from the lantern, otherwise the image will become indistinct and distorted. The tube is made to pull out, so that the distance of the lens from the slider being capable of being increased or diminished, an image of any moderate size, larger or smaller, may be formed, by increasing or diminishing the distance between the lantern and the screen.

Magic Square, in mathematics, a term applied to a series of numbers in arithmetical progression, arranged in the equal cells of a square, in such a manner that the vertical, horizontal, and diagonal columns shall give the same sums. The methods given for constructing them are divided into different rules, but no general method has yet been found that shall apply to all cases. The first sixteen numbers are arranged as a magic square in the annexed table:

1	16	11	6
13	4	7	10
8	9	14	3
12	5	2	15

There are said to be 880 methods of making these magical squares, and only those squares are included which are essentially different.

"Magic circles," "cubes," "cylinders," etc., are also constructed.

Maginn, ma-gin', William, Irish author: b. Cork, Ireland, 11 Nov. 1793; d. Walton-on-Thames, 20 Aug. 1842. He was graduated from Trinity College, Dublin, in 1811, and was for some years a school-master. In 1819 he became a contributor to 'Blackwood's Magazine' and was in turn Paris correspondent of the 'Representative,' junior editor of the 'Standard,' and one of the founders of 'Fraser's Magazine,' his contributions to which made it famous. He was a man of superb classical education, excelled as a critic, and his literary work abounded in rich fancy and the genuine Irish wit. Unfortunately he had no financial ability and he died in extreme poverty notwithstanding the large sums his pen had earned. His collected works were published in 5 vols. in 1855-7.

Magistrate. See COURT.

Magliabecchi, Antonio, ān-tō'nē-ō māl-yā-bēk'ē, Italian bibliographer: b. Florence 28 Oct. 1633; d. there 4 July 1714. In the early part of his life he was engaged in the employment of a goldsmith, which he relinquished to devote himself to literary pursuits. Through unremitting application he acquired a multifarious stock of erudition, which made him the wonder of his age. Duke Cosmo III. made Magliabecchi keeper of the library which he had collected, and gave him free access to the Laurentian Library and the oriental MSS., and of the latter collection he published a catalogue. He left no literary work, but freely afforded information to authors who sought his assistance in their own undertakings, his prodigious memory enabling him to furnish the exact reference to any page or paragraph of the numberless volumes he had read. He left his valuable private library of 30,000 volumes to his native city where it now forms part of the National Library.

Magna Charta, māg'nā kār'ta, or **Great Charter of Liberties**, a famous document extorted from King John of England by the confederated barons in 1215. The barons who with their followers composed "the Army of God and the Holy Church" were the whole nobility of England; their followers comprehended all the yeomanry and free peasantry, and the accession of the capital was a pledge of the adherence of the citizens and burghers. John had been obliged to yield to this general union, and in June both parties encamped on the plain called Runnymede, between Windsor and Staines, on the banks of the Thames, and conferences were opened between the king and his barons. The preliminaries being agreed on, the barons presented heads of their grievances and means of redress, in the nature of the bills now offered by both houses for the royal assent. The king, according to the custom which then and long after prevailed, directed that the articles should be reduced to the form of a charter, in which state it issued as a royal grant. The charter was signed on 15 June. Copies were immediately sent to every county or diocese, and ordered to be read publicly twice a year. To secure the execution of the charter John was compelled to surrender the city and Tower of London, to be held by the barons till 15 August, or until he had completely executed the charter. Many parts of the charter were pointed against

the abuses of the power of the king as lord paramount; the tyrannical exercise of the provisions of the forest laws was checked, and many grievances incident to feudal tenures were mitigated or abolished. But beside these provisions it contains many for the benefit of the people at large, and a few maxims of just government, applicable to all places and times, of which it is hardly possible to overrate the importance of the first promulgation by the supreme authority. The 39th article contains the celebrated clause which forbids arbitrary imprisonment and punishment without lawful trial. This article contains the writ of *habeas corpus* and the trial by jury, the most effectual securities against oppression which the wisdom of man has devised, and the principle that justice is the debt of every government, which cannot be paid without rendering law cheap, prompt, and equal. The provision which directs that the supreme civil court shall be stationary, instead of following the king's person, was an important safeguard of the regularity, accessibility, independence, and dignity of public justice in Great Britain. The Great Charter was frequently confirmed: four times by Henry III., and no fewer than 13 times by Edward III. Consult Stubbs, 'Constitutional History of England' (1897).

Magna Græcia, grē'shī-a, "Great Greece," the name commonly given in ancient times to that part of southern Italy which was inhabited by Greek colonists. Apparently the name was in use as early as the time of Pythagoras (586-506 B.C.). Strabo includes the Greek cities of Sicily under the appellation, but the name refers generally only to the Greek cities in the south of Italy, including those on the shores of the Tarentine Gulf and the Bruttian Peninsula, with Velia, Posidonia, and Laüs, on the west coast of Lucania. The name was not at first territorial, or co-extensive with any region, but applied merely to the Greek cities on the coasts. Cumæ was the most ancient of all the Greek settlements in Italy, but from its remote position it was in a great measure isolated from the later Greek settlements. The Achæans were the real colonizers of southern Italy, their first settlement being Sybaris (720 B.C.). A few years later (708 B.C.) Spartan colonists founded Tarentum, and to counteract their encroachments the Achæans founded Metapontum, on the frontier of the territory of the Tarentines, between 700 and 680 B.C. The Locrians founded further south the city known as Locri Epizephyrii, nearly contemporary with Crotona (710 B.C.). The Chalcidic colony of Rhegium, on the Sicilian Straits, claims to have been more ancient even than Sybaris. The Greek cities on the shores of Bruttium and Lucania were, Velia excepted (540 B.C.), offshoots from the earlier settlements, and not founded by colonists direct from Greece. The arrival of Pythagoras at Crotona (530 B.C.) produced a marked change in the cities of Magna Græcia, and led to the introduction of great political changes. He and his followers were ultimately expelled from Crotona. Magna Græcia comprised the provinces of Campania, Apulia, Iapygia, Lucania, and Bruttium.

Magnalia Christi Americana, māg-nā'li-ā krīs'ti ā-mer-i-kā'na, an 'Ecclesiastical History of New England, from 1620 to 1628,' pub-

MAGNENTIUS—MAGNESIUM

lished by Cotton Mather in 1702. It treats more extensively of the early history of the country than its title seems to indicate, and is divided into seven books: the first treating of the early discoveries of America and the voyage to New England; the second is 'Lives of the Governors'; the third, 'Lives of many Reverend, Learned, and Holy Divines'; the fourth, 'Of Harvard University'; the fifth, 'The Faith and the Order in the Church of New England'; the sixth, 'Discoveries and Demonstrations of the Divine Providence in Remarkable Mercies and Judgments on Many Particular Persons'; the seventh, 'Disturbances Given to the Churches of New England.' In the sixth book, the author gives accounts of the wonders of the invisible world, of worthy people succored when in dire distress, of the sad ending of many wicked ones, and of the cases of witchcraft at Salem and other places.

Magnentius, mǎg-nên'shī-ūs, **Flavius Popilius**, Roman imperial usurper of the West: d. August 353. Having been entrusted by Constans with a high military command he availed himself of his office to plot the emperor's overthrow. On 18 Jan. 350, presenting himself in imperial purple at a great banquet given by one of the conspirators at Autun, he was saluted with the title of Augustus; and assassins sent for the purpose having despatched Constans, Magnentius was acknowledged as emperor by all the western provinces except Illyria. Constantius, on hearing of his brother's murder, hastened from the confines of Persia and defeated Magnentius (357). These disasters led to the defection of all the countries that had recognized the usurper, who thereupon committed suicide.

Magne'sia, the oxid of magnesium, MgO . See MAGNESIUM.

Magne'sian Limestone, a rock consisting of the mixed carbonates of lime and magnesia. Mineralogically it is known as **DOLOMITE** (q.v.).

Mag'nesite, a white, porcelain-like mineral (magnesium carbonate, $MgCO_3$; carbon dioxide 52.4 per cent, magnesium oxide 47.6 per cent), usually found associated with serpentine, talcose slates, and dolomite. The magnesite of commerce comes from several localities; notably, Veitsch in Styria, Austria, where it occurs in conformable beds in a Silurian formation; at Frankenstein in Silesia, where a very pure variety is found; at Bolton, Canada, there is a ledge 60 feet wide which is tinged with green by chromium. The quality, however, is not good. In the Red Mountain mining district, Santa Clara and Stanislaus counties, Cal., is found the largest known deposit in the world. Here there are several ledges from 20 to 60 feet wide and of very pure quality. It is also found in Napa, Sonoma, Fresno, Placer, Mariposa, Monterey, and San Luis Obispo counties, Cal. Magnesite is used as a bleaching agent in paper-making, and for making an excellent artificial stone for interior decoration. Its chief use, however, is in the manufacture of firebrick. In brick-making it is calcined, the gas CO_2 being collected and sold for charging mineral water and for use in cold-storage plants, instead of ammonia, and the resulting magnesium oxide mixed with a binding material and pressed into brick. From the pure mineral metallic mag-

nesium and salts, as Epsom salts and magnesium chloride, are manufactured.

O. H. PACKER.

Magne'sium, a metallic element whose compounds are abundant and widely distributed but which does not occur, in nature, in the metallic form. Magnesium resembles calcium in its chemical deportment, and the oxids of the two metals were long confused with each other. Metallic magnesium was first prepared by Davy in 1808, both by electrolysis, and by the reduction of white-hot magnesia in an atmosphere of potassium vapor. In 1830 Bussy obtained a larger and purer yield of the metal, by heating a mixture of potassium and anhydrous magnesium chloride to redness. It is best prepared by the electrolysis of the fused anhydrous chloride, or of a mixture of magnesium chloride with the chlorides of sodium, potassium, and ammonium. Pure magnesium is silvery-white in color, lustrous, and moderately hard. It may be hammered, rolled, filed, and polished. Its specific gravity is about 1.70, and its specific heat about 0.245. Its melting point is variously given, the estimates ranging from $850^\circ F$. to nearly $1,500^\circ F$. When raised to a bright-red heat (out of contact with the air) it volatilizes, depositing upon cool surfaces again in the form of lustrous silvery crystals which belong to the hexagonal system, and are isomorphous with those of zinc. It expands by 0.000015 of its own length, per Fahrenheit degree of rise of temperature; and at $32^\circ F$. its electrical resistance is 0.0438 of that of mercury.

Chemically, magnesium is a dyad. It has the symbol Mg , and an atomic weight of 24.36 if $O=16$, or 24.18 if $H=1$. Its most important compounds are the oxid, MgO , the chloride, $MgCl_2$, the sulphate, $MgSO_4$, and the carbonate, $MgCO_3$. Metallic magnesium is not altered upon exposure to dry air, but ordinary air oxidizes it superficially. It dissolves readily in dilute acids, with the formation of the corresponding salts. Chlorine, bromine, iodine, fluorine, sulphur, phosphorus and arsenic combine with it directly. Red-hot metallic magnesium also slowly combines with free nitrogen to form a solid nitride. In the isolation of argon, helium, and the other rare gases of the atmosphere, advantage is taken of this fact for separating these gases from the nitrogen of the air. (See ARGON.) When strongly heated in the air, metallic magnesium takes fire and burns with an exceedingly brilliant white light that is rich in chemical rays; the product of the combustion being magnesia, MgO . Advantage is taken of this property in photography, most of the "flash-light" powders that are used consisting essentially of pulverized magnesium, either alone, or mixed with a small quantity of some explosive or oxidizing agent. Magnesium will also burn when sufficiently heated in steam, carbon dioxide, or sulphur dioxide.

Magnesium oxid, or "magnesia," MgO , is usually prepared by heating the nitrate or carbonate of the metal; and on account of this method of preparation it is commonly known as "calcined magnesia." Magnesia is a white substance, without taste or odor. It does not have a strongly alkaline reaction, but it acts as a powerful base, reacting with acids to form the magnesium salts. It is scarcely soluble in water, but it slowly absorbs moisture and carbon

MAGNETIC DIP — MAGNETISM

dioxid from the air, becoming converted into a mixture of the hydrate and carbonate. When made into a paste with water, magnesia sets to a hard, white mass, consisting partly or wholly of the hydrate, $\text{Mg}(\text{OH})_2$; but this action does not occur if the magnesia has been previously heated to whiteness. One of the most distinctive characteristics of magnesia is its infusibility. Even when heated in the flame of the oxyhydrogen blowpipe it does not melt, but gives out a bright white light, somewhat similar to that emitted by lime. (See CALCIUM LIGHT.) In the fiercer heat of the electric furnace, magnesia has been melted. On account of its infusibility, magnesia is used in the manufacture of crucibles and of firebrick. It occurs native as the mineral periclase, which crystallizes in the isometric system.

Magnesium chloride, MgCl_2 , is prepared by dissolving magnesia in hydrochloric acid, and evaporating the solution after the addition of a certain quantity of sal ammoniac. Upon subsequent fusion the sal ammoniac volatilizes, and the magnesium chloride is left behind. This substance is largely used as a preventive of mildew, in the sizing of cotton cloth. The mineral carnallite contains magnesium chloride, having the composition $\text{MgCl}_2 + \text{KCl} + 6\text{H}_2\text{O}$. Magnesium sulphate occurs native (in combination with one molecule of water) as kieserite, and it may also be prepared artificially by dissolving magnesium oxid or carbonate in dilute sulphuric acid. When combined with seven molecules of water, magnesium sulphate constitutes the familiar substance known as Epsom salts (q.v.), which is largely used in medicine. Magnesium carbonate, MgCO_3 , is a white substance, insoluble in water, but soluble in a solution of ammonium chloride, and also in water that contains carbon dioxide in solution. It occurs in nature as the mineral magnesite, which crystallizes in rhombohedral forms, isomorphous with calcite. Dolomite, which occurs in nature in enormous quantities, is a carbonate of magnesium and calcium.

Magnesium salts are used to a considerable extent in medicine. The name "magnesium" is derived from "magnesia," which substance is said to have been obtained from the province of Magnesia, in Thessaly.

Magnetic Pole. See MAGNETISM.

Magnetism, the name applied to a peculiar force action first observed in connection with certain iron ores. This ore, often called lodestone, is supposed to have been discovered in Magnesia, a part of Asia Minor. It is not possible to state just when this discovery was made, but certain passages in Lucretius show that something was known concerning it before the beginning of the Christian era. About the year 1200 we have the statement by Neckham that a lodestone free to turn takes up a definite position in space. Some further details were noted by Peregrinus (1269) and Ferrara (1629), but the greatest of the early works is that of Dr. Gilbert, a physician, who published his 'De Magnete' in 1600. Those interested in the history of the subject may consult the 'Intellectual Rise of Electricity' by Park Benjamin, in which an excellent historical sketch may be found.

The only direct evidence that a body is magnetic is its ability to exert a force on certain substances, which, by reason of their susceptibility to this action are called magnetic substances. A lodestone brought in contact with several small bodies will select those of iron or steel, if such be present, but show no appreciable force on copper, lead, wood, or in fact on any except iron, nickel, cobalt, and a few others to a lesser degree. Of even greater interest and importance is the fact that the lodestone is able to endow steel or iron with the ability to exert this force. Soft iron loses its external magnetic qualities when removed from the immediate neighborhood of the exciting source, but hard steel or iron will retain this property for a long time. If a bar or rod of hard steel is drawn across a piece of lodestone or other permanent magnet, and is then suspended so as to be free to turn about a vertical axis it will take up a definite position, usually its line of greatest length will be approximately north and south. If it be plunged into a box of iron filings, little magnetic action will be manifest near the middle of the bar, but near the ends considerable quantities of filings will be attracted and may be lifted against the action of gravity. These facts led to the naming of the regions of greatest external action the poles of the magnet and since the lines joining these regions would, in the case of a freely suspended magnet, lie in many places nearly north and south, the pole which seeks the north is often called the north-seeking or positive pole, the other which turns toward the south, is correspondingly named the south-seeking or negative pole. The entire subject was formerly studied with reference to the behavior of like and unlike poles, and it was even supposed that these poles consisted of opposite sorts of magnetic matter. Later investigations have developed methods less directly dependent upon the idea of poles, which are preferable for many purposes.

FIG. 1.

If we suppose two long magnets placed as shown in Fig. 1 a study of their mutual force action would indicate that each is exerting a push tending to increase the distance between them, and that the amount of this repulsion will vary with the distance between the magnets. If one of the bars be replaced by another whose magnetic quality is different, the force action will be modified. If one of the magnets be reversed in position a corresponding force tending to reduce the distance between the bars would be observed. It is convenient to use as a preliminary definition the statement that a unit pole is one which would exert unit force upon a precisely equal pole at a distance of one centimetre. The law of pole action can then be stated by saying that the force is equal to the product of the two poles strengths divided by the square of the distance between the poles.

If a freely suspended magnet is brought into the neighborhood of a large bar magnet as indi-

MAGNETISM

cated in Fig. 2 it will be observed to take up a position somewhat as indicated in the lower part of this diagram, as its point of suspension is moved along the line. The region where this directive force is noticeable is called the *field* of the magnet. (Gilbert's "orb of virtue.") If continuous lines are drawn, which at each point have the direction taken by the free magnet,

FIG. 2.

these lines are called lines of magnetic force, and they offer a very convenient method for a general study of magnetic action. While these lines have no objective existence, it is, nevertheless, desirable to imagine that they are real and that they possess certain definite qualities. They should always be considered as being directed away from the north-seeking or positive pole. In the early conception of magnetic action these lines would have been regarded as the lines of flow of the magnetic material, and the word flux, still in use, bears evidence of this conception. It is convenient also to regard the lines of force as being under tension and capable of repelling each other. The number of actual lines of force which could be drawn about a magnet is infinite. For purposes of comparison, however, it is customary to represent the force action at a point upon the unit pole placed at that point by the number of lines drawn per square centimetre on a surface perpendicular to the field. A unit field is one in which a force action upon a unit pole is one dyne, about the weight of 1-1000 of a gramme.

In order to compare magnets and to facilitate magnetic computations, certain methods of measurement have been devised. Only a brief sketch can be given here, as full details of these operations may be found in books devoted to this subject, some of which will be mentioned at the end of this article. When a bar magnet is placed at right angles to the lines of a uniform magnetic field it will experience a twist tending to place it along these lines. The amount of this twist will depend upon three things. First: The pole strength of the magnet in question. Second: The distance between the poles. Third: The strength of the field where it is placed. The product of the pole strength by distance between poles is called the magnetic moment of the magnet. When a magnet is suspended freely and slightly displaced from a position parallel to the lines of force it will vibrate about this position. The time required for a complete swing is found to depend upon the magnetic moment, the moment of inertia, and the strength of the field where the magnet is placed. The vibration period may be directly observed and the moment of inertia computed from the dimensions and weight of the magnet. In this way the product of the magnetic moment by the field strength may be found. If the same magnet is held with the line joining its poles east and west it will cause a small freely sus-

pended magnet some distance to the east or west to turn slightly from its equilibrium position. The amount of this deflection depends on the distance between the magnets and the ratio of *magnetic moment to field strength*. If we denote the magnetic moment by ml and the field strength by H , the product of ml times H is found from time of vibration, and by means of the deflection of the small auxiliary magnet $ml \cdot H$ may be determined. When ml times H or ml divided by H is known either ml or H is readily computed. When the field at any point is known, a comparison of the time of vibration of a magnet at the known point with its period when vibrating at any other point enables us to compare the two fields without further measurement. The law of change being that if periodic time is doubled the field strength would be four times as great; or the period varies inversely as the square root of the field in which the magnet vibrates.

The facts mentioned above regarding the ability of a magnet to cause pieces of neutral iron or steel to show magnetic properties is frequently spoken of as magnetic induction. The general phenomena can be readily remembered if we imagine that it is easier for lines of magnetic force to pass through iron than through air. Small pieces, as shown at P, Fig. 2, would have lines entering at "S" and leaving at "N" and would behave as small magnets placed in corresponding positions. Owing to the tension of the lines of force these small pieces would tend to set themselves nearly parallel to the undisturbed direction of the lines. If a sheet of glass or other non-magnetic material is placed over a magnet and iron filings are sprinkled on its surface, a slight tapping, sufficient to overcome friction, will enable the lines of force to arrange the small temporary magnets parallel to the field. In this way maps of magnetic fields may be readily found, and their study throws considerable light upon many de-

FIG. 3.

FIG. 4.

tails of these peculiar phenomena. Such fields are shown in Figs. 3 and 4. If a sphere of iron or cobalt is free to move in a magnetic field which is not uniform, a tendency is always ob-

MAGNETISM

served for the iron to place itself in the strongest part of the field, or so that as many of the magnetic lines pass through it as possible. Such a substance is called paramagnetic. Some substances, as for example a sphere of bismuth, will tend to move to the weaker portions of the field, indicating that it is more difficult for magnetic lines to pass through the material than through air. These are called diamagnetic bodies.

The importance of magnetic action in both theoretical and practical affairs is due largely to its intimate connection with the phenomena of the electric current. In fact it is absolutely impossible under any conditions to have an electric current flow in a conductor without producing a magnetic field. In the case of a long straight wire carrying current the magnetic lines are circular in form, concentric with the wire, and their planes are perpendicular to its axis. If a wire is wound in a long, straight, cylindrical coil, frequently called a solenoid, and a current be passed through it, the field produced will be nearly identical with that of a bar magnet, the difference being that the lines of force are entirely in air and are not modified by the peculiar properties of iron. By increasing the strength of the current and the number of turns of wire, a comparatively strong magnetic field may be produced at the centre. A piece of soft iron or steel inserted in the coil becomes a powerful temporary magnet, while strips or bars of hardened iron or steel would in the same way become permanent magnets. The requirements of modern electrical processes have led to very careful investigations of the magnetic behavior of iron in connection with the production and the measurement of electric energy. Only a brief sketch of the fundamental features can be given here. If we suppose an electric current flowing in a long solenoid, which does not contain an iron core, the strength of the magnetic field through the inside of the solenoid may be readily computed from a knowledge of the number of turns of wire and the strength of the current. The symbol H is generally used to indicate the field strength when iron is absent. If now a bar of iron be inserted it will be found that the magnetic field is greatly increased. The new field will depend partly on the original value of H and partly on the quality and previous magnetic history of the iron inserted. The symbol B is generally used to denote the intensity of the field when iron is present. It may then be stated that B equals μH , where μ is a variable factor depending on the nature of the iron and the field strength; this factor is called the *permeability*. The original field H is frequently spoken of as the magnetizing field and the new one as the induction. Or H stands for the number of lines per square centimetre where iron is absent and B stands for the number of lines per square centimetre in the iron. If iron, in a neutral magnetic condition, is placed in a solenoid and the electric current is gradually increased from zero the iron will be subjected to a steadily increasing magnetizing field. A comparison of corresponding values of B and H in such a case leads to very important results. The relation between these values is best explained by reference to a curve drawn by using these quantities as co-ordinates. Such curves, usually called the curves of magnetization, are shown in Fig. 5. It should be observed

that when H is almost zero, the induction is very small, then B increases more and more rapidly with a rising field until at point 2 the rate of increase of B with H begins to fall off

FIG. 5.

rapidly, and shortly a value of B is reached which cannot be materially increased no matter how strong a magnetizing field is used. For example in the specimens shown it is useless to extend the value of H much above 70, and in actual practice this limit would be taken much lower. When as many lines as possible are carried through the iron it is said to be saturated. The exact shape of the magnetization curve will depend upon the nature and previous magnetic history of the specimen, but the ratio B/H at any point gives the ability of the iron to multiply magnetic field strength for that particular field. If, however, any definite state of magnetization is attained as at the point M, Fig. 6, it will be found that upon reducing the field, H , the values of the induction, B , will not agree with those found for the same value of H when the field was increasing. In fact if H be changed to zero and then to negative values and back again to the former condition the value of B will form a loop as indicated. This peculiar lag of the induction when the field is reduced, is called hysteresis, and the hysteresis loop as shown is of practical importance because its area enables one to find the work converted into heat when the magnetization is carried through one complete cycle. The line ON measured the residual magnetism, which is semi-permanent, and will be greater in hard than in soft iron or steel. No matter where the process of magnetization is stopped a series of cyclic changes of the magnetic field always gives corresponding loops.

A theory which is useful in the correlation of the various phenomena observed in the magnetic behavior of iron is at once suggested by a simple experiment. Take a magnetic steel needle and which shows distinct polarity. Upon being broken into two parts it will be found that instead of securing two isolated poles, that

MAGNETISM

each piece possesses a plus and a minus pole practically identical with the poles of the original needle. Carry this process to any length and each little piece, however small, will be found to possess two poles, one positive and the other negative. If we assume that this process could be carried on to the smallest conceivable particle of the iron we should say that each molecule of the iron is by itself a magnet. We may further suppose that the molecular mag-

netism observed that there is a tendency for free positive poles to appear at one end, namely where the field lines leave the iron and for uncompensated negative poles to appear at the other end.

FIG. 8.

The facts in favor of this sort of explanation may perhaps be briefly summarized as follows: (1) The general shape of the magnetic curve is explained. (2) As friction or other molecular forces tend to prevent a return to the original chaotic condition after magnetization this arrangement would in part persist after removal from the field, or permanent magnetism would be explained. (3) Soft iron should be easier to magnetize and less permanent than hardened iron or steel. (4) Jarring as by blows tends to reduce friction and to assist in the process of magnetization and also to reduce permanent magnetism. (5) High molecular activity consequent on rise of temperature decreases magnetic action, in fact, at a dull red heat iron is non-magnetic. (6) Rapid reversals of magnetism involves work against molecular forces and the production of heat, this heat is proportional to the area of the loop. (7) A tube of iron filings or a set of pivoted magnets shows the same behavior in a rising or falling magnetic field as a solid bar. The precise agreement between experimental facts and the indications from theory shown above makes this conception extremely useful. Just why molecules of iron should be permanently endowed with magnetic properties is a subject for speculation which has been indulged in by numerous prominent scientists. It has been supposed for example that electrical currents flow around these molecules, that they consist of vortex rings or that small electrically charged parts are in vibration in such a way as to produce the phenomena of permanent molecular magnetism. The general usefulness of the hypothesis is in no way connected with the truth or falsity of such speculations any more than the facts regarding free fall are dependent on our view of gravitation.

The general statements noted above regarding magnetism of iron are of importance in the manufacture and utilization of magnets for various purposes. Where a considerable amount of permanent magnetism is undesirable, soft iron or steel is always used. For the manufacture of permanent magnets special steel is selected and hardened and is then magnetized by its insertion into a solenoid carrying a powerful electric current. Severe shocks or blows are frequently given in order to assist in the molecular rearrangement. The interaction of all the elementary magnets together with temperature changes and mechanical shocks will tend to weaken a magnet. This loss is very considerable at first but finally an almost permanent state is reached. When used in electrical measuring instruments magnets are artificially aged by subjecting them to considerable changes of temperature and a series of mechanical shocks. It should be noted in this connection that the permanence of the magnet will be somewhat increased by joining its poles, when not in use,

FIG. 6.

nets in a neutral piece of iron are entirely devoid of regular arrangement as regards position of the poles; such a chaotic condition may be indicated roughly by Fig. 7. It may be supposed that these molecular magnets are partly held in position by the action of forces analogous to friction, which also tend to hold them in any new position to a greater or less extent in case the original arrangement is disturbed. Under the action of a weak magnetic field these friction forces would prevent the turning of the molecular magnets into parallelism with the

FIG. 7.

field lines. As soon as the field is strong enough to overcome this sort of friction we might expect the same tendency to arrangement of these minute magnets that is observed in the case of iron filings in the mapping of magnetic fields. As long as a considerable number of the axes of these molecular magnets make fairly large angles with the field lines the leverage by which turning is produced would be considerable; if however they approach parallelism with each other and the field lines, the effective twisting would be very materially reduced. This would correspond to the approximate saturation of the iron and no considerable change in position could be produced by increasing the field strength. The general arrangement may be indicated approximately in Fig. 8, where it will be

MAGNETISM

by a piece of soft iron. The induced magnetism at the ends of the iron helps to hold the poles of the small molecular magnets in position, and counteracts the tendency of these poles to demagnetize the bar.

Aside from the extended use of permanent magnets in electrical instruments their practicable application is comparatively limited. The electro-magnet is widely used where it is desired to cause a temporary force action at a distance from the operator, as for example in the telegraph, etc. Powerful electro-magnets are now frequently used to lift large masses of iron during manufacturing processes. It may be noted in this connection that the lifting force of a magnetic piece of iron depends on the square of the number of lines per unit area at the contact face. Only so large an area should be used in contact as can be very highly magnetized by the current available. In the construction of dynamos, motors and transformers, the magnetic quality of the iron used is of great importance. The total number of lines set up (flux) must be sufficient for the operations involved and saturation should not be approached in any part. Where the cross section may be made large, cast iron can be used, but where the flux must be concentrated, special soft iron or steel is required. All air gaps are made as small as mechanical and electrical considerations of construction will permit, in order that the required flux may be more easily set up by the electro-magnets. Or as electrical engi-

neers say, the magnetic "reluctance" is made small by use of properly proportioned iron parts and small air gaps in order that the *magneto-motive force* required may not be excessive.

Terrestrial Magnetism.—The statement usually made that a freely suspended magnet needle, remote from magnetic masses, tends to point north and south is not correct except for a few localities at certain times. The actual nature of the earth's magnetic field must be found by extended experiments which are being carried on by numerous observers largely under the direction of various governments. (See methods of magnetic measurements above.) If a steel needle be suspended by a silk fibre and carefully balanced so as to hang horizontal and is then magnetized it will be observed to finally come to rest in a certain vertical plane and to be inclined to the horizontal. The angle between a horizontal line and the direction of the needle is called the dip, and the angle between

the true north and south plane and that in which the needle lies is called the declination. The values of the dip, declination and intensity of the earth's field at a point are called the magnetic elements at that point. The use of the compass both by the surveyor and mariner over nearly the entire surface of the earth makes an accurate knowledge of these elements indispensable. In order to convey this information, in a practical way, recourse is had to maps on which places having the same declination, for example, are joined by lines. Such maps bring into view many interesting features as regards the earth's magnetism. For example Fig. 9, published by the United States Coast and Geodetic Survey for 1900 shows that in northern Oregon, Idaho and Montana the compass pointed approximately 20 degrees east, while in the extreme northeastern part of Maine it pointed about 20 degrees west. Along an irregular line crossing Michigan, Ohio, North and South Carolina and passing east of Cuba the declination was 0, or the needle pointed due north. It is evident from an inspection of these maps that the poles of the earth considered as a magnet do not coincide with the geographic poles. The line of no dip follows the equator only approximately. North of this line the north end dips down, while at the south it is reversed. Some of the minor variations are no doubt caused by local causes, such as masses of magnetic material, but it is a general belief among observers that the earth's magnetism is largely due to outside agencies. Another very important point for the mariner, who depends on the compass to find his way in safety across trackless seas or the surveyor anxious to locate landmarks, is that these magnetic elements are continually changing even during the day, as well as month by month and year by year. In London during 232 years the declination changed 35 degrees. "A street one mile long laid out in London parallel to the compass direction in 1580 would have its terminus seven tenths of a mile too far east according to the compass in 1812." Since 1812 the declination at London has changed from about 24 degrees west to 16 degrees west. In 1580 it was 11 degrees east. In fact it would seem that the magnetic poles of the earth are slowly vibrating. The variation during the day must be taken into account in accurate work as a mile run in the morning and repeated in the afternoon, may vary by 5 to 20 feet at its terminus. Sudden changes called magnetic storms also frequently occur, which seem to be associated with atmospheric electrical conditions, sun spots, etc. In order to secure data for the study of these complex phenomena, magnetic observatories are maintained where delicate instruments record, day and night, the countless fluctuations of the magnetic forces.

Fig. 9.

The problem of the navigator is still further complicated by the use of iron ships which are always sources of disturbance, both because of their permanent as well as their variable magnetism. The continual jarring and changes of temperature during a voyage enables the earth's field to continually change the distribution of magnetism in the vessel. The means to be used for the correction of this deviation have received the attention of many skillful investigators. The limits of this article will hardly allow a discussion of the matter which may be found in special books noted at the end.

MAGNETISM — MAGNOLIA

The contrast between the state of knowledge regarding magnetism before 1600 and its present development is one of the most striking indications of the growth of scientific investigation. Instead of vague speculations, partial truths veiled in mysticism, more or less direct references to dogma and the supernatural, we have organized knowledge based on experience and constantly checked by experiment and application. The number of those who believe in "magnetic" healing or, that, because an iron pipe driven in the earth shows polarity, the water flowing through it is magnetic and has special medicinal virtues, is constantly on the decrease. The relations between magnetism and other fields of physical research can not be treated in this article, yet it may be well to mention that such relations are constantly being investigated and no one in touch with present developments believes that the end is at hand. And it may well be that the delicately poised magnetic needle in some future interpretation of its countless movements will give us a knowledge of the invisible yet all-pervading agency which governs its fluctuations and lead us to a broader generalization of physical phenomena than we can formulate at present.

JOHN S. SHEARER,

Asst. Professor of Physics, Cornell University.

Magnetism, Animal. See ANIMAL MAGNETISM.

Magnetite, or Magnetic Iron Ore, native magnetic oxid of iron, Fe_2O_4 . It sometimes has part of its iron replaced by titanium or magnesium, and occasionally by nickel. It is very abundant (the production of the United States in 1901 being 1,813,076 tons), and when pure it constitutes a valuable ore of iron, 72 per cent of its weight consisting of that metal. Magnetite crystallizes in the isometric system, commonly in octahedra, but also in dodecahedra, with striated faces. It also occurs, and very generally, in massive and granular forms. It is black in color, with a metallic or submetallic lustre. It is brittle, and has a hardness of from 5.5 to 6.5; the crystals having a specific gravity of about 5.17. It may be readily distinguished by the fact that it is strongly magnetic. Specimens are found which manifest quite a strong, permanent magnetic polarity, this variety of the mineral being known as "lodestone." Magnetite occurs in vast beds in Canada, and in the northern and eastern parts of the United States. Abundant deposits of it are also known in California and Washington.

Mag"neto-elec'tric Machines. See ELECTRO-MAGNETIC MACHINE; ELECTROTHERAPEUTICS.

Mag"neto-elec'tricity. See ELECTRO-MAGNETISM; ELECTRO-MAGNETS.

Magnetometer, an instrument employed in observatories to measure the intensity of terrestrial magnetism. A magnet may be allowed to move freely in a horizontal plane by being supported on a fine vertical pivot, or by suspension on a fine untwisted silk thread. Bifilar suspension is more to be depended upon; the magnet is supported by two parallel threads; screws enable the tensions in the threads to be equalized and their distance asunder to be adjusted. See MAGNETISM (*Terrestrial*).

Magnificat. The words which Mary pronounced when she visited Elizabeth (Luke i. 46-55) begin, *Magnificat anima mea dominum* ("My soul doth magnify the Lord"). Hence the whole of her thanksgiving on this occasion has been called the Magnificat. The present usage of the Roman Catholic Church is to chant or pronounce the Magnificat every day at vespers.

Magnolia, Ark., town, county-seat of Columbia County; on the Louisiana & N. and the St. Louis S. R.R.'s; about 138 miles southwest of Little Rock. It is in an agricultural and lumbering region. Considerable cotton and fruit are raised in the vicinity. It has a large trade in lumber, fruit, and cotton. Its chief buildings are the county buildings, the schools, and churches. Pop. (1900) 1,614.

Magnolia, a genus of ornamental, deciduous or evergreen trees and shrubs of the order *Magnoliacea*. The 20 species are natives mostly of the United States, India, China, and Japan. They are characterized by large, alternate entire leaves, large white, purple or pink, sometimes yellowish, solitary, terminal flowers, which are often highly fragrant; and cone-shaped, often red, decorative fruits. They are widely planted for ornament in parks and gardens; most of the deciduous species being tolerably hardy as far north as Massachusetts, some even farther north, but the evergreen kinds tender even at Washington, where, however, one species (*M. grandiflora*), can withstand the winters if in protected situations. The wood is close-grained, generally soft, spongy, light and satiny. It is little used because it is not durable, but in Japan one species (*M. hypoleuca*), is used for lacquering. The bark and the fruits of a few species were formerly employed as stimulants and tonics, but have fallen into disuse.

As a rule, magnolias thrive best in rather rich, fairly open, moist, peaty or sandy loams, but generally prove satisfactory upon any garden soil. A few, especially the heavier tree (*M. glauca*), which is also popularly known as sweet, swamp, or white bay, are natives of very wet grounds and must be naturally well supplied with water, when planted for ornament. They may be propagated by means of layers, by grafts, or by seeds planted as soon as ripe or stratified in sand and kept out of doors where they can not become dry. The plants should be transplanted when the new growth is commencing, otherwise the operation is frequently unsuccessful.

The following species are among the most generally planted in the United States. The hull bay or big laurel (*M. grandiflora*) is found naturally from North Carolina to the Gulf States. It is a pyramidal, evergreen tree which often attains heights of 75 feet or more, and is

especially conspicuous when in blossom, its fragrant white flowers often attaining a diameter of a foot. The swamp sassafras or sweet bay (*M. glauca*) ranges from the coast region of Massachusetts to Florida and irregularly southwestward to Texas. It reaches a height of 20 feet and bears fragrant cream-colored flowers. The cucumber trees (q.v.) are natives of the southeastern United States and are particularly attractive because of their pink fruits. The flowers of the first are often eight inches in diameter, and conspicuously colored; those of the latter are much smaller and greenish yellow, or green. Of the exotic species the yulan (*M. yulan*), a native of China, where it has been cultivated for more than a thousand years, and *M. pumila*, *M. obovata*, and *M. hypoleuca* are popular, the first and last particularly. By crossing, hybridizing and selection a large number of choice horticultural varieties have been produced.

Magoffin, ma-gōf'in, **Beriah**, American statesman: b. Harrodsburg, Ky., 18 April 1815; d. there 28 Feb. 1885. He was graduated from Centre College (Danville, Ky.) in 1835, from the law school of Transylvania University (Lexington, Ky.) in 1838, entered the practice of law at Jackson, Miss., in 1839, but in the same year returned to Harrodsburg. In 1840 he became police judge, in 1848, 1856, and 1860 was a delegate to the Democratic national conventions, in 1850 was elected to the State senate of Kentucky, and in 1859-62 was governor of Kentucky. He refused, 15 April 1861, to comply with Lincoln's call for 75,000 troops; in May 1861 by proclamation warned both the Confederate and Federal governments against occupying Kentucky soil, and the citizens of the State against entering hostilities; and in August requested Lincoln to withdraw United States troops. He vetoed a resolution of the legislature directing him to proclaim the evacuation of Kentucky by the Confederates; but the resolution was passed over his veto. In August 1862 he resigned his office, and in 1867 was elected to the lower house of the State legislature.

Magog, mā'gōg, Canada, town in Stanstead County in the province of Quebec; on Lake Memphremagog at its outlet, and on the Canadian Pacific; about 19 miles southwest of Sherbrooke. It has regular daily communications with Newport and other places in Vermont. Magog is a favorite resort for anglers. Pop. (1891) 2,100; (1901) 3,516.

Magog. See GOG AND MAGOG.

Mag'ot. See BARBARY APE; MACAQUE.

Magpie (originally *pie*, the pied or variegated bird), a bird of the genus *Pica*, closely related to the jays. The genus is distinguished by the extremely long wedge-shaped tail, the middle feathers of which equal the entire length of the head and body, while the outer feathers are less than half as long. The notorious magpie of Europe (*P. rustica*) is represented in North America by the variety *hudsonica*, which is rather larger but otherwise similar. The color is a lustrous black with a varied and changing iridescence and sharply contrasting white under parts and patches on the shoulders and wings, the latter being conspicuous as the bird flies. The yellow-billed magpie (*P. nuttalli*) of California, is precisely similar except that the bill

and a naked area at its base are yellow instead of black. Other species inhabit Asia and Africa. In America the common magpie is confined to the west, its range reaching from Alaska to Arizona and from the plains to the Cascade Mountains, being especially common in the Rocky Mountains. The magpie is a handsome bird of saucy, vivacious habits and is chiefly noted for its thieving habits and general rascality. It is always engaged in mischief, either in stealing brightly colored or glittering objects from the habitations of man or in robbing the nests of other birds, but because of its pert, merry manner is usually forgiven for the former class of offenses. The caged birds seen in the east give but a faint idea of the beauty and activity of these birds in the wild state. Like the jays the magpies are omnivorous, but are less strictly arboreal than they. The nest, which is built in a tree or bush, is very ingeniously and substantially constructed. It is a large domed structure protected outwardly by a thick, bristling layer of thorns and twigs, through which a narrow passage opening on one side leads to a deep cup plastered with mud and lined with fibres. Six to nine greenish drab eggs, much spotted and dashed with various shades of brown, are laid. The American magpie is occasionally taken young and made a pet, but it has not the reputation for talking and amusing, albeit thievish, manners which has made the European bird a favorite from ancient times. Descriptions of its many interesting habits will be found in the books of Coues, Ridgway, Merriam, Cooper, Keyser, and other writers upon the ornithology of the western United States.

Magrath, William, American painter: b. Cork, Ireland, 20 March 1838. He emigrated to the United States in 1855, and was elected National Academician in 1876. He has produced many excellent landscapes and his genre pictures are full of character. Among them may be mentioned 'The Road to Kenmair' (1871); 'The Reveillé' (1873); 'Rustic Courtship' (1877); 'On the Old Sod' (1879), which last is in the New York Metropolitan Museum.

Magruder, ma-groo'd'er, **John Bankhead**, American soldier: b. Winchester, Va., 15 Aug. 1810; d. Houston, Texas, 19 Feb. 1871. He was graduated at West Point in 1830, served for a short time in the 7th infantry, then in the artillery. In 1836 he was made first lieutenant, saw service in the Seminole war 1837-8, and became captain in 1846. He took an active part in the Mexican War, rising to the rank of lieutenant-colonel. In 1861, while in garrison at Washington, D. C., he resigned from the United States army, accepted a Confederate colonelcy, and commanded the artillery at Richmond. In the same year he won the battle of Big Bethel (q.v.), and was made brigadier-general and major-general. Assigned to the Yorktown district, he fortified the Peninsula, and with a force of 12,000 held it against the Army of the Potomac in April 1862. In the Seven Days' Battles (q.v.) he commanded the Confederate left. In October 1862 he was appointed commander of the Department of Texas. He recaptured Galveston 1 Jan. 1863, and broke the blockade of that port. After the War he served as major-general in the army of Maximilian in Mexico until the end of the empire, then settled at Houston for the rest of his life.

Magruder, Julia, American novelist: b. Charlottesville, Va., 14 Sept. 1854. Her education was conducted privately, and her literary career began in 1885 with 'Across the Chasm,' published anonymously. She has written: 'A Magnificent Plebeian'; 'The Violet'; 'Miss Ayr of Virginia'; 'A Manifest Destiny'; 'Princess Sonia' (1895); etc.

Maguey, mā-gwā'. See FIBRE.

Maguindanao, mā-gēn-dhā'now, a tribe of Moros who inhabit the valley of the Rio Palangui, island of Mindanao; the Moros of the Sarangani Islands, and some of those of Davao Bay belong also to this group. See PHILIPPINE ISLANDS.

Magyars, mō'gyōrz, the original name of the Hungarians, which they still use in preference to any other. See HUNGARY.

Mahā-bhārata, mā-hā-bhā'ra-ta, The, the greatest epic of the literature of ancient India. The name signifies 'The Great (Poem) of the Bhāratas.' The work is perhaps less truly an epic poem in a strict sense than a collection of epic material; there being a central narrative, but the constituent parts being assembled about it in rather a heterogeneous fashion; and many portions admitting of detachment without the slightest effect upon the poem. The composite authorship of the 'Mahā-bhārata' is indicated by the native ascription of it to Vyāsa, a generic title meaning an "arranger" or "distributor." In its present state the epos consists of upward of 100,000 couplets of 32 syllables each; and is therefore about eight times more extensive than the combined 'Iliad' and 'Odyssey.' It is subdivided into 18 parvas, or books, with an appendix or supplementary portion called the 'Haravaṇṇa.' Evidence exists to its currency under its present title as early as 350 A.C., but whether it was then in its present condition has not certainly been determined. Its origin is extremely remote. The main story of the poem concerns the feud between the Kauravas and Pāṇḍavas, rival branches of the royal line of Hastināpura (Delhi), among whose ancestors was the King Bhārata from whom India is sometimes called "The country of the Bhāratas" (Bhārata-varsha). The Pāṇḍavas are represented as goodness and heroism personified; the Kauravas generally as inconceivable villains. A final war results in the complete victory of the Pāṇḍavas. The episodical material which thickly overlays the central theme assumed an encyclopaedic character; and the study of the 'Māha-bhārata' became as much an education for the Hindu as that of the 'Iliad' and 'Odyssey' once was for the Greek. Much of the 'Māha-bhārata' must to the general reader appear grotesque or even absurd. But, even so, it will continue remarkable for its vast scope, its lofty teachings, and the literary merit of many parts. The so-called *editio princeps* of the text is that of 1834-9 (Calcutta). There is also an edition of 1890. A rendering into English was begun by Protap Chunder Roy in 1883 and has been contributed to by other Hindus. Translations from it have also been made by H. H. Milman ('Nala' 1860) and Sir Edwin Arnold ('Indian Idylls' 1883). Consult: Monier-Williams, 'Indian Epic Poetry' (1863); Wheeler, 'The Vedic Period of the Mahā-bhārata' (1867); Goldstücker, 'Literary Remains,' Vol.

II. (1879); Wheeler, 'Short History of India' (1884). See SANSKRIT LITERATURE.

Mahadeva, mā-hā-dā'va, in Hindu mythology, a deity who shares the attributes of Siva in the Indian Trinity, Mahadeva being regarded as a generator as well as a destroyer.

Mahaffy, mā-hā'fī, John Pentland, Irish Greek scholar: b. Chapponnaire, near Vevay, Lake Geneva, Switzerland, 26 Feb. 1839. He was educated in Germany and at Trinity College, Dublin, from which he was graduated in 1859; was appointed to a competitive fellowship in 1864; and became professor of ancient history in the college in 1871. In 1873 he was Donnellan lecturer. His first publication was a translation of Kuno Fischer's 'Commentary on Kant' (1866); and on philosophical subjects he has since issued 'Kant's Critical Philosophy for English Readers' (with J. H. Bernard 1872; new ed. 1889), containing a translation of the 'Prolegomena' and a defense of the critical philosophy; and a volume on 'Descartes' (1880) in Blackwood's 'Philosophical Classics.' The greater number of his works, however, treat of the history, literature, and everyday life of ancient Greece, among these being the following: 'Prolegomena to Ancient History' (1871); 'Greek Social Life from Homer to Menander' (1874); 'Greek Antiquities' (1876), a work much used in Continental schools; 'Rambles and Studies in Greece,' a record of antiquarian research (1876); 'Old Greek Education' (1879); 'History of Classical Greek Literature' (1880; 3d ed. 1891); 'Greek Life and Thought from Alexander to the Roman Conquest' (1887), a continuation of the work of 1874; 'The Greek World under Roman Sway' (1890), a continuation of the preceding; 'The Story of Alexander's Empire' (1890); 'Greek Pictures' (1890); and 'Problems in Greek History' (1892). He edited the English translation of Victor Duruy's 'Roman History' (1883-6); and has given some attention to Egyptian history, especially in the Greek period, the fruits of his studies in this field being his edition of the 'Flinders-Petrie Papyri' for the Royal Irish Academy (1891-3), and a work on the Empire of the Ptolemies (1896). He writes with particular interest and authority of the post-Alexandrian period of Greek life; and is continually discovering interesting parallels between that and modern civilization. What he may have sacrificed in pure scholarship he has gained in the vividness of his historical presentation. He is a most excellent stylist. Among his other writings are: 'Twelve Lectures on Primitive Civilization' (1868); 'Report on the Irish Grammar Schools' (1880-1); 'The Decay of Modern Preaching' (1882); and 'The Art of Conversation' (1889).

Ma'aleb, a species of European cherry-tree (*Cerasus Mahaleb*), whose fruit affords a violet dye and a fermented liquor like kirschwasser. Its flowers and leaves are used by perfumers, and its wood by cabinet makers. See CHERRY.

Mahan, mā-hān', Alfred Thayer, American naval officer: b. West Point, N. Y., 27 Sept. 1840. He was graduated from the United States Naval Academy in 1859, and served during the Civil War, rising to the rank of lieutenant-commander in 1865. In 1885 he was promoted captain, and in 1886 was appointed president of

the Naval War College at Newport, a position which he held till 1888, and again from 1892-3. In 1893-5 he was commander of the Chicago, and in 1896 was retired from active service at his own request. In 1898 during the war with Spain he was a member of the Naval Board of Strategy; and in 1899 one of the United States delegates to The Hague Peace Conference. In 1890 he published his chief work, 'Influence of Sea Power upon History'; the continuation, 'Influence of Sea Power upon the French Revolution and Empire' appeared in 1892; his other writings include: 'The Gulf and Inland Waters' (1883); 'Life of Admiral Farragut' (1892); 'Life of Nelson' (1897), highly commended by English critics; 'The Interest of the United States in Sea Power' (1897), a compilation of his magazine articles; 'Lessons of the Spanish War' (1899); 'The Problem of Asia' (1900); 'The South African War' (1900); 'Types of Naval Officers' (1901); 'Retrospect and Prospect' (1902). His 'War of 1812' appeared in 'Scribner's' in 1904.

As a historian he has made a distinct contribution to historical science as the first writer to demonstrate the determining force which maritime strength has exercised upon the fortunes of individual nations, and consequently upon the course of general history. Technically, his representative work, the 'Influence of Sea Power upon History,' is but a naval history of Europe from the restoration of the Stuarts to the end of the American Revolution. But the freedom with which it digresses on general questions of naval policy and strategy, the attention it pays to the relation of cause and effect between maritime events and international politics, and the author's literary method of treatment, place this work outside the class of strictly professional writings and make it a recognized leading authority. His prime object, in establishing the thesis that maritime strength is a determining factor in the prosperity of nations, was to reinforce his argument that the future interests of the United States require a departure from the traditional American policy of neglect of naval-military affairs. Captain Mahan was president of the American Historical Association in 1902-3; and has received honorary degrees from several universities, including Oxford and Cambridge, England.

Mahan, Asa, American Congregational clergyman and educator: b. Vernon, N. Y., 9 Nov. 1800; d. Eastbourne, Sussex, England, 4 April 1880. He was educated at Hamilton College, Clinton, N. Y., and Andover Theological Seminary, and after holding pastorates at Pittsford, N. Y., and Cincinnati, Ohio, was president of Oberlin College 1838-50; and also professor of philosophy there. He was president of Cleveland University 1850-6; and of Adrian College, Mich., 1860-71. After the last named date he lived mainly in England. Among his works were: 'Doctrine of Christian Perfection' (1839); 'System of Intellectual Philosophy' (1845); 'The Will' (1846); 'Science of Logic' (1857); 'Mental Philosophy' (1882); 'History of Philosophy' (1883).

Mahan, Dennis Hart, American military engineer: b. New York city 2 April 1802; d. near Stony Point, N. Y., 16 Sept. 1871. He was graduated at West Point in 1824, where in 1825 he was appointed assistant professor of mathe-

matics and of engineering. He was stationed in Europe four years on professional duty and in 1832 returned to West Point as professor of military engineering, where he remained until his suicide, which was caused by temporary insanity. His text-books are generally recognized authorities and include: 'Treatise on Field Fortifications' (1836); 'Descriptive Geometry' (1864); 'Military Engineering' (1865); 'Permanent Fortifications' (1867); 'Military Course of Civil Engineering' (1837, rewritten 1868); etc.

Mahanadi, mā-hā-nūdī, or **Mahanuddy**, a river in British India. In the upper part of its course it drains the fertile plain of Chhattisgarh in the Central Provinces; flows southeast and then east through the province of Orissa, past Sambalpur and Cuttack, into the Bay of Bengal by two mouths, after a course of about 530 miles. During the rains it is navigable 300 miles from its estuary, but a large portion of its channel is dry during five or six months of the year. An extensive system of irrigation canals is connected with it. Diamonds are found in this river and in several of its tributaries.

Mahanoy (mā-ha-noi') **City**, Pa., borough, in Schuylkill County; on Mahanoy Creek, and on the Lehigh Valley and the Philadelphia & Reading R.R.'s; about 55 miles northeast of Harrisburg. The first settlement was made in 1859, and it was incorporated in 1863. It is in the anthracite region, and in the vicinity is fire-clay and an excellent building-stone. Its chief manufactures are pottery, foundry products, flour, hosiery, and lumber. In the vicinity are about 20 collieries, all of which are operated by residents of Mahanoy City. The trade is principally in coal, pottery, and lumber. The city has excellent public and parish schools and a number of fine churches. Pop. (1900) 13,504.

Maharajah, mā-hā-rā'ja, a title used in India; applied in courtesy to every rajah, or to any person of high rank or deemed holy.

Mahaseer, mā-ha-sēr, a large and ravenous barbel (*Barbustor*) of India, which reaches six feet in length and in the early part of the rainy season afford the best sport known to the anglers of India and Ceylon, as they take a fly readily, and struggle with the gameness and energy of a salmon to get free, pleasantly taxing the skill of the angler to bring them to land without breaking rod and line. They spawn at the heads of the hill-rivers, and then descend before the young are hatched. The fry then have an opportunity to grow in comparative safety to a size which enables them, the following season, to descend the rivers and take care of themselves; otherwise they would be devoured in infancy by their elders.

Mahat'ma, a Hindu word meaning "the great-souled one," and applied among the Brahmans to one who has attained the highest possible point of spiritual enlightenment. It is also the name of a high priest or "wise leader" of the theosophists (q.v.).

Mahāyāna, a term applied to the "Northern School" of Buddhism which some centuries after the death of Buddha (q.v.) had spread and become the dominant system in northern India, including Kashmir and Nepal. Mahāyāna is a Sanskrit term meaning "Large Vehicle," so called because it is averred to be a system which

affords salvation to a larger number of persons than are reached by the "Southern School"—Hīnayāna, the "Little Vehicle." Mahāyāna corresponds with the Lamaism (q.v.) of Tibet and Mongolia. The Hinduistic and Shamanistic notions of the northern barbarians have been absorbed by it and the gods and rites that belong to Shivaism (q.v.) have become adopted so as to alterate the purity of original Buddhism. A thousand new Buddhas appear in its doctrines, among whom is Adi-Buddha, who at Nepal assumed the prerogatives and demanded the worship belonging only to the Supreme Being. In certain Japanese sects so far as "The Great Vehicle" diverged from true Buddhism that priests are allowed to marry.

Mahdi, mā'dē. See MAD MULLAH.

Mahé, mā-hā', Indian Ocean, the largest island of the Seychelles Archipelago, belonging to Great Britain. It is 17 miles long by 4 miles broad, has an area of 55½ square miles, and attains an elevation of 2,000 feet above sea-level, from which it rises in most places nearly perpendicularly. It contains Victoria, the administrative seat, and a coaling station with a good harbor. See SEYCHELLES.

Mahhol. See MACHOL.

Mahi Kantha (mā'hē kan'tha) **Agency**, India, a group of 39 native Gujarat states, administered since 1820 by a British political agent of the province of Bombay. The chief state Idar, occupies about one half of the combined area of 9,300 square miles. Pop. (1900) 361,508, consisting largely of wild Bhil and Khoil tribesmen.

Mahican, mā-hīk'an (meaning "wolf"), an Algonquin tribe of American Indians formerly occupying the Hudson River Valley. They were closely related to the Delawares and the Mohegans, the collective tribes being known as the *Loup* or Wolf Indians. At one time there was a settlement of 40 villages near the site of the present city of Albany. The assaults of the Iroquois and the white settlers diminished the tribe until the remnants of the race became merged with the Delawares. About 550 of the tribe still remain, located upon a reservation near Green Bay, Wis.

Mahmud (mā-mood') I., or Mohammed, Turkish sultan: b. Constantinople 1696; d. 1754. He was the son of Mustapha II. and succeeded his uncle Achmet III. He was a well-disposed but incapable monarch and his reign is of little importance.

Mahmud II., Turkish sultan: b. 20 July 1785; d. 1 July 1839. He was the second son of Abd-ul Hamid II., and under the reign of his uncle Selim III. he received an education exceptionally broad for a prince of his station. He succeeded his brother Mustapha in 1808 and organized his government on a reform basis. He conducted a war against Russia and Servia until 1812, subjected the Wahabees and quelled the insurrection of Ali Pasha in 1822. In his war with the Greeks he incurred the intervention of the powers with disastrous results to his forces. Mahmud was a progressive monarch, he introduced modern ideas of warfare, a regular police system, and founded schools. Against serious obstacles he crushed the janissaries, but a second rebellion of Mehemet Ali

in 1839 was followed by a defeat which shortly preceded the broad-minded monarch's death.

Mahmud, sultan of Ghazni, the founder of the Mohammedan empire in India: b. Ghazni about 970; d. 29 April 1030. His father Sabaktagin, governor of Ghazni, owed a nominal allegiance to Persia, but was really independent. On his death Mahmud put aside his brother Ishmael, whom his father had appointed to succeed him, took the title of sultan, then overthrew the Persian monarchy, and laid the foundation of an extensive empire in Central Asia. He then turned his attention to India, which he invaded repeatedly. His earlier expeditions into the country were directed against successive rajahs of Lahore, on whom he inflicted repeated defeats. In 1008 the rajah of Lahore, Anangpal, with the assistance of a powerful coalition of rajahs, had assembled one of the largest armies yet seen in the Panjab, but Mahmud was again victorious, and carried away enormous spoils from the Temple of Nagarcot (1008). On his return he celebrated a triumph at Ghazni. In 1010, after subduing Ghor in the Hindu-Kush, he resumed his conquests in India, captured Multan, plundered the Temple of Tanesar, and continued for a series of years to extend his conquests in successive expeditions. These for a time were interrupted by his conquest of Transoxiana, effected in 1016. In 1017 he set out at the head of an army of 100,000 foot and 20,000 horse, passed the Jamna Jumud, and turning to the south appeared before Canoj, the largest and most magnificent Indian city of the day, the rajah of which took precedence of all the Indian rajahs. As the rajah of Canoj at once submitted it was spared from pillage, a fate to which Mattrā, a famous religious city, was subjected without restraint for twenty days. In 1023 he annexed the territories of Jeipal II., who had revolted, and established for the first time a permanent Mohammedan garrison in Lahore. His last, which is usually called his 12th, expedition into India (1024-6) was directed against Gujerat. He took the capital and changed the government, but the chief attraction was Somnāth. The magnificence of its temple filled him with wonder, and the descriptions of it suggest images of the palace of Aladdin. Its lofty roof was supported by 56 pillars carved and glittering with precious stones. It was lighted by a lamp suspended from the centre by a gold chain. A huge idol, which Mahmud broke, was found hollow, and disclosed immense treasures in diamonds and precious stones. The pieces of the idol were sent to Mecca, Medina, and Ghazni. The remainder of his enterprises were confined to western Asia. Mahmud was avaricious, and loved to accumulate treasures from his warlike expeditions.

Mahogany. A popular name for the timber of several unrelated trees, among which are various species of eucalyptus (q.v.), natives of Australia and members of the natural order *Myrtaceae*; two species of *Cercocarpus*, of the order *Rosaceae*, *C. parvifolius* being known as valley mahogany and *C. leidifolius* as mountain mahogany in the Rocky Mountain region where they are native and are mainly used for fuel. African mahogany (*Khya senegalensis*), East Indian mahogany (*Soyimida febrifuga*) and *Cedrela toona*, an East Indian tree equally well known also as the toona, all belong to the

natural order *Neliacea*, but are less important timber trees than the true mahogany (*Swietenia mahagoni*) of the same natural order. This species is a native of tropical America, occasional small specimens being found in extreme southern Florida. It was formerly abundant in the West Indies, reaching altitudes of 1,500 feet or more in Jamaica, but on account of the demand it is now scarce. Cuba and San Domingo formerly supplied the choicest; Honduras the low grades; now, practically all comes from Central America. The wood is generally some shade of brown, fine grained, easily polished and durable except under lateral strain. It is highly valued for furniture, musical instruments, interior house-finishings, etc., and is one of the most popular woods of the world. Formerly it was used for ship-building but now very little. The tree, which sometimes attains heights exceeding 100 feet, and diameters of six feet, has abruptly pinnate leaves with usually four pairs of leaflets, and small white or yellowish flowers in axillary or nearly terminal panicles. As an ornamental tree it is planted in southern Florida and southern California in rich soil. A few other related species of this genus are occasionally found in commerce.

Mahom'et. See MOHAMMED.

Mahon, mā-hōn', or **Port Mahon** (ancient *Portus Magonis*), Spain, city and port; on the island of Minorca, of which it is the capital, at the head of a bay which forms one of the best harbors on the Mediterranean. Fishing, fish-curing, agriculture, and stock raising are the chief occupations. In the bay are several rocky islets, on one of which stands an arsenal, on a second a lazaretto, and on a third a naval hospital. The harbor is strongly fortified. The exports are brandy, wine, dried fruits, agricultural produce, etc.; and the imports, grain, wearing apparel, tobacco, sugar, coffee, cacao, leather, hats, and other manufactured goods. Its trade amounts to about \$1,000,000 annually. Mahon was occupied by the English in 1708. It was taken from them, after a memorable siege, by the French under Marshal Richelieu on 28 June 1756. Admiral Byng was shot for failing to relieve it. It was restored to the English in 1763; and taken by the Spaniards in 1782. It was retaken in 1798, and finally given up to the French by the Treaty of Amiens in 1802. Pop. (1901) 18,123.

Mahone, mā-hōn', **William**, American soldier and politician: b. in Southampton County, Va., 1 Dec. 1826; d. Washington, D. C., 8 Oct. 1895. He was graduated at the Virginia Military Institute in 1847, and became a civil engineer and railroad constructor. At the opening of the Civil War he entered the Confederate army; took part in the Peninsular and Rappahannock campaigns, and by bravery at Petersburg acquired the sobriquet "The Hero of the Crater." (See PETERSBURG, OPERATIONS AROUND.) In 1864 he was made brigadier-general and major-general. The war over, he accepted the presidency of the Norfolk & Tennessee Railroad, and also became active in politics. He was the principal organizer (about 1878) and leader of the Readjusters (q.v.), chiefly a faction of the Democratic party in Virginia who favored the forcible readjustment of the State debt on terms involving conditional or partial repudiation. Mainly by the supporters

of this movement, he was elected in 1880 to the United States Senate, where, however, he acted with the Republicans, making the vote of the Senate a tie and disappointing the Democrats of their expected majority. By this and other acts of his senatorial career he lost favor with his constituents and was not re-elected.

Mahony, mäh'ō-nī, **Francis Sylvester**, "Father Prout," Irish author: b. Cork 1804; d. Paris 1866. Educated at a Jesuit seminary at Amiens, he studied theology at Paris, was admitted into the Order of the Jesuits and taught for some time in a Jesuit college in Ireland, but for some irregularities was deprived of the position of a member of the order. He received clerical ordination and officiated for a short time at Cork and in London, but soon adopted the profession of literature. In 1834-6 he contributed the 'Prout Papers' to 'Fraser's Magazine,' published as the 'Reliques of Father Prout' in 1836. In 1846 he became Roman correspondent to the *Daily News*, his letters being afterward republished as 'Facts and Figures from Italy' (1847). In his later years he was Paris correspondent for the *Globe*. The 'Reliques of Father Prout' in a revised and enlarged form were published in 1860, and 'Final Reliques' in 1876. In 1881 Charles Kent published a collective edition with a memoir. He will be longest remembered by his poem 'The Bells of Shandon.'

Mahrattas, mā-rāt'az, a native Hindu race, supposed to be descendants of the Persians, and occupying a large tract of central and western India. They came into prominence about the middle of the 17th century, when the chief Sevaji extended his conquests in various directions, had himself crowned king in 1674, and established the Mahratta empire. After his death long minorities and the incompetency of the sovereigns caused the powers of the state to fall into the hands of the *Pcishwa* or prime minister, who became the acknowledged head of a Mahratta confederacy. This confederacy held together till 1795, but subsequent wars and disturbances reduced the *Peishwa* to the position of a British dependent, and Scindia, Holkar, and the rajah of Berar were able to take the position of independent sovereigns. The confederacy came to a final end in 1818, and Scindia, Holkar, the Guicowar of Baroda, and the rajah of Kolapore became dependent princes under British protection. Though devout worshippers of Brahma, no distinction of caste exists among them.

Mai, Angelo, ān'jā-lō mǎ'ē or mī, CARDINAL, Italian classical scholar: b. Schilpario, near Bergamo, Italy, 7 March 1782; d. Albano, 8 Sept. 1854. His abilities attracted the notice of Father Mozzi, a Jesuit, who instructed him in Latin, Greek and mathematics. On the establishment of a Jesuit college at Colorno, in the duchy of Parma, he accompanied Father Mozzi thither in 1799, and a few years afterward was made professor of Latin and Greek in the Jesuit college at Naples. He was transferred to Milan (1808), where he became an associate of the Ambrosian College, and one of the Curators of the Ambrosian Library. One special department to which he devoted himself was the examination of the palimpsests (q.v.) and through his industry in deciphering these, two volumes of fragments of Cicero's orations, of Lysimachus

and of *Isæus*, a fragment of the 'Vidularia' (a lost comedy of Plautus), and a collection of the letters and other writings of Cornelius Fronto, the preceptor of Marcus Aurelius, were recovered and given to the world. In 1819 he was appointed chief keeper of the Vatican Library at Rome, and discovered beneath a manuscript of St. Augustine's 'Enarrations in Psalmos' obliterated fragments of Cicero's treatise 'De Republica,' amounting to about a fourth of the original, which he published in 1822 with a critical commentary. A colossal work was then undertaken by Mai, the editing of the various unpublished manuscripts in the Vatican, sacred and profane. It comprises ten quarto volumes, under the title of 'Scriptorum Veterum Nova Collectio e Vaticanis Codicibus edita' (1828-38), and consists of numerous fragments, previously believed to be lost, of the ancient historians, such as Polybius, Diodorus Siculus, Dionysius of Halicarnassus, Dion Cassius, Appian, and others, besides the various writings of the fathers. In 1838 he was created a cardinal. A new collection, 'Spicilegium Romanum,' was published in ten volumes between 1839 and 1844, and a patristic series, called 'Nova Patrum Bibliotheca,' issued between 1845 and 1853, closed his list of publications.

Maia, mā'ya, in Greek mythology, the eldest daughter of Atlas and Pleione. She was placed with her six sisters among the stars, where they have the common name of *Pleiades*. The Romans also worshipped a Maia, who was also called *Majesta*, and was afterward identified with the daughter of Atlas. The Tuscans called their principal deity *Majus*. The month of May is said to have received its name from them.

Maid of Athens, immortalized by Lord Byron, was Theresa Macri, who 25 years after Byron's poem was written had lost her beauty, lived in a hovel in dire poverty and had reared a large family.

Maid Marian, a name given Matilda, daughter of Fitz-Walter, baron of Bayard and Dunmow. She eloped with Robert Fitz-Ooth, an outlaw, and lived with him in Sherwood Forest. It is supposed that she was married by Friar Tuck to Fitz-Ooth, who was more commonly called Robin Hood.

Maid of the Mist, (1) the name of a small steamboat formerly used on the Niagara River below the Falls, to carry passengers close to the cataract. (2) A name given to the heroine of Sir Walter Scott's 'Anne of Geierstein.'

Maid of Orleans, a name given Jeanne d'Arc (1412-31) (q.v.).

Maiden, or **The Widow**, an instrument of capital punishment used in Scotland during the 16th century, the prototype of the French guillotine (q.v.): It consisted of an upright frame and a broad piece of iron a foot or more wide, sharp on the lower part, and loaded above with lead. At the time of execution this was pulled up to the top of the frame, in which was a groove on each side for it to slide in. The prisoner's neck being fastened to a bar underneath, on a sign given the cutting iron was let loose, and the head instantly severed from the body.

Maiden Queen, in England, a popular title bestowed upon Queen Elizabeth.

Maidenhair Fern. See **FERNS** AND **FERN ALLIES**.

Maid'stone (Saxon MEDWEGESTUN) England, municipal and parliamentary borough and the county town of Kent; 32 miles south-south-east from London; on the banks of the Medway. The town consists chiefly of four principal streets, which cross each other at the market-place, with smaller ones branching off at right angles. It has a fine old church and one of the largest parish buildings in the kingdom, supposed to be of the 14th century. It has excellent educational institutions; schools, libraries, science and art institutions, museums, play grounds, and parks. The chief industries are paper-making (for which there are several large mills) and brewing. An extensive trade is carried on in fruit and hops. The Medway is navigable for 15 miles above the town. Pop. (1901), 33,516. Consult: Cave-Browne, 'Maidstone'; Russell, 'History of Maidstone.'

Maidu People, an aboriginal Pujunan group of Indians of northern California, of which the chief tribe, the Concow, inhabited the region of the Upper Sacramento River. Their descendants are to be found in the Round Valley Reservation. Their communities comprised rough dwelling-places or hogans built of boards, large circular halls or town-houses for assemblies and ceremonials, and wicker store-houses for the winter supply of acorns which with pignons formed their staple food supplies. Their clothing was of the scantiest description; the chief of their numerous dances was the acorn dance; and they had a secret male society in which the initiatory age was twelve.

Maignan, Albert, äl-bär mā-nyän, French painter: b. Beaumont, Sarthe, 15 Dec. 1844. He studied at Paris under Nöel and developed a strong and original manner in historical and landscape painting. At the Salon of 1879 he was awarded a first class medal. Amongst the most striking of his pictures are 'Dante's Meeting with the Countess Matilda' (1881) now in the Luxembourg; and 'Assault on Pope Boniface VIII. at Anagni' in the New York Metropolitan Museum of Art.

Maigre, mā'gër, or **Meagre**, a large European drum-fish (*Sciaen aquila*), common in the Mediterranean, where it forms one of the most important local food-fishes. It may attain a length of six feet, and its flesh has always been a favorite with epicures. Yarrell says that anciently on account of its large size it was always sold in pieces, and that the fishermen of Rome were accustomed to present the head, considered the finest part, as a sort of tribute to the three local magistrates who acted for the time as the conservators of the city.

Mail-shell. See **CHITON**.

Maildun, mäl'doon, hero of Irish romance. He was the son of Allil Ocar Aga, of the tribe of Owenaught of Ninus, in County Clare, and before his birth his father was killed by pirates. He grew up handsome and accomplished, but had scarce reached manhood before he set sail with a crew of 60 men to find his father's murderer. For three years and seven months he voyaged on the Western Ocean seeing marvels such as no eyes had seen before. At length he found the murderer of his father, but pardoned him his wrong in gratitude to the great mercy

MAIMON — MAIMONIDES

of God who had delivered him from so many perils. See Tennyson, 'The Voyage of Mael-dune.'

Maimon, mī'mōn, **Solomon**, German philosopher: b. near Mir in Minsk, 1754; d. Siegersdorf, Lower Silesia, 22 Nov. 1800. He was trained for a rabbi, but having become acquainted with the philosophy of Maimonides, he made his way to Berlin, and studied modern philosophy, languages, and some science. Besides cultivating his own mind, and teaching a little, he wrote some philosophical treatises and literary hack-work. Yet he had Mendelssohn, the philosopher, among his friends, was admired by Kant, and attracted the attention of Goethe. This he owed to his 'Attempt at a Philosophy of Transcendentalism' (1790), in which he set out to supplement Kant's system with truths gleaned for the most part from Spinoza, Leibnitz, Hume, Locke, and others.

Maimonides, mī-mōn'ī-dēz, properly MOSES BEN MAIMON BEN JOSEPH (Arabic, Abu Amram Musa ibn Maimun Obeid Allah al-Korlobi), Jewish scholar: b. Cordova, Spain, 30 March 1135; d. 13 Dec. 1204. At an early period he developed a taste for the exact sciences and for philosophy. He read with zeal not only the works of the Mohammedan scholastics, but also those of the Greek philosophers in such dress as they had been made accessible by their Arabian translators. In this way his mind, which by nature ran in logical and systematic grooves, was strengthened in its bent; and he acquired that distaste for mysticism and vagueness so characteristic of his literary labors. He went so far as to abhor poetry, the best of which he declared to be false, since it was founded upon pure invention—and this too in a land which had produced such noble expressions of the Hebrew and Arab muse. It is strange that this man, whose character was that of a sage, and who was revered for his person as well as for his books, should have led such an unquiet life, and have written his works so full of erudition with the staff of the wanderer in his land. For his peaceful studies were rudely disturbed in his 13th year by the invasion of the Almohades, or Mohammedan Unitarians, from Africa. They not only captured Cordova, but set up a form of religious persecution which happily is not always characteristic of Islamic piety. Maimonides' father wandered to Almeria on the coast; and then (1159) straight into the lion's jaws at Fez in Africa,—a line of conduct hardly intelligible in one who had fled for the better exercise of the dictates of conscience. So pressing did the importunities of the Almohad fanatics become, that together with his family Maimonides was compelled to don the turban, and to live for several years the life of an Arabic Marrano. This blot upon his fair fame—if blot it be—he tried to excuse in two treatises, which may be looked upon as his 'Apologia pro vita sua': one on the subject of conversion in general (1160), and another addressed to his coreligionists in southern Arabia on the coming of the Messiah. But the position was untenable and in 1165 we find Maimonides again on the road, reaching Acho, Jerusalem, Hebron, and finally Egypt. Under the milder rule of the Ayyubite caliphs, no suppression of his belief was necessary. Maimonides settled with his brother in old Cairo or Fostat; gaining his daily

pittance, first as a jeweler, and then in the practice of medicine; the while he continued in the study of philosophy and the elaboration of the great works upon which his fame reposes. In 1177 he was recognized as the head of the Jewish community of Egypt, and soon afterward was placed upon the list of court physicians to Saladin. When he died, his body was taken to Tiberias for burial.

Perhaps no fairer presentation of the principles and practices of rabbinical Judaism can be cited than that contained in the three chief works of Maimonides. His clear-cut mind gathered the various threads which Jewish theology and life had spun since the closing of the Biblical canon, and wove them into such a fabric that a new period may fitly be said to have been ushered in. The Mishnah had become the law-book of the Diaspora; in it was to be found the system of ordinances and practices which had been developed up to the 2d century A.D. In the scholastic discussions in which the Jewish schoolmen had indulged their wit and their ingenuity, much of its plain meaning had become obscured. At 23 Maimonides commenced to work upon a commentary to this Mishnah, which took him seven years to complete. It was written in Arabic, and very fitly called 'The Illumination'; for here the philosophic training of its author was brought to bear upon the dry legal mass, and to give it life as well as light. The induction of philosophy into law is seen to even more peculiar advantage in his 'Mishnah Tōrah' (Repeated Law). The scholastic discussions upon the Mishnah had in the 6th century been put into writing, and had become that vast medley of thought, that kaleidoscope of schoolroom life, known by the name of Talmud. Based upon the slender framework of the Mishnah, the vast edifice had been built up with so little plan and symmetry that its various ramifications could only be followed with the greatest difficulty and with infinite exertion. In turn, the Talmud had supplanted the Mishnah as the rule of life and the directive of religious observance. Even before the time of Maimonides, scholars had tried their hand at putting order into this great chaos; but none of their efforts had proved satisfactory. For ten years Maimonides worked and produced this digest, in which he arranged in scientific order all the material which a Jewish jurist and theologian might be called upon to use. Though this digest was received with delight by the Jews of Spain, many were found who looked upon Maimonides' work as an attempt to crystallize into unchangeable law the fluctuating streams of tradition. The same objection was made to his attempt to formulate into a creed the purely theological ideas of the Judaism of his day. His 'Thirteen Articles' brought on a war of strong opposition; and though in the end, the fame of their author conquered a place for them even in the Synagogue Ritual, they were never accepted by the entire Jewry. They remained the presentation of an individual scholar.

But his chief philosophical work, his 'Guide of the Perplexed' (Dalālat al Hāirīn), carried him still further; and for centuries fairly divided the Jewish camp into two parties. The battle between the Maimonists and anti-Maimonists waged fiercely in Spain and Provence.

In the 'Guide of the Perplexed' Maimonides

MAIN

has also produced a work which was "epoch-making" in Jewish philosophy. It is the best attempt ever made by a Jew to combine philosophy with theology. Aristotle was known to Maimonides through Al-Farābī and Ibn Sinā (Avicenna); and he is convinced that the Stagyrite is to be followed in certain things, as he is that the Bible must be followed in others. In fact, there can be no divergence between the two; for both have the same end in view,—to prove the existence of God. The aim of metaphysics is to perfect man intellectually; the same aim is at the core of Talmudic Judaism. Reason and revelation must speak the same language; and by a peculiar kind of subtle exegesis—which provoked much opposition, as it seemed to do violence to the plain wording—he is able to find his philosophical ideas in the text of the Bible. But he is careful to limit his acquiescence in Aristotle's teaching to things which occur below the sphere of the moon. He was afraid of coming into contact with the foundations of religious belief, and of having to deny the existence of wonders. The Bible teaches that matter was created, and the arguments advanced in favor of both the Platonic and Aristotelian views he looks upon as insufficient. The Jewish belief that God brought into existence not only the form but also the matter of the world, Maimonides looks upon much as an article of faith. The same is true of the belief in a resurrection. He adduces so little proof for this dogma that the people of his day were ready to charge him with heresy.

Maimonides is able to present 25 ontological arguments for his belief in the existence, unity, and incorporeality of God. What strikes one most is the almost colorless conception of the Deity at which he arrives. In his endeavor to remove the slightest shadow of corporeality in this conception, he is finally led to deny that any positive attributes can be posited of God. Such attributes would only be "accidentia"; and any such "accidentia" would limit the idea of oneness. Even attributes which would merely show the relation of the Divine Being to other beings are excluded; because he is so far removed from things non-Divine, as to make all comparison impossible. Even existence, when spoken of in regard to him, is not an attribute. In his school language, the "essentia" of God involves his "existentia." We have therefore to rely entirely upon negative attributes in trying to get a clear concept of the Deity.

If the Deity is so far removed, how then is he to act upon the world? Maimonides supposes that this medium is to be found in the world of the spheres. Of these spheres there are nine: "the all-encompassing sphere, that of the fixed stars, and those of the seven planets." Each sphere is presided over by an intelligence which is its motive power. These intelligences are called angels in the Bible. The highest intelligence is immaterial. It is the *noûs poiêtikós*, the ever-active intellect. It is the power which gives form to all things, and makes that which was potential really existent. "Prophecy is an emanation sent forth by the Divine Being through the medium of the active intellect, in the first instance to man's rational faculty and then to his imaginative faculty. The lower grade of prophecy comes by means of dreams, the higher through visions accorded the prophet

in a waking condition. The symbolical actions of the prophets are nothing more than states of the soul." High above all the prophets Maimonides places Moses, to whom he attributes a special power, by means of which the active intellect worked upon him without the mediation of the imagination. The psychological parts of the 'Guide' present in a Jewish garb the Peripatetic philosophy as expounded by Alexander of Aphrodisia. Reason exists in the powers of the soul, but only potentially as latent reason (*noûs húlîkos*). It has the power to assimilate immaterial forms which come from the active reason. It thus becomes acquired or developed reason (*noûs epîkîêtos*); and by still further assimilation it becomes gradually an entity separable from the body, so that at death it can live on unattached to the body. In ethics Maimonides is a strong partisan of the doctrine of the freedom of the will. No one moves him, no one drives him to certain actions. He can choose, according to his own inner vision, the way on which he wishes to walk. Nor does this doctrine involve any limitation of the Divine power, as this freedom is fully predetermined by the Deity. But Maimonides must have felt the difficulty of squaring the doctrine of the freedom of the will with that of the omniscience of God; for he intrenches himself behind the statement that the knowledge of God is so far removed from human knowledge as to make all comparison impossible. Again, in true Aristotelian style, Maimonides holds that those actions are to be considered virtuous which follow the golden mean between the extremes of too much and too little. The really wise man will always choose this road; and such wisdom can be learned; by continued practice it can become part of man's nature. He is most truly virtuous who has reached this eminence, and who has eliminated from his own being even the desire to do wrong.

The daring with which Maimonides treated many portions of Jewish theology did not fail to show its effect immediately after the publication of the 'Guide.' His rationalistic notions about revelation, his allegorizing interpretation of Scripture, his apparent want of complete faith in the doctrine of resurrection, produced among the Jews a violent reaction against all philosophical inquiry, which lasted down to the times of the French Revolution. Even non-Jews looked askance at his system. In Montpellier and in Paris, his own Jewish opponents, not content with having gotten an edict against the use of the master's writings, obtained the aid of the Church (for the 'Guide' had been translated into Latin in the 13th century), and had it publicly consigned to the flames. But all this was only further evidence of the power which Maimonides wielded. The Karaites copied it; the Kabbalah even tried to claim it as its own. Many who were not of the House of Israel, as Thomas Aquinas and Albertus Magnus, acknowledged the debt they owed the Spanish rabbi; and Spinoza, though in many places an opponent, shows clearly how carefully he had studied the 'Guide of the Perplexed.' Consult Yellin and Abrahams, 'Maimonides,' and the authorities there mentioned.

GUSTAV GOTTHEIL.

Main, măn, Hubert Platt, American composer and editor: b. Ridgefield, Conn., 17 Aug. 1839. He was educated in the public schools

MAIN — MAINE

and for 45 years has been editor of song collections and other publications for church use, besides composing many hymns. He has also published 'A Dictionary of American Musicians and Poets.'

Main, *mān* (Ger. *min*), or **Mayn**, a river of Germany, which has its source in the north-eastern part of Bavaria, about 13 miles northwest of Baireuth. It flows northwest to the border of Bavaria, and then makes a succession of remarkable zigzags, continuing, however, in a westerly direction, till it reaches the border of the grand-duchy of Hesse, which it enters. It then flows circuitously west, partly forming the boundary between Hesse and the Prussian province of Hesse-Nassau, and joins the Rhine a little above the town of Mainz, after a course of over 300 miles. The principal cities which it passes are Würzburg, Aschaffenburg, and Frankfurt. It is navigable for about 200 miles, and by improvements the largest Rhine steamers can ascend to Frankfurt. By means of King Ludwig's Canal it affords through navigation to the Danube.

Maine, *mān*, **Sir Henry James Sumner**, English jurist: b. Caverham Grove, Oxfordshire, England, 15 Aug. 1822; d. Cannes, France, 3 Feb. 1888. He was educated at Cambridge, where he was professor of Civil Law 1847-52. In 1852 he became reader on Roman law at the Inns of Court, London, and ten years later went to India where he was legal member of the council 1862-9. On his return, in 1869, he was appointed professor of jurisprudence at Oxford, 1869-78, and held this post till 1878. He was master of Trinity Hall, Cambridge, 1877, and professor of international law at Cambridge, 1887-88. Among his more noted works were: 'Roman Law and Legal Education' (1856); 'Ancient Law' (1861), an epoch-making book; 'Village Communities' (1871); 'Popular Government' (1855). Consult: Duff, 'Sir Henry Maine: a Brief Memoir of his Life' (1892).

Maine de Biran, **François Pierre Gonthier**, *frān-swā pē-ār gōn-tē-ā mān dē bē-rōn*, French philosopher: b. Bergerac (Dordogne) 29 Nov. 1766; d. Paris 16 July 1824. He entered the Life Guards of Louis XVI. in 1784, was present at Versailles on 5-6 Oct. 1789, but was not concerned in the Revolution. He opposed Napoleon in the latter part of his reign, and became a legitimist at the restoration. His chief philosophical essays are: 'Influence de l'Habitude' (1803); 'Sur la Décomposition de la Pensée' (1805); 'Sur l'Apperception Immédiate' (1807); and 'Rapports du Physique et du Moral' (1811). Maine de Biran's importance as a philosopher is chiefly due to his giving the direction to philosophic speculation afterward developed in the school founded by Victor Cousin.

Maine (name given as early as 1622 to distinguish the *main land* from the islands. It was called in the Mason and Gorges Patent, "the Mayn Land of New England," and in the great charter, "Province of Maine"), one of the New England group of North Atlantic States and the most easterly State of the Union. It is between lat. 43° 4' and 47° 28' N.; and between lon. 66° 57' and 71° 7' W. It is bounded on the north by Quebec and New Brunswick,

provinces of Canada, on the east by New Brunswick and the Atlantic Ocean, on the south by the Atlantic, and on the west by the State of New Hampshire and the Province of Quebec. Its greatest extent is from north to south; its greatest length about 303 miles and its greatest width about 212 miles; area 33,040 square miles of which 3,000 square miles are water surface. Maine is as large as all the rest of the New England group lacking 385 square miles, and it is the 35th in size among the States of the United States.

Topography.—The northeastern and southwestern boundaries are straight lines except a portion of the extreme southwestern boundary. The northern and northwestern boundaries are irregular, also the southeastern. The coast line is fringed by islands and indented by numerous bays, owing to submergence of the land. The river valleys along the coast have also been submerged, so the mouths of the rivers have become a series of firds extending in some places many miles inland. There are more good harbors along the coast of Maine than on any other coast of the United States. The coast from the east extremity to Penobscot Bay is high and rugged. The greater part of the coast of York County in the southwest is low. The length of coast line measured direct from Eastport to a point opposite Portsmouth is about 218 miles; but Maine has really about 2,500 miles of sea coast.

There are two general mountain slopes in Maine, the highest part extending across the State from north of the source of the Megalloway River in the west, northeast to Mars Hill. South of the main divide is Mount Katahdin, 5,385 feet in height; Mount Abraham in the west, in Franklin County, is 3,387 feet high; Saddleback Mountain, 4,000 feet, and Mount Blue, 3,900 feet are in the same county. Green Mountain on Mount Desert Island is 1,800 feet high, and is one of 13 peaks which form a considerable portion of this remarkable island. There is no long range of mountains in the State, only spurs or seeming extensions of the Appalachian system, and in scattered groups.

Hydrography.—That portion of the State north of the main divide is drained almost wholly by the Saint John River and its tributaries, and the part south of the main divide is drained chiefly by the Androscoggin, Kennebec, Penobscot, and Saint Croix Rivers. The basin of Saint John River has an area of about 7,425 square miles. The head-waters of this river are in the northwestern part of Maine and the eastern part of Quebec, and at first it flows north by east for some distance, past Saint Francis on the north to the extreme northeastern boundary, where it makes a turn and flows generally southeast through New Brunswick to the Bay of Fundy. The largest Maine tributaries of the Saint John are the Aroostook and the Allegash. The waters of a large number of the lakes of Maine find their outlet through the Saint John. The rivers south of the main divide flow generally south to the ocean. The Androscoggin in the southwest has an irregular course. The source of the Kennebec is about 2,000 feet above the sea, of the Penobscot over 2,300 feet, of the Androscoggin about 3,000 feet, of the Saco in the southwest nearly 2,000 feet. They, together with their tributaries are swiftly flowing streams in many places passing

MAINE

over rocky beds which form rapids and falls and furnish extensive water-power. The available water-power of the State has been estimated at nearly 3,000,000 horse-power. There are about 1,580 lakes in Maine, a large number of which are near the sources of the rivers. The surface of the lakes and rivers constitutes nearly one tenth of the whole area of the State. Moosehead Lake is the largest in the State. (For description of rivers, see separate articles.)

Geology.—The nature of the geological formation of Maine shows that it belongs to one of the oldest parts of the United States. The marks of the Glacial period may be plainly traced in several parts of the State; the change in extent and form of the river beds and lakes are shown by the rock formation of the vicinity and the nature of the deposits which were brought from the mountains to the valleys. The northern portion of the State belongs to the Devonian period and the region about Penobscot Bay to the Silurian. In the southern part of the State are fossiliferous clays. There are a number of low ridges which evidently were once portions of mountain ranges, but which usually formed angles with the two great ranges that at one time extended across the State. Granite, slate, and marble exist in large quantities.

Soil.—The soil of the State shows the effects of the Glacial period as much as the rocks; the greater part of the surface is till and various forms of glacial debris. The old lake bottoms, now dry land, are largely alluvial and in these places the soil is very fertile. In such localities there are extensive agricultural lands.

Minerals and Mining.—Granite is one of the most important wealth producing minerals of the State. Along the coast and inland for some distance there are large areas of granite outcrop. It is found in such quantities near tide water that quarrying and shipping are comparatively easy and inexpensive. The feldspar and quartz are easily separated. Hallowell and Dix Island furnish the greatest amount. The Capitol at Albany, N. Y., and the Metropolitan Museum of Art, New York City, are built of granite from Hallowell. Crystalline limestone and marble are found in several places; in the southwestern part of the State the deposits are quite extensive. Slate of good quality is found in the central part of the State. It is quarried for table tops, blackboards, roofing and for mantels. The slate from Piscataquis County is remarkably pure, capable of being split into thin plates, and in color a deep black. Silica and feldspar of an excellent quality are found in several places. Some of the products made in whole or in part from silica and feldspar are glass, porcelain, scouring soap, sandpaper, earthenware, and woodfiller. The silica is found in vein-quartz in some of the crystalline rocks. Tourmalin is found in Oxford County in large and most beautiful crystals. Some of the other minerals are iron, zinc, arsenic, manganese, tin, silver, gold, antimony, pyrites, and beryl. The value of the mineral output for 1899 was as follows: granite, \$1,321,182; limestone and marble, \$1,028,375; slate, \$181,766; silica, \$50,336; other mineral products, \$60,126. Maine ranks second among the States in output of granite, fourth in the output of slate, and sixth in the output of limestone and in marble. The total amount for quarry products for 1899 was

\$2,641,785. There are in the State nearly 30 mineral springs which are known and used; 10 of them are in Androscoggin County. In 1899 the State reported of 26 springs an output of 1,850,132 gallons for \$179,450.

Climate.—The climate is cold a considerable part of the year; snow covers the ground from three to five months. The summers are short; in the southern part of the State there is not more, usually less, than five months for the maturing of crops. The extensive forests have been a protection, and with the good river drainage and the sea breezes have tended to make the climate most healthful. The mean temperature in January is 15° F.; in May 52°; in July 68°; in October 51°; in December 22°. The average temperature in the whole State is in summer 62.5° F. and in winter 20° F.

Flora.—The trees and plants common to the northeastern part of the United States flourish here. In the southern part are fine grasses, hardy fruits, and a varied shrubbery. The strawberry, blackberry, raspberry, blueberry, thorn-apple, and gooseberry grow in all parts of the State. (See *Forests and Agriculture*.)

Fauna.—Maine has a large number and variety of animals, among which are deer, moose, fox, beaver, sable, marten, mink, weasel, squirrel, rabbit, porcupine, and wildcat. Wild geese, ducks and teal are found in the vicinity of the lakes; fish-hawks and gulls on the coast; plover, oriole, bobolinks and all the birds of other parts of New England are common. The lakes and rivers are filled with fish, and the coast fisheries are most valuable. (See *Fisheries*.)

Forests.—Maine is known as the "Pine Tree State" because of the large extent of pine forests which once existed within its limits. The majestic "mast pine," which the State once furnished for many ships, has almost become a thing of the past, yielding to the demands of commerce. The greater part of the State is covered with forests; about 79 per cent of the land area in 1900 was woodland, with nearly 5,600,000 feet of standing merchantable timber. The northern and central parts are forest; in the southern part along the coast and along the navigable streams the land is cleared and cultivated. Trees grow rapidly. Denuded tracts, unless cultivated, will soon send up an undergrowth which become fair sized trees in the course of a few years. The original pine forests have almost disappeared, but instead is a good sized second growth which is now contributing material for the lumber-mills. The soil which has given nourishment to the pine forests seems unfitted for general farm crops; and in some cases the cleared land is permitted to lie fallow until a new forest growth, springing from self-sown seed, or from roots not destroyed, covers the surface. Spruce is now the most productive of the timbers, outranking the pine, and the hemlock is a close competitor. The great spruce section is in the basin of the Saint John River. There were nearly 22,000,000 feet of standing spruce in the State in 1897, and of this the finest and best for lumber was in the region drained by the Androscoggin and its affluents. A large amount of spruce was standing in the basin of the Penobscot. About two thirds of the entire area of the State in 1900 was spruce-bearing. The white birch belt, extending across the State, supplies wood for spools, some of which is manufactured into spools within the State, and

MAINE

some sent to other places; a large amount of the white birch blocked for spools is sent to Scotland. In 1900 about one half the spool stock of Great Britain came from the forests of Maine. The pulp and paper mills are now drawing extensively upon the poplar. Pulp mills are located chiefly upon the Androscoggin, the Kennebec, and the Penobscot rivers. About 45 per cent of the timber for pulp and paper has come from the Androscoggin basin, and nearly all the rest from the areas drained by the Penobscot and the Kennebec. Cedar obtained largely from the Penobscot and the Saint John basins, is another valuable timber which is used in manufacturing. The long timber has been used extensively in ship-building, and for boards, planks, joists, etc.; but small articles are now being made in large quantities from the forest's output; as the spools mentioned, baskets, furniture, office equipments, etc. Private corporations are extensively employing the science of forestry for the preservation of the timber.

Fisheries.—The rivers and lakes are well stocked with fish; the State is considered the sportsman's paradise. Some of the varieties are the speckled trout, sturgeon, pickerel, salmon, bass, and bream. Lobsters, clams, and mussels are in large quantities in the coast waters, and in the bays and inlets are bluefish, rock-cod, sculpin, cunners, flounders, and some others. In the off-shore waters there are cod, herring, mackerel, haddock, hake, porgy, menhaden, and pollock which are caught in large quantities. One species of herring, the *Culpea harengus*, furnishes a large amount of the fish used in the sardine-canning establishments of Lubec, Eastport, and other places. The fisheries of Maine rank second in value among the fisheries of New England, but more men are engaged in this industry in Maine than in any other of the northeastern Atlantic States. The Federal census of 1898 gives the following statistics:

Persons employed	16,954
Fishermen	10,154
Shoemen	6,770
Value of product	\$2,654,919

In 1890 the number employed was 12,537, and the value of the product was \$3,046,989.

In 1890 the lobster fisheries product was \$992,855, this amount being greater than for all lobsters in all the other New England States. The law passed in 1895 for the protection of the lobster fisheries greatly curtailed this branch of the fishing industry, as it prohibited the taking of lobsters less than 10½ inches in extreme length. This has caused the removal of canning establishments to Nova Scotia, New Brunswick and the Magdalen Islands. Clam fishing ranks next in importance; canning clams is a prominent industry, also the preparation of smoked herring. Salmon fishing is largely in the Penobscot and Kennebec Rivers. The fishery trade is centred chiefly at Portland, Rockland, and Vinal Haven.

Agriculture and Stock Raising.—The soil in the greater part of the State is not conducive to agriculture. The large acreage of forest land leaves only a small proportion of the whole which can be classed as land suitable for tillage. Less than 33 per cent is farm land and of that nearly two fifths is not improved. The most fertile lands are in the river valleys, the largest acreage being in the northeastern part of the State in the Aroostook basin. The farms aver-

age in size about 105 acres, and less than 5 per cent of the farms are occupied by tenants (Government Census Bulletin No. 139, 13 Feb. 1902). The owner living on the farm means intensive methods of cultivation, a systematic enrichment of the soil, and a careful rotation of crops. The cereal crops, especially wheat, have decreased in extent owing to western competition, but in Aroostook County they are increasing. The Federal census of 1900 shows that in this county the cereals occupied one half the total of the cereal acreage of the State. Oats, once a large crop, has also decreased; yellow corn, formerly cultivated on all the farms, never occupied much area and is now raised principally for fodder. The finest sweet corn in the world is raised largely in Maine for canning, and goes to all parts of the country. There are about 50 canning establishments in the State, most of these having headquarters in Portland and Brunswick.

Buckwheat, which produces excellent flour in a soil and climate like Maine, is still cultivated. The returns from the potato crop are greater than from all the cereals, although the acreage per farm given to potatoes is from 3 to 10 acres. Hay of an excellent quality is marketed at good prices. Farmers living near markets are giving considerable attention to market gardening and dairying. Fine grained vegetables, sweet corn, small fruits, and apples flourish and bring excellent returns. Apple orchards are increasing in number and more attention is given to their care and cultivation. The raising of horses is increasing, but the number of neat cattle, and sheep is decreasing. The number of milch cows is increasing. The statistics of 1900 show that nearly 30 per cent of the farms derived more income from dairy products than from all other sources. However such statistics are sometimes unreliable as a large part of the living of the farmer's family comes from the farm, but that only is reckoned as income which is sold from the farm. The amount received in 1900 for dairy products was about \$5,605,000. The Federal Census Reports of 1900 give the following statistics: 59,299 farms, covering 6,298,591 acres, of which 2,386,428 acres were unimproved. The total value of the farm property of the State was \$122,383,844. The value of the products for 1899 was \$37,104,375. For the year ending 1 June 1900 some of the farm products were as follows:

		Value.
Hay,	343,997 tons	\$10,929,761
Potatoes,	6,200,208 bushels	3,038,102
Oats,	5,257,612 bushels	1,997,398
Buckwheat,	719,760 bushels	352,682
Corn,	440,244 bushels	242,134
Barley,	315,319 bushels	193,498
Wheat,	40,755 bushels	36,680
Rye,	17,080 bushels	14,006

In 1899 the farm animals were:

	Number.	Value.
Horses	109,747	\$6,432,826
Sheep	254,027	787,484
Milch cows	203,814	5,890,225
Other cattle	112,723	2,973,863

Manufactures.—The extensive water-power has been a great aid in developing manufacturing industries. Ship-building was among the first manufacturing industries of the State. The first vessel built in Maine was the Virginia. She was built by the Popham Colony 1607-8, and under command of Captain James Davis sailed from Plymouth with the Somers and

MAINE

Gates Colony for Jamestown, 1 June 1609. Bath was the chief ship-building centre of the United States for over 100 years, and is yet a ship-building centre of importance. Prior to the construction of steel vessels, the Maine forests supplied a large amount of the timber used in ocean vessels built in the United States and fully half the ocean vessels of the nation, up to 1900, were made in Maine. Bath builds now many steel vessels. The manufacture of leather is another of the leading industries. The bark of the hemlock is used in large quantities for tanning. The manufacturing of cotton and woolen goods began the latter part of the 18th century and has been continued. Lewiston is the chief centre of cotton manufacturing. There is a tendency now to remove the cotton manufacturing industry to the Southern States or nearer the supply of raw material. Biddeford and Saco are extensively engaged in manufac-

turing cotton goods. Woolen mills are scattered throughout the State. The oil cloth industry was first started in Maine in 1845 by C. M. Bailey of Winthrop (q.v.). Nearly all the factories are located near the coast, or in localities where abundant water-power and good transportation lessen the cost of production and shipping. Lime and cement are important manufacturing products; large quantities of lime are made in Knox County. The following comparative table from the Federal census for 1900 will give some idea of the value of the manufacturing industries.

Political Divisions.—Maine is divided into 16 counties; the names, capitals, areas, and population of which are given in the table below.

The principal cities of Maine are Portland, the metropolis, founded in 1632; Lewiston, Bangor, Bath, Augusta, Saco and Biddeford, each of which is treated in a separate article.

INDUSTRIES.	Year	Number of establishments	Capital	Value of products including custom work and repairing
Total for selected industries for State..	1900 1890	1,689 1,580	\$86,564,100 56,706,127	\$73,368,312 54,631,124

STATE

STATE CAPITOL AT AUGUSTA.

MAINE

Banks.—On 31 Oct. 1901, there were 84 national banks in operation, having \$10,521,000 in capital; \$6,261,284 in outstanding circulation; and \$5,732,350 in United States bonds. There were also 51 mutual stocks and savings banks with \$69,533,038 in deposits; and 17 trust and loan associations, with \$1,601,800 capital. The exchanges at the United States clearing-house at Portland during the year ending 30 Sept. 1901 aggregated \$64,889,638, an increase over those of the previous year of \$24,478,953.

Finances.—The assessed property value in 1900 was divided as follows: real estate, \$268,434,909; personal property, \$68,264,740; total, \$336,699,649; tax rate \$2.75 per \$1,000. The State debt 1 Jan. 1901 was, bonded debt, \$2,103,000; temporary loan, \$350,000; total, \$2,453,000; and the total resources of the State amounted to \$1,132,375.

Government.—The State Constitution, under which the laws of the State are administered was adopted by the people in town meetings, held throughout the State, December 1819. To amend or change the Constitution it is necessary to have in favor a two-thirds vote of both Houses of the Legislature and a majority of the votes cast at the next biennial election or meeting of the people. A voter must be a citizen of the State; that is, no one has the right of suffrage but males, 21 years or over, citizens of the United States, who have resided in the State, county, town, and voting district three months. Men of 21 years and over who are excluded from voting are, paupers, Indians who are not taxed, and persons under guardianship. Voters who are soldiers in the State militia or regular United States army may vote when serving outside the State. An amendment was made to the Constitution in 1884, a clause which was meant to prohibit the manufacture and sale of intoxicating liquors. Severe penalties were attached to the violation of the law. State officials supervise the sale of liquors in town and cities, and permit such sales only for medicinal, manufacturing, and mechanical purposes.

Executive.—A plurality of the votes cast is necessary for the election of the Governor, who holds office for a term of two years. His council, consists of seven members elected biennially on joint ballot of the Legislature, but any district prescribed for the election of senators can furnish only one councillor. The Governor and council have power to grant pardons, commutations, and reprieves, and to remit penalties. They also have the appointment of the judges of the Supreme Court. In case of vacancy in the office of governor, the President of the Senate and Speaker of the House are respectively in line of succession. The Secretary of State and the Treasurer are elected on joint ballot of the Legislature and for two years.

Legislature.—The Legislature is composed of a Senate and House of Representatives. There are (1903) 31 members of the Senate and 151 members of the House elected biennially on the second Monday in September. They meet in session on the first Wednesday in January next following their election. The Senators are elected from Senatorial districts into which the counties of the State are divided. The Representatives are elected from towns. All bills relating to revenues must originate in the House of Representatives. The House has power of

impeachment; but the Senate conducts the trials of impeachments. The Legislature may overcome the Governor's veto by a two-thirds vote each of House and Senate. The State has four Congressmen.

Judiciary.—The eight judges who compose the Supreme Court are appointed for a term of years by the Governor and Council. The judge of the Supreme Court of Cumberland County, which includes the city of Portland, the judges of the inferior courts, of municipal and police courts, are also appointed by the State executive and his council. The term of appointment of the judges of the inferior courts is seven years, and of the judges of municipal and police courts, four years. Probate judges are chosen by the people by election and for a term of four years. The attorney-general is elected on joint ballot of the Legislature and for a term of two years.

Local Government.—There is a general law providing for the election and duties of State, county, town, and city officers, and penalties for non-fulfilment of their duties. The county officers are, county attorney, county commissioners, bail commissioners, judges of probate, sheriff, deputy sheriffs, registers of deeds, treasurer, clerk, commissioners of disclosure, stenographic commissioners, and coroners. The town officers are, selectmen, clerk, treasurer, collector of taxes, constables, road commissioners, school-committees, health officer, and justice of the peace.

Militia.—In 1903 the National Guard of the State numbered 1,156 infantry, with 122 commissioned officers. The number of the National Guard of the State may be 2,940, which if needed for active service may be increased to 100,000. The State appropriations for 1903 was \$50,000.

Religion.—The Roman Catholics comprise about one third of the total church membership. The Protestant denominations rank in numbers as follows: Baptists, Methodists, and Congregationalists. In 1900 there were 2,020 evangelical Sunday schools, with 13,600 teachers and officers and 111,290 pupils. Sunday schools are maintained in connection with all the Roman Catholic churches.

Education.—In 1900 the school population was 161,600; enrolment in public schools was 131,588; and average daily attendance 97,706; enrolment in parish schools 11,000. There were 4,218 buildings used for public school purposes, 6,447 teachers; school property valued at \$4,699,475; receipts for the previous year \$1,507,345, and expenditures \$1,513,125. For the higher education there were 200 public high schools; 40 private secondary schools; 5 public and 2 private normal schools; Bowdoin College at Brunswick; Bates College at Lewiston; University of Maine at Orono; Colby College at Waterville; Westbrook Seminary at Deering; and Maine Wesleyan Seminary and Female College at Kent's Hill. The illiterate of 10 years and over were 5.1 per cent, but this per cent would have been lower if the test had been made from the standpoint of those who could read or write in any language. A law of 1821 required that not less than 40 cents per capita of all inhabitants should be raised annually for school purposes. A public school fund was created in 1828 by setting apart 20 townships of lands belonging to the State. Moneys

MAINE

received from the United States for claims for services rendered in the War of 1812 were set apart for educational purposes. The compulsory law which covers the ages from 7 to 15 is strictly enforced. The district system has been abandoned and, instead the town system is in use. Since 1873 the State has aided towns where free academic instruction is given to the pupils. This instruction may be given in a high school within the town, or, since 1889, the town authorities may arrange for the education of its pupils with a high school outside the town. The number of free high schools receiving State aid in 1901 was 211. State institutes or summer schools for teachers are maintained by the State under the supervision of the State superintendent. The Indians are well provided with schools. The teachers' examinations and certificates are uniform and are in charge of the State. Strong efforts are made to have all the teachers normal school graduates. In 1903 about 25 per cent of those teaching in the schools were normal graduates.

Charitable Institutions.—There is a National Soldiers' Home at Togus, a United States Marine Hospital, and a State General Hospital at Portland. There are State Insane Asylums at Augusta and Bangor, military and naval orphan asylums at Bath and a State Industrial Home at Hallowell. The State School for Deaf Mutes, the Eye and Ear Infirmary, the Home for Aged and Indigent Women, the Old Men's Home, Saint Joseph's Hospital, Saint Elizabeth's Orphanage, and several private institutions are located at Portland. There are two hospitals, five orphanages and one home for the aged under the auspices of the Roman Catholic Church.

Penal Institutions.—The State prison is at Thomaston, the State Industrial School for Girls at Hallowell, and the State Reform School is near Portland. Prisoners in the county jails and convicts in the State prison are obliged to work, and the products of their labor are sold in the markets. Contracts are sometimes made for the labor of prisoners in the jails of some of the counties. The work of the inmates of the reform school is usually on the farm and in workshops. The girls at the industrial school are taught domestic work and some trades.

History.—Maine is supposed to have been visited by the earliest explorers; Corte-Real in 1501, and Verrazano in 1524, reported a coast the description of which corresponds with that of Maine. Gomez in 1525 sailed along the coast and named the Penobscot River, Rio de las Gamas, or Stag River. Sir John Hawkins, the famous Elizabethan seaman, explored the coast in 1565, and Sir Humphrey Gilbert in the voyage which cost his life was on his way to the Penobscot region, then known as Norumbega, to settle a colony under a patent from Elizabeth. Bartholomew Gosnold, an Englishman (one of the founders of Jamestown, Va.), explored the coast in 1602, and Maine was visited by Martin Pring, in 1603, by De Monts in 1604, and by Weymouth in 1605. The first attempt to settle on the territory was made by the French under De Monts, who, having received a patent from the French king, planted a small colony on Neutral Island in the Saint Croix River. The first colony was settled at the mouth of the Sagadahoc by George Popham and Raleigh Gilbert in 1607. A fort was erected and a number of buildings, and here the Vir-

ginia, the first vessel built in the country, was launched and subsequently formed one of the fleet of the Somers and Gates Colony in 1609. The colony at Sagadahoc was broken up by the death of Popham and great hardships endured by the colonists. They returned to England in the autumn of 1608. In 1613, French Jesuits established a mission on Mount Desert Island, but they were expelled by the English the next year. In 1614, the coast was visited by John Smith, who found a few scattered settlers around Pemaquid Bay and on the island of Monhegan, off the coast of that part of the State now included in Lincoln County. In 1616 Sir Ferdinando Gorges, "The father of American Colonization," who had sent Pring and Popham to Maine, sent his agent, Richard Vines, to Saco to remain during the winter to explore the country and test the climate. In 1620, the King of Great Britain made a division of the grand charter of 1606, and granted to the Plymouth Company in England the whole country lying between 40° and 48° N., and to the Virginia Company the southern portion of the original patent. On 10 Aug. 1622, Gorges received a patent of territory between the Merrimac and Kennebec rivers, and the next year sent his son Robert as Governor and Lieutenant General of the country, accompanied by several councillors and a minister of the Church of England to establish worship. In 1629, another division of lands was made giving to Sir Ferdinando Gorges the country between the Piscataqua and Kennebec rivers, to which he gave the name of New Somersetshire, and the remainder to John Mason. The first court in the Province was convened by William Gorges, nephew of Sir Fernando, at Saco, March 21, 1636. Charles I. granted to Gorges in 1639 a charter under which in 1641 Gorges established the first chartered city in the United States, under the name of Gorgeana, and constituted it the capital of the province. What was then Gorgeana is now York. Its original name was Agamenticus. A fort was built here and efforts made to protect the people against the Indians. From 1630 to 1632, settlements were commenced in Saco, Biddeford, Scarborough, Cape Elizabeth, and Portland, all of which continued to prosper till the Indian War of 1675, when they were overthrown. Massachusetts claimed a portion at least of the territory of Maine on the ground that its charter included the lands as far north as three miles above the source of the Merrimac; but those to whom other charters had been given resented her interference. In 1677, Massachusetts purchased from the heirs of Gorges all their interest in the Province of Maine. A new charter, issued by William and Mary, in 1691, combined the provinces of Massachusetts, Plymouth, Acadia, Maine, and Sagadahoc, into one province called "The Royal Province of Massachusetts Bay." Maine was now a part of Massachusetts. Remote from the centre of white settlements of any great size, Maine suffered from attacks by Indians, especially during the French and Indian wars. When King Philip's War was ended there were within the boundary of Maine only five settlements.

Among the first soldiers in active service in the Revolutionary War were men from Maine, who fought as Massachusetts troops. A regiment from Maine was present at Bunker Hill. The British fleet, in 1775, attacked and destroyed Portland and Falmouth. Off Machias was

MAINE — MAINTENON

fought the battle in which the *Margaretta*, a British ship, was captured. At the close of the War Massachusetts still retained possession of the country and called it the "District of Maine." The people of Maine were divided in their allegiance to Massachusetts, one party desired to remain a part of the "Bay State" and another party wanted independent statehood. The separatist movement gained ground during the War of 1812, as Maine was left unprotected and practically at the mercy of the enemy so far as any assistance from Massachusetts. Maine was admitted into the Union as a State 15 March 1820.

The northeastern boundary continued a source of dissensions with Great Britain, or between the people of Maine and New Brunswick until after the ratification of the Ashburton Treaty (q.v.), which practically settled the eastern boundary between the United States and Canada. The lumbering industry has always been most important, and since 1888-90 there has been a considerable development of manufacturing industries. The legislation of the State has been marked by conservatism and sound judgment. In 1851 Maine adopted a prohibitory liquor law which has since been embodied in the constitution of the State. During the Civil War Maine furnished 70,107 soldiers, of whom 9,398 died during the War and a large number returned to their homes disabled invalids. The State went Democratic at State elections (except 1840) till 1855, when Anson P. Morrill was elected governor as the candidate of the "Know-Nothing" party and also of those who favored a prohibitory law. Since 1856 its elections have gone Republican except in 1878 and 1880, when the Democrats and Greenbacks on a fusion ticket elected their candidates. In 1879 a dispute arose as to the legality of the election of some of the members of the legislature and of the governor. For a time a serious disturbance was feared, but the militia preserved peace until the Supreme Court rendered a decision making the Republican candidates legal members of the legislature. The State has had no serious internal troubles except the "Know-Nothing" agitation in 1854-6, and the dispute about the legislature in 1879. The Australian ballot law was passed in 1891.

Since Maine became a State there have been 39 different governors, some of whom have held the office for more than one term.

JAMES PHINNEY BAXTER.

Maine, France, an old province having Normandy on the north, Brittany on the west, and Anjou and Touraine on the south, and Orléannais on the east. It corresponded to the modern departments of Sarthe and Mayenne. Its chief town was Le Mans.

Maine, University of, opened at Orono in 1867. It was established to take advantage of the national land grant of 1862, under the name of the State College of Agriculture and Mechanic Arts, and is under State control. The name was changed to University of Maine in 1897. Its organization includes: the school of arts and sciences, offering classical, Latin-scientific, and general scientific courses; the school of engineering, with courses in mechanical, civil, electrical, mining and naval engineering, the two latter being added in 1902; the school of agriculture; the school of pharmacy; and the school of law. The State agricultural experiment station is also connected with the University, and receives a special Federal appropriation of \$15,000 annually for its support. In 1902 a summer school and a correspondence course were also begun. The total annual income in 1903 was \$105,680, including the State appropriation, a Federal appropriation of \$25,000 and the above-mentioned special appropriation for the experiment station. In 1903, there were 21,700 volumes in the library; the number of professors and instructors was 54, and of students, 450. The University is coeducational, but the proportion of women students is small.

Maine, The, a battleship of the United States navy, mysteriously destroyed by explosion 15 Feb. 1898, just prior to the commencement of the Spanish-American war. The disaster, which occurred in the harbor of Havana, Cuba, caused the death of 257 American sailors. (See CUBA: SPANISH-AMERICAN WAR.) Another warship of the same name was launched in 1903.

Maine Liquor Law, a local option law of the State of Maine vesting the sale of intoxicating liquors in special agents appointed by the State, and prohibiting all other persons from such sale. The manufacture of intoxicating liquor for unlawful sale is also forbidden. If an authorized agent violate the law, he is subject to a fine not exceeding \$30, and imprisonment not exceeding three months; while the penalty for a violation of the law by a common seller is \$100 fine or three months' imprisonment for the first, and \$250 fine and four months' imprisonment for the second and every subsequent offense. Anyone injured by an intoxicated person may maintain an action against the seller of the liquor, and the owner or lessee of the building in which the liquor was sold is jointly liable if cognizant that the building was used for such purpose. See also TEMPERANCE LEGISLATION.

Main'tenance, in English law, an intermeddling in a suit, by assisting either party with money or otherwise, to prosecute or defend it. This was prohibited by the Roman as well as by the English law.

Maintenon, *Françoise d'Aubigné*, française swaz dô-bên-yâ mân-tê-nôn, MARCHIONESS DE, French queen: b. Niort, Poitou, 1635; d. Saint-Cyr, 1719. Her birthplace was the prison in which her profligate father and unfortunate

mother were confined. From her father's death in her 10th year she was the poverty-stricken ward of her grudging guardian and aunt, Madame de Neuillant, who dressed her like a peasant and set her to guard the poultry. Yet her humiliation did not embitter her bright and cheerful disposition. The famous wit and man of letters, Scarron, deformed, old, and infirm as he was, became her husband, and she was soon the centre of the clever literary people who frequented his house. When Scarron died, her good sense, and delightful disposition recommended her to many friends, who pointed her out to Louis XIV. as a fitting person to take charge of the education of the children born to him by Madame de Montespan. She undertook the office of governess to the royal children, won their affection and respect as well as that of the King, who married her in 1685, when she was 50 and he 47. There can be no doubt that she exercised a beneficent influence over the King's private life. She was undoubtedly disinterested and charitable, her character above stain in a profligate age, and her mind clear and resolute in pursuing the course she knew to be right. She survived the King four years and died at the nunnery which she had changed into a place of education for the poor daughters of decayed families, having enjoyed to the end all the honor and position of a royal widow. Consult Noailles, 'Histoire de Mme. de Maintenon' (1848-58); Geoffroy, 'Mme. de Maintenon d'après sa Correspondance authentique' (1887).

Mainz, mînts, Germany, a town in the Grand-Duchy of Hesse-Darmstadt, on the left bank of the Rhine, opposite the mouth of the Main, 20 miles by rail southwest of Frankfurt. It is a fortress of the first rank, an episcopal see, and a river port. The town rises gradually from the Rhine in the form of an amphitheatre. A railway bridge spans the Rhine a little above its junction with the Main, and a stone bridge connects with the opposite suburb of Kastel. A handsome quay, 330 feet wide, extends along the Rhine for a considerable distance, and large modern harbors have been constructed. The principal edifices are the cathedral, recently restored, a vast building of the 11th century; the former electoral palace, now containing the city library (180,000 vols.), picture-gallery, museum of Roman and Roman-German antiquities, etc.; the old collegiate church of St. Stephen, occupying the highest site in the town, the Church of St. Peter, the German House, or grand-ducal palace with the arsenal adjoining; the courts of justice, the government buildings, public hall, two new concert halls, central railway station, etc. One of the most interesting objects in the town is the house of Gutenberg which contained his first printing-office. A bronze statue of Gutenberg, by Thorwaldsen, stands in an open space near the theatre. The great open-air resort is the *Neue Anlage*, outside the gates, consisting of extensive public gardens, and commanding fine views of the town and surrounding district. The manufactures consist chiefly of leather, furniture, hardware, carriages, carpets, tobacco, beer, chemicals, musical instruments, gold and silver wares, machinery, soap, hats, etc. The trade, particularly transit, is extensive. The principal articles are Rhenish wine, corn, flour, oil, coal, and wood. Mainz owes its founda-

tion to a Roman camp which Drusus pitched here. On the decline of the Roman power it was almost entirely destroyed, but was afterward rebuilt chiefly by Charlemagne, and became the first ecclesiastical city of the German empire, of which its archbishop-electoral ranked as the premier prince. Its history during the 16th century is of considerable interest in connection with the Reformation, which early brought Luther into collision with its ecclesiastical authorities. Pop. (1900) 84,335.

Maiolica. See MAJOLICA.

Maipo, mî'poo, or **Maipu**, a river in Chile, having its rise in the Andes Mountains and flowing almost due west into the Pacific Ocean. It is 120 miles in length. The falls and rapids furnish valuable water-power which has not been utilized to any great extent. The city of Santiago is a few miles north of the river. On 5 April 1818 was fought on the banks of the Maipo the battle which decided the independence of Chile.

Mair, mār, **Charles**, Canadian writer: b. Lanark, Ont., 21 Sept. 1840. He was educated at Queen's University, Kingston, and entered journalism. He aided in quelling the Riel insurrections and was one of the organizers of the "Canada First" party. Among his works are: 'Dreamland and Other Poems' (1868); 'Tecumseh,' a drama (1886).

Maisonneuve, mā-zō-nèv, **Paul de Chomedey**, SIEUR DE, French colonizer: b. Champagne, France; d. Paris 9 Sept. 1676. He enlisted in the French army at 13 and later organized a band of colonists with whom he landed at Quebec in 1641. In 1642 he founded Montreal and was for 22 years its governor but was absent for a time in 1652 when he returned to France to conduct to America a new party of settlers. He displayed great administrative ability, but through the jealousy of De Mézy, governor-general of Canada, was in 1664 recalled to France by De Tracy. Though no charges were made against him he found no possibility of reinstatement in office and resigned in 1669.

Maistre, Joseph Marie, zhō-zéf mā-rē mās̄tr, COMTE DE, French philosopher and savant: b. Chambery 1 April 1754; d. Turin 26 Feb. 1821. He was of French extraction and was a senator of Piedmont at the time of the French invasion (1792). He left his country in consequence of that event, and afterward followed his king to Sardinia. In 1804 he was sent ambassador to St. Petersburg, and returned finally to Turin in 1817. De Maistre was familiar both with Greek and Latin literature, and his writings in French have obtained the highest praise of critics. He was a conservative in politics, religion, and philosophy, a supporter of absolute monarchy, and of the infallibility of the pope. His 'Mémoires politiques et Correspondance diplomatique' (1858), however, shows him in the light of a much more discerning and less uncompromising politician than his formal treatises, and indicates a large and liberal appreciation of the revolution which he opposed. As a diplomatist he exerted himself to effect the restoration of all his former possessions to his master, and to obtain the transfer of Genoa. Among his political writings are his 'Eloge de Victor Amadée III.'; 'Considérations sur la France' (1796); 'Essai sur le Principe Géné-

rateur des Constitutions politiques' (1810), in which he maintains the divine origin of sovereignty; 'Soirées de St. Petersburg'; 'Du Pape' (1819); 'De l'Eglise gallicane'; and 'Du Congrès de Rastadt' (the last with the Abbé de Pradt).

Maisur, mī-soor'. See **MYSORE**.

Maitin, José Antonio, hō-sā' ān-tō-nē'ō mī'tān, Venezuelan poet: b. Porto Cabello 1798; d. Choroní, Venezuela, 1874. In 1824 he returned from Havana to his own country whence he had fled on account of persecution, and made his home in the valley of Choroní. In 1844 his best poems were collected and published with the title 'Echocs from Choroní,' and in 1851 a collected edition of all his works appeared.

Maitland, māt'land, Frederick William, English historian: b. England 28 May 1850. He was graduated from Trinity College, Cambridge, and studied law; in 1884 was made reader of English Law at Cambridge and since 1888 has been professor of the same branch there. He has read widely on legal history and is a generally recognized authority. Among his works are: 'Gloucester Pleas' (1884); 'History of English Law,' with F. Pollock (1895); 'Canon Law in England' (1898); 'English Law and the Renaissance' (1901); etc.

Maitland, J. A. Fuller. See **FULLER-MAITLAND, J. A.**

Maitland, Sir Peregrine, British soldier: b. Hampshire, England, 1777; d. London 30 May 1854. He enlisted in the army in 1792 and was promoted rapidly, serving in Spain and at the battle of Waterloo, where he was a major-general. In 1818 he was appointed lieutenant-governor of Upper Canada and in 1828-34 was governor of Nova Scotia. He was made lieutenant-general in 1830 and commanded the Madras army 1836-8. From 1843-6 he was governor-general at the Cape of Good Hope.

Maitland, Sir Richard, LORD LETHINGTON, Scottish poet and antiquary: b. Scotland 1496; d. Edinburgh 20 March 1586. He was educated at St. Andrews and was one of the great lawyers of his day, and although he became blind in 1560 was nevertheless made a member of the privy council, and in 1562 keeper of the great seal. His manuscript collection of early Scottish poetry is preserved at Magdalen College, Oxford, and his own poems were published by the Maitland Club of Glasgow in 1830.

Maitland, William, Scottish statesman: b. Scotland about 1528; d. Leith 9 June 1573. He was a son of Richard Maitland, Lord Lethington, and was educated at St. Andrews and on the Continent. He early entered political life and was interested in the Knox reform movement; in 1558 he was appointed secretary of state by Mary of Guise, and is commonly called "Secretary Lethington." He was one of the commissioners who concluded the treaty of Berwick and in 1560 was speaker of the Scottish Parliament. He was one of Mary's ministers on her return from France, but was suspected of having betrayed her to Queen Elizabeth. In 1563 Maitland conducted a prosecution for treason against Knox whom he had earlier supported, and 1565 he became lord of the sessions but was removed from office for implication

in Rizzio's murder; he was also connected with the murder of Darnley. He contrived Mary's escape from Lochleven but fought against her at Langside. After the assassination of Moray he became the leader of the queen's party and was active in her support. In 1571 he was attainted for treason by Parliament as a result of joining Kirkcaldy at Edinburgh, whom he encouraged to hold the castle until the last. He was taken prisoner at its surrender and died in prison. Consult: Skelton, 'Maitland of Lethington and the Scotland of Mary Stuart' (1887-8).

Maitland, Australia, town, in Northumberland County, in New South Wales; on the Hunter River; about 100 miles north of Sydney. It is connected by railroad with Newcastle, about 15 miles distant. The Hunter River divides the town into East and West Maitland, two distinct municipalities, West Maitland being the larger. The Hunter River frequently overflows its banks and floods the town and surrounding country. Although serious devastation results, the soil has been enriched by this flooding, and so fertile is this section that Maitland is called the "granary of New South Wales." Grapes, grains, tobacco, and vegetables grow in abundance. Large coal fields are near the town. Considerable manufacturing is carried on, especially in West Maitland. Pop. (1901) 10,085.

Maize. See **CORN, INDIAN**.

Majendie, Sir Vivian Dering: b. Pipe Grange 18 July 1836; d. Oxford, England, 24 April 1898. He was educated at Leamington College, commissioned in the Royal Artillery in 1854 and first saw active service in the Crimean war, in which he won the medal with clasps, and the Turkish medal, and he achieved further distinction in the Indian Mutiny. He became captain of artillery in 1861, major in 1872, lieutenant-colonel in 1880 and colonel (retired) in 1882. He was created Commander of Bath in 1880 and Knight Commander in 1895. Was 10 years on duty at the Woolwich Arsenal and in 1871 attached to the Home Office as Inspector of Gunpowder Works under the Gunpowder and Nitroglycerin Acts. He was largely instrumental in passing the Explosives Act of 1875.

It was fitting then that after having had so wide an experience and displayed such thorough acquaintance with the subject, Maj. Majendie should, on the passage of the Act, have been appointed chief inspector. While in this office his investigations of dynamite outrages brought him most conspicuously before the public, his most important service to his country was in so drawing and enforcing the regulations in explosive works as to render employment in these factories among the less hazardous of occupations for British workmen while all mankind benefitted from the exhaustive examinations which he made into accidents arising in the manufacture and use of explosive substances and his admirable reports in which he traced out the causes and offered practical suggestions by which to prevent the recurrence of these disasters. His influence has extended far beyond the confines of his country. For his successful efforts to ameliorate the condition of man he takes rank with Davy, Jenner, Francis, Lister and Florence Nightingale. His monument is the 22 Annual and 50 Special Reports which bear his signature

MAJESTY — MAKART

as Her Majesty's Chief Inspector of Explosives. **CHARLES E. MUNROE**, *Professor of Chemistry, Columbian University, Washington, D. C.*

Majesty (Latin, *majestas*). *Majestas*, in a collective sense, was used in republican Rome to signify the highest power and dignity, the attribute of the whole community of citizens, the *populus*. The *majestas* was also ascribed to the dictator, consul, and even senate, though in the case of the last the word *auctoritas* was used in preference. At a later period, under the Roman emperors, *majestas* was the name of the imperial dignity, whilst that of a magistrate was called *dignitas*. To kings the attribute of majesty was given much later. The courtiers introduced the title into France under Henry II. In the Treaty of Crespy (1544) Charles V. is styled *imperial*, Francis I. *royal majesty*; and in the Peace of Câteau-Cambrésis (1559) the titles of *most Christian and Catholic majesty* are found for the first time. In England Henry VIII. first adopted the title *majesty*. At present this title is given to all European emperors and kings.

Majolica (Ital. *mā-yō'li-kā*), or **Maiolica** (from the Italian name of the island of Majorca, q.v.), a decorated, enameled pottery made in Italy from the 15th to the 18th century. Majolica is an earthenware manufactured from coarse clay paste and covered with a stanniferous glaze or enamel. It has sometimes been called "Raphael ware" from the fact that a number of the paintings on it were copied from the designs of that famous painter. Majolica is generally considered to be the most beautiful decorated pottery that was ever extensively made, at least during the Christian era. Some of the finer pieces when they come into the market bring large, and almost fabulous, sums of money.

Ma'jor, Charles, American novelist: b. Indianapolis, Ind., 25 July 1856. He was educated in the public schools and studied law, establishing a practice at Shelbyville. He has contributed to various magazines and has published: 'When Knighthood was in Flower' (1898); 'The Bears of Blue River' (1900); and 'Dorothy Vernon of Haddon Hall' (1902).

Major, (1) in music, a term applied to imperfect concords, but chiefly to the interval of the third. It also denotes that one of the two modern modes in which the third is 4 semitones above the tonic or key note. (2) In military science, the major is a field officer ranking next below a lieutenant-colonel and above a captain. He has generally the command of a battalion, the exercises of which he superintends, and in action or on parade carries into effect the orders of his superior officer. The term in the French service has been superseded by that of *chef de bataillon*. A brigade major is an officer who performs for a brigade, or in garrison, the duties ordinarily discharged by a major in a regiment or battalion. A major-general ranks next below a lieutenant-general. In other cases, the term major, when applied as an epithet to the several denominations of men in an army, signifies the superior of the department; as sergeant major, the chief non-commissioned officer in a regiment, who assists the adjutant; drum major, the chief of the drum corps, etc.

Majorca, *ma-jōr'ka* (Spanish, *Mallorca*; Latin, *Balearis Major*), Spain, an island in the

Mediterranean, the largest of the Balearic group; area, 1,420 square miles. It is about 120 miles distant from Spain. It is very irregular in shape, and deeply indented, particularly in the northeast. The coasts on the west and north, facing Spain, are lofty and steep; in other directions, and particularly on the east, they are low and shelving. It has a number of good harbors. The surface is irregular, in some places quite mountainous, the peak, Puig de Torella, has a height of about 4,800 feet. Almost all the rocks consist of limestones belonging to the upper part of the Secondary formation, and overlaid by Tertiary strata. The soil is fertile, producing besides large crops of cereals, hemp, flax, silk, saffron, and fruits. The principal occupations of the inhabitants are agriculture and cattle-rearing, and the chief manufacture is that of boots and shoes. The first railroad, crossing the island from Palma, the capital, to Inca, was opened in 1875, and other lines have since been constructed. Pop. (1901) 252,000.

Majorianus, *ma-jō-rī-ā'nus*, **Julius Valerius**, Roman emperor, raised to the throne on account of valor and soldierly qualities in 457. He made war against the Vandals who had landed under Genseric at Ostia and threatened Rome (458), and drove them from Italy. But the great fleet he prepared for the invasion of Africa was burnt in the harbor of Cartagena by the Vandals. He governed well, made excellent laws, and might probably have averted the fall of the Western empire had he not been deposed and assassinated in 461.

Majority, in law, the period of full age, at which the laws of a country permit a young person to manage his or her own affairs. In the United States, as well as in most other countries, the age of majority is 21 years for males, and the same age for females in New York and other States. In certain States the lawful period for females is 18 years. Legal age requirement for the electoral franchise is fixed at 21 years.

Majuba (*mā-joo'bā*) **Hill**, an eminence in the extreme north of Natal, the scene of the defeat of 648 British troops, with the loss of their leader, Sir George Colley, by a superior force of Transvaal Boers, 27 Feb. 1881. The attack was unexpected, and the Boers found the British resting after a night march and a climb of eight hours. The loss of the Boers was about 130, of the British more than 200 in killed and prisoners, besides many wounded and some missing. To the British nation the name Majuba Hill became a synonym for disaster. The anniversary of this fight was marked by the success of Lord Roberts, commander of the British forces in the campaign of 1900, when he received the surrender of the Boer commander, Gen. Cronje.

Makart, *māk'ärt*, **Hans**, Austrian painter: b. Salzburg 28 May 1840; d. Vienna 3 Oct. 1884. He began his art studies in the Academy of Vienna. In 1859 he went to Munich, and painted in the studio of Piloty, under whose teaching (1861-5) he developed remarkable talent as a colorist. His earliest success was a Rembrandt-esque picture of 'Lavoisier in Jail' (1862). His first work to gain him wide fame was his three-paneled picture, 'The Seven Deadly Sins' or 'The Plague in Florence,' which aroused a storm of adverse criticism, wonder and admiration in Paris and Germany. In 1869 the Emperor Francis Joseph built him a fine studio in

MAKEMIE — MALACHY

Vienna, and he produced his series of 'Abundantia' pictures, 'Fruits of the Earth'; 'Fruits of the Sea.' In 1873 followed the picture which attracted so much attention in the Exhibition of Philadelphia (1876) his 'Venice Doing Homage to Caterina Cornaro,' now in the National Gallery at Berlin. He traveled in the East during the winter (1875-6), and his Egyptian sketches materialized in his 'Cleopatra,' 'Antique Hunt on the Nile,' etc. His 'Entry of Charles V. into Antwerp' (1875-8) gained a medal at the Paris Exposition of 1878 and his 'Diana's Hunting Party' is one of the most successful of his larger paintings, combining superb coloring and modeling of the nude with grand landscape effect. It is in the Metropolitan Museum of New York and is most characteristic of the gorgeous sensuousness of a painter who woke the intellectualists of German art to a sense of color, and broke free from the traditions of a somewhat stiff and pedantic method, gaining in life and intensity what he sacrificed of academic correctness. Consult: Lützow, 'Hans Makart' (1886); Stiassny, 'Hans Makart und seine bleibende Bedeutung' (1886).

Mak'emie, Francis, pioneer of the Presbyterian Church in the United States: b. Rathmelton, County Donegal, Ireland, 1658; d. Accomac County, Virginia, 1708. He was a born missionary and zealot, and on being licensed by the Presbytery of Laggan sailed for the British West Indies, and began work in Barbados. In 1684 he sought a wider field in Maryland and organized the first Presbyterian congregation at Snow Hill, capital of Worcester County, Md. After 10 years' labor as an itinerant preacher in most of the Southern States he returned to England and induced two other ministers to accompany him back. He was the first moderator of the Presbytery of Philadelphia (1706), which he assisted in forming; and visited New York (1707), where he was imprisoned for preaching, though when brought to trial was acquitted of lawbreaking. Consult Briggs 'American Presbyterianism' (1885).

Malabar, māl-a-bār', British India, in the Presidency of Madras, in the southwest bordering on the Arabian Sea. A great portion is low land along the coast, rising abruptly at the east where it is bounded by the Western Ghats. The western part is intersected by long, narrow ravines, and the whole is covered with vegetation, in many place large forests. There are a number of tea and coffee plantations and a large amount of rice is raised. The principal towns are Cochin, Callicut, Tellicherry, Kananur, and Mangalore. The name Malabar is often applied to the whole extent of coast country from Cape Comorin as far north as Bombay.

Malabar Nightshade, a succulent edible vine. See **BASILLA**.

Malabón, Santa Cruz de, sán'tā crooth dā māl-lā-bōn', Philippines, a pueblo of the province of Rizal, Luzon, also known as Tambóbong. See **TAMBÓBONG**.

Malabuyoc, māl-lā-hoo'yók, Philippines, a pueblo of the province of Cebú, situated at the mouth of the Malutnoc River on the strait of Tañon, 60 miles southwest of Cebú, the provincial capital. Pop. 13,120.

Malacca, māl-lāk'ā. See **STRAITS SETTLEMENTS**.

Malac'ca Cane, an erect, slender-stemmed palm (*Calamus scipionum*) which, when dressed, is of a brown color, sometimes mottled or clouded. It is used principally for walking-sticks, and is brought from Singapore and Malacca, but is chiefly produced in Sumatra.

Malacca, Strait of, the channel between the Malay Peninsula and the Island of Sumatra, extending from lat. 1° to about 6° N. Entire length, about 520 miles; breadth, varying from 25 miles to 250 miles.

Malachi, last of the Hebrew minor prophets: he was contemporary with Ezra, writing about 450 B.C. Malachi's work was supplementary to that of Nehemiah and Ezra, who were struggling to preserve the integrity of the nation by opposing intermarriage with the heathen and to maintain the purity and persistency of the temple worship by which alone priests and people could be kept together as holy to the Lord. The prophet begins his message by showing that Jehovah still loves and favors his own people in contrast to the visitation he had brought upon Edom. He condemns the neglect and moral perversion of the priests who despise and prove ungrateful to God by the profanity of their niggardly offerings. He only is a true priest who recognizes his covenant obligation to God, and whose life and service are in keeping with it. The shortcomings of the people are next dealt with. Their intermarriages with heathen women and their divorces are an abomination. The coming of God's messenger, then of God himself in judgment, is announced. The day of Jehovah is near; in which the righteous shall triumph and the wicked perish. The law of Moses must be observed, and the coming of Elijah expected as a preparation for that day. The book of Malachi is argumentative and practical. It is plain and convincing. The prophet startles his hearers by stating their own objections, and answering them. Thus contemporary moral and religious life are plainly depicted, in the language of rhetoric rather than of poetry.

Mal'achite, a native basic copper carbonate and hydrate, having the composition $\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$, crystallizing in the monoclinic system, but commonly occurring in massive form, or as an incrustation. It is brittle, and has a specific gravity of about 4, and a hardness of from 3.5 to 4. Malachite is commonly subtranslucent, with an adamantine lustre. It is beautifully green in color, often banded with other colors, and it occurs in many parts of the world, usually in connection with other ores of copper. Specially fine pieces are found in the Ural district, and at the Nizhni Tagilsk copper mines a deposit is known which contains at least half a million pounds of pure malachite. In the United States, the best known deposits are those of Arizona. Malachite has been much prized as a gem stone, and it is extensively used for panels, clock cases, table tops, and other ornamental work.

Malachy, Saint, Irish bishop: b. Armagh 1095; d. Clairvaux, France, 1148. He belonged to the noble family of O'Morgair, was educated by Iombar, an anchorite, and ordained priest in 1119. He afterward studied at Lismore, and returning to Armagh was chosen bishop of Down and Connor (1125). His subsequent election to

MALACOLOGY — MALARIA

Armagh having been disputed (1129) he eventually returned to the less important diocese, and the last moments of his life were spent with St. Bernard, whose monastery he had visited for the purpose of meeting Pope Eugenius. The document known as 'Prophecy of Saint Malachy' containing a Latin motto for each of the popes, is not now considered to be his production. He was canonized in 1189. Consult: O'Hanlon, 'Life of Saint Malachy' (1859).

Malacol'ogy. See CONCHOLOGY.

Malacopterygii, māl-a-kōp-tē-rīj'i-i, or **Malacop'teri**, a group of fishes, in former systems of classification, including those with jointed and spineless or "soft" fin-rays. Compare ACANTHOPTERYGII; and see ICHTHYOLOGY.

Malacos'traca, one of the two primary divisions of the *Crustacea* to which all of the larger and more highly organized forms belong. The number of pairs of appendages and of segments is definite, the former being always 19 and the latter 19, except in the order *Leptostraca* which have the last two abdominal segments limbless. The boundary between head and thorax is not always clearly defined but the two always comprise 13 segments, of which 5 almost always belong to the head; the abdomen has six limb-bearing segments and is terminated by the telson which is probably a seventh segment. The head bears a pair of eyes, usually stalked, two pairs of antennæ, a pair of crushing jaws or mandibles and two pairs of maxillæ, to which a pair of maxillipeds is sometimes added (*Arthrostraco*). Of the typically 8 thoracic segments from 1 to 3 bear maxillipeds and the remainder walking feet. In most cases the thorax is more or less completely covered by a carapace. The mode of development is varied, sometimes, as in the crayfish, it is direct, sometimes with a nauplius, but usually through the larval form called zœa (see LARVA), which possesses paired eyes as well as a median eye, a swimming tail and usually 7 pairs of appendages. The subdivisions are:

Order *Septostraca* (*Nobalia*).

Order *Arthrostraca* { *Amphipoda* (beach fleas).
 Isopoda (wood lice).
 Cumacea (*Diastylis*).
 Stomatopoda (*Squilla*).
 Order *Thoracostraca* { *Schizopoda* (*Mysis*).
 Decopoda { *Macrura* (lobsters
 and shrimps).
 Brachyura (crabs).

Malade Imaginaire, mālād ē-mā-zhē-nār, **Le**, a comedy in five acts by Molière. It was produced in Paris (1673), was the last work of its author, and the last in which, as Argan, he appeared on the stage. See MOLIERE.

Malaga, māl'a-ga, Sp. māl'ā-gā (ancient MALACA), Spain, capital of the province of Malaga; on a small arm of the Mediterranean; about 70 miles northeast of Gibraltar. It was a flourishing city under the Romans, and its long occupation by the Moors has left distinct marks in the older parts of the town; the Gibralfaro, or Moorish castle, on a hill overlooking the town, and considerable portions of the ancient fortifications, yet remain. Among the important buildings are the cathedral, a highly decorated structure in the composite style with a spire 300 feet high; the Episcopal palace, custom-house, and several hospitals and charitable institutions, etc. The manufactures consist chiefly

of iron, the ore of which is obtained from rich mines in the vicinity; soap, cottons, linens, machinery, etc. The harbor is excellent and the trade is of importance, the principal exports being olive-oil, lead in bars, wine, and fruit, particularly raisins, oranges, and almonds. The climate is one of the mildest and most equal in Europe. Pop. (1902) 132,015.

Malaga Wine, a sweet Spanish wine produced in the province of Malaga. It is one of the "muscatel" wines, and is rich, luscious, and full of body. See also WINES.

Malagas'y Subregion, a faunal division of the Ethiopian Region in Zoogeography which embraces Madagascar and some small neighboring islands. See MADAGASCAR; ZOOGEOGRAPHY.

Malakoff, māl'la-kōf. See SEBASTOPOL.

Malampaya, māl-lām-pā'yā, a sound on the northwest coast of the province of Paragua, island of Palawan, Philippines; it is an arm of the China Sea, extending 24 miles from northwest to southeast, and from 3 to 6 miles wide. It is entirely landlocked, Tularan island protecting it from the China Sea, and is entered by Blockade and Endeavor Straits. Its depth varies from 36 to 54 feet, it is free from sunken dangers to navigation, is one of the finest harbors in the Philippine archipelago, and has been suggested as one of the best locations for a naval station between Balabac and Manila.

Malanao, māl-lā-now', the name commonly given the Moros, especially Ilanos, who live on the shores of Lake Malanas, island of Mindanao. See PHILIPPINE ISLANDS.

Mal'aprop, Mrs., a character in the 'Rivals' of Sheridan. Like Shakespeare's Dogberry she is made to employ words of the same length, accent, and more or less similar vowel and consonantal value, interchangeably. Hence her well-known 'Allegory on the Banks of the Nile'; 'Derangement of Epitaphs'; 'A Barbarous Vandyke'; etc.

Malapteru'rus. See ELECTRIC FISHES.

Mälär, mäl'är, **Lake of**, Sweden, a lake running inland from the Baltic about 81 miles, with an average breadth of 13 miles and an area of 525 square miles. It contains upward of 1,200 islands. Its east end is closed by Stockholm, where its waters are poured into the Baltic by various channels, the difference of level being about six feet. It is surrounded by the populous districts of Stockholm, Nyköping, Upsal, and Westeras, and the shores are varied with bays and hills, woods, lawns, and cliffs, and are adorned with many castles, country-seats, and villas, including the royal palaces of Drottningholm and Gripenholm.

Malaria, an infectious disease due to animal parasites, and which is characterized by intermittent attacks of chills and fever, so-called intermittent fever, or a continued fever with remissions; or by a chronic malarial cachexia. Malaria is a disease which is very widely distributed. It is found throughout Europe, particularly in the more southerly regions, Italy and Spain, but is absent in the more northerly parts of the Continent, where the temperature prohibits the development of the mosquito, the chief carrier of the disease. In Asiatic countries, particularly in India, malaria is very frequent; and in Africa different types of malarial fever con-

MALARIA

stitute a feature most obnoxious to colonization. In the United States, particularly in the Southern States, malaria prevails. Along the New England coast, where it at one time was very common, it has become much diminished in prevalence and in severity. The Pacific coast region is free from the disease, and the Northwest States are comparatively free. In the region of the Saint Lawrence River malaria is unknown.

In order to understand clearly the different forms of malarial fever, it is important to bear in mind that the different types are due to minute animal parasites which enter the blood, usually by the bite of one of a particular genus of mosquitoes (*Anopheles*). (See MOSQUITOES AND THE PROPAGATION OF DISEASE.) The parasite develops after its introduction into the blood and, according to the individual type that is introduced, certain variations in the developmental history of the disease result. The parasites themselves, which are thought to be low forms of animal life, protozoa, develop, for the most part, in the red blood-corpuscles, and have many allies in the red blood-corpuscles of other animals, as frogs, fish, birds, monkeys, cats, etc.

These organisms were first clearly demonstrated by Laveran, a French army surgeon, in 1880, and his early observations were enlarged and amended by Golgi, Marchiafava and Celli, Manson and Ross, and a host of others. At the present time at least three forms of the parasite *Plasmodium malariae* are known, the parasite of tertian fever, the parasite of quartan fever and the parasite of æstivo-autumnal fever. These parasites have two cycles of development, one taking place in the body of man, and the other in the body of the mosquito. Thus a patient with malarial fever infects a mosquito with a parasite which undergoes certain transformations within the body of the mosquito, and is then in turn introduced into the body of another patient, to cause typical attacks of fever according to the type of parasite introduced. Occasionally two different parasites are introduced into the patient's body, and a mixture of the two forms of the disease results.

The commonest form of malarial fever (the so-called chills and fever, or ague) is due to the tertian and quartan parasites. In these, after an unknown period of incubation, probably from 36 hours to 15 days, the patient has a feeling as though he were going to be sick, sometimes with headache, sometimes a feeling of lassitude and a desire to yawn and to stretch. Occasionally the patient has nausea and vomiting. At the same time the temperature has begun to rise and a chill commences. He begins to shiver, the face becomes drawn, thin, and cold, the body shakes, the teeth chatter, and the skin may be cold and blue, although the internal temperature is known to be gradually rising. After from 10 to 15 minutes, or perhaps a longer time, the chill is followed by a hot stage. The coldness of the surface disappears, and the face becomes congested and flushed, the skin is red, the pulse is full, and the patient may have a throbbing headache, with mental excitement. Thirst is excessive. Then the period of sweating begins, the whole body being covered with perspiration; the temperature drops, the headache disappears, and in an hour or two the paroxysm is over.

A number of variations from this typical form are known. In the tertian type of fever the chill and fever usually occur every other day. This is due to the fact that the cycle of development of the tertian parasite is about 48 hours and that the stage of full development of the parasite, or sporulation, which is more or less coincident with the attack, occurs at these times. Thus every third day the patient has an attack, hence the term "tertian." In the mixed infections, when two sets of parasites develop on alternate days, the paroxysms of chills, fever, and sweating may occur every day. In the quartan type of fever the cycle of development of the parasite is completed every fourth day. Mixed infections also occur in this form of the disease. In the northern United States these are the types of malaria which are more common, but below Mason and Dixon's line a much severer form of the disease is present. This is the æstivo-autumnal type, which gives rise to the so-called bilious remittent fevers and typho-malarial fevers of the South. In these the symptoms are extremely irregular. The paroxysms occur every 24 or 48 hours, and longer remissions are known. The length of the paroxysms is usually longer, lasting 20 hours, instead of 10 or 12 as in the tertian form; the onset of the disease is usually slow and gradual; and there may be no chill. Occasionally there is a continuous fever without much break, the temperature ranging from 102° to 103° F. Jaundice is not infrequent, and this, with the fever and a furred tongue and mental disturbance, often gives rise to the suspicion of typhoid fever. In the simpler types the patient may get well after ten days or two weeks without any special medication. The more severe forms may be fatal unless prompt diagnosis and medication are instituted. The diagnosis of malaria should always include an examination of the blood and the demonstration of the parasite. In the vast majority of untreated cases the parasite can be found. Occasionally, however, repeated examination fails to show it.

Treatment should be prophylactic as well as actual, and attention should be paid to the avoidance of infection no less than to care of the disease itself. Rigid protection of houses by means of screens to keep out the *Anopheles* is one of the most important procedures. Furthermore, it is highly essential that the mosquitoes themselves should be protected from the infection by screening all patients suffering from malarial fever. In order to do this the patient's couch should be surrounded by mosquito-netting, and all mosquitoes in the room of the malarial patient should be killed by means of pyrethrum-powder. Further measures for destroying malaria should be taken by draining off swamps and employing proper engineering methods in order to get rid of the mosquitoes themselves. The planting of swamps with leafy trees often dries them up, and thus prevents the formation of breeding places for mosquitoes. Finally the specific, quinine, should be used in all cases. It is a prompt and sure parasiticide, and in its varied forms can be used by almost every patient, despite individual idiosyncrasies.

In the consideration of some of the chronic forms of the disease a number of perplexing conditions are met. Thus, following constant exposure to malaria and repeated attacks of the disease, symptoms of anæmia, of breathless-

MALARIAL FEVER—MALAYS

ness, swelling of the feet and ankles, bleeding in different parts of the body and enlarged spleen may be found. This is a type of infection known as malarial cachexia. It is found in southern countries, and should be distinguished from the cachexia due to various forms of intestinal parasites. See MOSQUITO; MIASMA; MICROSCOPY, CLINICAL.

SMITH ELY JELLIFFE, M.D.

Malarial Fever. See MALARIA.

Malauéc, mā-low'ek, a provincial language, used largely in commerce, in Luzon, Philippine Islands (q.v.).

Malay (mā-lā') **Archipelago**, also called the **INDIAN, ASIATIC OR EASTERN ARCHIPELAGO**, and **EAST INDIA ISLANDS**, is the greatest group of islands, numerically and in extent, in the world. They are situated to the southeast of Asia between that continent and Australia, and extend between the meridians of 95° and 135° east, and the parallels of 11° south and 17° north, with the Indian Ocean on the west and the Pacific Ocean on the east. The archipelago is composed of the Sunda or Dutch East India Islands, Sumatra, Java, Flores, Timor, and the numerous adjacent smaller islands; Borneo, Celebes, the Molucca or Spice Islands and their several minor neighbors; and extending to the north includes the Philippine and Sulu Islands belonging to the United States. New Guinea was formerly included in the archipelago, but more properly belongs to Australasia. See separate articles on the various islands. Consult: Wallace, 'The Malay Archipelago' (1880).

Malay Peninsula. See STRAITS SETTLEMENTS.

Malay'an Bear, or **Sun Bear**, a small bear (*Ursus malayanus*), found in the Malayan Archipelago, Borneo, Sumatra, and Java. It is about 4½ feet in length; the fur is black, fading into brown on the nose which is remarkably broad and blunt. The chest bears a crescentic white mark, or, in the Bornean variety, an orange-colored, heart-shaped patch. It usually feeds on grains and fruits, and is very fond of honey, but occasionally indulges in animal food; and is said to attack man, when hard pressed.

Malayan Subregion, a faunal division of the Oriental Region, composed of the southern end of the Malay Peninsula and all the islands of the Malay Archipelago as far as the Philippines and to the Straits of Macassar, where this district is separated from the Australian and Papuan subregions by Wallace's line (q.v.). See ZOOGEOGRAPHY.

Malays', a race of people inhabiting the Malay Peninsula and the Malay Archipelago, and claiming to have their native country in the highlands of Sumatra. The civilization of India appears to have extended itself to the Malays at an early date. In the 13th century the Malays were on the Peninsula of Malacca, where they built a city of the same name, and founded an empire. Their sultans had subdued Sumatra previously to their settling in Malacca. They afterward possessed themselves of the rest of the Sunda Isles, of the Philippines, the Moluccas, and some of the Australian groups, where Malay tribes are found resembling, in their features, religion, and government, the Malays of Malacca. At that time they acted a splendid part in Asia; they carried on commerce, in part

with their own ships, and planted colonies. Great numbers of ships from China, Cochinchina, Hindustan, and Siam filled the harbors of Malacca. They are now divided into distinct tribes, without any general head. This is partly owing to the superiority which the Europeans, particularly the Dutch, have obtained in the Indian seas, and partly to the feudal system of the Malays, by which the national power has been divided and a common spirit prevented by the increasing power of the vassals. The civilized Malays profess the Mohammedan religion. Besides the Koran, the Malays have various local laws. They are fierce and warlike, always bearing arms, and much addicted to the use of force, treacherous in their alliances, and addicted to piracy. The Malay language is widely used as the language of commerce throughout the South Seas and in the islands south of the Philippines. The Malays have long pursued a piratical career, darting from hidden streams in their well-manned proas on any vessel that approached too near the coast, or more boldly lying in wait in fleets in the open sea, for any expected rich prize. Physically considered, the Malays are of low stature, slight in figure, and with very small wrists and ankles. The face is round, the eyes black and somewhat almond-shaped, the nose short and small, cheek bones prominent, features flat, the hair straight and black, the complexion yellowish. In various respects they bear a close resemblance to the Mongolians of Eastern Asia, but differ from them radically in language, all their dialects belonging to a distinct Malayo-Polynesian family which is widely distributed throughout the Indian and Pacific oceans. Of late years the lessons taught them by European and American war vessels have forced the Malays to desist from piracy, their old lawless, roving habits being largely abandoned for the more settled occupations of trade and agriculture. Among the many Malay tribes are the Sakais, or tree-dwellers, who build their houses in forked trees, eight to twelve feet above the ground, reached by bamboo ladders, which are hoisted at will. The tree-dwellers are armed with long blow-guns shooting poisoned arrows. The bamboo furnishes most of their articles of ornament and utility. The blow-gun is a bamboo about an inch and a half in diameter and six and a half feet in length. The bore, drilled most accurately, is a quarter of an inch, and the darts nine inches in length, about the circumference of a heavy darning-needle, sharpened at one end and poisoned. With these they secure all the meat they eat in the jungle,—birds, monkeys, snakes, and lizards. They also have knives made of bamboo.

The Malay intellect is of a low order, and the race has never developed a native culture, their civilization being entirely due to foreign influences, chiefly Hindu and Arab. The Malay language, which is soft and harmonious and of simple structure, is written in the Arabic character, which is ill suited for the purpose. Lately the Roman system has been largely adopted, especially in the Dutch and English dependencies. The literature, which is copious, comprises poetical compositions, such as rhyming-proverbs, love-songs, and dramas displaying some originality, but little imagination. The prose writings are mostly based on Arab or Persian models. Consult Crawford, 'History of the Indian Archipelago'; Logan, 'Journal of

MALBAIE — MALDIVE ISLANDS

the Indian Archipelago and East Asia, and Ethnology of the Indian Archipelago'; Wallace, 'The Malay Archipelago.'

Malbaie, Canada. See MURRAY BAY.

Malbone, māl-bōn', Edward Greene, American painter: b. Newport, R. I., August 1777; d. Savannah, Ga., 7 May 1807. As a boy he was in the habit of frequenting the theatre at Newport to watch the painting of the scenes. At that early age he executed an entire scene, a landscape for the stage, the success of which encouraged him to devote his attention exclusively to painting. At 17 he established himself in Providence as a portrait painter. Meeting with success, he removed in 1796 to Boston, and during the next four years pursued his art in various cities. In 1800 he accompanied Washington Allston (q.v.) to Charleston, and in the succeeding year the two young artists sailed for Europe. Malbone when in London was urged by Benjamin West to take up his permanent residence there with the prospect of ample professional employment; but he returned to Charleston in December 1801. For several years he painted miniatures in the chief cities of the United States with great reputation. His principal imaginative work is 'The Hours,' in which the divisions of the day are personified by female figures.

Malbrouk, māl-brūk', a yellowish, grizzled monkey of West Africa (*Cercopithecus cynosurus*), distinguished from other species of the genus (called guenons) by its wide flesh-colored face with a band across the forehead, the bristly whiskers and ventral parts white.

Malcolm, māl'kōm or mā'kōm, the name of four Scottish kings: MALCOLM I., reigned from 943 to 954, and during this period occurred the cession of Cumbria to the Scots by Edmund I., the English sovereign. MALCOLM II. (d. Glams 1034), succeeded Kenneth II. in 1005 and in his reign Lothian and Strathclyde were secured to Scotland. MALCOLM III., surnamed Canmore (Great Head); b. about 1024; d. near Alnwick, Northumberland, 13 Nov. 1093. After the murder of his father, Duncan, by Macbeth, he was assisted by Siward of Northumbria, and Edward, the Confessor. After the death of Macbeth he was crowned at Scone in 1058. In 1068 he granted asylum to Edgar Atheling, his mother, and two sisters (one of whom, Margaret, he married in 1070), with a number of Saxon exiles. His reign, though largely concerned in warring with England, had nevertheless an important bearing on the civilization and consolidation of Scotland. MALCOLM IV. (the Maiden), d. Jedburgh 9 Dec. 1165, succeeded his grandfather, David I., in 1153. He suppressed two rebellions in his realm, and surrendered Northumberland and Cumberland to Henry II. in 1157.

Malcolm, Sir John, British soldier and diplomatist: b. Burnfoot, Dumfriesshire 2 May 1769; d. Windsor, England, 31 May 1833. He entered in 1782 the service of the East India Company, in 1797 was made captain, and till 1799 was engaged in various important services, terminating at the fall of Seringapatam. He was three times ambassador to Persia, and in 1822 was made major-general, and received a grant of £1,000 per year from the East India Company. He was governor of Bombay, 1827-31, when he finally returned to Britain.

He was knighted in 1812. His principal works are: 'A Sketch of the Sikhs'; 'The History of Persia' (1815); 'Sketches of Persia'; 'A Memoir of Central India'; a treatise on the Administration of British India (1823); 'Life of Lord Clive' (1836). Consult Kaye, 'Life and Correspondence of Major-General Sir John Malcolm' (1856-7).

Malczewski, māl-chěv'skē, Antoni, Polish poet: b. Warsaw, Poland, 3 June 1793; d. there 2 May 1826. He entered the Polish army in 1811, but resigned in 1816 and traveled on the continent, where he met Byron. He settled in Warsaw and there wrote 'Marja' (1825), an epic poem which after his death was recognized as a literary work of great merit, and has since been translated into several languages. None of his work brought him fame or recognition during his life, and he died in wretched poverty. A tomb 'To the author of Marja' was erected in Varsovia.

Malden, māl'dēn, Mass., city, in Middlesex County; on the Malden River, and on the Boston & Maine railroad; about four miles north of Boston. It is connected by electrical railway with Boston, Lowell, Haverhill, Lynn, Salem, and a number of other cities and towns. Malden includes several villages.

The first settlement was made in 1641, but the place remained a part of Charlestown until 1649, when it was made a separate, incorporated municipality. It was chartered as a city in 1881. It is a manufacturing city, having over 630 manufacturing establishments, representing nearly 50 different industries. The chief products are rubber boots and shoes, boot and shoe lasts, and boot-trees, wire cord, leather, sand and emery paper, cotton goods, fibre goods, hosiery and hosiery supporters, knit goods, furniture, soap, and picture molding. The manufactories have a combined capital of nearly \$8,000,000, and the annual output is nearly \$17,000,000. The number of employees is about 5,000. The municipal expenditures are annually about \$602,000; the principal items of which are for schools, \$155,000; for waterworks, \$45,000; for charities, \$40,000; for fire department, \$35,000; police, \$30,000; for municipal lighting, \$30,000. The Metropolitan District water system supplies water to the city, also to Melrose and Medford. Malden has excellent public and parish schools, a number of fine church buildings, a Y. M. C. A. building, four libraries, which contain about 33,000 volumes, a Home for the Aged, and a city hospital. The Converse Library building, designed by Richardson, is beautiful and commodious. The government is vested in a mayor and a council. The executive appoints, subject to the approval of the council, the administrative officials. Pop. (1890) 23,031; (1900) 33,664.

Maldive mal'div Islands (Thousand, Isles), Indian Ocean, a chain of islands at the entrance to the Arabian Sea, 500 miles west of Ceylon, extending from lat. 0° 40' S. to 7° 6' N., nearly on the meridian of 73° 30' E., with a breadth of about 50 miles. The chain is composed of 17 coral atolls (see ATOLL), the larger islands richly clothed with wood, chiefly palm, fertile in fruit, and in various kinds of edible roots. They also produce millet, and abound in coconuts, fowls, and all descriptions of fish. The inhabitants are a civilized race of

people of mixed Singhalese and Arab extraction, Mohammedans and speaking a dialect closely allied to the Ceylonese. They carry on a considerable trade with Bengal, Ceylon, and the Malabar coast, as also to the Red Sea and to Sumatra; exchanging cowries, which are plentiful in the Maldives, coir, mats, oil, fish, tortoise-shell, etc., for rice, sugar, tobacco, and manufactured goods. They are expert navigators and sailors, and have schools for teaching navigation on some of the islands; and they make and repair nautical instruments. They are governed by a sultan, whose title and rank are hereditary; he resides in the island of Mali and pays annual tribute to the British government in Ceylon. Pop. about 30,000.

Malebranche, Nicholas, French philosopher: b. Paris 6 Aug. 1638; d. there 13 Oct. 1715. He studied philosophy in the Collège de la Marche, theology in the Sorbonne and entered the congregation of the Oratorians in 1660. In the history of French metaphysical speculation he ranks second only to Descartes, the greatest of French thinkers, and in 1699 was made member of the Academy of Sciences. He was induced to give many years' study to the Cartesian philosophy by the perusal in 1664 of the treatise 'De Homine' by Descartes, and the fruit of his investigations appeared in his brilliant and original works, 'De la Recherche de la Vérité' (1674), and 'Traité de l'Imagination.' The essence of his philosophy is a sort of mystical idealism. According to him, we have cognizance of things, as well objective realities, as subjective thoughts and feelings, through the idea which resides in our souls; but this idea is in God, so that we perceive everything in God (*vision en Dieu*) as the primal cause of all existences and things. Hence the famous doctrine of 'Occasionalism' or 'Interference,' in accordance with which the objective thing and the subjective impression are made on every occasion to coincide, by the direct interposition of God, in whom alone we think and feel. In the history of philosophy Malebranche may be styled the connecting link between Descartes and Spinoza, the difference between his philosophy and that of the pantheist Spinoza consisting in the fact that to him the Universe was in God, and to Spinoza God was, in fact, in the Universe. Among his other works are to be mentioned 'Conversations Chrétiennes' (1676); 'Traité de la Nature et de la Grace' (1680); 'Traité de la Morale' (1684); 'Entretiens sur la Métaphysique et la Religion' (1688); 'Entretiens d'un Philosophe Chrétien et d'un Philosophe Chinois sur l'Existence et la Nature de Dieu' (1708). Consult: Blampignon, 'Etude sur Malebranche' (1861); Ollé-Laprune, 'La Philosophie de Malebranche' (1870); André, 'La Vie du Révérend Père Malebranche' (1886); Farny, 'Etude sur la Morale de Malebranche' (1886).

Malessherbes, Chrétien Guillaume de Lamignon de, krā-tē-ān gē-yōm dē lā-moin-ōn dē māl-ēs-ārb, French statesman: b. Paris 6 Dec. 1721; d. there 22 April 1794. He was educated at the Jesuits' College, entered the legal profession and in 1745 became counsellor of the Parliament of France; in 1750 he was president of the Court of Aids. He was broad-minded

and liberal in his policy, favoring the publication of the 'Encyclopédie' and owing to his protestation against different measures of Louis XV. was removed from office. Under Louis XVI. he was minister of the interior, but resigned in 1776 and until the Revolution spent his time upon his estates and in travel, with the exception of 1787-8, when he was again minister. At the outbreak of the Revolution he came loyally to the assistance of Louis XVI. and was leading counsel in his defense. He remained with the monarch until almost the last and 11 months later was guillotined for treason. He was the author of essays and pamphlets on financial questions, etc.

Malet, Claude François de, klōd frān-swā dē mā-lā, French conspirator: b. Dôle, Franche-Comté, France, 28 June 1754; d. Paris 29 Oct. 1812. He entered the army in 1771 and became a brigadier-general in 1799. Suspected of conspiracy against Napoleon, he was dismissed from the army in 1807 and confined in La Force. While there he laid new plots and was thenceforward confined in a state prison from 1808 till 1812. During Napoleon's campaign in Russia Malet made his escape from prison on the night of 22-3 October, and by circulating the false news of Napoleon's death won over some of the National Guards. While the latter secured the principal public offices in his name, Malet liberated his fellow conspirators, Generals Guidal and Lahorie, from prison. He was, however, himself taken prisoner by Laborde, chief of the military police of Paris, and was shot with his fellow conspirators.

Malet, Lucas. See HARRISON, MARY SAINT LEGER.

Malherbe, François de, frān-swā dē māl-ārb, French poet: b. Caen, France, 1555; d. Paris 16 Oct. 1628. He was educated in Heidelberg and was engaged in the wars of the League. In 1605 he became court poet under Henry IV., but his work as a critic was of greater value than his poetry, which was lacking in poetic feeling and originality, though metrically perfect. He was the founder of the French school of classicism and must be credited with arousing a critical sense among the thinkers of France. His works consist of translations from the Latin and one volume of original verse. Consult: Allais, 'Malherbe et la Poésie française à la fin du XVI. Siècle' (1892); Brunot, 'La Doctrine de Malherbe' (1891).

Malibran, Maria Felicità, mezzo-soprano singer: b. Paris 1808; d. Manchester, England, 1836. She was early trained for the operatic stage by her father Manuel Garcia (q.v.), the Spanish tenor, and made her debut in London (1825). She had lived in that city since 1817 as a teacher of singing, and her success in Rossini's 'Barber of Seville' was such that she was induced to follow her father to New York, where he had an engagement to establish grand opera. Here she married a French merchant named Malibran. She returned to the stage on her husband's failure in business, and in the spring of 1828 appeared on the Parisian boards in Rossini's 'Semiramis.' She subsequently was welcomed with great enthusiasm in London, Naples, Vienna, Milan, and Venice, and traveled with the violinist de Bériot, whom she married shortly before her early death. She was a great actress as well as a marvellous songstress, and

MALIC ACID — MALLALIEU

the irresistible charm of her person, added to the generosity of her mind and disposition, made her during her brief career one of the most fascinating operatic singers that had ever won the applause of the European public. In 1838 a statue was erected to her in Brussels, which had been her last place of residence. Consult: Nathan, 'Life of Madame Maria Malibran de Bériot' (1846).

Malic Acid, an organic acid discovered in 1785 by Scheele, and now known to be widely diffused throughout the vegetable kingdom, occurring sometimes in the free state, and sometimes in the form of its potassium, magnesium, or calcium salts. It occurs abundantly, for example, in the gooseberry, cherry, strawberry, and barberry, and also in unripe apples, from which latter fact it derives its name (Latin *malum*, an apple). It may be conveniently prepared by boiling the juice of mountain ashberries with enough milk of lime to almost neutralize it, and pouring the precipitate into boiling dilute nitric acid. Acid malate of calcium crystallizes from the nitric acid upon cooling, and this is dissolved in water, and precipitated by acetate of lead, the lead malate that is thrown down being subsequently decomposed by sulphuretted hydrogen gas. Malic acid has the formula $C_4H_4O_6$, or $C_4H_3(OH)(COOH)_3$, is dibasic, and can be obtained in the form of colorless prisms or needles, which are hygroscopic, and dissolve readily in water and in alcohol. Malic acid kills algæ, and when present in a solution in any considerable amount it prevents the precipitation of cupric and ferric salts by the alkalis. With bases it forms compounds known as "malates," which are mostly soluble.

Malice, in law, a premeditated or formed design to do mischief or injury to another, called also "malice prepense" or "aforethought." Blackstone says that malice prepense is not so properly spite or malevolence to the deceased in particular, as any evil design in general; the dictate of a wicked, depraved, and malignant heart; and it may be either express or implied in law. Express malice is when one, with a sedate deliberate mind and formed design, doth kill another. In many cases where no malice is expressed, the law will imply it; as where a man wilfully poisons another; in such a deliberate act the law presumes malice, though no particular enmity can be proved.

Malicious Mischief, in law any injury done to the person or property of another with deliberate malice. This is an indictable offense both in Great Britain and the United States. The comprehensive English Black Act (so-called from its preamble that "several ill-designing and disorderly persons have of late associated themselves under the name of blacks") with others of a like kind were in 1861 codified (24 and 25 Vic., ch. 97) into an act which extends malicious mischief to buildings, fish ponds and other real estate, as well as to most classes of personal property. To constitute this offense, real not merely legal malice must be proved, such as is defined by Blackstone, "a spirit of wanton cruelty or black and diabolical revenge"; or, as defined by the supreme court of Massachusetts, "a spirit of cruelty, hostility or revenge." This spirit must be cherished by the offender not against a third party, but against the party whose person or property has been injured. Some States of

the Union make secrecy a necessary element in the offense, others generalize the offense as implying merely the infliction of unlawful injury. If the injury was inflicted in the discharge of official duty, or under an honest sense of justification, this is sufficient defense to secure acquittal. The offense may be either a misdemeanor (q.v.) or a felony (q.v.) according to its circumstances. Consult: McClain, 'Treatise on Criminal Law, as Now Administered in the United States' (1897); and Harris, 'Principles of the Criminal Law.'

Malicious Prosecution, prosecution of a person unsuccessfully, maliciously and without cause. To constitute this offense it must be proved (1) That the prosecution averred to be malicious was instituted by the defendant named. (2) That it was decided against prosecutor. (3) That the suit was without probable cause. (4) That the motive was malice. (5) That the plaintiff was injured by such malicious prosecution.

Quod facit per alium facit per se is fully applicable to the defendant in a suit for malicious prosecution; hence a corporation may be liable though they acted through their agent. (See TORT.) Consult: Newell, 'Malicious Prosecution, False Imprisonment, and Abuse of Process' (1892).

Maligi, mā-lē-hē', Philippines, an island lying southeast of Talim Island in the Bay Lagoon (q.v.); it is the seat of the United States military prisons.

Malig'nant Pustule. See ANTHRAX.

Malig'nants, in English history, a name applied in 1643 by members of Parliament to designate those whom they considered to be the evil advisers of Charles I. Afterward the name was extended to all who sided with the king against the Parliament.

Malinao, mā-lē'now, Philippines, (1) a pueblo of the province of Albay, Luzon, situated on the Lagonoy Gulf, 18 miles north by west of Albay, the provincial capital, and three miles north of Tabaco. It is on the main road, and is the shipping point for the large hemp product of the surrounding region. Pop. 11,800. (2) A pueblo and military station of the province of Capiz, Panay, on the Akdón River, 6 miles from its mouth, 30 miles west of Capiz. Pop. 5,800.

Malines, mā-lēn. See MECHLIN.

Malingering, mā-līng'gār-īng, a term denoting feigning disease on the part of a soldier, sailor, prisoner, etc., in order to obtain discharge from service, or escape from duty or labor. It implies some overt act, such as the previous application of a ligature, or the taking of some drug, which produced the appearance of the disease said to exist. A worse form of the same crime, "wilfully maiming," is erroneously called malingering.

Mall, māl or mēl, **The**, (1) a promenade in Central Park, New York, regarded as one of the most successful landscape effects in this country. (2) An avenue in London, on the north of Saint James Park.

Mallalieu, māl-lā-lū', Willard Francis, American Methodist bishop: b. Sutton, Mass., 11 Dec. 1828. He was graduated from Wesleyan University in 1857 and became a Methodist Episcopal clergyman in 1858. He has held many important charges and in 1872, 1876, 1880,

and 1884 was a member of the general conferences. He was presiding elder of the district of Boston in 1882-4 and in 1884 was elected bishop.

Mal'lard. See DUCK.

Mallarmé, Stéphane, stā-fān māl-ār-mā, French poet: b. Paris March 1842; d. there 9 Sept. 1898. Most of his life was passed as an instructor in English at the Lycée Fontanes of Paris. He is known as the founder of the curious poetic school of the "Décadents," in whose organ, 'Le Décadent,' as well as in 'Le Parnasse Contemporain,' he published much. Incomprehensibility appears to have been the object of his study, and he entirely attained it in his preface to an edition (1880) of Beckford's 'Vathek.' Others of his works are 'L'Après-Midi d'un Faune' (1876); 'Petite Mythologie' (1878); 'Les Dieux antiques' (1880); 'Poésies' (1887), a translation of Poe's poems (1888), perhaps his most satisfactory performance; and 'Vers et Prose' (1893).

Mal'leability, in metallurgy, the property of extending under the blow of a hammer. For every metal there is a temperature of greatest malleability. The following is the order of malleability of the metals: Gold, silver, copper, platinum, iron, aluminum, tin, zinc, lead.

Mal'leable Glass. See GLASS, MALLEABLE.

Malleco, māl-yā'kō, Chile, a province bounded by Argentina, Cautin, Bio-bio, and Arauco. It has an area of 2,857 square miles. The capital city is Angol. The province is mountainous and well wooded in the eastern and western parts. About one half of the population is composed of Indians of the Arauco tribe. Wheat is the staple agricultural product of the country. A portion of the province is traversed by two railway lines running north and south. Pop. (1885) 59,492; (1895) 97,320; (1902) 102,400.

Mal'lee-bird, or Maleo, a name for the Australian mound-bird (q.v.), derived from a native language.

Mal'lery, Garrick, American ethnologist: b. Wilkesbarre, Pa., 23 April 1831; d. Washington, D. C., 24 Oct. 1894. He was graduated from Yale College in 1850 and was admitted to the bar in 1853; he practised law in Philadelphia until 1861, when he enlisted and served through the war in the Federal army, attaining the rank of lieutenant-colonel. He was executive officer of the Signal Service Bureau until 1876, when he was engaged in a geological survey in Dakota, and in 1879 was retired from the army and appointed chief of the bureau of ethnology. Among his books are: 'A Calendar of the Dakota Nation' (1877); 'Israelite and Indian, a Parallel in Planes of Culture' (1889); 'Greeting by Gesture' (1891); 'Picture Writing of the American Indians' (1893); etc.

Mal'leson, George Bruce, English historical writer: b. London 8 May 1825; d. there 28 Feb. 1898. He was educated at Winchester College, and from 1842 till 1877 served in India, at first in the army, and subsequently in government posts. His chief work, his 'History of the Indian Mutiny' (1878-80), which commenced where the 2d volume of Kaye's 'Sepoy War' left off, and in 1890 there appeared a joint edition of the two histories in six volumes, the 3d volume of Kaye's work being omitted and a

new 6th one added. Other works by him are: 'The Mutiny of the Bengal Army' (1857); 'History of the French in India' (1868); 'Studies from Genoese History' (1875); 'Historical Sketch of the Native States of India' (1875); 'Final French Struggles in India and Indian Seas' (1878); 'History of Afghanistan' (1879); 'The Decisive Battles of India' (1883); 'The Battlefields of Germany' (1884); 'Ambushes and Surprises' (1885); 'The Indian Mutiny of 1857' (1890); and 'Refounding of the German Empire' (1892); lives of 'Clive' (1882), 'Marshal Loudon' (1884), 'Eugene of Savoy' (1888), 'Prince Metternich' (1888), 'Wellesley' (1888), 'Dupleix' (1890), 'Akbar' (1890), 'Warren Hastings' (1894), and 'Lakes and Rivers of Austria, Bavaria, and Hungary' (1897).

Mal'let, John William, American chemist: b. Dublin, Ireland, 10 Oct. 1832. He was educated at Trinity College, Dublin, and at Göttingen, and emigrating to the United States in 1853 became assistant professor in chemistry at Amherst 1854-6 and later chemist to the United States geological survey of Alabama. In 1856-60 he was professor of chemistry at the University of Alabama. He entered the service of the Confederacy and was paroled in 1865 as lieutenant-colonel of artillery. The chair of sciences at the University of Louisiana was occupied by him in 1865-8 and since 1868 he has been professor of chemistry in the University of Virginia. He has contributed valuable scientific articles to the leading chemical periodicals.

Mallet, a wooden hammer used in carpentry and also in the game of croquet (q.v.). The gavel (q.v.) is a variety of mallet. Various small mallets are used by gold beaters, jewelers, dentists and other artisans.

Mallian, mā-yān', Julien de, West Indian dramatist: b. Le Moule, Guadeloupe, 1805; d. Paris, France, 1851. He gained wide reputation as a writer of comedies and dramas, many of which have been presented on the metropolitan stage. The most popular are: 'Two Roses' (1831), a historical drama of the civil wars in England; 'The Carpenter' (1831), a comedy; and 'The Wandering Jew' (1834).

Mallock, William Hurrell, English author: b. Devonshire 1849. He was graduated from Balliol College, Oxford, and won the Newdegate prize in 1872. He has never entered a profession but has devoted himself entirely to literary work. His philosophical and sociological writings include: 'Is Life Worth Living?' (1879); 'Social Equality, a Study in a Missing Science' (1882); 'Atheism and the Value of Life' (1884); 'Property and Progress' (1884); 'Labour and the Popular Welfare' (1893); 'Studies of Contemporary Superstition' (1895); 'Classes and Masses' (1896); 'Aristocracy and Evolution' (1898); 'Doctrine and Doctrinal Disruption' (1900); 'Religion as a Credible Doctrine' (1902). He has also written several works of fiction, most of which deal with the same social and religious problems as the above works, including 'The New Republic' (1877), in which he introduces many well-known contemporaries under thin disguises; 'A Romance of the Nineteenth Century' (1881; new edition 1894); 'The Old Order Changes' (1886); 'A Human Document' (1892); 'The Heart of Life' (1895); and 'The Individualist' (1899);

MALLOPHAGA—MALONE

and has published two volumes of verse and a translation of Lucretius' 'On Life and Death' (1878). His philosophical works deal with the fundamentals of religion arguing for supernaturalism and aiming to show that science alone supplies no basis for religious belief; in his political and economic writings he has attacked the radical and socialistic theories and tendencies of the age.

Malloph'aga, a name used for an extensive and varied assembly of feather-eating and hair-eating bugs, usually called lice. They are very small, oval, delicate, and of swift motion; of light brown color, some with shovel-shaped heads, others with horn-like appendages on the head. One delicate kind vexes the canary, gluing eggs to its feathers and in the cracks of its perch. *Gonicotes* is a large form, a tenth of an inch long, with bristled head and shield-like head, and is one of the pests of domestic fowls. One species, colored with bands of yellow and brown, infests the turkey and the peacock. Another great family, *Liethidae*, contains species which resemble white ants, and prey upon the feathers of falcons and of wading birds. *Gyrpus* infests guinea-pigs, massing thickly about their neck and ears.

Mal'lory, Stephen Russell, American lawyer: b. Trinidad, W. I., 1813; d. Pensacola, Fla., 9 Nov. 1873. His parents removed with him to the United States in 1820, and he was educated in Mobile and in Nazareth, Pa. He studied law and was admitted to the bar in 1839; he was United States Senator 1851-7 and in 1861, entered the service of the Confederate States as secretary of a navy not in existence. He was arrested at the close of the war and held for 10 months, after which he returned to Pensacola and was until his death engaged in law practice.

Mallow, a genus of herbs (*Malva*), of the order *Makraccæ*. The species, of which there are less than a score, are widely scattered, and are characterized by angled, lobed or dissected leaves, and solitary, or clustered axillary flowers. They include four species cultivated in America and one very well known weed, *M. rotundifolia*, popularly known among children as "cheese-plant" because of the shape of the fruits, which also suggested another popular name, "shirt-button plant." The plant is a perennial, very persistent of life, and rather difficult to eradicate except by constant clean cultivation. Musk-mallow (*M. moschata*), is cultivated for its large, showy pink or white flowers; *M. alcea* is also popular. *M. crispa* furnishes a useful fibre, as probably other species could be made to do. Its leaves are often used for garnishing but are not eaten. This species and *M. sylvestris* are frequently seen in old gardens and in their vicinity as escaped plants, but are not offered for sale by seedsmen. The name mallow is loosely applied to many species of the mallow family, but not of the genus *Malva*; for instance, marsh-mallow (*Althæa officinalis*), rose-mallow (*Hibiscus moscheutos*), and Indian mallow (*Abutilon avicennæ*); also, more loosely still to unrelated plants, as Jew's mallow (*Corchorus olitorius* or *C. capsularis*). See ABUTILON; CORHORUS; HOLLYHOCK; HIBISCUS.

Malmaison, māl-mā-zōn, a celebrated French château on the Seine, 10 miles west of Paris. It was the favorite residence of Josephine,

wife of Napoleon I., and here she died. The château belonged to Richelieu, and was restored in 1861 by Napoleon III. In 1870 a sortie by Ducrot from Paris was repulsed here by the Germans.

Malmesbury, māmz'bēr-ī, James Harris, 1ST EARL OF, English diplomatist: b. Salisbury, England, 21 April 1746; d. London 20 Nov. 1820. He was educated at Merton College, Oxford, afterward studied at Leyden, and in 1768 became secretary of legation at Madrid. He was ambassador at Berlin 1772, in 1777 at St. Petersburg, and in 1784 at The Hague. In 1788 he was created Baron, in 1800 Earl of Malmesbury and viscount Fitz-Harris. In 1793, with other Whigs, he deserted Fox for Pitt, and in 1795 had married by proxy and conducted to England the Princess Caroline. Consult: 'Daines and Correspondence' (1845); 'Lord Malmesbury and his Friends' (1870). (Both works edited by J. H. Harris, his grandson.)

Malmesbury, William of. See WILLIAM OF MALMESBURY.

Malmignatte, māl-mī-nyăt', a spider. See LATRODECTUS.

Malmö, māl'mê, Sweden, a seaport and the third largest town of the country, on the Sound, almost opposite Copenhagen, 17 miles distant, with which it has steam-ferry communication, a channel being maintained in winter by an ice-breaker. Malmö is a busy industrial centre with important manufactures, is the terminus of several railroads, and is 384 miles by rail southwest of Stockholm. The town and its harbor have been considerably improved and modernized, and an extensive export and import trade is carried on. Malmö dates from the 12th century. Pop. (1900) 60,857.

Malmsey, mām'zī or māl'm'sī, a sweet wine, made from a grape grown on rocky ground, in Madeira, exposed to the full influence of the sun, and not gathered until partially withered.

Malolos, mā-lō'lōs, Philippines, a pueblo and the capital of the province of Bulacán, Luzon, situated at the head of one of the inlets of the Pampanga River delta, five miles northwest of Bulacán, the former capital. It is a telegraph and military station, is near a station of the Manila Dagupan railroad, and is the centre of an important trade. It is in a region which was a stronghold of the insurgents, and immediately after the close of the Spanish war was made the capital of the insurgent government. Pop. 14,600.

Malone, ma-lōn', Edmund, English Shakespearean scholar: b. Dublin 4 Oct. 1741; d. London 25 April 1812. He was educated at Trinity College, Dublin, and was called to the Irish bar in 1767, but henceforth devoted himself entirely to literary pursuits. His most important and permanent critical works are: 'Attempt to Ascertain the Order in Which the Plays of Shakespeare Were Written' (1778), which still carries authority; his edition of the poet in 10 volumes; and the edition known as the Third Variorum, which was prepared after his death by James Boswell, the younger, out of material left by the critic, and published in 21 volumes. This last is still the best of all complete critical editions. He also published: 'Remarks on the Rowley (Chatterton) Con-

MALONE — MALT AND MALTING

troverſy'; 'An Inquiry into the Ireland Shakespearian Forgeries'; and biographical memoirs of Sir Joshua Reynolds, Dryden, W. Gerard Hamilton, etc.

Malone, Walter, American verſe writer: b. De Soto County, Miſs., 10 Feb. 1866. He was graduated at the University of Miſſiſſippi, and ſubſequently engaged in the practice of law and in literary work. He has contributed to the periodicals of the day and has published: 'Claribel, and Other Poems' (1882); 'The Coming of the King,' ſhort ſtories (1897); 'Songs of the North and South' (1900); etc.

Malone, N. Y., village, county-seat of Franklin County; on the Salmon River, and on the New York C. & H. R. and the Rutland R.R.'s; about 275 miles north by weſt of Albany, and 12 miles from the boundary between the United States and Canada. It is ſituated at the northern foot-hills of the Adirondack Mountains, in an agricultural region, the chief products of which are hops, hay, and potatoes. The dairy products and poultry are important.

The place was named in honor of Edmund Malone (q.v.), an Irish barrister and writer, by his friend, William Conſtable, who, together with his wife, named many of the places located within the limits of the large tract of land in the northern part of New York known as 'The Macomb Purchase.' The firſt ſettlement was made in 1802, and its firſt inhabitants were moſtly from Vermont and Ireland. In 1829-30 the people began conſidering the founding of an academy, and a number of the farmers pledged their farms as ſecurity for the payment of the debt incurred for the erection of the building, and Franklin Academy was eſtabliſhed in 1831. The Northern railroad, now Rutland railroad, entered the town in 1851, and the New York Central in 1892.

Malone figured prominently in the War of 1812; and furniſhed a large number of ſoldiers, privates and officers, in the Civil War. The village was the ſcene of two Fenian (q.v.) gatherings.

The chief manufactures are paper, pulp, flour, lumber, leather, woolen goods, foundry and machine-shop products, ſaſh doors, and blinds, men's clothing, cigars, and dairy products. The electric-light and gas plants and the waterworks are owned by private companies. Malone is the commercial centre for the greater part of Franklin and parts of the adjacent counties, a ſection having a population of about 50,000. There are two national banks capitalized for \$300,000. The village has ſix fine churches, a high ſchool building (formerly Franklin Academy), ſeveral grammar and primary ſchools, the county court-house, jail, a State Army, and ſeveral wholesale eſtabliſhments. The educational institutions, beſides the public ſchools, are a State School for Deaf Mutes, and Saint Joſeph's Academy. There are three public libraries, the Wead Library, 7,000 volumes, free to the people of the ſchool diſtrict, is houſed in a beautiful building donated by Mrs. S. C. Wead; the Wadhams Library, 2,000 volumes, eſtabliſhed and maintained by a literary ſociety, free to all the people of the town of Malone (ſeveral ſchool diſtricts), and the Franklin County Hiſtorical Society library, eſtabliſhed in 1902. There is a well-kept park,

the 'Village green,' formerly the place of drill for the State militia. Malone was the home of William A. Wheeler, vice-president of the United States; John Larkin Thorndike, who built the Oroya and other railroads in Peru, S. A.; Aſhbel P. Fitch, later of New York city, and a number of other noted people.

The government is veſted in the preſident and board of truſtees of the village under the general laws of the State of New York. The officers beſides the preſident and ſix truſtees are collector, treaſurer, and police juſtice, all choſen by popular election, and the clerk and policemen who are appointed by the board of truſtees. Since the Federal cenſus of 1900 an adjoining manufacturing ſuburb has been incorporated in the village. Pop. (1890) 4,986; (1900) 5,935; (1903) 7,000.

Maloo Climber. See BAUHINIA.

Mal'ory, Sir Thomas, author of the Engliſh proſe romance 'Morte d'Arthur.' The work was finiſhed in the ninth year of Edward IV.'s reign, 1470, and published by Caxton in black-letter folio, in 1485. Little is known of the author; he may have been a prieſt; Caxton calls him "a ſervant of Jeſus both day and night," and prieſts frequently were accorded the title "Sir." Probably he was a Welſhman. See ARTHURIAN LEGENDS; MORTE D'ARTHUR; GRAIL, THE HOLY; LANCELOT; MERLIN; TRISTRAM.

Malot, mǎ-lô, Hector, French novelist: b. La Bouille, near Rouen, France, 20 May 1830. He ſtudied law, but abandoned it for a literary career, and in 1859 iſſued the firſt of a long ſeries of ſucceſſful novels. He was for a time newspaper correſpondent in London, and is literary critic of 'L'Opinion nationale.' Among his many books are: 'Victimes d'Amour' (1859); 'Sans famille,' published in Engliſh as 'No Relations' (1878); 'Conſcience' (1888); 'Complices' (1893); an autobiography, 'Le Roman de mes Romans' (1896).

Malpighi, mǎl-pĕ'gĕ, Marcello, Italian anatomist: b. Crevalcuore, Italy, 10 March 1628; d. Rome 29 Nov. 1694. He received a medical education in Bologna and was granted a doctor's degree in 1653. In 1656 he became profeſſor of medicine at Piſa, where he formed a frienſhip with the mathematician Borelli, who encouraged him to proceed with reſearches in anatomy. His health failing he returned to Bologna and continued his investigations, which reſulted in diſcoveries which eſtabliſhed facts undisputed in the modern world of ſcience and placed the world's knowledge of physiology on a new footing; his reſearches in botany and entomology were highly important. In 1691 he was ſummoned to Rome as firſt phyſician to Innocent XII., in which office he died. He published numerous ſcientific works of great value, a complete edition of which was published in Venice 1743.

Malplaquet, mǎl-plā-kā, Battle of, the bloodieſt in the war of the Spaniſh Succeſſion, gained by Marlborough and Eugène, the commanders of the allies, againſt the French under Villars 11 Sept. 1709. The French loſt 10,000; the allies more than 20,000.

Mälstrom. See MAELSTROM.

Malt and Malting. See BREWING AND MALTING.

MALT REFUSE—MALTE-BRUN

Malt Refuse, Malt Sprouts. See NUTRITION OF FARM ANIMALS.

Malta, māl'ta, an island in the Mediterranean, belonging to Great Britain, with its dependencies, Gozo, Comino, and Cominetto, forming the elevated portions of the plateau that extends northward to Sicily, 62 miles, and southward to Africa, 197 miles, and divides the Mediterranean into two basins. The Maltese group has a total area of 117 square miles, of which 95 square miles belong to Malta. Malta is of irregular oval shape, 17 miles long, with a central breadth of 9 miles; its greatest elevation is over 750 feet. It is of limestone formation, and is deeply indented on all sides except the south, where the coast forms a continuous and almost unbroken line. Of great strategical importance, it is very strongly fortified, especially Valetta, the capital, which is the headquarters of the British Mediterranean fleet, and the principal naval and mercantile coaling station in the Mediterranean, importing and exporting annually between 500,000 and 600,000 tons. Malta is also a valuable sanatorium for troops employed in the Orient. The climate is hot in summer and enervating when under the influence of the humid sirocco blowing from Africa, but generally is mild and healthful. There are only a few small streams, but the springs are so numerous and copious that no deficiency of water is felt, and since 1880 an extensive system of waterworks has greatly enhanced sanitary conditions. Malta has a bare, stony appearance, owing to the absence of trees. The soil is thin, but remarkably fertile; and its fertility is increased by the skilful cultivation and the diligent toil of the inhabitants. Large crops of wheat and potatoes are raised, early varieties of the latter being largely exported to England; maize, barley, cotton, clover, oranges, figs, grapes, carob beans, and peaches and other fruits are also grown. Filigree ornaments and a little cotton are manufactured. Sheep and goats are kept, with smaller numbers of cattle, mules, asses, and horses. The language of the people is a corrupt dialect of Arabic, with a strong admixture of Italian and other words; some authorities, however, connect it with the ancient Phœnician. The native population believe themselves to be of Phœnician descent. From the time of the settlement of the Knights of St. John down to quite recently Italian was the official language; but it has been superseded by English. Most of the educated Maltese speak Italian, and some speak English; the peasantry as a rule know neither the one nor the other. The Maltese are a sober, industrious race of people, though often quick-tempered and ignorant. They are proud of their island home—they love to call it "the flower of the world"—and are devout Roman Catholics. Legislation is carried on by 6 official and 14 elected members, the British governor, with the power of veto, being president. There is also an executive council, consisting of the governor as president, seven official members, and three nominated by the governor from among the elected members of the legislative chamber; the crown retains the right to legislate also through orders in council. There is no direct taxation in Malta. The local militia, including the Royal Malta Fencible Artillery, number about 1,200. The population in 1901 was 188,141, including 2,300

British residents, 1,200 foreigners, and from 6,000 to 7,000 imperial troops. Malta has great historical, archæological, and architectural interest. It passed successively through the hands of Phœnicians, Greeks, and Carthaginians, and was finally attached to Rome during the Second Punic War. Relics of these various occupations exist throughout the island. After the fall of the Roman empire it was seized at different times by Vandals, Goths, and Saracens. From the last it passed to Sicily, and followed its fortunes till 1522, when Charles V. granted it to the order of St. John of Jerusalem, the Knights of St. John of Malta being distinguished during successive centuries for their bold defense of Christianity against Moslem assaults. In 1798 the grand-master surrendered Valetta without defense to Napoleon. Shortly afterward the inhabitants regained it and asked for a British protectorate, which was confirmed in 1814 by the Congress of Vienna. Consult: Ballou, 'The Story of Malta' (1893).

Malta Fever (also MEDITERRANEAN FEVER, NEAPOLITAN FEVER, ROCK FEVER, etc.), a disease occurring near the Mediterranean shores, in which the fever symptoms are accompanied by intense pain, enlargement of the spleen, swelling of the joints, excessive perspiration, and other conditions tending to bring about extreme weakness and loss of functional activity. Its cause is now assigned to *Micrococcus melitensis*. Treatment thus far is not specifically determined. Hygienic care, such as is normal in fevers, with special attention to diet and bathing, together with ordinary applications for reducing swellings, is all that can be recommended.

Malta, Knights of. See KNIGHTS OF MALTA.

Maltbie, māl't'bī, **Milo Roy**, American sociologist: b. Hinckley, Ill., 3 April 1871. He was graduated from Upper Iowa University in 1892 and took the degree of Ph.D. at Columbia in 1897. He was professor of economics and mathematics at Mount Morris College, Ill., in 1893-5, and from 1897-1902 was secretary of the Reform Club Committee on City Affairs, and has devoted himself to the study of municipal questions, going abroad in 1899 to investigate foreign cities and their problems. He was lecturer on municipal government at Columbia University in 1900, and has been editor of 'Municipal Affairs' since 1897. He has written: 'English Local Government of To-Day' (1897); 'Municipal Functions' (1898); and 'Street Railways of Chicago' (1901).

Malte-Brun, māl't'ē-brōon (Fr. mält-brūn), **Conrad** (properly MALTHE BRUNN), Danish geographer: b. Thisted, Jutland, 12 Aug. 1775; d. Paris 14 Dec. 1826. He devoted himself to literature and politics in Copenhagen, but having given offense by writing in favor of the liberty of the press and the enfranchisement of the peasants, was banished to Sweden in 1796. He went later to Paris, where he became famous as a geographer. He edited the foreign political department of the 'Journal des Débats,' but is best known for his 'Summary of Universal Geography' (8 vols., 1810-29). The first six volumes only were completed by Malte-Brun. Among his other works are: 'Ancient and Modern Poland'; 'History of Travel'; and 'Mathematical, Physical and Political Geography.'

MALTESE CROSS—MALVERN HILL

Maltese (māl-tēs' or -tēz') **Cross.** See **CROSS.**

Maltese Dog. See **Dog.**

Mal'tha, (1) according to Pliny, a name used for an inflammable mud which flowed from a pool at Samosata, Commagene, North Syria, and resembled naphtha. (2) A mixture of wax and pitch for caulking ships; mineral tar is another name for maltha, which is found oozing from rocks in certain localities, particularly in California.

Mal'thus, Thomas Robert, English political economist: b. near Dorking, Surrey, 14 Feb. 1766; d. Bath 29 Dec. 1834. He studied theology at Cambridge and was ordained in the Church of England, continuing to pursue his profession as a teacher while holding a small living in Surrey. In 1805 he was appointed professor of history and political economy at Haileybury College. In his famous 'Essay on the Principles of Population' he propounded (1798) what is known as the Malthusian Doctrine, namely that the increase of population advances at a geometrical, the increase of the means of life at an arithmetical ratio; that this condition of things renders the condition of the poor more and more hopeless, that unless famine or war interfere to diminish population the means of life will eventually prove inadequate; that discouragement of early and improvident marriages and the cultivation of self-restraint must be employed to avert the danger. These positions have been the subject of long and widespread discussion. His other writings include: 'Principles of Political Economy' (1826); 'Definitions in Political Economy' (1853). Consult: Bonar, 'Malthus and His Work' (1885); Soetbeer, 'Die Stellung der Sozialisten zur malthusischen Bevölkerungslehre' (1886); Molinari, 'Malthus, Essai sur le Principe de Population' (1889); Cossa, 'Il principio di popolazione di T. R. Malthus' (1895).

Malus, Etienne Louis, à-tē-ën loo-ë māl-lūs, French physicist and military engineer: b. Paris 23 June 1775; d. there 23 Feb. 1812. He was educated at the Ecole Polytechnique, and upon leaving the school received a captain's commission in the corps of engineers, and served during the campaign of 1797 with the army of the Sambre and Meuse. Subsequently he participated in the campaign in Egypt, and in 1804 superintended the construction of fortifications at Antwerp and Strasburg. Whatever time could be spared from his professional labors was devoted to scientific pursuits. His chief publications consist of a mathematical 'Traité d'Optique,' first published in the 'Mémoires présentés à l'Institut' in 1810, in which he promulgated some valuable discoveries respecting the refraction of light in transparent media; and the 'Theory of Double Refraction' (Mémoires présentés à l'Institut, Vol. II.), containing an account of his discoveries respecting the polarization of light, which consisted in showing that light may acquire properties identical with either of two rays yielded by refraction through Iceland spar by the process of simple reflection at a particular angle from any transparent body. This discovery gained for its author his election to the Institute and the biennial medal of the Royal Society of London. He also published an 'Essay on the Measurement of the Refractive Force of Opaque Bodies.'

Malvaceæ, a family of flowering plants, the mallows and their allies, in the order *Columnifera*, with the calyx gamosepalous; petals contorted in the bud, stamens numerous, monadelphous; anthers extrorse, monothecious; pollen-grains spiny. They are herbaceous or woody plants, mucilaginous in their juices, and usually densely hairy, especially when young. The leaves are palmately nerved and frequently deeply five-lobed. The flowers are large, funnel-shaped, conspicuously and beautifully colored, attracting the aid of insects in fertilization. The fruit is schizocarpous. This family contains many important genera and species of plants elsewhere described, such as the mallows (*Malva*, *Lavatera*, etc.), hollyhocks (*Althæa*), cotton-plants (*Gossypium*), the rose-mallows (*Hibiscus*), etc. About 60 genera and 700 species are accredited to this family by systematic botanists.

Malvern, māl'vèrn, Ark., town, county-seat of Hot Springs County; on the St. Louis, I. M. & S. railroad; about 20 miles southeast of Hot Springs. It is in an agricultural region, in which the principal products are cotton and fruit. The chief manufactures are flour, lumber, and bricks. The trade is principally in lumber, cotton, and fruits. Pop. (1900) 1,582.

Malvern, māl'vèrn, Great, England, a fashionable inland watering-place in Worcestershire, on the east side of the Malvern Hills, at the foot of the Worcestershire Beacon, 1,395 feet high, the summit of which commands magnificent views. A restored 11th century priory church and Malvern College are the chief edifices. Malvern is widely celebrated and greatly frequented owing to its fine climate and the efficacy of its mineral springs. Pop. (1901) 16,400.

Malvern Hill, Battle of. After the close of the battle of Glendale (q.v.), 30 June 1862, the Army of the Potomac was put in position on Malvern Hill, an elevated open plateau on the left bank of James River, 60 feet high, and about 1½ miles by ½ mile in area. On this plateau the army was disposed in a large arc, both flanks resting on the river, and protected by gunboats. Porter's Fifth corps was on the left, Couch's division of Keyes' corps on the right of Porter, Heintzelman's two divisions—Kearny and Hooker—on the right of Couch, Sumner's corps on the right of Heintzelman, and Franklin's corps on the right of Sumner. Peck's division of Keyes' corps was on the right of Franklin and was the extreme right of the army, and it and the left of Porter's line stood back to back. There were numerous batteries of artillery along and in rear of the line. The position was a very strong one: the Confederate D. H. Hill says: "Tier after tier of batteries were grimly visible on the plateau rising in the form of an amphitheatre." The approach to the position was over 400 to 500 yards of open ground swept by artillery fire. When it was discovered early in the morning of 1 July that McClellan had fallen back from Glendale during the night, Lee gave orders for immediate pursuit. Jackson marched by the Willis road, and when in sight of Malvern Hill he formed line, with Whiting's division on his left and D. H. Hill's on his right, one of Ewell's brigades occupying the interval. The rest of Ewell's division and Jackson's own division were held in re-

MALVERN HILLS—MAMELUKES

serve. Magruder was directed to take position on Jackson's right, but before his arrival two of Huger's brigades came up and were placed next to Hill. The Confederates felt the Union lines with infantry and artillery, and when Magruder came up, about 2 p.m., Huger's two brigades—Armistead and Wright—with four batteries, were ordered forward. The batteries, as they emerged in succession from the woods, were promptly knocked to pieces by the fire of over 60 guns brought to bear upon them, and the two brigades were repulsed with loss. This attack fell upon the right of Porter and left of Couch, and the latter was now reinforced by Caldwell's brigade of Sumner's corps. No serious advance had been made on other parts of the line, but Hill had suffered severely from artillery fire in getting his troops in position opposite Couch's right. At 5:30 p.m. Magruder assaulted Porter's line and the left of Couch with the five brigades of Armistead, Cobb, Wright, Mahone, and Barksdale. All were met by such a terrific fire of artillery and musketry, which swept the slope of the hill, that they could make no headway, though gaining temporary advantages, and fell back with great loss. Toombs, G. T. Anderson's, and Ransom's brigades were now ordered in; Toombs got lost in the thick woods; Anderson and Ransom shared the fate of those preceding them, and fell back. Magruder's fight ended before dark. While Magruder was thus engaged with Porter and the left of Couch, D. H. Hill, on his left, advanced against Couch's right, which, as the action progressed, was reinforced by Caldwell's brigade, three regiments of Hooker's division, under Sickles, and some of Kearny's division. Hill's five brigades were commanded by Gens. Garland and Ripley, and Cols. J. B. Gordon, A. H. Colquitt, and C. C. Tew. The slope to Couch's line was about 800 yards, without cover, and the advance directly in the face of guns on the slope and bristling on the summit, from which burst forth such a terrific fire of shell and canister that Hill's brigades withered under it. Toombs' brigade was picked up and sent to their support, but the six brigades were hurled back, some in great disorder after the loss of half their men. Later in the evening Taylor's brigade of Ewell's division, on Hill's left, moved against the left of Kearny's division, and was repulsed by artillery fire alone. Half an hour after Hill had been disastrously repulsed and his troops scattered, McLaw's division of two brigades—Semmes and Kershaw—came up and assaulted Porter's right. Semmes made some headway up the slope, but was met by the 60th and 88th New York of Meagher's brigade, which Sumner had sent to Porter's assistance, and was repulsed after a hand-to-hand encounter. Kershaw, on Semmes' left, was likewise repulsed, and his repulse at twilight marked the close of the battle, but it was 9 o'clock before the firing ceased and quiet settled down on the bloody field. Sixteen Confederate brigades had heroically thrown themselves against the Union left, but were repulsed by the artillery and nine brigades. Advanced regiments were forced back, but generally recovered ground; batteries or parts of batteries were withdrawn, but again run forward; yet "never for an instant was the Union line broken or the guns in danger." The Confederate loss was over 5,500; Jackson's four divisions had 2,301 killed, wounded, and missing; Ma-

gruder and Huger about 2,900. The Union loss was less than 2,000. Consult: 'Official Records,' Vol. XI.; Webb, 'The Peninsula'; 'McClellan's Own Story'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II. E. A. CARMAN.

Malvern (māl'vern) Hills, England, a range of picturesque hills on the borders of Worcester and Hereford shires. It extends north and south for about 9 miles, and attains an altitude of 1,395 feet in the Worcestershire Beacon.

Mälzel, mäl'tsël, **Johann Nepomuk**, German musical artificer: b. Ratisbon 1772; d. at sea 1838. He invented an orchestrion, and an automatic trumpet, and was made court mechanician at Vienna in 1808. He died on his way to visit the United States.

Mama'nuas, mā-mā'noo-ās, a Negrito people of the Philippines living in the interior of Surigdo Peninsula, island of Mindanao. Large numbers of them have been converted to Christianity by the Jesuit missionaries. See PHILIPPINE ISLANDS.

Mamaroneck, mā-mār'ō-něk, N. Y., town, in Westchester County; on Long Island Sound, and on the New York, N. H. & H. railroad; about 21 miles east of New York. The town includes the village of Larchmont and part of the village of Mamaroneck. It is a residential section, in which many New York city people have homes. There are but few industrial establishments; the principal are the National Machine Company, manufacturing sewing machines and sewing machine attachments, and employing 80 persons; and a gutta-percha plant, in which 50 persons are employed. It is the headquarters of the Larchmont Yacht Club. Pop. (1900) 3,849.

Mamba'jao, mām-bā'how, a town of the province of Misamis, Mindanao, situated on the northwestern coast of Camigin Island, which lies off the northeast coast of Mindanao. Pop. 18,000.

Mam'ber, a widely diffused colloquial name for the common wild goat (*Capra agagrus*) of southwestern Asia. See GOAT.

Mambu'sao, mām-boo'sā-ō, Philippines, a pueblo of the province of Cápiz, island of Panay, on the Cápiz River, opposite Ibayaj and 17 miles southwest of Cápiz, the provincial capital. It is a military station. Pop. 11,000.

Mamelukes, mām'ē-lüks, **Mamlouks**, or **Mamlukes** (from the Arabic *mamlūk*, a slave), in Egypt, slaves from the Caucasian countries, who from menial offices were advanced to dignities of state. When Genghis-Khan made himself master of the greatest part of Asia in the 13th century, and carried vast numbers of the inhabitants into slavery, Nedjmeddin (Malek Salah), sultan of Egypt, bought 12,000 of them, including natives of Circassia, but chiefly Turks, from Capchak (Kipzak), had them instructed in the military exercises, and formed a regular corps of them. They soon exhibited a spirit of insubordination and rebellion. Under his successor they interfered in the government, assassinated the sultan, Turan Shah, and in 1254 appointed Ibegh, one of their own number, sultan of Egypt. The dominion of the Mamelukes in

MAMMALIA—MAMMALS.

Egypt continued 263 years. During this period they made some important conquests, and in 1291 they drove the Franks entirely out of the East. From the middle of the 18th century the number and wealth of the Mamelukes gave them such a superiority over the Turks in Egypt that the pasha appointed by the Porte was obliged to conform entirely to their wishes. This superiority was owing principally to Ali Bey, who ruled with unlimited power from 1766 to 1773, when he was assassinated. The Mameluke beys, especially Murad Bey, played an important part at the time of the French invasion. The Mamelukes, who were scattered throughout Egypt, and estimated at 10,000 or 12,000 men, maintained their numbers, principally by slaves brought to Cairo from the regions lying between the Black and Caspian seas. These were compelled to embrace the Mohammedan faith, and were all educated as soldiers. After a time they obtained a share in the government, and some of them even became beys, for none but Mamelukes were capable of holding this office. They formed a fine body of cavalry, and attacked the French, when they landed in Egypt, with the greatest fury; but they were unable to withstand the European artillery, and many of them soon joined the French. The Pasha of Egypt, Mehemet Ali, destroyed the Mameluke beys 1 March 1811, by a perfidious stratagem, and immediately afterward ordered a general massacre of the Mamelukes in every province of Egypt. Some hundreds managed to escape into Lower Nubia, where they built a small town, and endeavored to keep up their force by disciplining negroes in their peculiar tactics. They did not succeed, however, and shortly afterward dispersed. See also EGYPT.

Mammalia. See MAMMALS.

Mammals, a class of animals, known also as beasts, or quadrupeds, the highest of the vertebrate group in the sense that it comprises forms whose organization is on the whole the most efficient on account of the complexity, or perfection, of the various organs and parts. The diagnostic character of the class is the possession of cutaneous glands, which secrete a complex fluid, called milk, for the nourishment of the young. The lower jaw articulates directly with the cranium. The occipital condyles, two in number, form part of the exoccipitals. The internal ear contains a series of three or four separate small bones, which are concerned in audition. The heart is four-chambered, with two auricles and two ventricles; a single left aortic arch; blood warm; red blood disks, not nucleated. A muscular diaphragm separates the heart and lungs from the abdominal cavity. With few exceptions, mammals are clothed with hair, a special outgrowth of the epidermis.

Mammals as a class are extremely diversified in size, appearance and habits. The structure of some is modified for a purely aquatic life, of others for burrowing in the earth, for flying, for leaping, for running, etc. Some live entirely in the sea, others pass their lives in the tree-tops, and others in subterranean caverns, which they excavate.

All mammals possess limbs, which are normally four in number, but the hind pair is suppressed in the whales and sea-cows. The limbs assume the form of legs for terrestrial progression, wings for flight, or paddles for swimming.

The class includes man, and the majority of the animals most useful to man, such as the horse, ox, sheep, goat, dog, cat, etc. It includes also the whales, the largest of existing animals. About 600 genera and 5,000 species of mammals (exclusive of fossil forms) are known, of which about 200 genera and 1,200 species occur in North America, north of Panama.

Integuments.—The skin of mammals consists of two principal layers, a superficial one, called the epidermis or cuticle, and a deeper layer, the dermis or corium. The epidermis is again divided into two layers, an external horny layer and a deeper one, called the Malpighian layer. The epidermis is usually quite smooth, and is beset with hairs which are a special outgrowth of this part of the integument peculiar to the class. The cetacea are without hairs, except a few about the mouth. In the pangolins, the epidermis develops large scales which cover the greater part of the body. Epidermic scales of smaller size are found on the tails of various rodents, insectivores, and marsupials. The horns of ruminants, the nasal horn of the rhinoceros, and all claws, nails, and hoofs are also epidermic structures.

The dermis or corium is generally thicker than the epidermis and contains blood-vessels, tactile nerve endings, sweat glands which open on the surface of the body, and fatty tissue. In the whales and seals the fat cells are enormously developed immediately below the dermis and constitute the "blubber." In the armadillos bony plates occur in the dermis, forming a carapace or shell. They are covered by horny sheaths. The presence of small hard tubercles in the skin of certain porpoises gives ground for the belief that the ancestors of the cetacea were covered with a bony armor, somewhat like that of the armadillos.

Hair.—True hairs are found only on mammals. They are simple epidermic structures growing from papillæ sunk in the dermis. They consist of central cellular pith, encased in a horny sheath. In some mammals the sheath is rough, and the hair is then capable of being matted together to form "felt." In the majority of mammals the hairy covering consists of coarse long hairs and fine short hairs intermingled, forming the fur. In the porcupines the coarse hairs assume the form of large stiff spines, or quills; in the hogs they are smaller and more flexible, forming bristles. The hairy covering is usually shed once or twice annually, except the manes and tails of such ungulates as the horse, the hairs of which may persist throughout life.

The majority of mammals have a number of large, long hairs, or vibrissæ, arranged in a definite fashion about the mouth, eyes and ears, which serve to a certain degree as tactile organs. In deer and some other ruminants the hairs consist mainly of the cellular pith and hence are easily broken.

The color of mammals is chiefly due to the pigments contained in the hair, which belong to the class known as melanins. Black, white, and brown in various mixtures and shades are the commonest colors. The coloration is chiefly protective, but some such sharp contrasts of black and white as those of the skunks are thought to be warning colors, and the clear white of the under side of the tail of deer, certain hares, etc., to be directive, or distinguishing, marks for the young.

1. A white - aquatic type.
2. Antelope - terrestrial type.

MAMMALS

Skeleton.—The skeleton consists of an axial portion, comprising the skull, the backbone or vertebral column, the ribs and the sternum; and an appendicular portion, or the skeleton of the limbs. In the skull the bones are bound firmly together by the overlapping or interdigitation of the edges, except the lower jaw, the ossicles of the internal ear and the hyoid, or tongue, bones. In adults most of the sutures are usually obliterated. The snout or rostrum consists of the intermaxillary, maxillary, palatine and pterygoid bones below and on the sides, and the nasals above, while within are the median vomer and the ethmoid bones. The rostrum abuts against the brain-case or cranium, which is vaulted, and comprises three segments, an anterior one, consisting of the presphenoid, orbito-sphenoids and frontal; a middle segment, consisting of the basisphenoid, alisphenoids, squamosals, and parietals; and a posterior segment, consisting of the basi-occipital, exoccipitals and supra-occipital. The exoccipitals bear the two condyles for articulation with the vertebral column. At the base of the skull, between the occipital and squamosal, are the periotic bones, containing the organ of hearing or internal ear, and the tympanics, which form the bony walls of the orifice of the ear. The tympanics are greatly expanded in whales and some other mammals, forming shell-shaped bulle.

The vertebral column comprises five sections, the cervical, dorsal (or thoracic), lumbar, sacral and caudal. The cervical vertebræ are seven in number in all mammals, whatever the length of the neck, the only exceptions being the manatees, which have six, and the sloths, which have six, eight or nine. In certain whales, the majority of porpoises and some rodents, the cervicals are more or less united; in the right whales they form a single bony mass. The dorsals vary in number from 9 to 22. Articulated with each is a pair of ribs. The ribs terminate below in cartilages, which sometimes ossify, forming what are called "sternal ribs." By means of these cartilages the anterior pairs of ribs are connected with the breastbone or sternum, which may consist of a single piece, as in the whalebone whales, or of several segments arranged longitudinally. The posterior pairs of ribs are sometimes called "floating ribs" because their cartilages do not meet the sternum, but are attached to those of the more anterior pairs, or are quite free. The lumbar vertebræ follow the dorsals and are without ribs. In number they vary from 2 to 30 in different forms. The number of dorsal and lumbar vertebræ combined is quite constantly 23 in the odd-toed ungulates (horse, rhinoceros, tapir, etc.), 19 in even-toed ungulates (deer, ox, sheep, etc.), and 20 or 21 in carnivores and most insectivores. Man, the higher apes and many bats have 17. Following the lumbar is the sacrum, consisting usually of three vertebræ joined together and connected with the pelvis. This region is not distinguishable in the whales and sea-cows, which lack hind limbs. The caudals, or tail-vertebræ, complete the column. In man, and in certain apes and bats they are three in number and rudimentary, but as many as 46 are present in the long-tailed pangolins. In the intervals between the anterior caudals below are situated small V-shaped bones, called chevrons, whose chief function is to protect the larger blood-vessels of the tail. They

are especially well developed in the whales and edentates.

In many groups of mammals the anterior limbs are connected with the axial portion of the skeleton through the pectoral girdle, consisting of the shoulder blades, or scapulæ, and the collar-bones or clavicles. The scapula is not attached directly to the vertebral column, but its acromion process is joined to the anterior end of the breastbone, or sternum, by means of the clavicle. Clavicles are wanting in all seals, whales, sea-cows and ungulates, and are rudimentary or wanting in various representatives of several other groups. They are present in man and, with one or two exceptions, in all monkeys, bats, insectivores and marsupials. The upper-arm bone, or humerus, articulates superiorly with the scapula, and below with the two bones of the fore-arm, the radius and ulna. In the majority of mammals the radius, or outer bone, is permanently crossed over the ulna at the lower end, as is especially well seen in the elephants. In man and a few other forms the radius can be rotated. Following the fore-arm is the wrist or carpus, consisting of two rows of small bones, which, however, are variously united in different forms; and finally the digits, which are normally five in number, each consisting when fully developed of a metacarpal bone and three other bones, called phalanges, though the first digit, or thumb, usually has but three in all. In man and apes the thumb is opposable to the other digits. In many mammals this digit and also the fifth are greatly reduced, or entirely wanting. In the ruminants, such as the pig, ox, deer, camel, etc., the first digit is wanting, and the 2d and 5th are reduced in size, or entirely lacking, while the 3d and 4th are equal in length and well developed. In the odd-toed ungulates, such as the horse, rhinoceros, tapir, etc., the 3d digit is longest, the others being reduced in length, rudimentary, or wanting. In ungulates the metacarpals are usually much elongated and in such ruminants as the deer, ox, etc., are united, forming what is known as a "cannon bone." The cetacea are peculiar in that the bones of the fore-limb are not movably articulated and that the phalanges of the middle digits often greatly exceed three. In bats the phalanges are very greatly elongated to give support to the wing membranes.

The hind-limb is connected with the vertebral column through the pelvic girdle, which is united with the sacrum. The bones of the hind-limb, which are homologous to those of the fore-limb, are the femur or upper leg-bone, the tibia and the fibula or lower leg-bones, the tarsal or ankle bones, and the metatarsals and phalanges, constituting the hind-foot. The peculiarities of the bones of the fore-feet in ungulates, already mentioned, are found also, with only slight modifications, in the hind-feet.

The terminal phalanges of both fore and hind feet are compressed and pointed in beasts of prey and such as climb or dig, forming claws, which are covered with horny sheaths. In large running mammals, the terminal phalanges are more or less broad and flat and likewise covered with horny sheaths, forming hoofs or nails. Certain bones not connected with the skeleton, such as the *os penis*, *os cordis*, etc., are developed in the viscera of various mammals.

Teeth.—In mammals, unlike the lower ver-

MAMMALS

tebrates, teeth are not produced indefinitely, but in fixed number. Only two sets are developed. The first, called the milk dentition, appears during infancy, being replaced by the second set, called the permanent dentition, as maturity is reached. The milk teeth are less numerous and usually smaller than those of the permanent set. Teeth occur only in the premaxillary and maxillary bones, and the mandible or lower jaw. The upper teeth are divided into incisors, which are implanted in the premaxillæ; canines, which are almost invariably simple and stand immediately behind the suture between the premaxillæ and maxillæ; and premolars and molars, which occupy the edges of the maxillæ. The premolars have "milk" predecessors, while the molars have not. The nomenclature of the teeth of the lower jaw is the same as for those of the upper jaw, their character being determined by their relation to the latter and by their form and mode of development. While the greatest diversity exists as to the form of the individual teeth, and the development of the dentition as a whole, there are rarely more than 44 in all. The exceptions are among the marsupials, where the number rises to 54 in the marsupial anteater, *Myrmecobius*, and to 64 in a fossil form, *Amphitherium*; also among the cetacea, one species of which has as many as 246 simple teeth. The true anteaters, *Myrmecophagida*, and the spiny anteater of Australia, *Echidna*, are without teeth at any time, but many mammals which do not possess them when adult, have rudimentary teeth in the foetal stages. Such is the case with the whalebone whales, and with the platypus, *Ornithorhynchus*. The rudimentary teeth in these disappear early and are replaced by whalebone in the case of the whales, and by horny plates resembling teeth, in the platypus.

Teeth consist of two portions, the root and the crown. When most complex they contain three structural elements, the enamel, the dentine and the cement. The enamel is hardest and is restricted to the crown, while the dentine makes up the mass of the tooth, and the cement usually surrounds the root, or fills spaces between the enamel-folds of the crown. The enamel develops from the epithelial tissue of the jaws, the dentine from the deeper-lying areolar tissue, and the cement from the walls of the tooth-capsule. Some teeth, such as the incisors of rodents, the tusks of the elephant, etc., grow continuously during life; others complete their growth early. Especially remarkable forms of teeth are the tusks of elephants, which are incisors, and the tusks of the narwhal, the boar and the babirusa, which are canines. When the crowns of the teeth greatly exceed the roots, as in the horse, the teeth are said to be hypsodont or hypselodont; when the reverse is the case, the teeth are called brachyodont. Teeth having the crown in the form of tubercles, as in the hog, are called bunodont; those with transverse ridges, as in the ox, many rodents, etc., are called lophodont.

Alimentary Canal.—The mouth, or entrance to the alimentary canal, contains the tongue, which in the majority of mammals is so attached below that it can be protruded but a short distance, but is often sufficiently free to be used in grasping food and turning it about in the mouth during the process of mastication. In those mammals which feed upon ants and termites, such as the anteaters, pangolins, etc.,

and also in certain fruit-eating bats, the tongue is very long and slender and can be extended far beyond the mouth. On the posterior surface of the tongue are the organs of taste, and the upper surface is often roughened by horny papillæ. A number of large glands, called salivary glands, open into the mouth. Their function is to moisten the food and initiate the process of digestion. The glands most constantly present are the parotid, situated at the base of the ear, and opening inside the cheek, and the submaxillary, situated near the angle of the lower jaw, and opening under the apex of the tongue. At the back of the mouth is the entrance to the oesophagus or gullet, usually a simple tube, leading to the stomach. The stomach is an oblong, curved sac, usually enlarged at the cardiac end where the oesophagus is attached, and smaller at the lower, or pyloric, end, where it joins the intestines. It is usually simple, but in the ruminants and the cetaceans consists of several chambers. The intestines join the stomach at the pyloric end. They are usually of great length, and divided into two distinct sections. The portion nearest the stomach, called the small intestine, is joined below by one of larger diameter called the large intestine. The upper end of the latter is frequently dilated, forming a pouch called the cæcum, which in herbivorous mammals, and notably in rodents and many ungulates, is greatly enlarged or elongated. In man, the higher apes and the marsupial wombat it terminates in a narrow prolongation called the vermiform appendix. Different sections of the small intestine have received the names duodenum, jejunum and ileum; and of the large intestine, colon and rectum. The inferior orifice of the intestines is the anus or vent. Generally speaking, the intestines and cæcum are shortest in carnivorous mammals and longest in such as are vegetable feeders, but the carnivorous whales and seals, which have long intestines, form a conspicuous exception.

Besides the numerous glands situated within the intestine, are two large ones, the liver and the pancreas, whose ducts open into the intestines near the stomach. The liver is a large, flat gland, which may be divided merely into a right and a left lobe as in man, the cetacea and ruminants, or may have these lobes again subdivided into two by a longitudinal fissure. Two smaller lobes, called the Spigelian lobe and the caudate lobe, are commonly added. Attached to the liver is the gall-bladder, which is, however, absent in the cetacea and some other orders.

Kidneys.—The kidneys, whose function is to secrete urine, are situated in the upper part of the abdominal cavity near the vertebral column. They are two in number, oblong and usually simple, but in the cetacea, and also in bears and seals, are divided into separate lobules. A duct or ureter leads from each kidney to the urinary bladder, from which in turn a common duct, called the urethra, leads to the exterior of the body. In the monotremes, however, the ureters do not enter the bladder, but into a common urogenital passage or cloaca.

Lungs.—The lungs are situated in the thorax, which is cut off below from the abdominal cavity by a muscular diaphragm whose action assists in the process of breathing. The lungs consist of two spongy lobes, a right and a left, which are free below, but attached above to the two principal divisions of the wind-

MAMMALS

pipe. In the cetacea and sea-cows, the lobes are simple externally, but in other orders are more or less subdivided. A third median lobe, called the *azygos lobe*, is present in some groups. Air breathed in through the nostrils reaches the lungs through the trachea or windpipe, the upper end of which, the larynx, lies in the throat. Its orifice, the glottis, is protected by a cartilage, called the epiglottis, which prevents particles of food from entering the windpipe. The larynx is made up of cartilages, of which the largest are the thyroid, the cricoid and the arytenoid. Within the larynx are the vocal cords, two parallel elastic, fibrous bands, whose vibrations produce the voice. The lower end of the windpipe divides into two smaller tubes, or bronchii, each of which enters a lobe of the lungs and subdivides into numerous smaller branches. A third bronchus, which enters the right lung, occurs in some cetaceans and ruminants.

Heart.—The heart in mammals is four-chambered, consisting of two thin-walled auricles and two ventricles, both with thick walls, but the right, which supplies only the lungs, thinner than the left. There is no direct communication between the left and right sides of the heart after birth. The valve between the right auricle and the right ventricle is tendinous, except in the monotremes.

The aorta, or principal artery, bends toward the left immediately beyond its connection with the heart and gives off the innominate, left common carotid, and brachial arteries, which, with their branches, supply the head and anterior limbs. Blood is carried from the alimentary canal to the liver by a single vein, except in the monotremes, in which as in lower vertebrates the abdominal vein is present. The kidneys are supplied with blood only by the renal arteries.

Brain.—Except for certain fossil forms, the brain of mammals is characterized by its relatively larger size as compared with that of lower vertebrates, and especially by the magnitude of the cerebral hemispheres and the perfection of the connections between them. In most mammals the surface of the brain is divided by numerous irregular fissures and convolutions. They are absent only in small bats, rodents, and insectivores, and in the *Ornithorhynchus*. The largest forms in each order, generally speaking, exhibit the greatest complexity, and there has been a remarkable development in the class in this direction since Tertiary times. The cetacea have very large and complex brains, though they are small relatively, when compared with the size of the body.

Sense Organs.—The organs of sense, except that of touch, are located in the head. The sense of touch is generally distributed over the skin, but is most acute in the snout, and in the extremities, except when used merely in locomotion. The wings of bats and the prehensile tails of monkeys are also especially sensitive. Some burrowing mammals, such as the mole, have imperfect eyes, the optic nerve being more or less atrophied. The Indian river-dolphin, *Platanista*, is a blind form, having rudimentary eyes, without crystalline lenses. The mammalian ear is characterized, beside the chain of ossicles, already mentioned, by the complex cochlea, which is usually spirally convoluted. The tympanic membrane, or eardrum, seals the auditory chamber from without. In the majority of

mammals the external orifice of the ear is surrounded by a fold of skin, called the pinna or external ear. These are absent in cetaceans, sea-cows, seals, etc., which live in the water, and also in some burrowing mammals.

Reproductive System.—In mammals the female reproductive organs comprise the ovaries, Fallopian tubes or oviducts, uterus and vagina. The ovaries are two in number, a left and a right. Approximated to them are the Fallopian tubes, which widen below and form the uterus. In the lower mammals the uterus of each side is separate, but the two unite below in a common vagina, while in the higher groups, the uterus and vagina are both single. The male organs comprise the testes, spermatic cord, and penis. In cetaceans, sea-cows and seals, which are aquatic, and in the elephants, conies and many edentates, the testes are internal in position, but in most other forms they descend periodically, or permanently, into a pouch of the integument, called the scrotum. The structure of the penis in mammals is peculiar to the class. An *os penis* is present in the majority of bats, insectivores, rodents, carnivores and primates.

During development the mammalian *fœtus* is nourished through a complex structure, called the placenta, formed in part by the internal wall of the uterus of the mother and in part by the membranes of the *fœtus* itself. The placenta is characteristic of the class as a whole, but is not found in the monotremes, or in most marsupials. The form and other characteristics of the placenta differ in the several orders of mammals and are regarded as of importance in classification.

Distribution.—The geographical distribution of existing mammals, as of other animals, is the result of varied conditions and influences, some transient and others of long continuance, beginning in the relatively remote geological times when the class first made its appearance. Among the principal factors in the problem of distribution may be included changes in the extent and configuration of the land areas of the globe, changes in climate and in food supply, the appearance and disappearance of enemies, and latest, but by no means least, the interference of man. These and other factors in distribution are considered under the heading GEOGRAPHICAL DISTRIBUTION OF ANIMALS. It is only possible here to mention some of the more important facts in the distribution of mammals. Of widest distribution are the purely aquatic orders, the cetacea and pinnipedia, whose range covers all seas and reaches from pole to pole, but it should be noted that no sea-lions occur in the North Atlantic. Next follow the bats, whose range is nearly world-wide, but they do not enter the antarctic zone, and only very few species cross the arctic circle. On the other hand, they are found in New Zealand and in oceanic islands where no terrestrial indigenous mammals occur. Of the purely terrestrial orders, the rodents have the widest range, covering every continent and reaching from the arctic zone to Patagonia and Tasmania. Carnivores, like rodents, have an almost world-wide distribution, but in Australia only one species of the order occurs, the dog known as the "dingo," *Canis dingo*; and it is uncertain whether this may not have been introduced by man at a remote date. The monotremes (comprising only the genera *Ornitho-*

MAMMALS

rynchus, *Echidna* and *Proechidna*) are limited to Australia, Tasmania and New Guinea. Marsupials occur only in Australia, Tasmania, New Guinea and America. The American marsupials, with the exception of one genus, all belong to the family *Didelphiidae*, or the opossums. Edentates occur only in America, southern Asia and Africa. They have their greatest development in South America. One genus, *Tatu*, extends northward into Texas. Ungulates inhabit all continents except Australia, but only two or three species enter South America. Of the two groups forming the order *Primates*, the lemurs and lemuroids occur only in Madagascar, Africa and southern Asia, while monkeys inhabit only Africa, southern Asia, and South and Central America. One ape, *Macacus inuus*, is found at Gibraltar, but it is only doubtfully indigenous.

Fossil Mammals.—Mammals are believed to have originated as an off-shoot from certain Permian and Triassic reptiles called *Theromorpha* or *Anomodontia*. The earliest recognizable remains of mammals are certain small teeth and jaw-bones found in the Triassic formations. They belonged to forms resembling monotremes and marsupials in some characters, but are usually placed in a separate order, called *Allotheria* or *Multituberculata*. Representatives of the *Allotheria* continued on through the Jurassic and Cretaceous. The existing orders of mammals first appear in the Eocene, the lowest formation of the Tertiary period, being foreshadowed in the lowest beds of that period by certain generalized groups such as the *Creodonta* and *Condylarthra*. The Eocene also contains remains of several groups, or suborders, of ungulate mammals, which have no living representatives. These are the *Ancylopoda*, *Tyotheria* and *Toxodontia*.

The later Tertiary and the Quaternary periods show a greatly increased number and diversity of forms. Many of them represent families which persisted for only a relatively short period and are now extinct; others have continued to the present. Among the oldest of existing genera are *Didelphis* (opossum), *Sciurus* (squirrel), *Myoxus* (dormouse), *Sorex* (shrew), *Vespertilio* and *Vesperugo* (bat), and *Viverra* (civet), which originated in the Eocene; *Tapirus* (tapir), *Rhinoceros*, *Giraffa* (giraffe), *Elephas* (elephant), *Sus* (pig), *Talpa* (mole), *Erinaceus* (hedgehog), *Mustela* (marten), *Lutra* (otter), *Hyena*, *Felis* (cat), and *Phoca* (seal), which originated in the Miocene.

Classification.—The class *Mammalia* was divided by Linnæus into three principal sections, *Unguiculata*, *Ungulata*, and *Mutica*. The last comprises the cetaceans, the second all the ungulates except the elephant; and the first, the remainder of the class. This classification was replaced by Blainville, who proposed on embryological grounds to divide the class into *Monodelphia*, or mammals with a placenta; *Didelphia*, or mammals without a placenta (the marsupials), and *Ornithodelphia*, or the monotremes. Richard Owen combined the last two subclasses under the name of *Eplacentalia*, and gave the placental mammals the name of *Placentalia*. Speculation as to the origin of the class as a whole led Huxley to propose as the source, a hypothetical group which he named *Hypotheria*, the characters assigned

being the absence of milk glands and of a corpus callosum in the brain, and the presence of a quadrate bone for the articulation of the mandible. Existing mammals were divided into *Prototheria*, comprising the monotremes, *Meta-theria*, the marsupials, and *Eutheria*, the so-called placental mammals. Cope in 1889, while retaining the subclass *Prototheria* for the monotremes, placed the entire remainder of the class in the subclass *Eutheria*. Flower and Lydekker (1891) adopt Huxley's divisions, while Beddard (1902) makes use of those of Cope. Flower and Lydekker's arrangement of families and higher groups is as follows (fossil groups printed in italics):

Subclass 1. PROTOTHERIA.

Order 1. Monotremata (Monotremes).

Families: Ornithorhynchidae, Echidnidae.

(Group, *Multituberculata* or *Allotheria*.)

Families: *Plagiaulacidae*, *Polymastodontidae*, *Tritylodontidae*.)

Subclass 2. METATHERIA.

Order 2. Marsupialia (Marsupials).

Suborder 1. Polyprotodontia.

Families: *Dromatheriidae*, *Amphitheriidae*, *Spalacotheriidae*, *Didelphyidae*, *Dasyuridae*, *Peramelidae*.

Suborder 2. Diprotodontia.

Families: Phascologyidae, Phalangeridae, *Diprotodontidae*, *Nototheriidae*, *Macropodidae*.

Subclass 3. EUTHERIA.

Order 3. Edentata (Edentates).

Families: Bradypodidae, *Megatheriidae*, Myrmecophagidae, Dasypodidae, *Glyptodontidae*, *Manidae*, *Orycteropodidae*.

Order 4. Sirenia (Sea-cows).

Families: Manatidae, *Rhytinidae*, *Halicoridae*, *Halitheriidae*.

Order 5. Cetacea (Cetaceans).

Suborder 1. Mysticoceti (Whalebone whales).

Family: Balenidae.

Suborder 2. Archæoceti.

Family: *Zuglodontidae*.

Suborder 3. Odontoceti (Toothed whales).

Families: Physeteridae, *Platanistidae*, *Delphinidae*.

Order 6. Ungulata (Hoofed mammals).

Suborder 1. Artiodactyla (Even-toed ungulates).

Families: Hippopotamidae, *Suidæ*, *Charopotamidae*, *Anthracotheeriidae*, *Merycopotamidae*, *Cotylopidae*, *Anoplotheriidae*, *Dichodontidae*, *Tragulidae*, *Camelidae*, *Poebrotheriidae*, *Cervidae*, *Giraffidae*, *Antilocapridæ*, *Bovidae*.

Suborder 2. Perissodactyla (Odd-toed ungulates).

Families: *Tapiridae*, *Lophiodontidae*, *Palæotheriidae*, *Equidae*, *Rhinocerotidae*, *Lambdotheriidae*, *Chalicotheriidae*, *Titanotheriidae*, *Macraucheniiidae*.

Suborder 3. Toxodontia.

Families: *Toxodontidae*, *Tyotheriidae*.

Suborder 4. Condylarthra.

Families: *Periptychidae*, *Phenacodontidae*, *Meniscotheriidae*.

Suborder 5. Hyracoidea (Conies).

Family: Hyracidae.

Suborder 6. Amblypoda.

Families: *Pantolambdidae*, *Coryphodontidae*, *Uintatheriidae*.

MAMMARY GLANDS — MAMMON

Suborder 7. Proboscidea (Elephants).

Families: *Dinotheriidae*, *Elephantidae*.

(Group *Tillodontia*.)

Families: *Anchippodontidae*, *Calamodontidae*.)

Order 7. Rodentia (Rodents)

Suborder 1. Simplicidentata.

Families: *Anomaluridae*, *Sciuridae*, *Haplodontidae*, *Ischyromyidae*, *Castoridae*, *Myoxidae*, *Lophiomyidae*, *Muridae*, *Spalacidae*, *Geomyidae*, *Dipodidae*, *Theridomyidae*, *Octodontidae*, *Castoroididae*, *Hystricidae*, *Chinchillidae*, *Dinomyidae*, *Caviidae*, *Dasyproctidae*.

Suborder 2. Duplicidentata.

Families: *Lagomyidae*, *Leporidae*.

Order 8. Carnivora (Carnivores).

Suborder 1. Carnivora vera (Fissipeds).

Families: *Felidae*, *Hyenidae*, *Proteiidæ*, *Viverridae*, *Canidae*, *Ursidae*, *Mustelidae*, *Procyonidae*.

Suborder 2. Pinnipedia (Pinnipeds).

Families: *Otariidae*, *Trichechidae*, *Phocidae*.

Suborder 3. *Crocodontia*.

Families: *Hyæodontidae*, *Proviverridae*, *Arctocyonidae*, *Mesonychidae*.

Order 9. Insectivora (Insectivores).

Suborder 1. Insectivora vera.

Families: *Tupaiidae*, *Macroscelididae*, *Erinaceidae*, *Soricidae*, *Talpidae*, *Potamogalidae*, *Solenodontidae*, *Centetidae*, *Chrysochloridae*.

Suborder 2. Dermoptera.

Family: *Galeopithecidae*.

Order 10. Chiroptera (Bats).

Suborder 1. Megachiroptera.

Family: *Pteropidae*.

Suborder 2. Microchiroptera.

Families: *Vespertilionidae*, *Nycteridae*, *Rhinolophidae*, *Emballonuridae*, *Phyllostomatidae*.

Order 11. Primates.

Suborder 1. Lemuroidea (Lemurs and Lemnroids).

Families: *Hyopsodontidae*, *Chiromyidae*, *Tarsiidae*, *Lemuridae*.

Suborder 2. Anthroipoidea (Monkeys and Man).

Families: *Hapalidae*, *Cebidae*, *Cercopithecidae*, *Simiidae*, *Hominidae*.

The groups of existing mammals whose structural peculiarities are such as to entitle them to rank as separate families vary greatly as regards the number of genera and species they comprise, some being represented by a multitude of different forms, while others consist only of a single species, or a single genus with but a few species. Families consisting of only a single genus and species are as follows: the *Chiromyidae*, established for the reception of the Aye-Aye, a singularly modified lemuroid mammal, confined to Madagascar; the *Dinomyidae*, comprising only a large Peruvian rodent, somewhat like a paca, of which a single specimen is known; the *Antilocapridæ*, represented only by the Prong-horn of the western plains of North America; the *Notoryctidae*, comprising only a small mole-like marsupial recently discovered in South Australia; the *Ornithorhynchidae*, comprising only the Platypus, or Duckbill, of Australia. These and other restricted families are to be looked upon as fragments of groups of genera and species, of which the greater num-

ber are extinct, or as branches from main lines of development which have never progressed and ramified.

FREDERICK W. TRUE,

United States National Museum.

Mammary Glands, the milk-glands of mammalian animals (see BREAST). They are present in all mammals, in both sexes, but in the male are usually rudimentary, their functional activity being limited to the female, who secretes in these glands the milk for nourishing her young during a natural period after birth. In all mammals they are placed in pairs, but vary much in position and number in different groups. Zoologists give them names according to their position near the armpits (axillary), on the chest (pectoral), on the belly (ventral or abdominal), or near the groin (inguinal). They are never situated on the back. The number in an individual may be from two to twelve or more, and is usually even. The structure of the cow's udder is due to the uniting of the same number of mammary as there are of teats, the number of which, when more than two, usually corresponds to that of the young produced at each birth. The mammary glands of *Marsupialia* (q.v.) are contained in the pouch. In monotremes—duck-bills and echidnas—the nipple is not present. (See PROTOTHERIA.)

Diseases of the Mammary Glands.—The common inflammation of the glands (mastitis) is often attended by much swelling, with fever and painful tenderness. The formation of pus is apt to result in a slowly pointing abscess. Great care in diet and regulation of the bowels should be observed. Purgatives and fomentations may be necessary, also in many cases the placing of the arm on the affected side in a sling. Drawing off the milk and evacuating the pus may be practicable, and will afford great relief. Pain in the breasts (mastodynia) may result from many causes, of which sore nipples is one of the most frequent. The nipples are also subject to cracks, ulcerations, etc., which occasion much difficulty and pain to the mother when suckling the child. Lotions of an astringent character, as tannin, etc., have a remedial effect in such disorders, as have also collodion and lunar caustic (nitrate of silver), when applied to the sore nipple. Metallic shields are used in severe cases for protection of the affected point. Among many specific disorders to which the mammary glands are liable are cancer and galactoceles and other forms of tumor. See MILK FEVER.

Mammee' Apple, or **South American Apricot**, the fruit of a clusiaceous tree, bearing white, showy, fragrant flowers, growing naturally in tropical America, but largely cultivated in tropical parts of the Old World. The fruit is several inches in diameter, with a double rind and a yellowish pulp like that of an apricot, which is sweet and nourishing, and is eaten raw or with wine and sugar, or is boiled. A spirituous liquor called Eau Créole, is distilled from its flowers; and the gum exuding from the bark is used by the Central Americans for destroying chigoes in the feet. This gum-resin is similar to the "gamboge" derived from a closely related West African tree (*Garcinia hamburyi*).

Mammon, a term popularly held to be a mere personification of riches. It is used in

MAMMOTH — MAMMOTH CAVE

Matt. vi. 24 and Luke xvi. 9. Milton makes Mammon a fallen angel of sordid character.

Mammoth, an elephant (*Elephas primigenius*) which inhabited the temperate parts of the northern world during the Glacial period, and at its close spread northward with the retreat of the ice, and survived until the Neolithic period of human history. Some account of the origin and probable wanderings of the species is given in the paragraph relating to fossil elephants under ELEPHANT. Mammoth remains have been found in intimate association with the handiwork of savage man; and upon a piece of bone a portrait of this animal was found scratched, the accuracy of which shows a close acquaintance by the Cave-dwellers of France with the animal in life, and much artistic skill. This elephant, although the word "mammoth" has become an expression for hugeness, was little if any larger, on the average, than the modern Asiatic elephant, to which it was nearly related. Its remains are abundant and enable us to reconstruct its form and features completely, especially since the remarkable discovery, first in 1799, of carcasses frozen into the icy cliffs along the Arctic coast of Siberia. The latest and most important discovery of this kind occurred in 1901. Since the earliest known times ivory from buried tusks of these animals has been obtained from northern Siberia and Alaska, and many curious stories were invented to account for its origin, especially among the Chinese, who had never seen an elephant; but the specimens above mentioned contained not only the tusks still in their sockets, and every bone in its place throughout the skeleton, but a great part of the flesh was in a condition fit for sledgedogs to cat and enjoy, and was covered with thick skin still clothed with long dark hair, beneath which was a dense woolly fur, well fitted to protect the animal against arctic cold. The ears were much smaller than those of modern elephants. This specimen of 1901, which is preserved in the Royal Museum at St. Petersburg in the attitude in which it was found buried, measured 16 feet 4 inches from the forehead to the extremity of the tail; its height was 9 feet 4 inches; and the tusks, along the outer or greater curve, measured 9 feet 6 inches. Of other well-known specimens, that skeleton mounted in Chicago is one of the largest known, and its tusks measure 9 feet 8 inches. The largest tusks on record are a pair found in Alaska, which measure $12\frac{3}{4}$ feet in length. All mammoth tusks show an outward and upward sweep very distinct from the growth of elephant tusks. The mammoth seems to have been extremely numerous all over northern Europe, Asia and North America, especially during post-glacial times, when northern Asia was covered with pine forests to the borders of the Arctic Sea, affording plentiful food in their leaves and twigs upon which these animals browsed. The disappearance of these forests, due to slow climatic changes, is supposed to be the principal influence which led to the extermination of the species, a fact otherwise not easily to be explained. It is probable that human hunting had much to do with the mammoth's final disappearance. Consult: Beddard, 'Mammalia' (1902); Lucas, 'Animals of the Past' (1901). Compare MASTODON.

Mammoth Cave, Ky., a remarkable American cavern, in Edmondson County, 85 miles southwest of Louisville, reached by a small branch line connecting at Glasgow Junction with the Louisville & Nashville railroad. Its areal diameter is about 10 miles, and about 100 miles of passage-way have been explored, including avenues, chambers, pits, domes and rivers. What is termed the Main Cave is three miles long, varying in width from 40 to 175 feet, and in height from 40 to 125 feet. Its greatest enlargement is known as the Chief City (or Temple), an oval room 541 feet long, 287 feet wide, and 125 feet high; anciently a rendezvous of the Indians, whose torches and other relics have been found in abundance. The Star Chamber mimics the starry heavens by reason of its lofty ceiling of black oxide of manganese flecked by snowy crystals of gypsum. The cavern exists in five successive tiers, through which, at various points, shafts have been cut, which are styled pits or domes, according to the point of view. The largest are the Bottomless Pit, Gorin's Dome, the Mammoth Dome, and the Maelstrom, and their average depth is about 100 feet. Oval depressions, locally known as "sink-holes," drain through the pits and chasms, and form subterranean lakes and rivers; which finally find an outlet to the neighboring Green River. The largest, the Echo River, gets its name from the wonderful reverberations of sound along its course. Boats are provided for short voyages. Eyeless fish abound, of which there are three or four species; besides, blind crawfish, blind crickets, flies, beetles and spiders, and other abnormal fauna, are found on the walls and under the rocks. The structure and habits of these animals have been studied with great care.

Beyond River Hall long avenues extend, many adorned by marvellous gypsum rosettes and brilliant arches of crystal efflorescence in the most fantastic diversity. Cleveland's Cabinet is frequently mentioned as a treasure-house of cave flowers; but some of the smaller rooms, for instance, Charlotte's Grotto, can boast of finer displays. The great cavern is said to end at Croghan's Hall, where is the Maelstrom already mentioned, but the few who have dared go to the bottom of this profound abyss report wide and long avenues beyond, which are yet to be explored. Everywhere, even in the deepest pits, the atmosphere is both chemically and optically pure; the temperature is uniformly about 54° F., all the year around, as has been determined by a long series of exact scientific observations, in order to discover the temperature of the crust of the earth.

The discovery of the Mammoth Cave is usually credited to a hunter named Hutchins, in 1809; but the present manager of the estate finds that the county records, in 1797, fix the entrance to this cavern as a landmark for a piece of real estate. The locality first gained notoriety by reason of its immense deposits of saltpeter, which were used in the manufacture of gunpowder, during the War of 1812. After passing through the hands of several owners, the cave was bought by Dr. John Croghan, who willed it to his nephews and nieces, with instructions that at their death it should be sold at auction. An earnest wish has been expressed by many that the famous cavern should even-

MAMMOTH HOT SPRINGS—MAN

tually become a State or National park. See also CAVES; CAVE ANIMALS. H. C. HOVEY,

Author of 'Celebrated American Caverns.'

Mammoth Hot Springs. See YELLOWSTONE PARK.

Ma'mo, a bird (*Drepanis pacifica*) of the Hawaiian Islands, related to the creepers, and now nearly extinct because of the great demand in past years for their yellow feathers for making the feather-cloaks formerly worn as insignia of royalty by the chiefs. Other birds supplied certain other required feathers. Very few of these cloaks remain in museums.

Mamoré, mā-mō-rā', a river of Bolivia which has its rise in the Cordillera Real, near Sucre, and flows first east by south, then forms almost a semicircle toward the north to Trinidad, from where its course is nearly north to where it unites with the Beni and forms the Madeira River. In the first part of its course it is called Rio Grande. The Mamoré is about 1,300 miles long and navigable for about 1,000 miles, with some obstructions. About 40 miles above its junction with the Beni are the Guajara Falls, above which navigation is free for about 400 miles to places where fallen logs have filled in between the banks and formed dams.

Mam'palon, an aquatic animal (*Cynogale bennetti*) of Borneo, of the civet family. It is otter-like in form, is about 18 inches long, has stout webbed plantigrade feet, and is thoroughly adapted to an aquatic life while retaining purely viverrine characteristics of structure.

Man (*Homo sapiens*), the most highly developed of the animals of the earth, differing from the other creatures in intellectual and spiritual nature, but so closely resembling them in physical organism that it is perfectly clear from the point of view of the comparative anatomist that he is not to be separated from the animal kingdom. Physiologically the distinction between man and the anthropoid ape is slight. As to the place of man in the animal kingdom there is some doubt, largely a matter of technical nomenclature. The point at issue is whether man is to be put in a separate order, and, if not, just what higher animals are to be included in the same order with him. The view that man is to be grouped with the anthropoid apes is taken by Huxley, Darwin, and Haeckel, all following Linnæus; it is the predominant view, and classes man with the apes in the order *Primates*. Sir Richard Owen, who followed Cuvier, was the foremost scientist of the 19th century to classify man as a separate order of the mammals, the *Bimana* in opposition to the *Quadrumana*. The order of *Primates*, to take the more authoritative classification, is divided into: the *Lemurida*, of which the lemurs (q.v.) are typical; the *Simiada*, including the "higher" apes; and the *Anthropoidea*, Man. The question as to the demarkation and the interrelation between the last two classes then arises. Comparative embryology may furnish some clue to this in the future; at the present the development of the embryo of the simians is almost entirely unknown. Geology and palæontology on the other hand not only have furnished no great assistance to this problem, but in the nature of the case are not likely to do more in the future. Haeckel's *Pithecanthropus* is little more than nomenclature; and it is only in minor degrees

that the lowest form of man approaches the most highly developed ape. Haeckel urges the contrast between the snub-nosed human races and the nose ape (*Semnopithecus nasicus*), and holds that the latter has a better claim to being created in the divine image; but this argument scarcely affects the case, for the points are not typical, and the evidence not so conclusive as skeletal identities, for instance, would be.

But if identities and approximate resemblances are hard to find, the distinguishing marks, especially anatomically, are evident. Foremost is the erect position of man as contrasted with the carriage of the apes. For no ape assumes a perfectly erect posture, and the attempts of the ape to stand erect are brief as well as unsuccessful. The human skeleton shows an obvious adaptation for the erect posture; the pelvis is wider than it is broad, and is shorter and stronger than in the ape; the articulations of the thigh are wider apart because of the breadth of the sacrum; the femur is longer than in any other animal and much more nearly in the same line with the axis of the trunk; and the spine has a double curve, which makes the erect posture possible. The human skull, however, exhibits the most striking differences from that of the ape. In the first place it is differently balanced, less of the mass of the head lying anterior to the line of the spinal cord, and much of the brain being posterior to the occipital condyles. Secondly, the facial bones are elongated downward and do not project forward. This difference may be due to the difference in posture noted above; the projection of the lower part of the ape's head makes it possible for the ape to look horizontally when on all fours, and to look up when in the semi-erect posture of tree-climbing, for example. The cranial capacity of the lowest savages averages about 100 per cent more than in the biggest-headed apes; hence the facial angle is entirely different. The difference between the hand of man and of the ape, and the distinctly plantigrade locomotion of man as opposed to the movement of the ape are further distinctions.

With these and other anatomical differences it is probably nearer the truth to consider man as the product of evolution from an ancestor common to him and to the simians, no matter how anthropoid the latter, than to make him, as hostile and superficial critics of Darwin would have it that evolution made him, a direct descendant of any ape. This is hinted by other important facts; thus the dentition of man is nowhere closely paralleled among the so-called *Quadrumana*, save in the case of a lemur, *Tarsius*, which alone has no intervals between the canines and the adjoining teeth, and which in no other respects bears any striking resemblance to man. The Darwinian Theory (q.v.), in so far as it was concerned with the descent of man, put stress on his ultimate and less immediate ancestry and on the steps in this development, urging, in brief, a line of evolution from naked molluscan Ascidians, successively through lower fish forms, ganoid fish, amphibians, reptiles and birds to the lower mammal form, and thence to the highest. This theory finds, perhaps, its most overwhelming proofs in comparative embryology, as in Haeckel's 'Evolution of Man.' As to tracing man's genealogy further back, even Lord Rayleigh, a notable defender of biogenesis, thinks that life upon the earth originated from

mosses from other worlds, in brief, that animal life is a continuation or evolution of vegetable life—a conclusion to which the very difficulty of drawing a hard and fast line between the two naturally leads. The attempt to carry back man's ultimate ancestry still further is to be found in the theory of abiogenesis (a term introduced by Huxley in place of the less exact "spontaneous generation"). This theory is urged both by Huxley and by Haeckel, notably in his 'Riddle of the Universe' (1900); and to the same end tend the apparently successful experiments in America of Loeb and others, who would show a close connection between electro-chemic phenomena and nervous force or life itself.

The life habits of prehistoric man, as well as his antiquity on the earth, are known almost entirely from fossil remains of various sorts. The data, however, are perplexingly scanty and insufficient for strictly logical deduction. Thus, although the general character of the Neanderthal skull, as Taylor says, "is less human and more simian than any other known skull . . . its precise age is doubtful, and it would be unsafe to regard it as the type of a special race since its characteristics . . . have been occasionally reproduced in modern times." In brief, any single anatomical specimen, simply because it is isolated, may not be considered typical of the *Urmensch*, nor as evidence of his antiquity, nor as belonging to *Pithecanthropus erectus*, inasmuch as the isolated specimen may be abnormal and freakish. Actually misleading are such "fossil" finds as the various anthropolites or petrified men, for the anthropolite is not a true fossil but merely a quasi-petrification due to the action of calcareous waters, in short, is due to chemical and not to geological action. Had such remains been real fossils they would have put the appearance of man upon the earth much farther back than it can be put. The information to be gathered from utensils found together with human remains and from adjacent remains of wild beasts is valuable. Tools and hunting weapons, bones of tropical fauna and remains of man are found in the gravel beds of western Europe; it apparently follows that man antedates the Glacial period, inasmuch as this tropical fauna there was previous to the Ice Age, and since remains of Glacial fauna together with human remains occur in later (and superior) geological deposits. Thus the question of the antiquity of man becomes the simpler question of the date of the Ice Age. The answer is, 60,000 years ago at least. It is largely on the discovery of flint implements styled "chelléans" at Chelles in France that man is thus dated back to the semitropical epoch of the Pleistocene period.

The implements of prehistoric man, as ordinarily classified by material, form the basis of a division of early industrial development into the Stone Age, the Bronze Age, and the Iron Age. The use of animal sinews, bones, etc., apparently antedates the period of stone implements; hence the more elaborate classification into Zoomimic, Protolithic, Technolithic, and Metallurgic, for which see ANTHROPOLOGY, AMERICAN.

As industrial arts began in imitation of the animals, so it is possible that the worship of man began with his wonder at the beasts, and with his personifying them, and secondly all natural forces. Animism or spirit worship was probably a second stage, although Herbert Spencer makes its sub-species ancestor-worship, which

is still a live force in China, the source of all religious cults, tracing back to it totemism, as a sort of ghost-worship, and naturism, hinting that the spirits of the departed were supposed to take up their dwelling in trees and rocks. Magic is closely related in primitive cultus both with naturism and animism. (See RELIGION.) (See also ANTHROPOLOGY, AMERICAN; ANTHROPOLOGY; ETHNOLOGY; ANTHROPOMERY.) Consult: Keane, 'Man, Past and Present' (1899); Girard, 'Aide-mémoire d'Anthropologie et d'Ethnographie'; 'The American Anthropologist'; Mivart, 'Man and Apes' (1873); Quételet, 'Physique Sociale' (1869).

Man and Nature, a work of great research written in 1864 by George Perkins Marsh (q.v.). Its full title was 'Man and Nature, or Physical Geography as Modified by Human Action.' The work became at once a standard with international recognition; a considerably enlarged Italian edition was issued at Florence in 1870; and a second American edition, with further changes, appeared in 1874.

Man-eater, a term applied to any fierce animal which has acquired, or is believed to have acquired, a habit of killing human beings as food. Lions, tigers, leopards and other great cats are accused of it, and undoubtedly many of these beasts, finding how easily a man or woman among East Indian or African villagers may be struck down or seized when sleeping in a flimsy hut, make their lairs near settlements and for a time regularly subsist upon human victims. Such are sometimes, but not always, old cattle-thieves, whose teeth are worn, and which feel unable or unwilling to undertake the exertion of tracking and pulling down wild animals; but this is not always the case. When such a beast has taken his residence in a district no pains must be spared to kill him, for he will not cease his depredations. Horses, elephants, camels, etc., sometimes become man-eaters in effect, understanding and exercising their power over him for harm.

A man-eater shark is the great white or blue shark (*Carcharodon carcharias*), which is one of the largest and most formidable of fishes. See SHARK.

Man-of-the-Earth, a local name in the Southern States for the wild potato-vine (*Ipomœa pandurata*), which "over the dry soil of fields . . . spreads in summer many of its great, white, waxy flowers, effectively spotted at their bases with purple." See IPOMÆA; MORNING-GLORY.

Man in the Iron Mask, The. See IRON MASK, THE MAN IN.

Man, Isle of. See ISLE OF MAN.

Man-of-war, an armed naval vessel regularly employed in the service of a government for war purposes. See NAVY OF THE UNITED STATES.

Man-of-war Hawk, or **Frigate-bird**, a tropical web-footed bird (*Fregata aquila*), of the family *Pelecanida*. The color of the adult bird is shining black, glossed with green, the female being duller in hue. Including the long tail the male bird reaches 3 feet in length, but the body is extremely small. The bill is longer than the head, strong, hooked at the point, and sharp. In proportion to their size their wings are longer than in any other bird, and have an

MAN-YOSHU — MANASSAS GAP

extent of 7 feet or more. Their flight is so powerful that they are seen more than a thousand miles from shore. They move with great difficulty on land, and rarely alight on the water. Possessing great strength and superior power of wing, the frigate-bird pursues terns or gulls which have secured a fish, and by beating them with wings and beak forces them to drop or disgorge it; then seizes the prey before it reaches the water. It also catches flying-fish for itself. Its usual locality for breeding is the summit of some rocky cliff, but breeds among trees where there are no rocky shores, making a rough platform of sticks. There is only one chalky white egg. This species is found throughout the tropics, and a second species (*F. minor*) ranges about the Indian and South Pacific Oceans.

Man-yoshu, *mān-yō-shoo'*, or **Manyōshiu** (Japanese, COLLECTION OF ONE THOUSAND LEAVES), Japanese anthology, the most ancient in the language. It is believed to have been completed early in the 9th century; it comprises about 4,000 poems which form a valuable index to the history, customs, and literary attainments of the time. Among its hundreds of authors the most able are Hitomaro and Akahito. The poems form a record of about 130 years, covering the latter part of the 7th and the early part of the 8th centuries.

Man'acle Rocks, England, a dangerous reef on the south coast of Cornwall, not far from Lizard Head and near the town of Falmouth. They are barely visible, except at low water, and there is no warning of their presence to the mariner except a bell buoy. Many wrecks have occurred here.

Managua, *mā-nā'gwā*. Nicaragua, (1) the capital of the state, near the southwest shore of Lake Managua, 32 miles south-southwest of Leon, consists of long rows of huts, and a large square lined with houses of two stories. The centre of the square is occupied by a large church, and there is another large church with a conspicuous white arched portal. The inhabitants, chiefly Indians, are industrious. A railway connects Managua with Corinto on the Pacific. Pop. about 30,000; (2) the lake, about 38 miles long, discharges itself into that of Nicaragua, above which it has an elevation of 16 feet, while its elevation above the Pacific is 156 feet. It has attracted a good deal of attention in connection with a proposed navigable communication between the Atlantic and Pacific.

Man'akins, a rather undefined group of South American tropical birds, mostly of the family *Pipradæ*, related to the North American tyrant-flycatchers. They are small, brightly colored (but the females are usually much plainer than the males), and the wings often bear curiously modified and often highly ornamental feathers. They are of terrestrial habits, staying upon or near the ground in wooded places, clinging to herbs and twigs of bushes like chickadees, and subsisting upon insects largely caught on the wing. Some of the species, called "dancers" in Brazil, gather in little parties in the breeding season, and go through queer active motions, called dancing. Consult: Evans, 'Birds' (1900).

Manacag, *mā-nā'wāg*, Philippines, a pueblo of the province of Pangasinán, Luzon, sit-

uated on the Malabolo River, 18 miles east of Lingayén, an important road centre. Pop. 17,500.

Manaos, *mā-nā'oos*, Brazil, city and capital of the state of Amazonas, on the Rio Negro, 12 miles above its confluence with the Amazon. A whitewashed cathedral rises in the centre of the town, which also has a custom house, a small fort, and a military barracks and hospital. The city is a steamboat station, and has a considerable trade in various forest products, but principally in india-rubber. Pop. about 20,000.

Manar, *mā-nār'*, or **Manaar**, Gulf of, southern India, an ocean inlet between Ceylon and the Madras coast with an extreme width of nearly 200 miles. It is almost closed at Paik Strait on the north by Adam's Bridge, a low reef of rocks and islands. The gulf has celebrated pearl fisheries.

Manassarowar, *mā-nā-sā-rō-wār'*, Tibet, a sacred lake and pilgrimage resort north of the main Himalayan range, near Darchan, between the sources of the Brahmaputra and the Indus. It is almost circular in form, about 15 miles in diameter, and is drained by the Sulej.

Manassas, *mā-nās'as*, Va., town, in Prince William County; near a creek named Bull Run, and at the place where the Manassas Gap and Alexandria railroads meet. It is about 35 miles southwest of Washington. Twice during the Civil War Manassas was the scene of engagements. See BULL RUN, BATTLE OF.

Manassas, First and Second Battles of. See BULL RUN.

Manassas Gap, Engagement of. Gen Lee, in retreating from Gettysburg, crossed the Potomac at Williamsport, into the Shenandoah Valley, and 15 July 1863 marched to Bunker Hill, and occupied the gaps of the Blue Ridge. On 19 July he ordered Longstreet to march next morning to Culpeper Court House, by way of Front Royal and Chester Gap. Gen. Meade crossed the Potomac at Harper's Ferry and Berlin, on the 17th and 18th, and moved up the Loudoun Valley along the eastern side of the Blue Ridge; and on the 21st Merritt's brigade of Buford's cavalry division, pushing well up into Manassas Gap, skirmished with the 17th Virginia infantry, and took 20 prisoners, from whom it was ascertained that Lee was moving up the valley with the evident intention of passing to the east of the Blue Ridge. Meade ordered the Third, Fifth, and Second corps to march upon Manassas Gap, directing Gen. French, commanding the Third corps, then guarding Ashby's Gap, to hasten to Buford's support. Before dark of the 22d French reached Piedmont, and Birney's division was pushed forward to Buford's aid, followed by the remainder of the corps, and at daylight of the 23d entered the Gap and relieved Merritt's cavalry, which moved up to Chester's Gap. Meanwhile, at dawn of the 23d, Hood's division of Longstreet's corps had marched from Front Royal and, relieving the 17th Virginia, was deployed in the Gap, where it was relieved during the morning by Wright's brigade of about 600 men of R. H. Anderson's division, under orders to hold the Gap until relieved by Ewell, then marching from Winchester. Wright's brigade was deployed at the west end of the Gap, and Rodes' division, with two batteries of artillery, coming to its support, drew up about 600 yards

MANASSEH — MANCE.

in rear, and sent 250 sharpshooters to take position on its left. These dispositions were completed about 2 P.M. Meanwhile Birney's division had advanced, steadily driving in the Confederate outposts and from Wapping Heights beyond which was Wright's line. About 4 P.M. Spinola's Excelsior brigade and two regiments of Ward's went forward at a charge and, sweeping past Wapping Heights, engaged Wright's men in a close and severe fight, driving them back upon Rodes, who stood firm, the artillery checking the Union advance about dark, Rodes' line not being engaged, and losing but 15 killed and wounded. Wright's loss was 19 killed, 83 wounded, and 66 missing. French's loss was 21 killed and 84 wounded. Ewell fell back to Front Royal during the night. Next morning the Union advance marched to Front Royal, but all of Lee's army had passed and, marching swiftly through Chester and Thornton's gaps, it took position on the south side of the Rappahannock. Consult: 'Official Records,' Vol. XXVII.; Humphreys, 'From Gettysburg to the Rapidan.' E. A. CARMAN.

Manasseh, the name of several scriptural personages: (1) eldest son of Joseph: b. Egypt. When brought with Ephraim to receive the blessing of his grandfather Jacob, the old man placed his right hand upon the head of the younger, and his left upon that of Manasseh, thus depriving the latter of the precedence due to his priority of birth. The descendants of Manasseh formed a tribe, which, in Canaan, was settled half beyond the Jordan, and half on the west side. (2) A king of Judah, who was made tributary to Esarhaddon, carried captive to Babylon, but restored upon his repentance. (3) A priest who in the time of the prophet Malachi built a rival temple on Mount Gerizim.

Manatee, an aquatic mammal or "seacow" of the order *Sirenia* (q.v., for general structure), several species of which inhabit the fresh waters along the eastern coasts of tropical America, and of western Africa. The body is somewhat seal-like in shape, reaches a length of eight or ten feet, has a large round head with bristly, tumid lips, no apparent neck, no external ears, the forelimbs converted into paddles, no hind limbs, and the tail spade-shaped, like that of a beaver. The thick wrinkled skin is blackish, and almost hairless, but a coat of short, seal-like fur clothes the fetus, indicating descent from furry ancestors. Structurally the manatee differs from other sirenians in having only six cervical vertebrae, and in the large number of molar teeth, which apparently go on increasing indefinitely during the animal's life,—the suggestion being, as Bedard points out, that they are worn away by the attrition resulting from so much sand being mixed with the daily food. The cleft lip to be mentioned hereafter, is also a generic peculiarity. The manatees are stupid, gentle, defenseless and harmless creatures, showing great affection for their young, one or two in number, which are nursed at pectoral udders, often while the mother stands erect upon her tail enfolding the "calves" with her broad arms. They never come ashore, but secrete themselves amid aquatic vegetation, where the only enemies they need fear are the larger alligators, and the jaguar. Their food consists of fresh-water weeds and their roots, and these are procured by means of the curious form of the upper lip:

"this is split in two, and the two halves, which are furnished with strong bristles, can play upon each other like the points of a pair of forceps." This cleft-lip is only suggested in the case of the dugong, but the fetus of that animal shows the structure plainly, indicating that the manatee is the more primitive form of the two. The flesh is excellent for food. The American manatees have been nearly exterminated. They formerly abounded in the Indian River and other marshy waters about southern Florida, but by the end of the 19th century had been reduced to a small carefully protected band near Biscayne Bay. They still survive in small numbers along the coast of the Caribbean Sea and about the mouths of the Orinoco. The Florida manatee is called by American zoologists *M. latirostris*, and is regarded as different from those of Central and South America, long known as *M. americanus*. The African species is *M. senegalensis*.

Manatt, James Irving, American educator: b. Millersburg, Ohio, 17 Feb. 1845. He was graduated from Iowa College in 1869, having previously served for a time in the Federal army. He engaged in journalism, but soon abandoned it to continue his studies and in 1877-84 was professor of Greek at Marietta College; in 1884-9 he was chancellor of the University of Nebraska and since 1893 has occupied the chair of Greek literature and history at Brown University. With Tsountas he has published 'The Mycenaean Age' (1895).

Manayunk, mán-a-yŭnk'. See PHILADELPHIA.

Man'by, George William, English inventor: b. Hilgay, Norfolk, 28 Nov. 1765; d. Southtown, Great Yarmouth, 18 Nov. 1854. He was educated at the military college of Woolwich, and became in 1803 barrack master at Great Yarmouth. His attention having been drawn to calamities resulting in cases of shipwreck, from the difficulty of establishing communication with the shore, he attempted casting a rope from the shore to the wreck by the agency of gunpowder. Chains were unable to stand the shock of the discharge, but stout strips of rawhide closely platted together were found to answer; and on 12 Feb. 1808, the entire crew of the brig Elizabeth, wrecked within 150 yards of the beach, were rescued by the simple contrivance of Capt. Manby. In 1810 his invention was brought before a committee of the House of Commons, and having been favorably reported on, he received a grant of money, and all the dangerous stations on the British coasts were supplied with his apparatus. He also contrived shells filled with luminous matter, to enable the crew to perceive the approach of the rope, in the manufacture of which he suggested several improvements. He published the 'History and Antiquities of the Parish of St. David, South Wales' (1801); 'The Preservation of Shipwrecked Persons' (1812); 'Journal of a Voyage to Greenland in 1821' (1822); and a number of writings relative to shipwrecks and to his various inventions.

Mance, Jeanne, zhān māns, French philanthropist: b. Nogent-le-Roi, France, 1606; d. Canada 1673. She was a religious enthusiast

1. West Indian Manatee.

2. West Indian Manatee.

MANCHA—MANCHESTER

and was one of the party conducted by Maisonneuve (q.v.) to Canada in 1641, and was an able assistant to him in the religious enterprises established in Canada. She was an indefatigable worker, had charge of the hospital at Montreal and exercised much influence in the government of the colony. She made several visits to France to obtain the funds necessary in the work and died head of the Sisters of Saint Joseph.

Mancha, mǎn'chā, La, Spain, an ancient province of New Castile, now forming the chief part of the province of Ciudad Real. It is almost encircled by mountains and is an immense elevated plain intersected by ridges of low hills and rocks, watered by the head-streams of the Guadiana, almost treeless with the exception of a few dwarfish oaks and olive trees, but carefully cultivated and rich in grain, grape vines, and esparto grass. The region is one of the most agreeable in Spain, and is celebrated by Cervantes in *Don Quixote de la Mancha*. The inhabitants are affable and great lovers of music and dancing. Chief towns, Ciudad Real and Ocana.

Man'chester, Conn., town, in Hartford County; on the Hockanum River, and on the New York, N. H. & H. railroad (formerly New England railroad); about eight miles east of Hartford. Until 1823, when it was incorporated as Manchester, it formed a part of East Hartford; it includes the villages of Highland Park, Buckland, Manchester, Manchester Green, and South Manchester. The town has extensive manufacturing plants, the most important being the Cheney Silk Mills. It has also cotton and woolen mills, paper mills, needle works, and electrical supply works. A large amount of tinware is made in Manchester. There are two public libraries, one in the village of Manchester, and one in South Manchester. Pop. (1900) 10,601.

Manchester, England, a city, inland port, and municipal county of Lancashire, 31 miles east of Liverpool, on the Irwell, an affluent of the Mersey, since 1894 connected with the sea at Eastham on the Mersey estuary, by the Manchester ship-canal, 35½ miles long. It is one of the principal manufacturing cities in the world and the cotton trade centre of Great Britain. It stands on a large hill-encircled plain, and with Salford, a suburban municipality on the west bank of the Irwell, covers over 13,000 acres, while railways, steam and electric street railroads communicate with the surrounding towns and villages of one of the most populous industrial regions of England. Four main lines of railway connect with all parts of the kingdom. The principal among its many fine public buildings are, the Exchange, built in the Doric style; the Town Hall, an elegant building of Ionic architecture, formed on the model of the Temple of Erechthus at Athens, and the Corn Exchange. Of over 300 places of worship the chief are St. John's Roman Catholic Cathedral in Salford, which has a splendid interior and a spire 240 feet high, and the "Old Church" or Anglican cathedral, a fine Gothic building dating from 1422, and recently restored. It has numerous educational institutions, one of which, the college founded by Humphrey Chatham in 1665, contains a large library, while Owens College,

the central institution of Victoria University, is of world-wide celebrity. There are, besides, several public libraries, possessing collectively over 300,000 volumes; and a number of associations for promoting literature and science.

Many of the commercial and banking establishments are on a grandiose scale, while the factories and warehouses are numerous and of gigantic proportions. In modern municipal enterprise Manchester is one of the leading cities of the world, with model waterworks, gas and electric lighting plants, electric street railroad system, sewage precipitation and filtration works, artisans' dwellings, markets, parks, public baths, washhouses, etc. Manchester owes its rapid rise and importance to its manufactures and trade. It derives considerable advantages from its proximity to one of the largest and most valuable coal fields in England and from the canals and railways, which connect it with all parts of the country, and with the Atlantic and North Sea. Its transportation facilities since 1894 have been largely increased by the construction of the Manchester Canal (q.v.), its greatest municipal undertaking, carried out against immense opposition, chiefly from Liverpool, and by which the largest ocean steamers now load and unload in the centre of the city, over 100 acres of dockage and six miles of quayage providing ample accommodation. The staple article of manufacture and trade in the district of which Manchester is the centre is cotton, from the working of which the name of the town and its goods have become household words throughout the world. In more immediate connection with the textile manufacture are numerous bleach-works, dye-works, print-fields, chemical works, and engine factories. Besides articles of pure cotton, nure silk and mixed goods are manufactured to a considerable extent. The manufacture of silk goods, which was introduced in 1816, has generally flourished since 1826, producing every description of fabrics from the rich brocade to the flimsy Persian. In some cotton factories spinning only is carried on. Several thousands of spindles are at work in each of the principal factories, and in many of them upward of 600 power looms are in action, each producing from 15 to 20 pieces of fabric, of 24 yards each, per week. Besides the population connected with the factories, which almost absorb the plain goods trade, upward of 9,000 hand loom weavers are employed in weaving cotton, silk, and mixed goods. The principal articles manufactured are velvets, fustians, dimities, calicoes, checks, tickings, jeans, shirtings, ginghams, quiltings, handkerchiefs, nankeens, diapers, muslinets, muslins, cambrics, and almost every kind of fancy cotton and silk goods. The spinning trade is extensive, and considerable quantities of yarn are annually exported. There are over 60,000 persons employed in the cotton mills, besides 7,000 skilled mechanics engaged in the production of steam-engines, looms, and other machinery; there are also important works devoted to paper, leather, hardware, electric appliances, etc. The United States is represented by a consul. Though Manchester became a parliamentary borough in 1832, it was not incorporated as a municipal borough till 1838. The town council consists of 104 members, of whom 26 are aldermen, with a lord mayor at their head. Manchester has a separate commission of the peace and court of quarter-sessions.

MANCHESTER

Manchester was known at an early period, the Romans having a station here. In 620 it was taken from the Britons by Edwin, king of Northumbria, and was shortly after occupied by a colony of Angles. The conversion of the inhabitants to Christianity was effected about 627 by the preaching of Paulinus, and a church dedicated to St. Michael was erected. Manchester next passed to the Danes, who were expelled about 920 by Edward, king of Mercia. Manchester and Salford both had charters in their early days from their feudal lords. In 1422 the church (now the cathedral) was built and collegiate. During the civil war possession of Manchester was keenly disputed, and the town suffered much at the hands of both parties. It has played an important part in the political history of the country, especially in connection with the agitation for parliamentary reform and the establishment of free-trade. An important episode in its modern history was the cotton famine and distress caused by the Civil War in America. Manchester became the seat of a bishopric in 1847. The title of lord mayor was conferred on the chief magistrate in 1893. The population in 1773 amounted to 26,426; in 1801 it was 106,798; in 1891 the municipal borough had a population of 505,368. The population of Salford in 1891 was 198,139. In 1901 the population of Manchester was 543,872; of Salford, 220,747.

Manchester, Iowa, city, county-seat of Delaware County; on the Maquoketa River, and on the Illinois Central railroad; about 130 miles northeast of Des Moines and 45 miles west of Dubuque. It is situated in an agricultural region, and its excellent water-power is utilized in manufacturing industries. The chief manufactures are woolen goods, tiles, brick, fencing, flour, wagons, carriages, and dairy products. Manchester is the trade centre of a large part of Delaware, and the adjoining counties, and ships farm produce, dairy products, and live-stock. A United States fish hatchery is in the vicinity. Pop. (1900) 2,887.

Manchester, Mass., town, in Essex County, on Massachusetts Bay; and on the Boston & Maine railroad; about five miles southwest of Gloucester. The first settlement was made in 1630, and until 1645 the place was called "Jeffrey's Creek," when the name was changed to Manchester and the town was incorporated. Since 1845 Manchester has been a favorite summer resort, one of the attractions being a Singing Beach. In addition to good public schools the town has a free public library in the Coolidge Memorial Library Building. Consult: Lamson, 'History of the Town of Manchester.'

Manchester, N. H., city, one of the county-seats of Hillsboro County; on the Merrimac River at the mouth of the Piscataquog, and on branches of the Boston & Maine railroad; about 17 miles south of Concord, the capital of the State, and 56 miles north of Boston. The first settlement was made in 1722, and for a number of years it was called Amoskeag and Harrytown. In 1751 it was incorporated as "Derryfield," and in 1810 the name was changed to Manchester. It was chartered as a city in 1846. The Amoskeag Falls (54 feet) in the Merrimac, above the city provides extensive water-power which by means of canals is made available for manufacturing. The city's prosperity is largely

dependent upon this water-power, which for years has been controlled by the Amoskeag Manufacturing Company. The city has over 400 manufactories, representing about 60 different industries. The capital invested is about \$25,000,000, and the number of employees about 16,000. The chief industrial establishments are the cotton mills, the Amoskeag, Amory, Manchester, and Stark mills alone have a capital invested of about \$14,018,000, and their annual output is estimated at \$11,000,000. Other manufactures are foundry and machine-shop products, (especially locomotives and fire-engines), hosiery, paper, boots and shoes, wooden-ware, needles, woolen goods, knit goods, leather, lumber, wagons, carriages, and furniture. The system of waterworks, owned by the city, has a reservoir of 16,000,000 gallons capacity which is fed from Lake Massabesic, a body of pure water about four miles from the city. The works were completed in 1874 at a cost of \$600,000. Some of the principal public buildings are the Government building, the Roman Catholic Cathedral, the county court-house, Sacred Heart Hospital, Hospital of Our Lady of Lourdes, and a public library, which contains about 46,000 volumes. The several public parks are well kept and add much to the attractive features of the city. The city has the State Industrial School, Saint Joseph's and Saint Patrick's orphanages, and Saint Patrick's and Saint Vincent's Homes for the Aged. The educational institutions are a public high school, three parish high schools, a number of grammar and elementary public and parish schools, a training-school for teachers, Saint Augustine's and Saint Mary's academies, and Saint Anselm's College. There are five national banks with a combined capital of \$750,000, and six savings banks, with a surplus of \$855,500. Pop. (1890) 44,126; (1900) 56,987.

Manchester, Vt., village, one of the county-seats of Bennington County; on the Battenkill River, and on the Bennington & Rutland railroad; about 32 miles south by west from Rutland. Manchester was one of the disputed places in the early days, when what is now Vermont was nearly all owned by New Hampshire, but a part by New York. In 1761 Manchester was incorporated as a town and as a village in 1900. It is situated in a beautiful locality near Mount Equinox, which is 3,816 feet above the sea. The village is in a fertile farming section, where dairy products are a chief source of income. An excellent quality of marble is found in the vicinity, and the forests furnish a considerable amount of timber for the lumber mills. The water from mineral springs nearby is shipped to many parts of the country. Fishing rods and ginger champagne are manufactured extensively. It is the seat of the Burr and Burton Seminary, and has the Skinner Memorial Library, which contains about 17,000 volumes. A large part of the sidewalk of the village is made of marble. Manchester is a favorite summer resort. Pop. (1900) 1,955.

Manchester, Va., city, in Chesterfield County; on the James River and on the Atlantic C. L., the Seaboard A. L., and the Southern R.R.'s. It is opposite Richmond, with which it is connected by several bridges. It is situated in an agricultural and coal region; and its industries are connected largely with the products of the farms and mines. At Manchester there

MANCHESTER CANAL — MANCHURIA

is a fall in the James River of 100 feet in about six miles. The extensive water-power is used for manufacturing in both Richmond and Manchester. Its chief manufacturing establishments are foundries, cotton mills, flour mills, woodenware factories, brick yards, paper mills, tanneries, and the repair shops of the Southern railway. The city owns and operates the waterworks. Pop. (1900) 9,715.

Manchester Canal, England, a great ship-canal, by which Manchester (q.v.), an inland town, was virtually converted into a seaport. The canal works were begun 11 Nov. 1887 and traffic was fully started in the beginning of 1894, the canal having been opened over a part of its length in 1891. The canal is $35\frac{1}{2}$ miles long, the seaward end being at Eastham on the south side of the Mersey estuary, where three large locks have been constructed. There are locks on other portions of the canal, Manchester being situated 60 feet above sea-level. The minimum width of the canal at bottom is 120 feet, the maximum 170 feet; the minimum width at water-level is 172 feet, the maximum 230 feet; the minimum depth is 26 feet, on the lock sills it is 28 feet. From Manchester to Warrington the canal follows generally the course of the Irwell and the combined Irwell and Mersey, the river being deepened, widened, and straightened, where this was deemed advisable. In the lower part of its course the canal becomes semi-tidal, and from Runcorn onward it runs along the southern bank of the Mersey estuary, parallel with and near the river. At one point the Bridgewater Canal crosses the Manchester Canal, by a swinging caisson capable of being revolved while full of water to let a vessel through that has masts too high to pass under. The contract for constructing the canal was let at \$26,750,000, but the company had to raise a sum of over \$75,000,000 as capital. Of this sum Manchester contributed \$25,000,000, stipulating for unconditional control by a majority of the directorate.

Manchester Coppy, a very long-bodied, crested variety of canary-bird, first bred in Manchester, England.

Manchester Massacre. See PETERLOO MASSACRE.

Manchester School of Political Economy, a name given in Great Britain to the political party whose exertions were particularly directed to the development and thorough carrying out of the principles of free-trade. They came forward as a compact party in the Anti-Corn-law League, and had their chief seat in Manchester. After the abolition of the corn-laws this party extended their programme, and agitated in favor of non-intervention in foreign affairs, of arbitration instead of war, etc. Several eminent statesmen were connected with it, among others Richard Cobden and John Bright. From their advocating non-intervention in foreign affairs they were sometimes called the "peace-at-any-price" party.

Manchester Unity. See ODD FELLOW.

Manchineel, a West Indian maritime euphorbiaceous tree (*Hippomane mancinella*), celebrated for the poisonous qualities of the milky juice which abounds in every part of it. When a drop of the juice is applied to the skin it causes the same sensation as a burning coal,

and quickly produces a vesicle. The Indians used it for poisoning the points of their arrows, which preserved their venom for a long time. The workmen employed in felling these trees first build a fire round the trunks in order to make the juice evaporate, and cover their eyes with gauze, yet are likely to be incommoded with the dust. The accounts, however, which represent it as dangerous to sleep in the shade, or to come in contact with the rain which has fallen upon this tree, are highly exaggerated, and it is difficult to say how much trust may be placed in other stories as to its poison. The inhabitants of Martinique formerly burned entire forests of the manchineel, in order to free their dwellings from its presence.

Manchuria, mǎn-choo'-rī-a, China, comprises the northeasternmost portion of the empire, called by the Chinese TUNG SAN SHENG, 'Three Eastern Provinces,' from its administrative divisions, Hilung Kiang, the northern province; Kirin, the central province, and Sheng-King, the southern province. It lies mainly between lat. 40° and 53° N. and lon. 118° and 135° E., and is separated from Asiatic Russia on the north and northeast by the Amur, on the east by the Usuri, and on the northwest by the Argun. On the west it is bounded by Mongolia and China proper, part of the boundary being the Palisade Barrier, separating it from the province of Pe-chi-li; on the south the boundaries are the Liao-tung Gulf, the Strait of Pe-chi-li, Korea Bay and Korea. Manchuria has an estimated area of 363,610 square miles. Vast chains of mountains ramify all over the country, one of them forming the south limits of the valley of the Amur. The principal rivers are the Amur; the Argun; the Sungari, the vast basin of which occupies a great part of the territory; the Usuri, like the Sungari, a tributary of the Amur; and the Liao-ho, flowing south into the Gulf of Liao-tung. The Nonni is an important southward-flowing tributary of the Sungari, and the Hurka or Khurkha joins the same river from the south. The climate is in most parts healthful and invigorating. In the northern and more elevated parts the cold of winter is intense, the thermometer sometimes falling to 48° below zero, and the snow lying for six months in the year. The summer temperature reaches about 90° in the shade.

The vast forests of the north are rich in useful timber of all kinds, such as walnut and oak, together with the soft pine and fir. They abound in wild animals, the tiger, panther, bear, wolf, and stag, as well as the eagle and other birds of prey. The rivers abound with fish. The soil is exceedingly fertile, especially in the valleys of the Liao and Nonni rivers. In the summer the southern part looks to an American much like Illinois, and one may find on its most northern hills lilies-of-the-valley, pink peonies, white and yellow daisies and the fragile dog roses, as in Wisconsin and Minnesota. With the exception of four ice-locked months its fields are luxuriant with wheat, barley, and millet, so that it has come to be called the "Garden of China." In the warmer portions the grape vine, indigo, cotton, opium, tobacco, sorghum, rice, ginseng, etc., are cultivated, the opium poppy being a valuable crop. Oleaginous beans are extensively grown for the oil yielded by them, and form the staple articles of export. The silk-

MANCHURIA

worm also is reared. The mineral wealth of Manchuria is great, but as yet is little developed. Iron, gold, silver, coal, peat, etc., occur in abundance. The Manchus are a Tungusian race. They are of a lighter complexion and a more powerful build than the Chinese, have the same conformation of the eyelids, but their countenances are far more expressive and intellectual. In the 17th century they invaded China, and placed their leader's son upon the throne. Since that time the Manchu dynasty has continued to reign in China, the Manchu language being the court and official language. Manchuria possesses a native population of 22,000,000, of whom 12,000,000 inhabit the southern province of Sheng-King, 8,000,000 the central province of Kirin and 2,000,000 the wild northern province of Hilung Kiang. A great immigration from Russia, China, and Korea, has taken place especially since the Russian occupation in 1900. (See CHINA, paragraph *Events of 1902-3*). For a considerable time prior to 1891, when the first sod was turned for the construction of the great Siberian railroad, the Russian government was anxious to secure control of this territory. When Japan in 1895 occupied the Liao-Tung Peninsula of Manchuria and began to fortify Port Arthur as its southern tip, Russia, with two other powers protested. Weak, though victorious, Japan withdrew, shortly afterward to learn of the secret treaty of Count Cassini by which Russia leased Port Arthur from China for an indefinite number of years. Having obtained this foothold, the Russians cast covetous eyes on the vast territory which lay between, and under the commanding influence of Admiral Alexieff, generalissimo of the Russian military and naval forces in the Far East, for his services recently proclaimed by imperial ukase Vice-Czar of Greater Russia and lord of all the lands which lie between Baikal and the Pacific and which extend from the Arctic to the Yellow Sea, they accordingly began a pacific conquest by colonization on an unparalleled scale. The route of the Siberian railroad was originally surveyed with Vladivostok on the Pacific coast of Russian Asia as the terminus. Port Arthur, however, washed by the warmer waters of the Yellow Sea, now became the coveted goal.

A corporation known as the Russo-Chinese Bank was established, which to all appearances was a mutual combination of Russian and Chinese capital. Although the bank was only another name for the Department of Finance of the Russian empire, yet its name pleased Mongolian vanity and won respect, the Chinaman having as great esteem for a banker as he has contempt for a soldier.

There were times when China was short of ready cash, and the Russo-Chinese Bank each time went to her aid. Therefore when China was asked to grant a concession for a railroad from the Siberian trunk line to Liao-Tung Bay, and the Russo-Chinese Bank offered to furnish the necessary \$250,000,000, China could not well refuse. With the same discretion with which the bank was named, the railroad was called the Russo-Chinese railroad. On its stationery were the grouped flags of China and Russia. These flags also appeared on the cars and engines, and on days of popular festivity they floated over the depots.

After the road was built some Chinese awak-

ened to the railroad's true purpose. They discovered that it penetrated the most fertile as well as the most densely populated districts of Manchuria, and had for its terminus the Russian fortress of Port Arthur. On the north it joined with the Siberian trunk line at Harbin, on the mighty Sungara. It passed through the cities of Tsitsihar, Kirin and Mukden, capitals of the three Manchurian provinces. It tapped the Gulf of Liao-Tung, by means of the port of New-Chwang, and skirted the whole eastern coast of this arm of the Yellow Sea.

When the other powers became alarmed at the armies of soldiers which kept pouring in with every train from Siberia and European Russia, the officials of the Czar explained that they were simply "railway guards," and, to further prove that their presence was wholly warrantable, they pointed to a sentence of the railroad's charter, which permitted Russia to guard the railway with troops, but did not limit their number. Faster than the soldiers, however, came the colonists. Families were gathered from all parts of the Czar's western dominions, and put aboard trains of the Siberian railroad at Chilibinsk, the border town between European and Asiatic Russia. They were charged nothing for transportation. Their wants were cared for on the way. At each railroad station along the 6,000 miles of track there was hot water and fuel where they might cook, and markets of wooden sheds where they might buy food from the peasants at low cost.

Every inducement was and is held out to the Russian settler. To each male member of the household is given 100 acres, and oftentimes a man who has a large number of sons will assume ownership of more than a square mile. In addition to the land the government furnishes the settler with agricultural implements, carpenter tools and cattle, and even advances him money, to be repaid at an insignificant rate of interest.

But although immigration has amounted to nearly 200,000 a year, it has not yet penetrated far from the railroad. The region is too vast.

Consequent on the Boxer massacres and troubles of 1900 a Russian military force occupied the right bank of the Amur River, declared it to be Russian territory and established a provisional Russian administration. On 8 April 1902 the Manchurian convention between China and Russia was signed, wherein Russia agreed to evacuate Manchurian territory within 18 months. But now Russia cannot voluntarily withdraw. The civilization of the Slav has rooted itself too firmly in this soil to be eradicated except by a political cyclone. One may see everywhere, from Port Arthur at its extreme southern end to the Amur River, the old Russian boundary, on the north, evidences of the Muscovite occupation. Under the direction of Russian engineers native laborers are building railroads and military highways, constructing wharves, marking out vast farms and laying out cities. The Russian fortress is found wherever a strategic site will make Russian cannon still more formidable, and almost in the shadow of these guns rise the peaceful sanctuaries of the Orthodox Greek, with their white walls and green roofs and cupolas.

For the purpose of supplying her thousands of colonists with a great seaport and commercial outlet, Russia has built the city of Dalny, 14

MANCHUS—MANCO INCA

miles from Port Arthur, on the eastern side of the Liao-Tung Peninsula. Engineers built its wharves, laid out its streets and even planted trees along driveways intended for pleasure vehicles before the inhabitants arrived. The population is rapidly growing and the lines of steamships which load here directly from the cars of the Siberian railroad are increasing in number and in frequency of service, while bids have been received at Port Arthur by the Russian authorities for the construction of electric light plants and electric railways for Mukden, Harbin and New-Chwang.

New-Chwang, the ancient treaty port, which was formerly the chief port for this part of Manchuria, has also passed into the hands of the Russians, who intend to transfer its commerce to modern Dalny, where it will be almost within range of the sixteen-inch guns of Port Arthur.

On 8 Oct. 1903 the Russian government was pledged to evacuate Manchuria, yet when that day came she only poured in more soldiers, and made a great naval demonstration, her actions creating international uneasiness, affecting as they do Japanese especially, and British interests, while the United States is also involved, being anxious to maintain the rights obtained under the Shanghai treaty to trade freely with Manchuria. Notwithstanding all rumors it seems more than probable that Russia is in Manchuria to stay.

Manchus, *mǎn-chooz'*, a name given the reigning family in China, members of whom sat upon the throne of the empire as early as 1644. They belong to the Tungusic type of Mongolians. A modern application of the name Manchus is ascribed to the Mongol tribes of the Amur district.

Mancinelli, *Luigi*, *loo-ě-jě mǎn-chě-ně-l'ě*, Italian composer: b. Orvieto, Italy, 5 Feb. 1848. He studied at Florence and in 1870 was a member of the orchestra of the opera at Rome; the directorship came into his hands five years later. In 1881 he was director of the Bologna Conservatory and under his control its reputation was greatly enhanced. As a conductor he is famous over Europe, and has been recognized as a leader in the musical world since his engagement at Drury Lane, London, in 1886-8. He was at Madrid for seven years in the opera and there produced several operas of his own. Since then he has been connected with the opera of New York and London. Among works of his may be mentioned the opera 'Isora di Provenza' (1884), the opera seria 'Ero e Leandro' (1897), and the cantata 'Isaiah' (1887).

Mancini, *mǎn-chě-ně*, a name borne by the five nieces of Cardinal Mazarin. They were born in Rome and summoned by their uncle to Paris, where they played a conspicuous part in the court of Louis XIV. during the early years of his reign. They were: (1) **LAURE** (b. 1636; d. 1657), the amiable and pious companion of Louis XIV.'s boyhood. She became the mother of Louis, Duke of Vendôme, one of the greatest generals of the Grand Monarque. (2) **MARIE** (b. 1639; d. about 1715), for whom the king conceived a violent affection, but in 1661 Mazarin gave her in marriage to Prince Colonna, constable of Naples. She left her husband in 1672 in the vain hope of renewing her influence over the king. Expelled from France, she took up her residence in various parts of Europe, and

finally settled at Rome 1705. (3) **OLYMPÉ** (b. 1640; d. 1708), a witty and attractive woman, who became wife of Eugène de Savoie-Carignan, count of Soissons, and mistress of the queen's household. She was suspected of complicity in the affair of the notorious poisoner, La Voisin (see VOISIN, LA), and left France to wander over Europe, and finally ended her days in Brussels. (4) **HORTENSE** (b. 1646; d. 1699), the most attractive and beautiful of the Mancini. Her hand was sought by Charles II. of England, then in exile, and Peter II., future king of Portugal. In 1666 she left her husband, the Duke de Mazarin, and became one of the chief beauties of King Charles II.'s court. The king pensioned her, and after the revolution of 1688 she lived in retirement at Chelsea. (5) **MARIE ANNE** (b. 1649; d. 1714) was the wittiest and most vivacious of the sisters. In 1662 she married the Duke de Bouillon, and her salon became the centre of social and intellectual life at Paris. She patronized La Fontaine, Corneille, and Molière. Being entangled with her sister in the La Voisin affair, she left Paris, but returned in 1703 and regained her place in the court. She died at Clichy.

Mancini, Laura Beatrice Oliva, Italian poet: b. Naples 1823; d. Florence 17 July 1869. In 1840 she married, against the wish of her relatives, the jurist Pasquale Mancini (q.v.), and she wrote a play entitled 'Ines,' founded upon the romantic circumstances of this alliance, which was performed in Florence in 1845. In 1846 appeared her poem, 'Colombo al convento della Rabida,' and a volume of miscellaneous poetry. In 1851 she addressed a poem to Mr. Gladstone in gratitude for his revelations in regard to the Neapolitan government; and one of her finest poems was elicited by the death of Gioberti, 'L'Italia sulla tomba di Vicenzo Gioberti' (1853). Her 'Patria ed Amore' appeared in 1874.

Mancini, Pasquale, Italian statesman: b. Castel-Baronia, 17 March 1817; d. Naples 26 Dec. 1888. He was a member of the Neapolitan Parliament in 1848, and because of his prominence in opposition to the king, was obliged to flee to Turin, where he became professor of international law in the University, in which he was popular as a lecturer. He entered the Sardinian Parliament, and in 1862 was minister of public instruction. He subsequently resided in Rome, where he was not only a member of the Italian Parliament, but professor in the University and a busy lawyer. Attending the Peace Congress at Ghent in 1873 as delegate from Italy, he was chosen its president. He was minister of foreign affairs, 1881-83, and the author of 'Prelezioni di diritto internazionale' (1873).

Manco Capac, *mǎn'kō kǎ-pāk'*, founder and legislator of the Peruvian empire, supposed to have flourished in the 12th century. See INCAS.

Manco Inca, I., *Ing'ka*, Peruvian ruler: b. about 1500; d. 1544. He was the second son of the Inca Huayna Capac (q.v.), who died about 10 years after the first arrival of the Spaniards, dividing his kingdom between his legitimate successor Huascar and a younger son, Atahualpa. The latter, after having made war upon Huascar, and put him to death, was himself captured and executed in 1533 by Pizarro. Shortly afterward

MANDÆANS — MANDAN

Manco appeared in the Spanish camp to announce his pretensions to the throne and claim Pizarro's protection. The conqueror received him cordially, and made it his first care after the taking of Cuzco to place him on the throne. After in vain petitioning for power to exercise the sovereignty, he withdrew secretly from Cuzco, but was brought back and imprisoned. Again escaping, he roused the whole nation to arms against the invaders, and appeared before Cuzco (February 1536) with a countless host of Indians who covered the surrounding hills. He destroyed a large part of the city by fire, and reduced the Spaniards to extremities; but after the siege had lasted over five months, had to withdraw on account of the scarcity of food. Defeated subsequently by Almagro, and forsaken by most of his warriors, he fled to the Andes, and for several years maintained his independence sallying forth as occasion offered at the head of a few brave followers, always eluding pursuit in the wilds of the Cordilleras, and in the event of civil war among the foreigners throwing his weight into the weaker scale in order to prolong their contests. He was killed by a party of Spaniards belonging to the younger Almagro's faction, who on the defeat of their leader had taken refuge in the Peruvian camp.

Mandæans, mǎn'dé'anz, an ancient Oriental religious sect of mixed Christian, Jewish, and heathen elements. They are still found on the east shore of the Tigris, working as jewelers, blacksmiths, carpenters, etc. Their religion is a kind of Gnosticism, retaining various Jewish and Parsee elements. They worship a number of personifications, particularly of the attributes or names of God. They publicly call themselves Sabians (*Sabbā*, "baptists"), thus professing to identify themselves with the Sabæans tolerated in the Koran. They were formerly called Christians of St. John the Baptist from their habit of baptism or ablation. They have five important sacred books: 'Sidrā rabbā' ("the great book"), called also "ginza," "treasure"; 'Sidrā de Yahyā' ('Book of John'); the 'Qolasta,' a collection of hymns; 'Diwān,' a ritual; and 'Asfar Malwāsē,' a manual of astrology. The Mandæans had three degrees in the priesthood, with a supreme official (Rish ammā) as the source of both civil and ecclesiastical authority. The priests officiate in white robes, barefooted, and women may be admitted to their order.

Mandaites. See NAZARENES.

Mandalay, mǎn'da-lā, East India, capital of Upper Burma; two miles from the left bank of the Irawadi, a little north of Amarapura (q.v.), the former capital, and about 410 miles north of Rangoon. It was founded in 1860, was the capital of independent Burma until its capture by the British in the end of 1885, and since the treaty by which (1886) the king lost his throne it has been the capital of Upper Burma. The area is six square miles. The most famous building in Mandalay is the Aracan Pagoda; it contains a brazen image of Buddha, 12 feet high. In the centre of the town stands what was once King Theebaw's palace. Outside the enclosures of the city was, until the British conquest, a crowded, dirty native town, now cleared away to make room for a British cantonment. The present native quarters lie outside the fortified city. Beyond them, again, on the slopes of the hills that border the valley of the Irawadi,

are numerous fine monasteries. Silk weaving is the most important of the industries; some of the others are gold and silver work, ivory and wood carving, bell and gong casting, and knife and sword making. In 1886 and in March 1892 much damage was done by fire and by an inundation of the river. In 1886 a meteorological observatory was built. Kipling (q.v.) called special attention to this ancient city by his poem 'Mandalay.' Pop. (1901) 183,816.

Manda'mus, in law, a writ issued by a superior court and directed to some inferior tribunal, or to some corporation or person exercising public authority, commanding the performance of some specified duty. In general practice in the United States a mandamus issues where a party has a right to have a thing done, and has no other remedy, and in some cases where he has another but a tedious and inadequate one; and must be applied for without delay. It is either in the alternative, ordering the court, corporation, or party to which or whom it is directed to do the thing specified, or to appear and show cause why it should not be done; or absolute, commanding the thing specified to be done without any condition or alternative. The writ is usually first issued in the alternative, and in case of there being no appearance, or no sufficient cause to the contrary being shown, an absolute mandamus is issued. The cases enumerated for the issuing of this writ are—to compel the party applying to be restored to some office or franchise of a public nature, whether temporal or spiritual; for the production, inspection, or delivery of public books and papers; to oblige bodies corporate to affix their common seal; or to compel the holding of a court. It may be directed to an inferior court, ordering it to proceed in the hearing of a cause, or to enter up a judgment.

Man'dan, N. Dak., city, county-seat of Morton County; on the Missouri River, and on the Northern Pacific railroad; about five miles above Bismarck. In the vicinity are extensive coal mines, and on the large ranches are raised cattle and sheep. Considerable wheat is cultivated on the farming lands. Nearby are a number of the ancient mounds somewhat similar to those in Ohio and other parts of the United States. The State Reform School and Indian schools are located here. The city is the headquarters of a railroad division and has large railroad shops. Pop. (1900) 1,658.

Mandan, a tribe of American Indians of the Siouan family, the remnants of which number less than 300, are settled upon the Fort Berthold Reservation in North Dakota. In 1778 the Mandans occupied nine villages upon both sides of the Missouri River near Saint Louis, but wasted by smallpox and decreased by numerous battles with the Sioux, they removed further up the Missouri. In 1804 they were found by the Lewis and Clark Expedition (q.v.) occupying two villages at the mouth of the Knife River. In 1837 when a smallpox epidemic destroyed thousands of American Indians the Mandans were still further reduced in numbers from 1,700 to less than 400. In 1846 the remaining families of the tribe took up their residence at the Fort Berthold Reservation. The Mandans were not a nomadic people, but resembled the Pawnees, living in log houses with village administration and local

government. They were an agricultural people, raising corn, tobacco and other crops.

Man'darin, the term usually applied in China by foreigners to government officials of every grade. It is supposed to be derived from the Portuguese *mandar*, to command, or from the Sanskrit *mantrin*, counsellor; the Chinese equivalent is *kwan*, which signifies literally a public character. There are nine ranks, distinguished by different buttons.

Mandarin Duck, a small Chinese duck (*Aix galericula*) closely related to the American wood-duck (*A. sponsa*), and dressed in an exceedingly beautiful plumage of metallic green, purple, chestnut, white and black. It has long been domesticated by the Chinese, and, as it is said to pair for life, is held up by them as a model of marital virtues; and it has been introduced upon park waters and ornamental grounds in America and Europe.

Mandat, mǎn-dǎ, the name given to a kind of paper-money in the French Revolution. After the assignats, which had been kept in circulation by the violence of Robespierre, had lost all credit, a new money was created—the mandats—founded, like the assignats on the credit derived from the confiscated property, but with the essential difference that specific pieces of property, enumerated in a table, were pledged for the redemption of the bills, while the assignats furnished only a general claim. These mandats were issued in accordance with the law of 1796, to the nominal value of \$480,000,000. A forced circulation was given to them, by which the government was enabled to defray the expenses of the approaching campaign.

Mandate, in law, a term derived from the Roman civil law. It may be defined as a bailment (delivery) of a chattel or chattels to a person who is to do something with or about the things bailed, entirely without compensation. The essential element of the contract lies in the fact that there is not paid or promised, in law or in fact, any compensation whatever for the service to be rendered. The person delivering the chattels is called a mandator; and the person receiving them and undertaking the service is called a mandatary. As it must be a service or an act, the whole benefit of which rests with the mandator, this, by the ordinary principles of bailment, determines the amount of care to which the mandatary is bound, and the degree of negligence for which he is answerable. For negligence in a bailee has in law three degrees: slight negligence, which makes the bailee responsible where the bailment was wholly for his benefit; ordinary negligence, for which he is responsible if the bailment be for the benefit of both parties; and gross negligence, for which only the bailee is responsible where the contract is for the exclusive benefit of the bailor. And as it is not a mandate if the bailee derives any benefit whatever from the service, it follows that a mandatary is responsible for loss of or for injury to the thing delivered to him, only when it is caused by his gross negligence. There is no especial form for the contract of mandate; it may be in writing or by word only, and made very solemnly or in the simplest way; in either case the law is the same. No man can be held in the United States for a breach of any promise, whether that breach be partial or total, if

the promise rests upon no consideration. But if he who has made a promise, afterward does some injury to the promisee (and this would be the case if he does something which is positively injurious because it is not completed), he is liable for the injury he has caused, as he would be if there were no promise between the parties. Banks and bankers are so far mandataries, that they receive notes for collection, and render, or engage to render, by agreement or by mercantile usage, these and similar services without any especial or specific compensation. But it is understood that they do this as a part of their business, and for the general and indirect benefit they derive from doing it; and this is undoubtedly consideration enough to make them liable for any injury to their customer caused by their negligence; and it is sufficient to make them liable that their negligence was ordinary, or consisted in the want of common care. And a bank has, as bailee, a lien on its deposits for its general balance against the depositor.

Mandaue, mǎn-dǎ-wā, Philippines, a pueblo of the province of Cebú, situated on the east coast, on the north shore of Cebú Channel, five miles northeast of the town of Cebú; it is on the coast road. Pop. 15,300.

Mandaya, mǎn-dǎ-yǎ, a Philippine tribe of the Malay race living in the commandancia of Bislig, and the district of Dávao, island of Mindanao. They are bloodthirsty, and head-hunters, mostly heathen, though Jesuit missionaries have converted some to Christianity. See PHILIPPINE ISLANDS.

Mandel, mǎn-dēl, Eduard, German engraver: b. Berlin 15 Feb. 1810; d. there 20 Oct. 1882. He studied in Paris with Henriquel-Dupont, and in 1842 became professor of engraving at the Berlin Academy. He was one of the greatest of modern German engravers, the most important work of his being the plate of Raphael's 'Madonna di San Sisto,' his latest effort. Consult Pietsch, 'Eduard Mandel und seine Werke' (1883).

Man'derson, Charles Frederick, American lawyer and politician: b. Philadelphia 9 Feb. 1837. He received his early education in Philadelphia, removed to Canton, Ohio, in 1856, studied law and was admitted to the bar in 1859. He was city attorney in Canton 1860-1; at the outbreak of the Civil War he enlisted as a private in the Union army, served in the campaigns in the Middle West, and rose through the intermediate grades to the rank of brigadier-general of volunteers. He was severely wounded at the battle of Lovejoy's Station, Ga., and resigned from the army in 1865 on account of his wounds. He resumed his law practice in Stark County, Ohio, but removed to Omaha, Neb., in 1869. Here he soon became prominent in public affairs, was city attorney for more than six years, and a member of the Nebraska constitutional conventions in 1871 and 1874. In 1883 he was elected to the United States Senate, serving until 1895, and being chosen speaker pro tem in two Congresses, 1880-93. Since 1895 he has been solicitor for the Burlington system of railroads, west of the Mississippi; and was president of the American Bar Association in 1900-1. He has published 'The Twin Seven Shooters' (1902), and several addresses on political and legal subjects.

MANDEVILLE — MANET

Mandeville, Sir John, English traveler and author of a book of travels in Asia and Africa. It was originally written in French, between 1357 and 1371. An English version was made from the French MSS. about the beginning of the 15th century. That part of the book which treats of the Holy Land may be a record of the author's experience; but the greater part is taken from the travels of the friar Odoric, written about 1330, and from other sources. A good edition of these travels, entitled the 'Voiage and Travaile of Sir John Mandeville, Knight,' is that of Halliwell (1839), a reprint of the edition of 1725, which was taken from a MS. of the 14th century in the Cotton Library, written in the Midland dialect. Another text was first printed for the Roxburghe Club in 1880. The first printed English edition is that of Wynkyn de Worde (1499). Mandeville had long the reputation of being the "father of English prose." He was said to have been born at St. Albans about 1300, set out on his travels in 1322, returned in 1357, died, and was buried at Liège; but these statements are untrustworthy, and the very name of the compiler of the travels is doubtful.

Mandingoes, mǎn-dēng'gōz, a native tribe of West Africa, remarkable for their intelligence. The original country of this people was the north slope of the high table-land of Senegambia, between the head-waters of the Niger and Senegal. Their language is more widely diffused, and more employed by translators, than that of any of the other languages of West Africa. They formed at one time a single large empire, but are now widely scattered. Their religion is Mohammedan.

Man'dolin, a musical instrument, belonging to the lute species, played with a quill or plectrum as well as with the finger. It is of Italian origin, but latterly has become common in all civilized countries. In the usual form it has four pairs of metallic strings and a finger-board or neck with numerous frets across it. Operatic composers have occasionally employed the mandolin to obtain characteristic effects.

Man'drake, a genus of perennial herbs (*Mandragora*) of the order *Solanaceæ*. The species, of which only three are described, are almost stemless, thick-rooted, and large-leaved, with rather large whitish or bluish bell-shaped flowers, followed by globular berries. The plant is chiefly interesting from the numerous allusions to it in old writings, the superstitions relating to it being mainly in connection with its fetid, reputedly poisonous root, which, from a fanciful resemblance of its roots to the human figure, was considered an aphrodisiac.

The May-apple (*Podophyllum peltatum*), of the order *Berberidaceæ*, is often called "mandrake" in the United States, where it is common east of the Mississippi River. It is a perennial herb which sends up umbrella-shaped leaves, usually two at the summit of a stem and bearing one or two creamy, fragrant flowers in the axil. A mawkish yellow fruit about the size of a large cherry develops during early summer. The fruits "are relished by pigs and boys." The creeping rootstocks have been used medicinally.

Man'drill, the largest, and one of the most repulsive and savage of the African baboons. See BABOON and compare DRILL.

Maned Wolf, a long-legged, slender-bodied, long-nosed, brightly reddish wolf (*Canis jubatus*) of eastern South America, which may be regarded as one of the "aguaras" or fox-dogs (q.v.). It is a denizen of forests, not being known south of the northern edge of the Argentine pampas; and goes about alone at night and secretly, seeking its food, which consists mainly of small rodents, frogs, insects, and the like, and even some fruit. It will sometimes attack sheep, but is remarkably timid, and no one fears it.

Manes, mā'nēz, among the Romans, the souls of the dead. The good spirits were also called *lares*, and the evil *larvæ*. The manes were reckoned among the infernal gods; but a belief was prevalent that they sometimes appeared upon the earth in the form of ghosts, particularly on the 30th of August, 4th of October, and 7th of November; whence the Romans considered these unlucky days.

Manes Worship, from Roman *Manes* (q.v.), a term to denote the worship of the dead, whether of an ancestor of the particular worshipper or of some deified hero of his race. Herbert Spencer thinks it developed from the belief in an other self, which survived after death, and that manes worship was the outcome of a desire and endeavor to propitiate the ghost. Sir John Lubbock says of manes worship that it "is natural development of the dread of ghosts."

Manet, Edouard, ed-oo-är mā-nā, French painter: b. Paris 1832; d. there 30 April 1883. Sprung from a family of lawyers, he was destined for the same profession and sent to travel in South America to distract his mind from a youthful resolution to become a painter. But on his return to Paris in 1850 he insisted on entering the studio of Couture, from whom he seems to have received little inspiration; but after his travels in Germany, Holland, and Italy, and much study of Rembrandt, Tintoretto, Velasquez, and Goya he launched out into an entirely new style, which has been denominated Impressionism (q.v.). He emphasized what may be styled the light values of color (see VALUES OF COLOR) and disregarded the relative or corresponding values of conventional art. His breadth of treatment sometimes seemed to end in the flattest naturalism, and the influence of the photograph is manifest in all his pictures. In the Salon of 1861 he exhibited the 'Guitar Player'; and his next canvas, 'Breakfast on the Green,' created much discussion, from the glaring manner in which the painter had grouped nude female figures with men in conventional dress. Being excluded from the Salon, he founded his "Salon of Rejected Pictures," and became the head of the new school of Impressionists. Among his most characteristic pictures are 'Boy with a Sword' (1860), in the New York Metropolitan Museum; 'Le Bon Bock,' a portrait of Belot, the engraver, drinking beer, which is familiar from many reproductions; 'The Garden' (1874), an open air scene, which reveals all the special features of the new school. His 'Buffet at the Folies-Bergères' reveals his tendency toward the portrayal of low life. He was also active in the execution of pastels, and illustrated Cros, Champfleury, and Poe. Consult: Zola, 'Edouard Manet' (1867); and Bazire, 'Edouard Manet' (1884).

MANETHO — MANGANESE

Manetho, Egyptian historian of the 3d century B.C. He was the first who wrote a history of his native country, and an account of the Egyptian religion, in the Greek language. His history was based on ancient Egyptian documents, and more especially on the sacred books of the Egyptians. It was divided into three books, the first of which gave the fabulous or mythological history of Egypt previous to the 30 dynasties, along with the history of the first 11 dynasties; the second, that of the 8 following dynasties; and the third, that of the remaining 11 dynasties from the 20th to the 30th, inclusive, ending with the reign of Nectanebus, the last of the native Egyptian kings. The period embraced by the pre-dynastic history was calculated by Manetho himself at 24,900 years, and that of the 30 dynasties at 3,555 years. The history of Manetho is lost, but the lists of the dynasties are preserved in Julius Africanus and Eusebius, and some fragments of the work are to be found in Josephus, in his work against Apion. The work of Manetho's on the religion of the Egyptians was entitled 'Τὸν Physikṓn Epitomē.' It is also lost. The only work bearing the name of Manetho which has come down to us is an astrological poem entitled 'Apotelesmatika,' and it is spurious. Consult: Boekh, 'Manetho' (1845); Unger, 'Chronologie des Manetho' (1867).

Maney, George, American soldier and diplomat: b. Franklin, Tenn., 24 Aug. 1826; d. Washington, D. C., 9 Feb. 1901. He was educated at the University of Nashville, fought in the Mexican War (1846-7), in 1849 was admitted to the bar, and in 1849-61 practised law. On 1 May 1861 he became colonel of the 1st Tennessee infantry, and at Shiloh (6-7 April 1862) he commanded first his regiment and later the 2d brigade of the 2d division. Promoted brigadier-general for his conduct at Shiloh, he commanded the 3d brigade of Cheatham's division in Bragg's army at Murfreesboro (31 Dec.-3 Jan. 1863) and Chickamauga (19-20 Sept. 1863), subsequently was appointed to the command of Cheatham's division, and participated in the battle of Atlanta (22 July 1864). In 1876 he was nominated by the Republican party for the governorship of Tennessee, but before the election retired from the contest. He was minister to Colombia in 1881-3, and to Paraguay and Uruguay in 1889-93. In 1884 and 1888 he was a delegate to the Republican national conventions of those years. In 1868-77 he was also president of the Tennessee and Pacific railway.

Manfred, king of Naples and Sicily, 1258-66: b. about 1231; d. 26 Feb. 1266. He was a natural son of the emperor Frederick II., on whose death, in 1250, he became Prince of Tarantum, and acted as regent in Italy in the absence of Conrad IV., his half-brother. After the death of Conrad he was regent of the kingdom during the minority of his nephew Conradin. At the instigation of Pope Alexander IV. a crusade was preached against him, and Manfred was temporarily driven from his kingdom, which, however, he soon recovered, and on the rumored death of Conradin, had himself crowned king of Palermo, 10 Aug. 1258. The Pope at once excommunicated him and his followers, but Manfred marched into the papal territory and compelled acknowledgment as mas-

ter of Tuscany. Through matrimonial alliances for himself and his daughter he sought to increase his power, and his administration of the government was efficient, benign, and for a time prosperous. But the excommunication was renewed by Pope Urban IV., who also bestowed his kingdom on Charles I. of Anjou (q.v.), and a war ensued in which Manfred was finally defeated and killed at Benevento. After his death imprisonment and extreme cruelty were visited upon his widow and children.

Mangabey, mǎng-ga-bā, one of the odd West African monkeys of the genus *Cercocebus*, nearly related to the guenons and to the macaques. They are distinguished by the whiteness of the eyelids and the backward growth of the hair on the crown of the head. Some of the species are well-known, especially the sooty mangabey (*C. fuliginosus*) which always carries its long tail turned over its back. There are three or four species and they make docile pets.

Mangaldán, mǎn-gāl-dǎn', Philippines, a pueblo of the province of Pangasinán, Luzon, situated 12 miles northeast of Lingayén, the provincial capital. It is on the coast road, and is the meeting point of several roads extending to towns in the interior; and is on the route proposed for the railroad from Dagupan to Laoag. Pop. 16,150.

Mangalore, mǎng-ga-lōr', India, a seaport town, on the Malabar coast, capital of the district of South Kanara, Madras presidency. It is clean and well built, surrounded by groves of cocoanut palms, and stands on the edge of a fine salt-water lake or back-water formed at the mouths of two rivers. The port will not admit of vessels drawing more than 10 feet of water, except in spring tides; but there is good anchorage off the mouth of the river, in 5 to 7 fathoms. The exports are principally coffee, rice, sandal-wood, cassia, and turmeric; the imports sugar, salt, and piece-goods. There is a Roman Catholic college; and the Basel Lutheran mission in India has its headquarters here. The Roman Catholics have a bishop and several churches, a considerable number of the natives belonging to this faith. Pop. (1901) 44,108.

Manganese, mǎn-ga-nēs', a metallic element which is widely distributed in nature, though it never occurs except in combination with other elements. The dioxid was believed to be a compound of iron until 1774, when Scheele proved it to be a compound of a previously unknown metal; and in the same year Gahn prepared the element in its metallic form. It was first called "magnesium," from the fact that it was prepared from a compound then called "magnesia nigra" (and now known as manganese peroxid or dioxid); but in 1808 the name was arbitrarily changed to "manganese," by Buttmann.

Manganese may be prepared in the metallic form by reducing any of its oxids with carbon at a white heat, and this is the method followed commercially. For experimental purposes, however, it is easier to obtain it by reducing the chloride with metallic sodium or magnesium. The physical properties of manganese vary somewhat according to the precise way in which the metal is obtained. Its melting-point may be taken as 3500° F., its specific gravity as 7.4, and its specific heat is 0.12. It is a gray, hard,

MANGANESE BRONZE — MANGASARIAN

brittle, lustrous metal, susceptible of taking a high polish, and resembling iron in most respects, both physically and chemically. It is not magnetic, however. The pure metal does not appear to be affected by dry air, but moist air oxidizes it, at least superficially. Some authorities describe it as oxidizing readily in common air, and as decomposing water with almost as great a facility as potassium; but it appears probable that the specimens from which these results were obtained contained impurities of some sort. Metallic manganese is not used in the arts, but some of its alloys with iron, aluminum and copper are valuable. It is particularly valuable in steel, its presence in small amount increasing the hardness, tenacity and elasticity of the metal. It is added to the molten steel, in the process of manufacture, in the form of an iron-manganese alloy containing from 10 to 80 per cent of the latter metal, and known in the arts as "spiegeleisen" or "ferromanganese." The "manganese" of commerce is usually not the metal itself, but a mixture of its oxids.

Chemically, manganese is a dyad. It has the symbol Mn, and an atomic weight of 55 if $O=16$, or 54.6 if $H=1$. It forms numerous oxids, the best known of which are (1) the monoxid, MnO , from which the manganous salts may be prepared, and which is itself obtained by heating manganese carbonate out of contact with the air; (2) the sesquioxid, Mn_2O_3 , which exists in nature as the mineral braunite, and which is also formed when the monoxid is heated in air to a red heat; (3) the red or mangano-manganic oxid, Mn_3O_4 , which corresponds to the magnetic oxid of iron, does not form salts, and exists in nature as the mineral hausmannite; (4) the black oxid, or dioxid, MnO_2 , which occurs in nature as pyrolusite and varvacite, and which is largely used in the arts in the preparation of oxygen and chlorine; (5) the trioxid, Mn_2O_3 , which is difficult of preparation and very unstable; and (6) the heptoxid, Mn_2O_7 , a heavy, dark green liquid, prepared by treating potassium permanganate with cold concentrated sulphuric acid. Several of these oxids also occur in a hydrated form, as minerals. Of the soluble manganous salts, the chief representatives are the sulphate and the chloride. Manganous sulphate, $MnSO_4$, is prepared by treating the dioxid with sulphuric acid, oxygen being liberated at the same time in accordance with the equation $MnO_2 + H_2SO_4 = MnSO_4 + O + H_2O$. It crystallizes with five molecules of water, as a pink-colored salt, and is used in dyeing and in medicine. The chloride, $MnCl_2$, crystallizes with four molecules of water, and is obtained as a by-product in the manufacture of chlorine by the action of hydrochloric acid upon manganese dioxid. It is used in calico printing. Of the insoluble manganese salts we may specially note the sulphid and the carbonate. The sulphid, MnS , is thrown down as a flesh-colored precipitate, when a soluble manganous salt is precipitated by an alkaline sulphid. The carbonate, $MnCO_3$, occurs native as the mineral rhodochrosite, and it may also be obtained as a white precipitate by adding an alkaline carbonate to a solution of manganous sulphate or chloride.

Two other important classes of manganese compounds are known, in which the manganese does not act as a base, but as an acid-forming element. These are the manganates and per-

manganates, which may be regarded as the salts of "manganic acid," H_2MnO_4 , and "permanganic acid," $HMnO_4$, respectively. The potassium salts of these acids are by far the most important ones. Potassium manganate, K_2MnO_4 , may be prepared by melting manganese dioxid with caustic potash and a little potassium chlorate, dissolving the bright green mass so obtained in a small quantity of water, and crystallizing by evaporation in a vacuum. Potassium manganate is used in laboratory operations, but it is very unstable, taking up oxygen with great readiness, and depositing hydrated dioxid of manganese. If the green solution containing potassium manganate be allowed to stand in the air, it absorbs oxygen, changes in color to a bright purple, and deposits hydrated manganese dioxid. The purple color is due to the presence of potassium permanganate, $KMnO_4$, which may be obtained, by crystallization, in the form of purple prismatic crystals. Potassium permanganate is a powerful oxidizing agent, and is extensively used in chemistry, in the arts, and in medicine, on account of the facility with which it parts with oxygen, especially in the presence of organic matter. It forms the basis of "Condy's fluid," which is largely used as a disinfectant.

Manganese Bronze, a metallic element in which the copper forming the base of the alloy is mixed with a certain proportion of ferromanganese, and which has exceptional qualities in the way of strength and hardness. Various qualities are manufactured, each suited for certain special purposes. One quality, in which the zinc alloyed with the treated copper is considerably in excess of the tin, is made into rods and plates, and when simply cast is said to have a tensile strength of about 24 tons per square inch. Another quality has all the characteristics of forged steel without any of its defects. Another quality is in extensive use for toothed wheels, gearing, brackets, and all kinds of machinery supports. From its non-liability to corrosion it is largely employed in the manufacture of propellers.

Man'ganite, native hydrated oxid of manganese, $MnO(OH)$, or $Mn_2O_3 \cdot H_2O$. It crystallizes in the orthorhombic system, but also occurs in columnar and stalactitic forms. It is brittle, and has a hardness of 4 and a specific gravity of about 4.3. It is steel gray to iron black in color, and opaque with a submetallic lustre. It occurs in the Harz region, in Norway and Sweden, and in the British Isles. In the United States it is found in the Lake Superior mining district, and in Douglas County, Colo. It also occurs in Nova Scotia and New Brunswick. Manganite is used as a source of manganese for the preparation of spiegeleisen and other alloys, and also in the manufacture of pigments and dyes.

Mangasar'ian, Mangasar M., American author and lecturer: b. Constantinople, Turkey, 29 Dec. 1869. He was educated in Constantinople and at Princeton Theological Seminary, New Jersey, and has traveled and lectured widely. At the Grand Opera House, Chicago, he at present (1903) lectures weekly to the Independent Religious Society. Among the best known of his writings are: 'Omar Khayyam' (1901); 'Christian Science, a Comedy in Four

MANGATARËN — MANGUANGAS

Acts' (1903); 'European Criticism of America' (1903).

Mangataren, mǎn-gǎ-ta'rĕu, Philippines, a pueblo of the province of Pangasinán, Luzon, 18 miles south of Lingayén; it is on the Agno River road. Pop. 10,150.

Mange, a cutaneous disease to which dogs, horses, cattle, etc., are liable. It resembles in some measure the itch in the human subject, ordinary mange being due to the presence of a burrowing parasite. Both local application and internal remedies are used in its cure. Frequent washing of the skin is essential. See ITCH.

Mangel-Wurzel. See BEET.

Mangle, a machine for smoothing linen and cotton goods. See LAUNDRY MACHINERY.

Mango, mǎng'gō, a genus of trees (*Mangifera*) of the order *Anacardiaceae*. The 30 species are natives of southeastern Asia, whence some of them have been distributed by man throughout the tropics of both hemispheres. The wood of various species is used for boat and canoe making, for house building, and for boxes. It is gray, rather soft, and easily worked. The trees are valued also for shade, being of large size, attractive form and very leafy, the leaves large, leathery and evergreen. It is for their fruits, however, that they are most esteemed. These are widely used for human food especially in the East, either ripe, in which condition they are eaten raw, with or without wine, sugar and spices, or unripe as preserves, jellies, pies or pickles. They are also used for making wine and glucose. The finer varieties are considered equal to the choicest pineapples and even to the mangosteen.

The most commonly planted and most widely distributed species is the common mango (*M. indica*), a native of India. It often exceeds 40 feet in height, bears terminal panicles of rather small pinkish or yellow flowers, followed by smooth kidney-shaped yellow or reddish fruits which often weigh more than half a pound. Each fruit contains one large flattened seed, almost as long and often nearly as wide as the fruit, but flattened like the seed of a melon. The kernel is often roasted and eaten like chestnuts. The pulp of the fruit is soft, luscious in the finer varieties but very fibrous in the inferior sorts. These have a more or less pronounced flavor, suggestive of turpentine, which is characteristic of all parts of the tree. Since 1782, when the mango was introduced into Jamaica with a lot of other plants taken from a French vessel captured on its way to Haiti, the fruit has spread throughout the West Indies and southern Florida. In Florida, however, the freeze of 1886 destroyed all trees except those in the extreme southern part, where the mango is now confined. The market, which seems to be growing but is somewhat limited because of the prevailing ignorance regarding the fruit, is supplied mainly from the West Indies. California supplies little more than its home markets. The trees do best upon well drained sandy land, and should be well supplied with potassic manures. They quickly fail to bear upon wet soils. They may be propagated by grafting, but since a large proportion of the varieties reproduce practically without change by seedage, this method is widely employed.

Several other species of mangoes are culti-

vated. For instance, the horse mango (*M. fatida*), a native of Malacca, is cultivated in India, and *M. sylvatica*, whose fruits are dried and used like prunes.

Mango-bird. Several birds are called mango-birds in various parts of the world because they frequent mango-trees. The East Indian one is an oriole (*Oriolus kundoo*); the West Indian one, so called in Jamaica, is a humming-bird (*Lampornis violaceauda*), which may occasionally visit Florida.

Mango-fish, one of the threadfins (q.v.), a small perch-like sea-fish (*Polynemus plebivus*) which is numerous along Oriental coasts, and approaches the shore and is caught at the time when mangoes ripen. The same name is sometimes given to a relative in the West Indies (*Polydactylus virginicus*), called barbudo in the Cuban markets.

Mangosteen, the fruit of an East Indian tree (*Garcinia mangostana*) of the order *Guttifera*, which contains many Oriental trees of useful properties. The mangosteen resembles an orange in size and in the wedge-like segments of its interior; in color its thick rind is reddish brown, and the cool juicy pulp is esteemed as among the most delicious of Oriental fruits. The tree grows to a height of 20 to 30 feet, has large, thick shining leaves, bears large deep-red four-petaled flowers, and is largely cultivated throughout the East. The group contains some 40 African and Oriental trees, which furnish astringent medicinal bark, etc., the oily material called kokum-butter (from *G. indica*), and the pigment-gum called gamboge (q.v.).

Mangrove, mǎng'grōv, a genus of trees and shrubs (*Rhizophora*) of the natural order *Rhizophoraceae*. The species, of which there are less than half a dozen, are all natives of the tropics, where they inhabit tidal marshes and the mouths of streams. They are remarkable for their aerial roots, which extend from the branches to the mud and then become trunks for the extension of the trees which gradually advance even to low tidal mark; and also for their peculiar method of seed germination, the seeds sprouting while still attached to the twigs. The wood, which in some species is close-grained and durable, is used for fuel and to a small extent for other purposes; the bark, which is rich in tannic acid, is employed in tanning; the fruit of some species is edible and is used for wine making. The trees are important soil builders, their numerous roots serving to catch debris and by checking the current enhance the settling of mud from the water. Hundreds of acres of arable land have thus been formed in Florida, and the Keys where mangrove groves are very common. The best known species is *R. mangle*.

Mangrove Hen, a West Indian clapper-rail (*Rallus longirostris*), which seeks its food in the mangrove swamps.

Mangrove Snapper, the gray snapper, an excellent food-fish, which abounds among the mangroves along the coasts of Florida and the Bahamas, and thence to Brazil. See SNAPPER.

Manguangas, mǎn-gwǎn'gās, a collective name for a number of heathen tribes living in the forests of the island of Mindanao, Philippines. They are of the Malay race. See PHILIPPINE ISLANDS.

MANGUIANES — MANICHÆANS

Manguianes, mǎn-gē-ānz', the natives of the interior of Mindoro, Romblon and Tablas (qq.v.), Philippines; they are divided into four branches, one of which is of Negrito blood, another is Mongoloid, and the other two are of the Malayan race. There are several tribes, including the Bangot, the Buquil, etc. The term is also used in the island of Palawan to designate all wild natives of unknown origin.

Mangum, mǎng'gūm, **Willie Person**, American legislator: b. Orange County, N. C., 1792; d. Red Mountain, N. C., 14 Sept. 1861. He was graduated from the University of North Carolina in 1815, was admitted to the bar in 1817, in 1818 was a member from Orange County of the lower house of the State legislature, and in 1819 became a judge of the superior court. From 1 Dec. 1823 to 18 March 1826 he was a Whig representative in the 18th and 19th Congresses; but this post he resigned, and again he was elected a judge of the superior court. He retired from the court in 1826, but filed the office a third time in 1828-30. He was a United States senator from 5 Dec. 1831 to 1836, when he resigned, and from 9 Dec. 1840 to 3 March 1853; and in 1842-5 was president *pro tempore* of the Senate. Throughout nearly his entire term of service in Congress he was a leader of the Whigs; and in 1837 he received the 11 electoral votes from South Carolina for the presidency of the United States.

Manhat'tan, one of the boroughs comprising the city of New York. See NEW YORK CITY.

Manhattan, Kan., city, county-seat of Riley County; on the Kansas River, at the junction of the Big Blue, and on the Chicago, R. I. & P. and the Union P. R.R.'s; about 55 miles west of Topeka. The surrounding region is mainly agricultural; limestone quarries are in the vicinity. The chief industrial establishments are a foundry, machine shops, flour mills, lumber and brick yards. Manhattan is the trade centre for a large section and ships live-stock, grain, and limestone. The city owns and operates the waterworks. Pop. (1900) 3,438.

Manhattan College, an institution in Manhattan borough of New York city. It was opened originally (1849) as an academy for young men under the name of the Academy of the Holy Name, but the constant increase of the student body and the consequent demand for higher branches of study forced the academy to adopt the college courses, which was done in 1853, the academy then assuming the name of Manhattan College. The courses lead to the degrees of B.A. and B.S. There are also courses in Naval Construction and Architecture. The resources of the college are derived from the tuition only, there being no endowment. The institution reported at the end of 1903: professors and instructors 25; students 638; volumes in library 9,459; value of grounds and buildings \$625,000; income \$47,000; number of graduates 932.

Manhattan Island. See NEW YORK CITY.

Mani, mā'nē, the founder of the sect of Manichæans. See MANICHÆANS.

Man'ia. See INSANITY.

Manicaland, mā-nē'ka-lānd, South Africa, a portion of southern Rhodesia, situated on the border of Portuguese East Africa, east of

Mashonaland, between the parallels of 18° and 21° S., and the meridians of 31° 30' and 33° E. It has an area of some 10,000 square miles, generally fertile, and is traversed by the railroad from Beira to Fort Salisbury. The river Sabi flows southward through Manicaland, and on the eastern side there are mountains of considerable height. Gold is found in the neighborhood of the chief town, New Umtali. The boundary between British and Portuguese territory in this district was finally settled in 1892 after some trouble.

Manichæans, mǎn-i-kē'anz, the followers of Manes, Mani, or Manichæus, as he is variously styled, a Gnostic teacher, whose opinions prevailed in Western Asia and Eastern Europe during the 4th and 5th centuries of our era. Manichæism is generally considered to be the Persian type of gnosis, as it is distinguished by Zoroastrian dualism, and other features of that system. Hebrew elements of religion and Buddhist doctrines were also found in Manichæism, which appears to have been an eclectic jumble of wild fancies, among which the soberest and strongest dogmas of the Christian creed were sometimes seen to be embedded. The dualism of Manes was conceived of by him as manifested in two contiguous realms of light and darkness, good and evil. The kingdom of light included a heaven and an earth, the latter guarded by æons, or good spirits, and presided over by a spirit of goodness. From the kingdom of darkness sprang Satan and his evil angels. This confusion and mixture, in the universe, of light and darkness, originated before the creation of man, a creature of light and darkness combined in proportions varying in each individual. The human race is finally to be purged of darkness and sin. Jesus Christ was looked upon as dual in nature; there was Jesus who did not and could not suffer, *Jesus imptabilis*, a sort of phantom or immaterial personage, and *Jesus patibilis*, who suffered death upon the cross.

The practical side of Manichæism appears in the condemnation of marriage, or sexual indulgence of any sort, and the ascetic purification of hands, mouth, or bosom, which kept the initiated from eating animal food, contracting ceremonial defilement through the touch and indulging the flame of human passion in the heart. There were two classes of disciples, the initiated, or *perfecti*, and the *auditores*, hearers, or novices. St. Augustine of Hippo was, for nine years before his conversion to Christianity, a Manichæan hearer. These hearers lived a much less strict life than the *perfecti*, and constituted by far the majority of the Manichæan sect. The clergy of this sect were organized after the model of the Christian ministry; their rite of baptism was performed with oil instead of water; they had also a eucharistic meal among their public ceremonies. The system spread rapidly through the Roman empire and competed with Neo-Platonism in hostility to the Church. Diocletian persecuted the Manichæans, and under Justinian the profession of Manichæism was a capital crime. The system, however, flourished in Asia beyond the 10th century and has reappeared in some shape or other, and under different names at different times in subsequent periods of European history. Consult: Routh, 'Acta Disputationis Archelai' (1848); Eusebius, 'Ecclesiastical History'; De Beausobre, 'Histoire

MANIFESTO — MANILA

critique du Manichéisme' (1734); and Harnack, 'History of Dogma' (1897).

Manifesto, in international law, a declaration publicly issued at the commencement of a war by the contending powers to show the causes which justify such a measure. Manifestoes are in the form of public letters; they commence with a short address to the public in general, and are signed with the name of the sovereign or other person who issues them. See LAW, INTERNATIONAL.

Man'igault, Arthur Middleton, American soldier: b. Charleston, S. C., October 1824; d. 16 Aug. 1886. In 1846 he was elected 1st lieutenant of the Charleston company in the "Palmetto" regiment for the Mexican War, throughout which he served. In June 1861 he was elected colonel of the 10th regiment, South Carolina infantry, and in 1861-2 was in command of the 1st South Carolina military district. From the early part of 1862 he served in the army of the West successively under Bragg, Johnston, and Hood, in 1862 was placed in command of a brigade, and in 1863 made brigadier-general. At Chickamauga he distinguished himself by his repeated assaults, and in the retreat before Sherman's invasion he did some vigorous fighting. His death was hastened by a wound received in the battle of Franklin, Tenn. (30 Nov. 1864). Subsequent to the war he was elected by the Democrats adjutant-general of South Carolina, served by two re-elections until his death, and at that time was a candidate for a fourth term.

Man'ihot, a genus of euphorbiaceous shrubs containing the edible cassavas, etc. See CASSAVA.

Manila, ma-ni'l'a or mā-nē'lā, the capital of the Philippine Islands, the principal city of Luzon as well as of the archipelago, situated in lat. 14° 35' 31" N. by lon. 120° 58' 08" E., lies on both sides of the Pasig River, and has a frontage of four miles on the bay of Manila. The corporate jurisdiction for police purposes extends three miles from the shore over Manila Bay, making the total area under the police jurisdiction of the city 32 square miles or 20 square miles on land, and 12 on the bay. The name of the city is a corrupt form of a Tagalog word, originally written "Maynila," and means a species of shrub or bush which formerly grew on the site of the city. It is now applied not merely to the town within the walls, but to the whole region and the inhabitants included within the corporate limits. The most important divisions of the city are the walled town, particularly known as Manila, on the left bank of the river and Binondo on the right bank. Other districts, formerly more independent than at present, have retained their names and some degree of individuality. Immediately south of the walled town lies Ermita; farther on along the shore is Malate; and inland directly east of these lie Paco, Pandacan, and Santa Ana. The most northern district on the shore of the bay is Tondo, and between this district and the lower part and mouth of the river lies San Nicolas. The other districts north of the Pasig are Quiapo, San Miguel, Sampaloc, Santa Cruz, and Trozo.

The walled town was occupied chiefly by the members of the Spanish colony. Its streets are straight and run at right angles with one

another, dividing the area within the wall into 54 blocks. The buildings have usually two stories, and are built like the houses of Spanish cities. It contains the cathedral, the principal religious houses and churches of the ecclesiastical orders, various schools, the University of St. Thomas, the hospital of San Juan de Dios, the mint, and the building known as the palace containing the offices of the government. The most imposing of these is the cathedral, a Roman Byzantine structure, which occupies a part of the site of the cathedral destroyed by the earthquake of 1880.

The north wall of the town extends along the bank of the Pasig. Around the outside of the rest of the wall, runs a moat receiving water from the river just east of the town and emptying into the river just west of it. Until 1852 the drawbridges across the moat at the several gates were raised every evening at 11 o'clock, and lowered in the morning at 4. Since then it has not been customary to close the gates.

Only a few of the streets of Manila, of which there are about 80 miles, are paved. The rest are macadamized. European and American retail shops occupy the Escolta, in Binondo. The street called Rosario is almost entirely given up to Chinese shops. The wholesale houses and the banks occupy the district north of the Pasig and west of the Bridge of Spain.

Miguel Lopez de Legaspi established Spanish authority at Manila in 1571, by a treaty with Lacandola, Rajah of Maynila, which was confirmed by the compact of blood made between the contracting parties. On 3 June 1571, he conferred upon Manila the title of "distinguished and ever loyal city." This title was subsequently confirmed by royal decree. He also gave the city a municipal organization, by appointing two *alcaldes*, one *agualil mayor*, and twelve *regidores*. He also appointed one notary for the *cabildo*, or corporation, and two notaries public for the court of the *alcaldes*. Later there were only eight *regidores*, but in addition a registrar and a constable. The *alcaldes* were justices, and were elected annually from the householders by the corporation. The *regidores* were aldermen and with the registrar and constable held office permanently as a proprietary right. The permanent positions in the *cabildo* could be bought and sold or inherited. This form of organization was maintained throughout the Spanish period.

In 1578 the church and all the inhabitants of Manila were separated from the jurisdiction of the archbishop of Mexico, and the church was erected into a cathedral, but the new bishop was subject to the archbishop of Mexico. On account of the long time needed to communicate between Spain and the Philippines the king ordered the governor of the islands to fill vacancies in the cathedral whenever they might occur.

As early as the beginning of the 17th century the city of Manila was surrounded by a wall of hewn stone about three miles in circuit. It contained a college conducted by the Jesuits, a school for girls called the Santa Potenciana, two hospitals, one for Spaniards and one for Filipinos, a house of mercy for receiving sick slaves and furnishing lodgings to poor women, and a hospital for Chinese. At this time there

MANILA BAY — MANILA HEMP

were within the walls about 600 houses built of stone and mostly occupied by Spaniards. There were also about 2,000 Chinese, with 200 shops, and a garrison of 200 soldiers.

In the war between England and Spain, in 1762, Vice Admiral Samuel Cornish was ordered to proceed against Manila. He carried British and Sepoy forces under Sir William Draper. On 6 Oct. 1762 Archbishop Rajó, as acting governor, surrendered the city, agreeing to pay the British an indemnity of \$4,000,000. Only a part of this was paid. The affairs of Manila were administered by the British military authorities until 10 Feb. 1763. After this Manila remained uninterruptedly under the control of the Spanish until 13 Aug. 1898, when it was surrendered to the authorities of the United States. On 20 August the military government opened the custom-house for business, continuing in force the Spanish tariff and customs regulations. In 1899 the Filipinos in insurrection made several attempts to destroy the city. The attempts on 4 and 22 February resulted disastrously to the insurgents. A similar undertaking was planned for the occasion of General Lawton's funeral.

The political relation of Manila to the central government of the islands is not greatly unlike that which Washington holds to the Federal government of the United States. The city was incorporated by an act passed by the United States Philippine Commission on 31 July 1901. This act vests the government in a municipal board of three members appointed by the civil governor, with the advice and consent of the Commission. The municipal board has certain legislative and executive authority. The organic act provides also for a secretary and other officers, and prescribes their powers and duties. Appropriations for city purposes are made by the Commission on estimates submitted by the board. Thirty per cent of the expenses of the city are paid by the central government, and the balance is met by funds derived from city taxes. All moneys collected in the city are paid into the Insular Treasury, and are there subject to appropriation by the Commission. All municipal accounts of receipts and expenditures are examined by the Insular Auditor.

Vessels approaching Manila by sea from the northwest first sight the Capones Grande light off the southwest coast of Zambales. Vessels from the ports of Indo-China first sight the Corregidor light in the centre. Vessels from Singapore, Java, India, Borneo, and all the southern ports of the Philippine Islands sight the Cabra Island light. All converge on the Corregidor light at the entrance of the bay.

The inhabitants of Manila number 297,154, consisting of 218,900 Filipinos, 60,680 Chinese, 7,852 foreigners, 6,462 Americans, and 3,260 members of the United States army.

Water for Manila is distributed from a reservoir consisting of intersecting tunnels in a low hill about three miles from the city. The reservoir is supplied by pumping the water from the Maraquina River at a point three miles farther away. The waterworks are owned by the city, having been constructed with funds received as a legacy from Francisco Carriedo, who died in 1743. The amount of water consumed in Manila was in 1897, 6,441,011 cubic

metres; in 1900, 8,305,611 cubic metres; in 1901, 9,252,844 cubic metres; in 1902, 10,593,794 cubic metres. The total annual capacity of the present pumping plant is 13,140,000 cubic metres.

The Luneta is an elliptical drive and promenade on the shore of the bay between the city wall and the houses of Ermita. It has been greatly enlarged by the American government, and it has ceased to be a place for public executions. A military band gives a concert here nearly every evening. Between five and eight o'clock the driveway is thronged with carriages, and persons on foot fill the space about the band stands.

Among the statues adorning public places the most noteworthy are that of Charles IV. in the square in front of the "Palace" or Ayuntamiento building, that of Isabella II. in the plaza of Malate, and that of Legaspi and Urdaneta near the Luneta. The several parts of the last mentioned monument were found in the city and erected by the American authorities. Other monuments are the Magellan column standing on the south bank of the river just below the Bridge of Spain, and the Anda monument on the same bank of the river at the end of the Malacon drive, which runs between the western wall and the shore of the bay. The three other bridges which span the river are the new steel Santa Cruz bridge, the suspension bridge, and the Ayala bridge.

Among the noteworthy establishments or institutions in the city are the civil hospital, the hospitals of San Lazaro and San Juan de Dios, the trade school, the normal school, the public library, the government laboratories, the government printing office, and the government cold storage and ice plant.

BERNARD MOSES,
University of California.

Manila Bay, the largest bay in the Philippine archipelago, indenting the western central coast of the island of Luzon. Its greatest dimensions are from Tutubatu Island in the northwest to Las Pinas on the southeastern shore, 35 miles, and from the delta of the Grande de la Pampanga River southwest to Corregidor Island, 31 miles; circumference 120 miles. The entrance from Pulo Munti Point to Restinga Point is 12½ miles and is divided into two channels by the islands of Corregidor and Pulo Cabello. The bay is surrounded by five provinces, and receives the waters of many rivers, including the Grande de la Pampanga, with its large delta, and the Pasig at Manila. The land on both sides of the bay at the entrance are high and covered with vegetation, but the shores at the head of the bay are low and marshy, intersected by numerous small rivers, estuaries, and tidal lakes. It is one of the finest harbors in the East, being free of obstructions to navigation, and affording excellent anchorage. Manila, the capital of the archipelago, and Cavite, the United States naval headquarters in the Philippines, are on its shores; an artificial port is being constructed at Manila. In this bay Admiral Dewey won a victory over the Spanish fleet 1 May 1898.

Manila Bay, Battle of. See SPANISH-AMERICAN WAR.

Manila Hemp, or *Abaca*, *Musa textilis*. This species belongs to the plantain or banana family, the commercial fibre being derived from

REVUE

J. P. H. H. H.

J. P. H. H. H.

the stalk or trunk of the wild plantain of the Philippine Islands, and is classed as a structural fibre. The strongest and best of our hard cordage fibres, it is employed in the United States for standard binder twine, and for all sizes of rope from the smallest dimensions to hawsers and cables. The old rope and the waste are employed as paper stock. The fibre is creamy white to reddish white, lustrous, easily separated, stiff and resistant, while its lightness makes it advantageous for employment in cordage for the rigging and running ropes of ships. Structurally the bundles of fibres are very large, but easily separated into fibres of even diameter; the walls of the cells are of uniform thickness, growing slender toward the ends gradually and regularly. In breakage tests for textile strength, with English hemp — made by the British government — Manila stood a strain of 4,669 pounds against 3,885 pounds for hemp, ropes $3\frac{1}{4}$ inches in circumference and 2 fathoms long being used in each test. In the Philippine Islands the finer grades of the fibre are extensively used for fabric manufacture, the product being worn by the natives of both sexes throughout the archipelago. Mixed with cotton a durable fabric is produced well adapted to the climatic conditions of the islands. According to a recent report of the Philippine Bureau of Agriculture, the manila hemp plant was introduced into India in 1859, and the Andaman Islands in 1873. The plant is also said to be found in Borneo and Java, and attempts have been made to introduce it into other countries. It remains a fact, however, that the commercial fibre is produced only in the Philippines. The culture has been attempted without success in the West Indies, and seed was imported for trial in Florida only a few years ago, by the writer, but it failed to germinate. Several species of banana yielding fair fibre are successfully cultivated throughout tropical and sub-tropical America, and in many other portions of the world. Banana fibre bears no comparison, however, with the Manila hemp of commerce, although the fibre of *Musa basjos* is produced commercially in Japan where it is employed for undergarments for summer wear, as well as for light dresses for the higher classes of Japanese.

Manila hemp first attracted attention commercially early in the last century, and was imported into Salem, and Boston, Mass., about 1824; samples of the fibre, however, were brought to this country by naval officers as early as 1820. The production of the textile had reached about 8,000 tons in 1840, 30,000 tons in 1860, and 50,000 tons in 1880. In 1900 the production was nearly 90,000 tons, and at the present time represents over 62 per cent of the Philippine exports. The United States consumed last year 56,455 tons of the fibre, valued at \$10,558,381.

Regarding the specific localities of production and details of cultivation, preparation, etc., the student is referred to Bulletin of the Royal Gardens Kew (August 1894), to a Descriptive Catalogue of Useful Fibre Plants of the World (Washington 1897), and to Farmer's Bulletin (No. 4, pub. 1903), by the Philippine Bureau of Agriculture, Manila.

The extraction of the fibre is a simple proposition. The *abaca* is cut near the roots when the plant is two to four years old, and just before blossoming; if cut earlier the fibre is finer

but shorter. After striking off the leaves the trunk or stem is slit from end to end, and the sheathing layers of cellular matter, which form the petioles of the leaves are separated, dried a day or two and then cut into strips three inches wide, and finally scraped until the fibre has been cleaned of all extraneous matters, soft cellular tissue, etc. The bundles of wet fibre are shaken into filaments, washed, dried and sorted. This is the export fibre for cordage purposes, the fabric fibre necessitating further treatment by beating, which softens and subdivides the filaments. The export fibre is wrought into hanks and made into bales of about 270 pounds, when it is ready for shipment. Attempts to use machinery for extracting the fibre have not been successful, partly because the machines have not been adequate, and partly on account of native prejudice. There is great waste by the hand methods of preparation which it is thought machine extraction would obviate. See FIBRE; HEMP; JUTE; RAMIE; SISAL.

CHAS. RICHARDS DODGE.

Manila, University of, founded in 1585 by Philip II. of Spain. Later branches or affiliated schools were founded in different parts of the island. A seminary for the sons of Spanish nobles was opened in 1601, and 10 years later departments were added for the sons of those not belonging to the nobility and for the natives. The university was reorganized in 1857. The departments are science, classics, law, medicine, theology, philosophy, pharmacy, arts and music. The usual degrees are granted. In 1901 there were over 1,000 students in attendance.

Manin, mā-nèn', Daniele, Italian patriot: b. Venice 13 May 1804; d. Paris 22 Sept. 1857. He studied at the University of Padua, was admitted to the doctorate of laws, and practised at the bar. In politics he became the leader of the liberal class, and by 1847 had secured a solid reputation as a political economist. For anti-Austrian utterances made during that year and the next he was twice imprisoned, but while awaiting trial was set free by the populace upon arrival of news of the revolution of 1848 in Italy and France, was made President of the Republic of Saint Mark, and given supreme power as head of the patriotic revolt. The Austrians were driven out, and during the siege, which began in the autumn of 1848 and lasted 12 months, Manin was at the head of the civil government, and to his counsels and patriotic spirit it was mainly owing that the Venetians maintained so long and brilliant a defense. After the capitulation Manin retired to Paris, where he maintained himself by giving lessons in Italian, and continued in various pamphlets and through the press to advocate the cause of Italian independence. Consult Martin, 'Daniel Manin and Venice in 1848-9.'

Ma'nioc, or Mandioc. See CASSAVA.

Man'ple, (1) one of the divisions of the ancient Roman army. It consisted of 60 rank and file, two officers called centuriones, and one standard-bearer called vexillarius. (2) In the Roman Catholic ritual a sacred vestment attached to the left arm, to leave the right at liberty for ministering.

Manipur, mǎn-i-poor', northeast India, a native state consisting principally of an extensive valley situated in the heart of the mountainous

MANIS — MANITOBA

country which lies between Assam, Cachar, Burma, and Chittagong; area, 8,300 square miles. The greater part of the state is covered with forest and jungle, and the wild animals include the elephant, rhinoceros, tiger, leopard, bear, deer, and buffalo. The people belong to the Mongolian race. They are governed by a rajah, at whose court resides a British political agent under the control of the chief commissioner of Assam. The capital is Manipur [pop. (1901) 67,093]. Most of the work is done by the Manipuri women, the men being lazy. The chief crop is rice. There is a special breed of ponies in the country, which are much employed in the game of polo, the national sport of Manipur. There has been a political agent in Manipur since 1835. In 1891, in an outbreak headed by a member of the reigning family, the chief commissioner of Assam and the political agent were murdered; but the disturbance was soon put down and avenged. Pop. (1901) 283,957. Consult Grimwood, 'Three Years in Manipur' (1891).

Ma'nis, Pangolin, or Scaly Ant-eater, an edentate mammal, belonging to the group *Squamata*, co-extensive with which is the family *Manida*. The body and long, thick tail are covered with horny, imbricated scales. The legs are short and very strong, and the toes are armed with powerful claws, enabling the animals to burrow rapidly. These animals can roll themselves into a ball, and are then protected by their scales, and they exhibit remarkable strength in holding their bodies in this protective attitude. The scales are regarded as formed of agglutinated hairs; and in the Asiatic species true hairs grow between the scales and extend beyond them. All dwell in burrows, come abroad only at night, and subsist almost altogether on ants and termites, which they capture by means of their long, rope-like, sticky tongues. They have no trace of teeth; and in general structure show a close resemblance to the American ant-eaters. The latest review of the family shows that it contains seven species, scattered through Africa and tropical Asia, all referable to the genus *Manis*. The best-known species is probably the Indian pangolin (*M. pen-tadactyla*), which is about two feet long. See Beddard, 'Mammalia' (1902).

Manistee, măn-is-tê', Mich., city, county-seat of Manistee County; on Lake Michigan and the Manistee River, and on the Manistee & N. and the Flint & P. M. R.R.'s; about 140 miles northwest of Lansing. The Manistee River enters Lake Michigan near Manistee Lake, so the city is almost surrounded by water. The river is navigable for small steamers for some distance from the lake. The first permanent settlement was made in 1841, but Manistee was not chartered as a city until 1869. It is situated in what was once the great lumber region of the State, but fruit orchards are taking the place of the pine forests. The extensive salt deposits contribute to the wealth of the city. The chief manufactures are salt, boards, shingles, leather, furniture, foundry products, laths, and tan-bark. The vacuum evaporating salt plant produces annually about 6,300,000 bushels. Manistee has extensive shipping interests; its transportation facilities make it an excellent distributing point for the interior of the northern part of the Upper Peninsula, and it has steamer connections with all the important lake ports.

The principal buildings are the school-houses, court-house, and the churches. The City Park and Orchard Beach add to the attractions, and the bridges across the Manistee River are objects of interest. The waterworks are owned and operated by the city. Pop. (1890) 12,812; (1900) 14,260.

Manistique, măn-is-têk', Mich., city, county-seat of Schoolcraft County; on Lake Michigan, at the mouth of the Manistique River, and on the Manistique & N. and the Minneapolis, St. P. and S. Ste. M. R.R.'s; about 70 miles southeast of Marquette. It is in the vicinity of the forests which furnish considerable of the marketable lumber. Iron ore and limestone are abundant in this region. The chief manufacturing establishments are foundries, lime-kilns, lumber mills, chemical works, and distilleries. Charcoal is one of the important products made just outside the city, and fishing is a prominent industry. The opportunities for trade are excellent, and Manistique is a commercial centre for a large portion of the southeastern part of the Upper Peninsula. The city has good public and parish schools and a public library established in 1894. Pop. (1890) 2,940; (1900) 4,126.

Manitoba, măn-i-tô-bă, or **măn-i-tô-bă'**, Canada, a central province bounded on the north by Saskatchewan and Keewatin, on the east by Keewatin and Ontario, on the south by Minnesota and North Dakota, U. S., and on the west by Assiniboia and Saskatchewan. Area 73,956 square miles, of which 9,800 square miles are water. The capital is Winnipeg, at the junction of the Assiniboine and Red Rivers, with a population (1901) 42,340. Other towns are Brandon and Portage La Prairie.

Topography.—The greater part of the province consists of prairie land in a series of levels known as "steppes" or "benches," and dotted with growths of deciduous trees. About 30 miles east of Winnipeg, a swampy district begins, in which are occasional elevations of ground, covered with cedar, spruce, white pine, aspen, cottonwood, balsam-willow and tamarack. The central and southeastern parts consist of level, rich, and fertile plains, the former bed of the prehistoric Lake Agassiz. There are a few mountains of low elevation, including Porcupine Hills, Riding Mountains, Moose Mountains, and Turtle Mountain. The chief rivers are the Assiniboine, Red River, and Winnipeg, while the lakes, which are numerous, and virtually detached and undrained portions of the ancient Lake Agassiz, include Winnipeg, Winnipegosis, Dauphin and Manitoba.

Geology, Natural Resources, etc.—The plains are of Cretaceous and Laramie formations, covered by thick glacial deposits; the western shore of Lake Winnipeg is formed by a belt of Silurian and Devonian limestones, while the northeastern part of the province consists of ancient crystalline rocks of the Laurentian system. There are deposits of coal, lignite, and iron ore; in the northwest are dense pine forests; the rivers and lakes teem with fish, and the wild animals include the moose or elk, prairie-chicken, ducks, wild geese, crane, snipe, swan, partridge, pheasants, pigeons, etc.

Soils.—The lacustrine deposits of the central of phosphate and nitrogen than any other known and western plains contain a higher percentage virgin soil; it is generally a rich, black mold,

MANITOBA — MANITOU

resting partly on a limestone formation, and partly on a thick strata of hard clay. The hilly regions westward and to the northeast have generally sandy and unproductive soils.

Climate.—The climate in winter is cold, the mercury sometimes falling to 50° below zero; but the province has few violent storms, and is healthful. The summer months are warm, the mercury sometimes rising to 95°.

Agriculture and Stockraising.—Wheat, oats, barley, Indian-corn, hops, flax, hemp, and all kinds of garden vegetables ripen early. For wheat-growing Manitoba presents peculiar advantages. When compared with the best wheat-growing districts of the United States, the soil of Manitoba is found to produce on an average a greater number of bushels to the acre and a greater weight to the bushel. Thirty bushels to the acre is stated to be a common crop in Manitoba, while in South Minnesota it is 20 bushels, in Pennsylvania and Ohio 15, and in Wisconsin only 14; and while spring-wheat in Manitoba weighs from 63 to 66 pounds to the bushel, that of Minnesota weighs only from 60 to 65 pounds, and that of Ohio and Pennsylvania no more than from 57 to 60 pounds. Potatoes and all other root-crops thrive well, and the prairie grasses furnish good hay. The indigenous fruits include the strawberry, currant, raspberry, plum, cherry, cranberry, etc. The grassy savannas of the Red River afford unlimited pasture ranges. Cattle of approved breeds are increasing, and stock-raising and dairying are among the most remunerative pursuits.

Commerce, Manufactures, Communications.—The exports in 1901 amounted to \$1,084,902, chiefly of wheat. The imports in value were \$5,396,189. The manufactures are relatively unimportant: there are lumber and flouring mills and some manufactures of articles of domestic use. The trade of the province has greatly increased since 1878, when Winnipeg was connected with the railway system of the United States; and the construction of the Canadian Pacific railway, which crosses the province from east to west, along with the other railways, has added materially to the progress and prosperity of the country. In recent years much has been done to draw attention to the natural advantages offered by Manitoba to settlers, and to increase these advantages by improving the communications. Every male settler above 18 years of age, and female head of a household, receives a grant of 160 acres of land on certain easy conditions as to residence and cultivation.

Government.—The affairs of Manitoba are directed by a lieutenant-governor, appointed for a term of five years by the Canadian Governor-General-in-Council, with an Executive Council of five members, and a Legislative Assembly consisting of 40 members, who are chosen every four years by popular vote. The province is represented in the Dominion Parliament by four senators, appointed for life by the Governor-General-in-Council, and by seven members of the Legislature elected by popular vote. The judiciary includes a chief justice, three judges of the Court of King's Bench, and three county judges. In 1901 the province had 10 members in the Canadian House of Commons.

Finances.—The ordinary receipts of the province for the year ending 31 Dec. 1900 were \$905,331; the ordinary expenditures \$1,085,405; total assets \$9,566,056.

Education.—The school system established by law is compulsory and undenominational, religious instruction being permitted only by the parents' consent. The government has set apart two sections of land of one square mile each in each township of 36 square miles for the support of education. As fast as settlement progresses, schools are established, and as teachers have to pass a rigid examination before they are appointed, the education of the children is generally of a high class. At the head of the educational establishments stands the Manitoba University, an examining and degree-conferring body, affiliated to which are the Episcopal, Presbyterian, and Roman Catholic Colleges. Collegiate institutes for higher education are connected with the public school system in Winnipeg, Brandon, and Portage la Prairie. There is also a normal school for the training of teachers in Winnipeg. The total receipts for the year amounted to \$1,229,878 and the total expenditures to \$1,179,416.

Religion.—The Presbyterian Church is the strongest in the province, with a membership of 1891 of 39,001. The Church of England had 30,852 members; the Methodist 28,437; the Roman Catholic 20,571; the Baptist 16,112; and other denominations an aggregate of 17,533.

History.—English fur traders visited this region in 1769. Manitoba was first settled about 1812, when the Hudson Bay Company conveyed a grant of land to Lord Selkirk, who sent out a number of colonists. These settled on the west bank of the Red River, four miles north of the present site of Winnipeg. In 1836 the territory was repurchased by the Hudson Bay Company, and was sold in 1867 for \$1,500,000 to the British government, which then transferred it to Canada. In 1870, under a law of the Canadian Parliament called the Manitoba Act, the province began its constitutional life. The French settlers, discontented by the transfer of the province, formed a provisional government headed by Louis Riel. On the arrival of a British military expedition Riel fled to the United States, and opposition to Canadian rule collapsed. A second rebellion in 1885 led to Riel's capture and execution. In 1881 the boundaries were greatly widened, but latterly the area has been reduced about one half. Pop. (1901) 254,947, including 5,827 Indians, and 10,372 half-breeds.

Manitoba, Canada, a lake situated in Manitoba province, to which it gives its name, about 59 miles southwest of Lake Winnipeg. It is of irregular shape, 119 miles long, with a maximum breadth of 29 miles, a shore-line of 535 miles, an area of 1,171 square miles, and an average depth of 12 feet. It is 810 feet above sea-level, and 40 feet higher than Lake Winnipeg, into which it drains through the Saskatchewan or Dauphin River. The name is a contraction of two Cree words, *Manito-waban*, meaning "the spirit's strait," and was originally applied on account of a peculiar agitation of the waters of a strait in the lake. The first European to visit the lake was the Chevalier de la Verendrye in 1739.

Manitou, *mān'ī-too*, a name given, among the American Indian tribes, to any spirit, good or evil; also applied to any object of religious awe and reverence. "The Illinois," wrote the Jesuit Marest, "adore a sort of genius, which they call *manitou*; to them it is the master of life, the spirit that rules all things. A bird, a

MANITOU — MANLEY

buffalo, a bear, a feather, a skin—that is their manitou." "If the Indian word manitou," says Palfrey, "appeared to denote something above or beside the common aspects and agencies of nature, it might be natural, but it would be rash and misleading, to confound its import with the Christian, Mohammedan, Jewish, Egyptian, or Greek conception of Deity, or with any compound of a selection from some or all of those ideas." The word was applied to any object used as a fetish or an amulet. It was common among all western and Mississippi tribes.

Manitou, Colo., town, in El Paso County; on the Denver & R. G. and the Colorado M. R.R.'s; about seven miles northwest of Colorado Springs. It is situated in a region renowned for the beauty and grandeur of its scenery, and at an altitude of about 6,330 feet above sea-level. It is in three cañons—William's Cañon, Ute Pass, and Engleman's Cañon. Nearby are Pike's Peak and the Garden of the Gods. The medicinal springs, six in number, are visited annually by a large number of health seekers. The wonderful cave or series of caves, which were discovered by George W. Snider in 1881, have been explored for quite a distance. One of the remarkable features of this remarkable underground natural curiosity, is the Guadalupe Dome and the Pipe Organ. The group of stalactites which have been named the Pipe Organ give forth the complete musical scale, in sweet, clear notes. Numerous waterfalls are in the vicinity of Manitou, also Monument Park, which like the Garden of the Gods, has many peculiar formations of red and white limestone. The Pike's Peak cog railway terminates at Manitou. A large number of tourists visit the town annually especially in the summer season. The population in July and August is said to be about five or six times greater than in winter. Pop. (1900) 1,303.

Manitoulin (mān-i-too'lin) Islands, Canada, a group of islands in the northeastern part of Lake Huron, which separates the waters of the Lake from Georgian Bay. The name is a corruption of the Indian word Manitowin, which means divinity. Except Drummond Isle, about 25 miles long and 9 miles wide, which belongs to the State of Michigan, the group is a part of the province of Ontario. The largest island of the group is Grand Manitoulin, or Sacred Isle; about 87 miles long and averaging 22 miles wide. Cockburn, or Little Manitoulin, is nearly circular, and about eight miles in diameter. The coast is very irregular, and all are well wooded; Grand Manitoulin and Cockburn have large pine forests. The shore waters abound in fish. Fully half the inhabitants are Indians of the Algonquin race. The cool climate in summer and the striking natural features add to the attractions of the islands and make them a favorite summer resort. Pop. 2,000.

Manitowoc, mān-i-tō-wōk', Wis., city, county-seat of Manitowoc County; on Lake Michigan, at the mouth of the Manitowoc River, and on the Wisconsin C. and the Chicago & N. R.R.'s; about 112 miles northeast of Madison and 77 miles north of Milwaukee. It has steamer connection with all the important lake ports, and its good harbor makes it an important shipping port. The chief manufactures are leather, flour, dairy products, foundry and machine-shop products, agricultural implements, furniture,

cigars, beer, and canned goods. Its trade consists chiefly of the shipment of its own manufactures, also grain, tobacco, and lumber, and the imports of groceries, cloth, and clothing. It has Saint Mary's Hospital and Asylum, Saint Felix Industrial and Reform School, Holy Family Hospital, the James Library, a high school, public and parish schools. Pop. (1890) 7,710; (1900) 11,786.

Manizales, mā-nē-sā'lās, Colombia, town, in the southern part of the department of Antioquia; about 95 miles northwest of Bogotá. The altitude is about 7,000 feet. It was founded in 1848; and its situation at the junction of the main passes over the mountains, and near valuable gold mines has contributed to its rapid growth. In the valleys, in the vicinity, stock-raising is an important industry. It has fine churches and schools, a good library and a number of comfortable homes. During the civil war of 1877-8 the town was the headquarters of the rebels. The climate is not severe, although in a high altitude, as higher mountains in the vicinity are a protection. Pop. about 20,000.

Man'jak, a mineral discovered on the island of Barbados. It is of a lustrous black color and as a fuel surpasses coal and all substances heretofore known. It is thought that manjak is petrified petroleum, great quantities of petroleum being found on the same island. It contains only 2 per cent of water and fully 27 per cent of solid organic matter, thus surpassing in utility the best asphalt of Trinidad.

Mankato, mān-kā'tō, Minn., city, county-seat of Blue Earth County; on the Minnesota River at the mouth of the Blue Earth River, and on the Chicago, M. & St. P., the Chicago & N. W., and the Chicago, St. P., Minneapolis & Omaha R.R.'s; about 88 miles southwest of Saint Paul. It is situated in an agricultural and timber region, and in the vicinity are valuable stone quarries. Its chief manufactures are knit goods, lime, cement, beer, butter, candy, flour, lumber, foundry and machine-shop products. There are in manufacturing business about 3,000 employees. The principal buildings are the State Normal School, a government building, a Carnegie public library, Saint Joseph's and Tourtellotte hospitals. The city has 20 churches, good public and parish schools, a Commercial College, and the State school, which has been mentioned. There are four banks with a combined capital of \$350,000. The business amounts to about \$4,000,000 annually.

The place was first settled in 1852 by eastern people. It was incorporated 15 July 1858, and chartered as a city 6 March 1868. The present government, according to a charter of 1891, is vested in a mayor and in a council composed of six members. Mankato was the scene of several battles during the Sioux Indian War 1862-63. In 1863, 38 Indians were hung for murder. Pop. (1890) 8,838; (1900) 10,599; (1903) 12,000.

J. E. REYNOLDS,
Editor 'Daily Free Press.'

Manley, mān'li, John, American naval commander: b. 1734; d. Boston 1793. At the outbreak of the Revolutionary War he had command of the armed schooner Lee, with which he cruised along the coast of Massachusetts Bay,

making captures of great value to the American army then investing Boston. In July 1778, his ship, the Hancock, was captured by a British frigate and after a rigorous confinement in Halifax, he was exchanged, and in 1782 was put in command of the Hague frigate, which, after lying in a perilous position on a sand bank off Guadeloupe for three days, exposed to the fire of four British ships of the line, contrived to effect her escape. This exploit closed the regular maritime operations of the United States during the Revolutionary War.

Manlius, măn'li-üs, Marcus, Roman legendary hero of the 4th century B.C., called Capitoline because of his successful defense of the Capitoline Hill. Tradition says he was aroused to action by the cackling of Juno's sacred geese just in time to prevent the surprise of the citadel by the Gauls (390 B.C.). Two years before (392 B.C.), he defeated the Æquii; and in six years after (384 B.C.) was thrown from the Tarpeian rock, having been declared guilty of plotting to become king or dictator. This judgment, almost certainly unjust, was due to the envy of the patricians, who distrusted Manlius' philanthropic endeavors to free plebeians sold for debt.

Mann, Cameron, American Protestant Episcopal bishop: b. New York city 1851. He was graduated from Hobart College in 1870, and studied at the General Theological Seminary. His ordination to the ministry occurred in 1876 and he was rector at St. James', Watkins, N. Y., until 1882 when he went to Kansas City where he was rector of Grace Church 1882-1901. He was consecrated bishop of North Dakota in 1901. He has contributed poems and articles on botanical and theological subjects to different magazines and also has published: 'October Sermons' (1888); 'Comments at the Cross' (1893); etc.

Mann, Henry, American journalist: b. Glasgow, Scotland, 25 March 1848. He was educated in Scotland and England, but at 15 came to the United States where he served in the Federal army in 1864-5 and later in the wars with the Indians in the Northwest. He has been on the editorial staff of the leading New York and Providence newspapers and was special correspondent in the war with Spain. In 1895-6 he was editor of the 'Home and Country Magazine' and in 1898-9 assistant editor of 'Success.' He has published: 'Ancient and Mediæval Republics' (1879); 'Features of Society in Old and New England' (1885); 'Turning Points in History' (1895); 'The Land We Live In' (1896); etc.

Mann, Horace, American educationist: b. Franklin, Mass., 4 May 1796; d. Yellow Springs, Ohio, 2 Aug. 1859. He was graduated from Brown University in 1819, studied law at the Litchfield (Conn.) law school and in offices at Dedham, Mass., in 1823 was admitted to the bar, and practised at Dedham from 1827 to 1833, when he removed to Boston. In 1827-33 he was a representative in the State legislature, in 1833-7 State senator, and in 1836-7 president of the senate. From the first he identified himself with philanthropic interests. His first speech in the assembly was on religious liberty; and one of his enterprises was the establishment of the State lunatic hospital at Worcester (1833), in con-

nection with which he was chairman of the board of commissioners and later of the board of trustees. In 1837, upon the appointment by the State of a board of education to revise and reorganize the Massachusetts common-school system, Mann became secretary to the board (19 June). He withdrew from politics and from a lucrative practice at the bar, and devoted himself entirely to a work which proved of the greatest significance not for Massachusetts only but for the entire United States. This work he accomplished largely in spite of opposition often pronounced. For the reform of State education he founded and edited the monthly 'Common-school Journal,' held teachers' conventions, published 12 most valuable annual reports, and established normal schools. In 1843 at his own expense he visited Europe for the study of Continental methods. He was successful in arousing throughout the country an unprecedented interest in educational affairs. In 1848 he was elected to Congress to succeed John Quincy Adams, deceased; and he served until March 1853. He was strongly opposed to slavery, and fearlessly attacked Webster's course. On 15 Sept. 1852, he declined the nomination for the governorship of Massachusetts, and on the same day accepted the presidency of Antioch College, Yellow Springs, Ohio, in which post he served until his death, greatly influencing the educational development of Ohio. He was a fellow of the American Academy of Arts and Sciences. In addition to his annual reports he published: 'Reply to 31 Boston Schoolmasters' (1844); 'Report of Educational Tour' (1846); 'A Few Thoughts for a Young Man' (1850); 'Slavery: Letters and Speeches' (1852); 'Lectures on Intemperance' (1852); 'Powers and Duties of Woman' (1853); and 'Sermons' (1861). Consult the 'Life' by Mary P. Mann (1865); and Boone, 'Education in the United States' (1890).

Mann, Tom, English socialist: b. Foleshill, Warwickshire, 15 April 1856. His boyhood was spent in farming and mining and from the age of 14 he served an apprenticeship of seven years at engineering in Birmingham; and in 1877 he went to London where he was prominent in connection with various trade-union affairs, and in 1885 he became a Socialist. He has served as secretary to different leading socialistic societies and has been the socialistic candidate for Parliament. He has written quite extensively and with ability. Among his works are: 'A Socialist's View of Religion' (1896); 'The Position of the Dockers and Sailors' (1897); 'The International Socialistic Movement'; etc.

Manna, a name for several substances, especially a saccharine matter which exudes naturally or from incisions made in the trunk and branches of a species of ash (*Fraxinus ornus*). It first appears as a whitish juice, thickens on being exposed to the air, and when dried forms a whitish or reddish granular substance, which is the manna of commerce. The tree is a native of Italy, and is cultivated extensively in Sicily. June and July are the two months in which the manna is collected. It is detached from the trees with wooden knives and is afterward exposed to the sun for drying. A little rain, or even a thick fog, will often occasion the loss of the collections of a whole day. The taste is sweet, and slightly nauseous. It is a mild pur-

gative, and is principally administered to children. The finest kind of manna is called *flake manna*; it is white or yellowish-white in color, light, porous, and friable. *Sicilian manna* is generally found in small, soft, round fragments; its color is yellowish-brown, and it is generally mixed with more or less impurities. The principal constituent is mannite, chemically separable as a white crystalline substance of a sweetish taste, which also appears as a whitish efflorescence on certain edible seaweeds and fungi. To this, and the saccharine elements, the nutritiousness of manna is due.

Many other sweet tree-juices go by the name of manna, or false manna, since they contain no mannite, but depend for their peculiar qualities upon the possession of melitose or melezitose. In many cases the exudation of the sap is due to the irritation produced by insects or is the product of the insects themselves. Thus edible exudations are obtained from the oriental teatree, sandal-wood and an Australian grass (*Andropogon*); in Europe from the larch and an oak, and in Persia from the camel's-thorn. American manna is derived in California from the sugar pine and from a rush (*Phragmites*); while in India a species of bamboo secretes it so copiously as to form an important food-resource for the people in periods of famine.

The tamarisk manna, derived from the tamarisk trees about the eastern end of the Mediterranean, is not a direct product of the tree, but of a scale-insect, the manna-insect (*Jossyffaria mannifera*), which abounds upon the tamarisk and secretes the substance, which some persons have regarded as the manna of the Bible. In Australia the waxen larval cases of several species of flea-lice (*Psyllidæ*) that feed upon the gum-trees (*Eucalyptus*) are gathered and eaten by the natives under the name of "lerp."

The Scriptural manna (Heb. Man-hu, what is it?) is described in Exodus (xvi. 15) as covering the ground in such quantities as to supply food for the vast multitude of the Israelites. It was small and round like coriander seed, white and tasting like honey and wafer. It cannot be identified with any of the substances known nowadays as manna; but is called in the Bible "bread from heaven," while the Jewish doctors taught that it became to each person who ate it that meat of whatever kind he liked best.

Mannaia. See GUILLOTINE.

Mannheim, män'him, Germany, a town of Baden on the Rhine, at the confluence of the Neckar, 66 miles by rail southwest of Frankfurt. Dikes protect it from inundation and there are extensive harbors and modern docks. A bridge across the Rhine, here 1,200 feet wide, connects with Ludwigshafen, Bavaria, and there is also a bridge across the Neckar. Mannheim is the first commercial town in the grand-duchy and on the upper Rhine. This it owes to its admirable position on two important navigable rivers, and its railway communications. The principal articles of trade are corn, flour, wood, petroleum, coal, tobacco, cattle, sugar, iron goods, etc. The manufactures consist chiefly of iron-castings, machinery, chemicals, cigars, carpets, woolen goods, celluloid and rubber wares, mirrors, carriages, trinkets, sugar, liqueurs, starch, glue, etc. Mannheim was once strongly

fortified and lying not far from the French frontier, and near the centre of military operations, suffered severely during the wars between France and Germany. In a siege by the Austrians in 1795 only 14 houses remained uninjured. Hence, notwithstanding the antiquity of its foundation, it has become an entirely modern town with regular, straight streets, known, as in America, by numbers, and with fine public squares. The principal buildings are the former Palatine palace, with a museum and picture-gallery in one of its wings, a public library, and good gardens behind it; the Jesuits' church, an imposing edifice, with a profusely decorated interior; the former observatory building; the theatre, one of the best in Germany; several gymnasia and schools; conservatory of music; hospitals and orphanage; town-house; railway-station, etc. Pop. (1895) 97,980; in 1890 the suburb of Neckarau was incorporated with it; pop. (1900) 140,384.

Manning, män'ing, Daniel, American journalist and financier: b. Albany, N. Y., 16 May 1831; d. there 24 Dec. 1887. At 10 he entered the printing-office of the Albany 'Atlas' which shortly after was merged in the 'Argus' upon which paper he became a reporter and in time an authority in State politics. He was associate editor in 1865 and later was part owner of the paper which in his hands was a strong political power and instrumental in breaking up the Tweed ring. He strongly supported Gov. Tilden's administration and through his membership of the New York State committee he was intimately connected with the leaders of his party. Upon Cleveland's inauguration in 1885 Manning was appointed secretary of the treasury, the affairs of which office he conducted with great ability. He resigned in 1887 as a result of ill health, though he was connected with several commercial and banking enterprises until his death in the same year.

Manning, Henry Edward, cardinal of the Roman Catholic Church and archbishop of Westminster: b. Totteridge, Hertfordshire, 15 July 1807; d. Westminster 14 Jan. 1892. He was educated at Harrow, and Balliol College, Oxford, became a fellow of Merton College in 1832, and in that year he was ordained and appointed curate of Woollavington-cum-Graffham in Sussex. In 1833 he became rector of Woollavington, and was appointed archdeacon of Chichester in 1840. In 1842 he was select preacher to the University of Oxford. He took very little part in the tractarian movement and did not write any of the tracts, but he formed friendships with some of the leaders of the movement. In 1851, after the decision in the "Gorham case," he joined the Roman Catholic Church and was ordained priest. He founded the Congregation of the Oblates of St. Charles at Bayswater, London, in 1857, and upon the death of Cardinal Wiseman was consecrated archbishop of Westminster in 1865. At the Œcumenical Council in 1870 he was an ardent supporter of the infallibility doctrine, and in 1875 was made a cardinal by Pius IX. Manning was a trusted leader of the Ultramontane party in his church, and he commended himself to the world in general by his zeal on behalf of temperance, education, and the betterment of the working-classes. He is the author of four volumes of sermons published before 1850; and among his other

MANNING — MANOMETER

writings are: 'Temporal Power of the Popes' (1860); 'The Temporal Mission of the Holy Ghost' (1865 and 1875); 'Petri Privilegium' (1871); 'The Vatican Decrees' (1875); 'The Catholic Church and Modern Society' (1880); 'The Eternal Priesthood' (1883); 'Characteristics' (1885); 'Miscellanies' (1877-88); and 'Religio Viatoris' (1889). Consult *Lives by Hutton* (1894); *Purcell* (1896); *Fitzgerald*, 'Fifty Years of Catholic Life and Progress' (1901). See his *Memorials* (1892).

Manning, James, American Baptist clergyman, first president of Brown University: b. Elizabeth, N. J., 22 Oct. 1738; d. Providence, R. I., 29 July 1791. He was graduated at Princeton College in 1762, in 1763 became pastor of a Baptist church at Morristown, N. J., and about a year later pastor of a church in Warren, R. I. There he almost immediately commenced a Latin school, which seems to have been in some sense the germ of Rhode Island College. He had previously proposed to several influential men in his denomination, assembled at Newport, the organization of "a seminary of polite literature, subject to the government of the Baptists," and had drawn up a plan for such an institution. In 1764 the legislature granted them a charter, and in 1765 he was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college went into operation at Warren in 1766, and the first commencement was held there in 1769, when a class of seven was graduated. In 1770 it was determined to remove the college to Providence, and during the Revolution, when the college edifice was occupied as a military barrack, and afterward as a hospital, he was actively engaged in clerical duties, and also rendered important services to the patriotic cause. In 1783 he resumed his duties at the college, and in 1786 represented Rhode Island in Congress, where he exerted himself to secure the adoption of the national Constitution. From 1770 till the year of his death he was also pastor of the first Baptist Church in Providence. He resigned the presidency of the college in 1790. Consult: *Guild*, 'Life and Times of James Manning and the Early History of Brown University' (1894). See **BROWN UNIVERSITY**.

Manning, Thomas Courtland, American jurist: b. Edenton, N. C., 1831; d. New York city 11 Oct. 1887. He was graduated from the University of North Carolina, admitted to the bar and for a time practised law in his native place, but in 1855 he went to Alexandria, La., and there established himself in a large practice. He was a delegate to the Secession Convention and at the outbreak of the war entered the Confederate army as lieutenant. He served as adjutant-general in 1863 and attained the rank of brigadier-general. In 1864 he was associate judge of the supreme court of Louisiana. He was a presidential elector in 1872 and 1876 and in 1877 he was chief justice of the State supreme court. He was denied admission to the Senate upon his appointment to that body in 1880, and in 1882-6 he again filled the office of justice of the supreme court. He was appointed minister to Mexico in 1886 and died in office.

Manning, S. C., town, county-seat of Clarendon County, on the Atlantic Coast Line

railroad; about 50 miles southeast of Columbia, and 70 miles north of Charleston. It is situated in an agricultural region, and in the vicinity are large pine forests. Some of the manufactures are flour, lumber, and knit goods. Pop. (1900) 1,430.

Man'nite, or **Mannitol**, a singular chemical compound which has the formula $C_6H_{12}(OH)_6$, and constitutes from 30 to 60 per cent of the weight of the dried juice which exudes from the manna ash (*Fraxinus ornus*), a tree growing in the Mediterranean regions. It occurs also in many other plants, and is formed in the lactic fermentation of sugar, and also in the spontaneous fermentation of the juice of the sugarcane, in tropical countries. It may be prepared by boiling manna with dilute alcohol, the mannite crystallizing out upon cooling. The crystals are then purified by re-crystallization from water. It is a white compound, crystallizing in needles or four-sided prisms, and is readily soluble in water, insoluble in ether, and but slightly soluble in alcohol. It melts at 329° F., and begins to sublime at about 400° F. Mannite has a pleasant, sweet taste, and in some respects it resembles the sugars. It is not a sugar, however, but a hexatomic alcohol. (See **ALCOHOL**.) Chemically, it is derived from the hydrocarbon hexane, C_6H_{14} , by the replacement of six atoms of hydrogen by six molecules of hydroxyl (OH). Sorbite (or sorbitol) and dulcite (or dulcitol) have the same chemical formula as mannite, and resemble it very closely. They are, in fact, isomers of mannite. Sorbite is prepared from mountain ashberries, and dulcite from Madagascar manna. See **MANNA**.

Mannlicher, mǎn'liĕ-ĕr, **Ferdinand**, **RITTER** von, Austrian engineer and inventor: b. Mainz 30 Jan. 1848. He was chief engineer of the Northern railroad for many years, and after the success of the needle-gun at Sadowa in 1866 began experiments which ultimately produced a magazine rifle which was adopted by the Austrian army in 1885. He has become famous for his numerous inventions in small arms and was elected to the Upper House of Austria in 1899 in recognition of his distinguished services.

Manobas, mā-nō'bās, a native tribe of the Philippines, living chiefly in the valley of the Rio Agusan, island of Mindanao, and at some places in the district of Davao, Mindanao. They are of Malay race, head-hunters, and largely heathen, though the work of the Jesuits among them has resulted in a considerable portion becoming Roman Catholics. The name in earlier times was often applied to other heathen tribes of Mindanao.

Manœuvres, mā-noo'verz. See **ARMY AND NAVY MANœUVRES**.

Manom'eter (Greek, "rarefaction measurer"), an instrument for measuring the pressure exerted by a gas or liquid. It may have many forms, of which the mercurial barometer is one. (See **BAROMETER**.) One of the commonest designs, for the measurement of pressures not greatly different from that of the atmosphere, consists of a U-tube, one of whose legs is open to the air, while the other is in communication with the gas or liquid whose pressure is to be measured. The lower part of the U is filled with some non-volatile liquid of known density, and the difference between the

pressure of the fluid under examination and that of the atmosphere is found by observing the difference between the levels of the manometric fluid in the two branches of the U-tube. If the absolute pressure of the fluid is desired, it is necessary to add the atmospheric pressure to the differential pressure as read from the manometer. In rough work it may be sufficient to assume the atmospheric pressure to be 14.7 pounds per square inch; but in more refined observations the atmospheric pressure must be determined by reading the barometer, simultaneously with the manometer. Mercury is commonly the liquid that is used in the U-tube, but when the differences in pressure that are to be read are very small, some less dense liquid may be used with advantage. Sulphuric acid is often employed in such cases; and where (as in the measurement of chimney draft) a slight amount of evaporation from the manometric fluid is unimportant, water may be employed. When the pressure to be measured materially exceeds one atmosphere, the siphon manometer, as just described, is modified by sealing one of the ends of the U-tube, instead of leaving it open to the air. In this case the pressure is determined by observing the amount of compression that it produces in the air that is confined in the sealed arm of the siphon, by the manometric fluid; for it is known, by Boyle's law, that the volume of the air in this arm is sensibly proportional to the reciprocal of the absolute pressure, so long as the temperature remains constant. (See GASES, GENERAL PROPERTIES OF.) Boyle's law is not rigorously exact, however, and when a high degree of precision is required from the compression manometer, it is necessary to make allowances for its error. Data for this purpose have been given by Amagat, up to 85 atmospheres, when the temperature of the manometer is maintained at 16° C. (60.8° F.) (See Amagat, 'Comptes Rendus,' Vol. XCIX., p. 1153; Preston, 'Theory of Heat,' p. 403.) In steam engineering the commonest form of manometer is the "Bourdon gauge," which depends for its action upon the elastic deformation of a flattened metallic tube when exposed to an internal pressure. In practice the flattened tube is bent into a circular form, one end of it being fixed while the other communicates, by means of a multiplying gear, with an index hand which travels over the face of a graduated dial. A tube so constructed straightens out slightly when subjected to an internal pressure, returning again to its original form when the pressure is removed. The deformation is approximately proportional to the magnitude of the pressure (so long as the tube is not strained beyond its elastic limit), and hence the dial may be graduated, without difficulty, so as to indicate true pressures, at least to a degree of precision quite sufficient for the purposes of steam engineering. All such gauges should be carefully compared with a standard mercury column, however, before great reliance is placed upon them; for it is found that they are sometimes seriously in error in some parts of the scale, even when sensibly correct in other parts. In using them in connection with steam boilers, care should also be taken to prevent steam or highly heated water from coming in direct contact with the curved tube, since the elastic properties of the tube are injured by overheating. To ensure the proper protection of the gauge, a siphon, or a complete

circular bend, should be placed in the pipe between the gauge and the boiler. The trap so formed will fill with water of condensation the first time the boiler is fired up, and thereafter it will be impossible for steam to enter the gauge directly.

Manon Lescaut, mā-nōn lēs-kō, a romance by the Abbé Prévost, published in Amsterdam in 1733, when its author was in exile. It is appended to 'Memoirs of a Man of Quality' as a kind of postscript, and is ranked by critics as the first example in French literature of what may properly be considered a novel.

Man'or (old French *manoir*, *manoir*, from L. *manere*, to remain, being the residence of the owner) a piece of territory held by a lord or great personage, who occupied a part of it, as much as was necessary for the use of his own household, and granted or leased the remainder to tenants for stipulated rents or services. No manors, with all their incidents and franchises, have been granted in England since the reign of Edward III. One of the most important incidents to these ancient manors was the right to hold a court, called a *court-baron*, which was held within the manor, and had jurisdiction of misdemeanors and nuisances within the manor, and disputes about property between the tenants. The manor system was in vogue in the United States only during the British occupation; but many old manor names like Briarcliffe manor, Pelham manor, etc., are still retained by the present owners of large estates. See also TENURE.

Mans, mān, Le, France, the capital of the department of Sarthe, on a height above the Sarthe, here crossed by three bridges, 115 miles southwest of Paris. It consists of a lower and an upper town. The principal edifice is a fine Gothic cathedral of the 10th century. The chief manufactures are metal-works, tobacco, and woolen and linen goods; and the trade in these and other goods is considerable. Le Mans existed in the time of the Romans under the name of Cenomani, a tribe who inhabited the district. Numerous vestiges of Roman structures (subterranean aqueducts, walls, etc.), still remain. It was long in the possession of the English, and Henry II., the first Plantagenet, was born here. During the Franco-German war (1870-1) Gen. Chanzy was defeated here by Prince Frederick Charles and the Grand-duke of Mecklenburg. Pop. (1901) 52,902.

Mansard, mān-sār, or **Mansart**, François, frān-swa, French architect: b. Paris 23 Jan. 1598; d. there 23 Sept. 1666. He designed many important buildings in Paris, as well as provincial chateaux and country seats. The chateaux at Blois are partly his work, and he built the Church of Val de Grâce and the Hotel Carnavalet. The mansard roof is called after him.

Man'sard Roof, in architecture (so called from François Mansard, or Mansart (q.v.), a French architect to whom the invention is attributed), a roof formed of two sets of rafters, of which the upper set are more inclined to the horizon than the lower set, and form an obtuse angle at the ridge. The transverse beams connecting the lower ends of the under set of rafters are called as in ordinary roofs tie-beams; the corresponding beams at the union of

MANSART — MANSFIELD

the upper and under rafters are called collar-beams.

Mansard Roof.

Mansart, Jules Hardouin, zhül är-doo-än män-sär, French architect: b. Paris 16 April 1645; d. Versailles 11 May 1708. He was a nephew of François Mansart, or Mansard (q.v.). He directed all the great building operations of Louis XIV., who heaped favor and wealth upon him. His works include the palace at Versailles; the Maison de Saint-Cyr; the Grand Trianon; the dome of the Invalides; and the Chateau de Clagny, the residence of Madame de Montespan. He also designed the Place Vendôme, and the Place des Victoires.

Manse, in Scotch law, a name given the dwelling house of the minister of the Established Church. In popular use the term is often applied generally to the dwelling house of any minister of a dissenting congregation. In the Established Church every first minister of a rural parish is entitled to a manse, which the heritors or landed proprietors in the parish are bound to build and uphold. When a manse has been built or repaired by the heritors it becomes a free manse, and all ordinary repairs have to be done at the charges of the minister.

Man'sel, Herry Longueville, English logician and theologian: b. Cosgrove, Northamptonshire, 6 Oct. 1820; d. London 30 July 1871. He was educated at St. John's College, Oxford, and took orders in the Anglican Church in 1845. He became Waynflete professor of philosophy at Oxford in 1859; Regius professor of ecclesiastical history 1867; and Dean of St. Paul's, London, 1868. He was made a canon of Christ Church, Oxford, in 1867. Among his publications are: 'The Philosophy of Kant' (1856); 'The Limits of Religious Thought,' being the Bampton lectures for 1858; 'Metaphysics, or the Philosophy of Consciousness' (1860); 'The Philosophy of the Conditioned' (1866); 'Letters, Lectures, and Reviews' (1873).

Mansfield, mäns'fält, Peter Ernst I., COUNT, Austrian general and statesman: b. 15 July 1517; d. Luxemburg 22 May 1604. He became governor of the Low Countries after the death of the Duke of Parma.

Mansfeld, Peter Ernst II., COUNT, German Protestant military leader: b. Luxemburg, 1580; d. Racowitza, Bosnia, 29 Nov. 1626. He was a natural son of the preceding, but, disappointed in regard to the inheritance of his father's lands, joined the Protestant princes and became the bitter enemy of Austria. He gained a victory over Tilly at Wiesloch in 1622 but was defeated by Wallenstein at Dessau in 1626, and died soon after.

Mansfield, mänz'fëld, Edward Deering, American author: b. New Haven, Conn., 17 Aug. 1801; d. Morrow, Ohio, 27 Oct. 1880. He

was graduated at West Point in 1819 and at Princeton in 1822 when he took up the study of law and was admitted to the bar in 1825. He went to Cincinnati and there engaged in practice until 1835 when he accepted the chair of constitutional law and history in Cincinnati College. This post he resigned to enter the field of journalism and was editor of the 'Cincinnati Chronicle,' the 'Atlas,' and the 'Railroad Record.' For many years he was a contributor to the New York newspapers under the title 'Veteran Observer.' Among his many books are: 'Political Grammar' (1834); 'History of the Mexican War' (1848); 'American Education' (1850); 'Personal Memoirs' (1879); etc.

Mansfield, Joseph King Fenno, American soldier: b. New Haven, Conn., 22 Dec. 1803; d. near Sharpsburg, Md., 18 Sept. 1862. He was graduated from West Point in 1822 and was engaged in engineering service under the government until the opening of the Mexican War when he became chief engineer under Gen. Taylor. He took an active part in the engagements at Fort Brown, Monterey and Buena Vista, receiving promotion to the rank of colonel in recognition of his services. In 1853 he was appointed inspector-general of the United States army and served in that capacity until 1861 when he was made brigadier-general and given command of the Department of Washington which he fortified; he was afterward in command at Hatteras, Camp Hamilton, Newport News, and after capturing Norfolk was placed in command at Suffolk, Va., receiving the rank of major-general. He was in command of a division of the Army of the Potomac at Antietam and while leading his troops fell fatally wounded.

Mansfield, Richard, American actor: b. Heligoland 1857. He first studied art, opening in a studio in Boston for a time, but later returned to England, and entered the theatrical profession. He at first played small parts in comic opera, and first appeared in America as Dromez in 'Les Manteaux Noires' at the Standard Theatre, New York. Since then he has been very successful in a wide variety of plays, and has become the head of his own company. He has created such parts as Beau Brummel, Baron Chevalier, Dr. Jekyll and Mr. Hyde, and Monsieur Beaucare; among his other most successful roles are: Cyrano de Bergerac, Shylock in 'The Merchant of Venice,' Henry V., Brutus in 'Julius Caesar,' and Prince Karl in 'Old Heidelberg.' His own acting, as well as the work of his company which he carefully oversees, is of a high artistic standard, carefully worked out in details. Consult: Hapgood, 'The Stage in America'; Strang, 'Famous Actors of To-day in America.'

Mansfield, William Murray, EARL OF, British jurist: b. Scone, Scotland, 2 March 1705; d. London 20 March 1793. One of the youngest sons of Viscount Stormont, he was educated at Christ Church, Oxford; studied law; was called to the bar in 1730; won a large Scottish practice and many literary friends, the foremost being Alexander Pope; and in 1742 was made solicitor-general and entered Parliament. Though of Jacobite descent he unfalteringly upheld the Hanoverian interest in 1745, did special service in 1748 by his defense of the Treaty of Aix-la-

MANSFIELD — MANSLAUGHTER

Chapelle, and was admitted leader of the House. An attempt to prove him guilty of treason or disloyalty to the Crown was unsuccessful, though often obliquely repeated. He was made attorney-general in 1754, and chief justice and Baron Mansfield in 1756. He was a member of the cabinet, without office, for 15 years, but his part in politics waned after he went on the bench. He was still a typical Tory, however, and in 1770 sided violently with the government in the political libel trials and was sharply attacked by Junius. His unpopularity steadily increased because of his opposition to Wilkes, whose sentence, however, he greatly lightened because of a technical flaw which he discovered himself, and in general because of his contention in various famous cases of libel that the jury could decide only on the facts and not on any question of law. In 1774 in the case, *Campbell v. Hall*, he decided that countries acquired by British conquest were governed by the general principles of the British constitution; but in regard to the American colonies he insisted that their complaints could not be considered until they had submitted themselves to Parliament. He became Earl of Mansfield in 1776; proposed the coalition of 1779; and in 1780 suffered at the hands of the Gordon rioters because of his sympathy with Catholic emancipation. In 1788 he retired from the bench. Though so unpopular, and though constitutionally a believer in royal prerogative, Mansfield was a great judge, whose work was not too conservative, and an able, calm, logical debater. Possibly his greatest labor was his revision of the mercantile law.

Mansfield, England, a town in Nottinghamshire, 14 miles north by west of Nottingham, in a deep valley, surrounded by vestiges of Sherwood Forest. There are cotton-mills, manufactures of silk and cotton hosiery, lace thread-mills, etc. Pop. (1901) 21,441.

Mansfield, Ohio, city, county-seat of Richland County; on the Pennsylvania, the Baltimore & O., and the Erie R.R.'s; about 62 miles southwest of Cleveland and the same distance northeast of Columbus. Mansfield was first settled in 1807 by Jacob Newman, and became a borough in 1828 and a city in 1857. It is situated in a fertile agricultural region, and its manufactures and commerce are connected with the farm products of the county. The chief manufactures are boilers, agricultural machinery, pumps, soil pipe, steel harrows, brass goods, electrical supplies, stoves, webbing, suspenders, and wagons. The number of persons employed in the manufactories is about 3,500. The trade is principally in the manufactures of the city, farm and dairy products. The chief buildings are the Ohio State Reformatory, the Public Library, the Children's Home, and the Y. M. C. A. building. The city has 25 church buildings, nine large school buildings and several primary school and kindergarten buildings, one parish school, and two business colleges. Mansfield was the home of John Sherman. There are four banks with a combined capital of \$725,000. The government is vested in a mayor, boards of public service and safety and a council of seven members. Four members of the council are elected from the wards and three at large. The city owns and operates the waterworks, also a

large sewage and garbage disposal plant. Pop. (1890) 13,473; (1900) 17,640.

E. S. HIESTAND,
Editor of Mansfield 'Daily News.'

Mansfield, Pa., borough, in Tioga County; on the Tioga River, and on the Erie railroad; about 108 miles north by west of Harrisburg and 25 miles southwest of Elmira, N. Y. It is in the midst of an agricultural region and near the coal fields and oil region. Its chief manufactures are lumber, glass, sheet-iron, agricultural and mining machinery. It is the seat of a State normal school, and has two libraries, one of about 6,000 volumes belonging to the Normal School, and a city library containing about 2,000 volumes. Pop. (1900) 1,847.

Mansfield College, Oxford, England, a theological institution established in 1889 for the education of men for the Nonconformist ministry. It owes its inception chiefly to Congregational support. Its students must be graduates of some recognized university, or undergraduates of Oxford who have passed Moderations. The staff consists of a principal, a vice-principal, three lecturers, and a bursar. Mansfield House, at Canning Town (West Ham), is a settlement in connection with the college.

Mansfield, Mount, in Vermont, one of the highest elevations of the Green Mountains; in the northwestern part of the State, about 23 miles east of Burlington. The view from its summit includes the Adirondack and White Mountains, Lake Champlain, a large portion of the northern part of Vermont, and some of New Hampshire. See GREEN MOUNTAINS.

Mansilla de García, Eduarda, ã-doo-är'dã mán-sel'yã dã gâr-sê'ã, Argentine novelist: b. Buenos Ayres 1838. Her maiden name was Mansilla; at 16 she married Manuel R. García, a diplomat; and at 19 published 'El Médico de San Luis,' possibly her best novel. It was followed by 'Lucia Miranda,' a historical novel on the discovery of La Plata, and by 'Pablo, ó la Vida en las Pampas,' which with its fresh description of Argentine life made a great impression in Paris and was praised by Hugo. She was a musician of much talent and wrote, besides novels, several plays.

Mansion House, in London, England, the official residence of the Lord Mayor, built on the site of the Old Stock Market in 1739, at a cost of \$213,190. It is an oblong building and contains an Egyptian banquet hall accommodating 400 guests.

Man'slaughter, the 2d degree of felonious homicide. Murder and manslaughter are distinguished from each other by the intent which causes or accompanies the act. If a homicide be not justifiable nor excusable, and yet be not committed with malice aforethought, it is manslaughter. It is quite certain that the intent need not be to kill; for while there must be a criminal intent to make a person amenable to law as a criminal, yet if one crime be intended, and in the act of committing it another of a higher character be also committed without intent, the criminal is responsible for this higher crime. The general principle laid down in respect to manslaughter is, that not only a positive intention to commit some crime, but mere negligence, may make one guilty. If any one take upon himself an office or duty requiring

MANSURAH — MANTEGNA

care or skill, he is liable for the want of either; and if death be the consequence of his ignorance or carelessness, he is guilty of manslaughter. So if one driving furiously run over and kill a person whom he did not see, or if one in command of a steamer or sailing-vessel by reason of gross negligence run down a boat and some one in it be drowned, this would be manslaughter. So if any one, whether medical by profession or not, deal with another as a physician, and through gross want of care or skill kill him: or if any one charged with building a house of any kind construct it so badly that it falls and kills persons within or near it; or if in building he drop a stone upon some one passing below, and kill him; in all these cases he would be guilty of manslaughter, provided he were grossly negligent in the act causing the death. This is the essential question.

Blackstone defines manslaughter thus:

Manslaughter is therefore thus defined, the unlawful killing of another without malice either express or implied; which may be either voluntarily, upon a sudden heat, or involuntarily, but in the commission of some unlawful act.

The judicial treatment of this crime, being regulated by statute, varies in the several States. The element of premeditation is not essential to conviction of this crime. There are cases which the law regards as only manslaughter, without evidence of momentary excitement; partly because the law infers that from such a provocation there must be excitement; and partly, perhaps, because the party killed brought his death upon himself by his outrageous wrong. Thus, if a husband detects his wife in adultery, and instantly and purposely takes either her life or the adulterer's, it is only manslaughter. Not so, however, if he waits for a subsequent opportunity, for then the first reason wholly fails, and the killing becomes murder.

In New York State four degrees of manslaughter are defined. The first degree, briefly stated, consists of killing without the purpose of death, when the deceased was engaged in perpetrating or attempting a crime less than felony, and where such killing would be, at common law, murder. Assisting in self-murder is manslaughter in the first degree, as also wilfully killing an unborn quick child by injury to the mother if it would be murder in case the mother died from the injury. The second degree consists in procuring abortion otherwise; killing in the heat of passion without the intent of death, but in a cruel and unusual manner; or killing unnecessarily one attempting to commit felony. The third degree is killing in heat of passion, without intent of death, but with a dangerous weapon; involuntary killing, by procurement or negligence of another, while the person killed is engaged in committing a trespass on property; suffering an animal known to be mischievous to go abroad without care, or keeping it without care, and thereby causing death; receiving wilfully or negligently so many persons into a boat or vessel as to cause death; racing while in command of a steamboat carrying passengers, bursting the boiler, and so killing; killing by a physician while in a state of intoxication. The fourth degree may be said to include all other modes or forms of manslaughter, known as such at common law, and of a milder kind than the preceding. See HOMICIDE.

Mansurah, măn-soo'ră, Egypt, a town on the Damietta branch of the Nile, 34 miles southwest of Damietta. It has railway connection with Zagazig and Cairo, and is the chief depot of the bread-stuffs, cotton, indigo, hemp, and flax which this part of the Delta produces. There are also linen and cotton manufactories, etc. Mansurah was founded in 1221 and here in 1250 during the Crusades, Louis IX. of France was captured and imprisoned. Pop. (1900) 27,200.

Manta, măn'tă, Ecuador, city, port of entry on the Pacific coast; about 155 miles southwest of Quito. It has an excellent harbor and steamer connection with nearly all the Pacific coast towns of South America. It was founded as early as 1534-5, and for many years its importance has consisted in being the port of Monticristi, which is about 10 miles inland. The chief exports are coffee and rubber. Pop. 4,000.

Mantolini, măn-ta-lē'nē, a low and affected character in Dickens' 'Nicholas Nickleby' who lives on the labors of his wife, a mantua-maker.

Mantaro, măn-tă'rō, a river in Peru which has its rise in the mountains in the western part of the province of Junin. Its source is about 13,000 feet above the sea. It flows south and east to Huanta, near which it breaks through the mountains and turns northwest, which course is continued for about 60 miles, when again it changes and flows northeast to Pisquintin, where it joins the Apurimac River and forms the Ené. The Mantaro is nearly 300 miles long and navigable only a short distance above the junction with the Apurimac. It has extensive water-power which is not used except in a few cities.

Mantegazza, Paolo, pã'ô-lô măn-tă-gât'să, Italian author and physiologist: b. Monza, Italy, 1831. He was educated at the universities at Pisa and Milan, spent several years in traveling, visiting almost every portion of the globe, after which he returned to Milan and practised medicine there. He was appointed professor of physiology at Pavia in 1860 and in 1870 became professor of anthropology at Florence, where he founded the Museum of Anthropology, also a society and a review of anthropology. He was a member of the Italian Parliament 1865-76 and then became senator. He is the author of many medical and philosophical books, among them are: 'Elementi d'igiene' (1875); 'Fisiologia del piacere' (1881); 'Le istasi umane' (1887); 'L'anno 3000' (1897); 'L'amore' (1898); etc. He has also written books of travel and has devoted a share of his attention to political affairs.

Mantegna, Andrea, Italian painter: b. Vicenza 1431; d. Mantua 13 Sept. 1506. His master Squarcione was induced by the talents which he displayed to adopt him as a son. The youth employed himself principally in drawing from antiques, and at the age of 16 painted a picture for the grand altar in the church of St. Sophia at Padua. About 1468 Mantegna entered the service of Ludovico Gonzaga, at Mantua, where he opened a school. Here he painted his great picture, the 'Triumph of Julius Cæsar,' for the tapestry of a palace erected in Mantua. It consists of several cartoons, which have since been transferred to Hampton Court. Gonzaga conferred on him the honor of knighthood in reward for his merit. Innocent VIII. invited the artist to Rome to paint in the Belvidere. One of the latest and best of this artist's works is the 'Madonna della Vittoria,' now in the Louvre.

MANTELL — MANTIS

at Paris, in which Giovanni Francesco Gonzaga is seen returning thanks for the victory gained by him in 1496 over the forces of Charles VIII. The genuineness of this picture is, however, sometimes doubted. There are several others of his works in the Louvre, and an 'Annunciation' in the Dresden Gallery.

Man'tell, Gideon Algernon, English geologist: b. Lewis, Sussex, 1790; d. London 10 Nov. 1852. For many years he practised as a medical man, and employed his leisure time in studying the strata and fossil remains of the weald district, by which he was surrounded. Through his investigations the fossilized skeletons of the *Iguanodon* and *Hylæosaurus* were discovered, the fresh-water origin of the wealden beds demonstrated, and many other important facts established in regard to the geology of that district. He published 'The Fossils of the South Downs' (1822); 'Illustrations of the Geology of Sussex' (1822); and the very popular 'Wonders of Geology' (1838); and 'Medals of Creation' (1844). His magnificent collection of fossils was purchased in 1839 for the British Museum.

Mantell, Robert Bruce, American actor: b. Irvine, Scotland, 7 Feb. 1854. He made his début upon the stage at Rochdale, England, in 1876, and in 1878 played in juvenile roles with Modjeska in the United States. He then spent three years in England as leading man, returning to New York to play with Fanny Davenport. He became a star and plays at the head of his own company, presenting the leading classical and romantic roles, including Hamlet, Macbeth, Romeo, Richelieu, etc.

Mantes, mânt, France, a town in the department of Seine-et-Oise, on the left bank of the Seine, opposite Limay, with which it communicates by two handsome bridges connecting the banks with an island in the river, 29 miles west-northwest of Paris. It contains a fine Gothic church, with two lofty towers; a beautiful Gothic tower, the only remains of the church of St. Maclou; and has manufactures of leather and salt-peter, famous breweries, numerous mills, and a trade in leather, corn, and wine. William the Conqueror (q.v.) received his death-wound at Mantes. Pop. (1901) 8,034.

Manteuffel, män'toif-fël, **Edwin Hans Karl**, BARON VON, German field-marshal: b. Dresden 24 Feb. 1809; d. Karlsbad 17 June 1885. He entered the army in 1827 and advanced rapidly, becoming lieutenant-general of cavalry 1861. He took part in the Danish war of 1864, and next year was appointed governor of Schleswig. During the war between Prussia and Austria he commanded the army of the Main, and fought at Hemstadt, Vettingen, Rossbrunn, and Würzburg. He served with distinction in the Franco-German War, especially in several actions around Metz, at Amiens, and from June 1871 to July 1873 he commanded the army of occupation in France, and was made field-marshal. In 1879 he was appointed governor-general of Alsace-Lorraine, and in this capacity showed singular want of skill and tact in ruling a conquered people.

Manti, män'ti, Utah, city, county-seat of Sanpete County; on the Rio Grande, and on the Sanpete V. and the Western R.R.'s; about 125 miles south of Salt Lake City. Manti was settled in 1849 and incorporated in 1851. It is sit-

uated in an agricultural region, where sheep raising is one of the principal industries. Large coal mines are in the vicinity. The chief industrial establishments are creameries, flour mills, and machine-shops. The principal buildings are the Mormon temple, which cost \$1,500,000, and the public school building. Pop. (1890) 1,950; (1900) 2,408.

Mantineia, män-ti-né'a, Greece, one of the most ancient and important cities of Arcadia, on the frontier of Argolis, on the little river Ophis. The site is now known as Palæopoli, and excavations and explorations by the French school at Athens have disclosed the foundations of the walls and buildings of the ancient city. Mantineia was known for its wealth, and famous for the battles fought near it; in 418 B.C., when the Argives, Athenians, and Mantineans were defeated by the Spartans. In 385 B.C., when the city was taken and destroyed by the Spartans and in 362 B.C., when the Thebans under Epaminondas defeated the Spartans, although the victory of the Thebans was purchased with the life of their commander. Mantineia was, in 226 B.C., surprised by Aratus; and in 222 B.C. taken by Antigonus Doson; on this occasion the town was sacked, and the inhabitants sold as slaves. Another battle was fought near Mantineia 207 B.C., between Machanidas, tyrant of Lacedæmon, and Philopœmen, general of the Achaean League. The latter was victorious, and slew the tyrant with his own hand.

Mantiqueira, män-të-kä'ë-rä, **Serra Da**, Brazil, a mountain range which is in the southeastern part of the republic. It is about 75 miles from the Atlantic and extends nearly parallel with the coast for about 200 miles. Ranges connected with the Mantiqueira are often included with this range and the name Mitiqueira applied to the whole. Mount Itatiaia, the highest peak, is 9,000 feet above the sea. Several large rivers have their sources in this range.

Man'tis, an orthopterous insect of the family *Mantida*. These curious insects, allied to grasshoppers, abound in many parts of the world, and have always excited popular notice, and have been endowed with many supernatural qualities by the ignorant and superstitious of all countries. They are slender, with long, locust-like legs, oval wings, and a long neck-like prothorax, terminating in an angular head with large protruding eyes. The front legs are stout, spiny, fitted for grasping their prey, and are held up in front of them in an attitude that to some suggest prayer. Hence the names praying insect, prophet and the like often given to the more familiar species; to others they suggest other ideas, as of a horse pawing the air, whence our common species of the Southern States (*Stegomantia carolina*) is known as the "rear-horse," and in Europe these insects are called "camel-crickets." Why it should also be called "mule-killer" is harder to explain, probably it is by confusion with a scorpion also so called. These insects in tropical countries have come to assume various forms and hues similar to the flowers near which they lurk to catch the insects visiting the blossoms,—a protective measure which comes under the head of mimicry. A large proportion of the insects upon which they feed are injurious to crops, so that they may be regarded as beneficial to man. Among the Japanese and Chinese they are made

MANTIS SHRIMP — MANU

to minister to human amusement also, being kept in cages and made to engage in combats upon which the spectators bet money. The eggs of the mantis are laid in an oval mass upon the stem of a plant, and covered with a tough case of hardened mucus, which shows a curiously braided pattern of surface, and is easily recognized.

Mantis Shrimp, a large crustacean (*Squilla empusa*) of the order *Stomatopoda*, which dwells in burrows between tide-marks along our eastern coast, and seizes marine worms, and the like, that come within its reach. Its general shape is shrimp-like, but it has strong claws on the second pair of legs, which much resemble the forelegs of a mantis (q.v.), are provided with sharp spines, and are so jointed that they can be folded back upon themselves like the blade of a clasp-knife, and so take a firm grip upon the struggling captives. It is quite blind, although the eyes appear to be well formed. A well-known European species is gathered for food by the coast people.

Mantle, (1) a kind of cloak or loose garment to be worn over other garments. (2) In heraldry the name is given to the cloak or mantle which is often represented behind the escutcheon. (3) The name given an invention used on lamps and in gas lighting. See GAS, ILLUMINATING.

Mantling, in heraldry, an ornament depicted as hanging down from the helmet, and behind the escutcheon. It is considered to represent either the countess, an ornamental scarf which passed around the body, and over the shoulder; or the military mantle, or robe of estate. When intended for the countess, it is cut into irregular strips and curls of the most capricious forms, whose contortions are supposed to indicate that it has been torn into that ragged condition in the field of battle. When the mantling is treated as a robe of estate, the bearings of the shield are sometimes embroidered on it. A mantling adjusted so as to form a background for the shield and its accessories, constitutes an "achievement of arms."

Mantraps, engines for the terrifying of trespassers and poachers (formerly often indicated by the warning notice "man-traps and spring-guns set here"), resembled gigantic rat-traps four feet long. They may be seen in museums; it is, since 1827, illegal to set them save indoors between sunset and sunrise, as a defense against burglars.

Mantua, măn'tü-a, Italy, a fortified northern town, capital of the former duchy, and now of the province of Mantua, 80 miles by rail southeast of Milan, on an almost insular site on the Mincio, which here divides into several arms ending in a marshy and insalubrious lake. Communication is maintained between the islands and mainland by several bridges, the chief of which is Ponte di San Giorgio, 800 yards long. Mantua is the see of a bishop, the seat of a civil, criminal, and mercantile court, and the residence both of a military governor and of a provincial delegate. The most remarkable edifices are the cathedral, after an elegant design by Giulio Romano; the church of Sant' Andrea, conspicuous from a distance by its majestic cupola and Gothic tower; the church of Santa Barbara, containing the mausoleum of Carlo

Gonzaga; the church of San Sebastiano; the Corte Reale, formerly the ducal palace of the Gonzagas, a huge irregular pile, now partly used as barracks; the Castello di Corte or old castle of the Gonzagas; the Torre della Gabbia, the Torre del Orologio, and the Torre dello Zucaro; the Beccheria and Peschiera, or shambles and fish market, both built by Giulio Romano; the house of Giulio Romano, the Palazzo Coloredo, with enormous caryatides supporting its façade; the Palazzo del Tè, outside the walls of the town, also built by Giulio Romano, and adorned with some of that master's largest frescoes; the Accademia Virgiliana di Scienze e Belle Arti; the Liceo, the military arsenal, two theatres, one called the Teatro Virgiliano, employed for open-air performances in summer, situated in a fine piazza also named after Virgil, and containing a marble pillar surmounted by a bronze bust of the poet; the library, containing 80,000 volumes and 1,000 interesting MSS.; the civic and two founding hospitals; the Monte di Pietà, the principal house of correction for the whole of Lombardy. The manufactures are of very limited extent. The trade is chiefly in the hands of the Jews, who live in a separate quarter. The principal article of trade is silk. There is also a considerable trade in timber, which is floated down the Mincio. Mantua was an ancient Etruscan settlement, and in the time of Virgil, a native of the region, was a Roman town. Charlemagne built its first fortifications. Soon after 1115 Mantua succeeded in making itself independent, and continued so till 1276, when it fell under the iron rule of Buonacossi or Bonacossi. In 1328 it found better masters in the Gonzagas, who, first as captains, then (from 1432) as marquises, and finally (from 1530) as dukes of Mantua, governed it with great ability, and distinguished themselves by the splendor of their court and their patronage of literature and art. The last of the Gonzaga family who reigned in Mantua was Ferdinando Carlo, or Carlo IV., who, having taken part with the French in the War of Succession, was declared to have incurred a forfeiture by withdrawing his allegiance from his liege lord the Emperor of Germany. The Mantuan territory was accordingly annexed to the Austrian possessions in Lombardy, and the remaining part of Montferrat was assigned to Savoy (1708). The fortifications of the town, previously formidable, were completed and put into their present form by the Austrians. In 1796 Napoleon, apparently hopeless of reducing it by any other means, contented himself with keeping it under strict blockade, till famine compelled the garrison to capitulate. After the cession of the western part of Lombardy to Sardinia in 1859, Mantua, with what else of Lombardy remained to Austria, was united to Venetia, and with it was given up to Italy in 1866. Pop. (1901) 29,160.

Manu, mā'noo, the reputed author of the most renowned law-book of the ancient Hindus, and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Manu, especially in the case of the author of the law-book, was intended to designate a historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahābhārata (q.v.), Manu is mentioned as the progenitor of the human race;

MANUAL ACTS—MANUAL TRAINING

and, in the first chapter of the law-book ascribed to him, he declares himself to have been produced by Virāj, an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age.

The word Manu—akin to “man”—belongs therefore, properly speaking, to ancient Hindu mythology, and it was connected with the renowned law-book in order to impart to the latter the sanctity on which its authority rests.

This work is not merely a law-book in the European sense of the word, it is likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and, among other things, treats of the state of the soul after death.

The chief topics of its 12 books are the following: (1) creation; (2) education and the duties of a pupil, or the first order; (3) marriage and the duties of a householder, or the second order; (4) means of subsistence and private morals; (5) diet, purification, and the duties of women; (6) the duties of an anchorite and an ascetic, or the duties of the third and fourth orders; (7) government and the duties of a king and the military caste; (8) judicature and law, private and criminal; (9) continuation of the former and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude.

Bühler has proved that Max Müller was right in regarding the extant work as a versified recast of an ancient law-book, the manual of a particular Vedic school, the Mānavas; and holds that the work, the date of which used to be given at 1200 B.C., was certainly extant in the 2d century A.D., and seems to have been composed between that date and the 2d century B.C. There are many remarkable correspondences between this work and the Mahābhārata, suggesting the use in both of common materials.

Manual Acts, in ecclesiastical and church history, acts performed by the hands of the celebrant in the mass, chiefly the fraction of the host, and making the sign of the Cross over it before consecration. Both were objected to at the Reformation.

Manual Alphabet, the deaf and dumb alphabet; the letters made by deaf and dumb persons with their fingers.

Manual Exercises, the exercise or drill by which soldiers are taught to handle their rifles and other arms properly.

Manual Training, a term which, according to the best usage, signifies the systematic study of the theory and use of common tools; the nature of common materials; elementary and typical processes of construction; and the execution and reading of working drawings; and the study of cookery, sewing, printing, etc. The materials referred to are wood, metals, alloys, and plastic minerals; the drawing includes both freehand and instrumental, with pen, pencil, and brush. The systematic study of tools, processes, and materials is the essential feature of manual training; hence the incidental use of tools without system for some ulterior object, is not man-

ual training. There is of course a suggestion of manual training when the teacher shows a child how to handle a pitch-fork; when a woodman teaches a novice how to swing an axe in cutting down a tree; when a foreman shows a green hand how to head a pin. Yet such cases are usually without system and continuity; and accordingly are excluded from the content of manual training. One does not give a boy manual training by turning him loose in a shop, any more than he gives a literary education to a boy who cannot read by locking him in a library. It follows that the manipulations of the kindergarten, the “busy work” in the primary grades on the one hand, and the science laboratory and the commercial workshop on the other, are beyond the pale of manual training.

Manual training proves to be a far better thing than was expected when the name was first used and when the first manual training school was opened, and the present purpose and object of manual training is stated so broadly and philosophically that the statement published for many years in the catalogue of the Saint Louis manual training school seems very modest; to wit: (1) To furnish a broader and more appropriate foundation for higher technical education. (2) To serve as a developing school where pupils could discover their inborn capacities and aptitudes, whether in the direction of literature, science, engineering, or the practical arts. (3) To furnish to those who look forward to industrial life opportunity to become familiar with tools, materials, the methods of construction, and exact drawing, as well as with mathematics, elementary science, and ordinary English branches.

Manual training is essentially a culture study; its function is to develop the child by developing the brain and increasing its control over materials through the hand and eye. In early years the work of a child is qualitative rather than quantitative. Physiologists tell us that the areas of the brain develop gradually and unequally; that a normal child does not recognize accuracy and that he is incapable of precision either in ideas or deeds until he is several grades along in school. Tool work should result in accuracy in thought and in deed, and hence should not be attempted before the sixth or seventh grade. Dr. C. H. Henderson defines Manual Training as “quantitative handicraft.” He adds: “The brain grows by what it feeds upon. Given perfect health and a wealth of sense-impression, especially a wealth of quantitative sense-impression, that is to say, well-trained senses, and we have the physical basis for a full intellectual life. Without this large quantitative knowledge and developed brain, we live in a world of illusion, a guess-world of very imperfect rationality. To cultivate the hand and eye and ear, even the nose and the tongue, is to enlarge the material of thought and the tool of thought.” In 1882, before the National Educational Association at Saratoga, the writer of this article defined Manual Training as “a new art of expression,” in the concrete, as contrasted with verbal description, and graphical representations. This view of manual training has been much elaborated of late, with the result that “expression” is by many persons regarded as the very essence of

MANUAL TRAINING

manual training. This result is unfortunate, since it confuses "expression" with the "art of expression." The former is a product of manual training; the logical study of the "art" constitutes the sum and substance of the educational feature known as manual training.

All arithmetical operations depend upon the "fundamental rules"; the scientific study of a language begins with declensions and conjugations. So tool-work, drawing, needlework, cooking, etc., begin with fundamental processes with typical appliances upon typical materials. The articles constructed, the figures drawn, the garment sewed, or the dishes cooked, are incidental like blackboard work in long division, and like them they are valuable because they involve effort and result in mastery and power. The real end and aim of all education, whether "manual" or "spiritual," is the developed, strengthened, disciplined, executive person, regardless of the fate of the exercises or products which were the means of his development.

Originally, when manual training first took definite form in school education, it was generally assumed that it was intended to supersede the old form of trade apprenticeship, and not a few people defended and supported it on this ground. Because a boy learned how to use tools, how to keep them in order, and how to treat the common materials of construction, it was claimed that he was learning a trade, or several trades, and so the manual training school was regarded as a trade school. In spite of the fact that this assumption and this claim were both wrong, the practical value of the boy's knowledge of tools and skill in their use was for some years regarded as the chief evidence of the value of manual training.

In all ages men have recognized the value of skill in the use of tools and the processes of construction. The mythical Vulcan, the Jewish Tubal Cain, the Greek Dædalus, Archimedes of Syracuse, the Miltonian Memnon, are familiar examples. The greatest invention of the ages has been the generation, transmission, and utilization of mechanical power, and along with it has come the invention and use of tools. Rousseau advocated systematic instruction and practice in the details of a trade or occupation; and Carlyle in words now familiar to us all declared that man was a tool-using animal; that without tools he was nothing; with tools, he was all. In every land men advocated the learning of a trade for a livelihood, or for culture; witness, Peter the Great of Russia; the King of Prussia; and the New England seer, Emerson—but in all cases it was taken for granted that the only avenue to mechanical skill and culture lay through an apprenticeship to a builder or manufacturer. Schools were for the study and mastery of books. The arts of the schoolroom were for masters and freemen, hence they were noble, and were called the liberal arts. The arts of the mechanic were for serving men, and were acquired only by intimate association with mechanics; so the practical arts were held to be degrading, because requiring a base companionship.

Later the invention of machinery and the use of costly machine tools so far modified and limited apprenticeship as almost to ruin it. Trade schools sprang up all over Europe, and native American skilled mechanics ceased to ex-

ist. Numerous "manual-labor" or "half-time" schools came into being in America, but they involved no forward step, for the manual elements were unsystematic and unprogressive, since the purpose of the labor was to earn a living while gaining literary culture. Engineering schools in Germany, England and America introduced some features of "shop-work" with skilled mechanics engaged upon commercial work as foremen. Next arose a wide-spread demand for an opportunity for American boys to acquire the arts of the mechanic and at the same time avoid the narrowing unscholarly atmosphere of the trade school. It was then that it was first proposed "to put the whole boy to school," a maxim first used in Boston in 1885. The phrase meant to combine manual with mental training; to put the liberal arts and the mechanic arts into the same curriculum; to deal simultaneously with material forces and appliances and with spiritual forces and appliances.

This consummation was helped in a signal manner by an exhibit at the Centennial Exhibition at Philadelphia in 1876. In the educational exhibit from the Imperial School of Moscow there was a full presentation of the method of tool instruction devised by Victor Della-Vos, who gave three years to tool instruction and then three more to actual construction, with engineering students. His systematic analysis of tools and processes offered a practicable basis for such work in the programme of secondary schools. Professor John D. Runkle of the Massachusetts Institute of Technology performed a great service to education by publishing a report upon the Russian Exhibit, by emphasizing the difference between "instruction" and "construction," and by insisting upon the former as the special province of the school. Instruction shops for students of college grade were opened in Boston and in Saint Louis in 1877. The Saint Louis Manual Training School was established 6 June 1879, and opened in September 1880, as a school of secondary grade. This was the first of its kind and soon attracted wide attention from educators both at home and abroad. The Baltimore Manual Training School opened in 1883; the Jamestown, N. Y., School and the Chicago Manual Training School in 1884; the Toledo School the same year; the Central Manual Training School of Philadelphia in 1885; and then the movement became general. All these schools were of high school grade, and there was a close resemblance in curricula, equipments, and methods of instruction.

This progress was made not without strong opposition. It was asserted that tools and shops would lower the educational tone, degrade the high purpose of the school, and introduce confusion into the orderly conduct of the secondary school. It was claimed by eminent educators that the time spent in manual training would be an intellectual loss; that the graduates would become "a degraded mass of operatives" that the school was undertaking work which did not belong to it, etc. There is now abundant evidence that all these fears were groundless and that all the evil predictions were false. Better still, systematic and thorough manual training was found to have intellectual and moral value far exceeding all expectations.

MANUAL TRAINING

Great as is the economic and industrial value, the effect upon the mind and the heart is of far greater value. A recent writer, looking at the reflex action of manual training upon the pupil, maintains that when "rightly conceived and carried on, it promotes co-ordination, it develops creativeness, it broadens culture, it strengthens character." Nevertheless objections occasionally appear, some of which are extremely amusing. One opponent says: "I am opposed to teaching boys how to be sticks in all cases of emergency. You put a lad into a palatial shop and teach him how to be helpless all the rest of his life because he hasn't the tools handy."

In Germany where educational manual training was first introduced in 1886, there was violent opposition, partly because it was thought to be purely industrial, and partly on the general ground that manual training had not a single valid claim to entrance into the school programme. For arguments pro and con the reader is referred to the Reports of the United States Commissioner of Education and those of the National Educational Association for the years 1883-1894 inclusive. Active opposition practically ceased in 1890.

In 1904 there was in nearly every large city at least one manual training high school, and there were hundreds of secondary schools in which more or less manual training is available as an optional study. The European plan of making it a pure "extra" to be taken after hours is in little favor in the United States. No sooner was manual training shown to be a valuable educational feature in secondary schools than numerous efforts were made to introduce it into grammar schools in an elementary form. Hundreds of experiments have been tried with carefully selected lessons in wood, with hand tools only. In this study of tools and methods the Swedish Sloyd (so called) has served a very useful purpose in the way of suggestions. It is true the wooden spoons and ladles of Sweden have disappeared, and careful drawing as a preliminary to tool work has come into being, but the value of presenting a "motive" to a young child quickly became evident. An older pupil appreciates the theory of a tool and is at once interested in its peculiar construction, its range of service, and the correct ways of using it, just as an older boy is interested in the study of a rifle and in shooting at a mark, knowing that men use rifles for shooting at game, burglars, and public enemies. Children of from 10 to 14 years of age are always anxious "to make something," though generally quite unable to do so in a fruitful manner. They are incapable of good workmanship and impatient under criticism of matters to which they have given little or no thought. They are interested in finished objects, not in the sequence of steps, not in accurate measurements, close fits, and the use of the right tools in the right ways. Hence the greatest care is necessary in elementary grades that the exercises are simple, involving few elements, and that they are capable of analysis into steps which the child can fairly appreciate. Above all he must learn when and how to use each particular tool.

In England manual training is more often called technical education, and it is more often than not associated with trades, and even this in

a majority of cases is given in evening schools. There is as yet in Great Britain no general conviction that manual training is essential to intellectual development and that its moral influence is wholesome and strong. Accordingly it is planned for working people chiefly. Undoubtedly the educational value of tool work of the most elementary character as developed by Dr. Solomon of Sweden has had great influence in England, but manual training of a severer and more intellectual sort owes its establishment largely to Sir Philip Magnus of London, Sir William Mather of Manchester, and Prof. Ripper of Sheffield. Sir William has not only encouraged its introduction into Manchester schools, but has built and equipped a "Department of Manual Training and Technical Instruction" in Gordon College, Khartum, in Sudan, for the benefit of Sudanese boys. There is an abundance of elementary manual training in France, particularly in Paris, but no sooner is the boy old enough and strong enough to learn a trade than he is put at trade work. The French are convinced, as indeed are all nations, that the principles and details of a trade like the fundamental principles of a profession may be most successfully taught in a special school connected with a commercial or manufacturing establishment. Hence all the fine specimens of metal work exhibited by French educational institutions are the work of special or trade schools. Educational tool work is found in Australia, Japan, China, India, and in South America.

The Methods of Tool Instruction.—Methods vary greatly, not only with pupils of different grades where variation is necessary, but with different teachers in the same grades. While children of 12 years can be taught to care for and properly use some edge-tools, instruction in regard to the theory of machine tools, the laws of heat and friction, the theories of strength and stiffness are beyond them. In the hands of an expert every good hand tool has abundant theory and elegant uses. These should be carefully taught and illustrated. A manual training school is a place where the care and use of tools, details of processes, natures of materials, and the essential forms of construction are systematically explained and taught. No school omitting such systematic work is worthy of the name. Manual training, like instrumental music, is something to be taught, something to be studied and learned. The notion is too prevalent that the pupil must be left to find out how tools are to be used, and how the parts of a construction are to be joined—by himself without the aid of the teacher. One writer says "the pupil makes what he wants to make, and what he does not want to make is left unmade. He usually decides without help from the teacher. He is at liberty to go ahead and work out his own ideas rather than those imposed by the teacher." The trouble is that the novice, whether pupil or teacher, has no mechanical ideas worthy of serious consideration. The mechanic arts like other arts which have been slowly developed by study and research, should first be taught in all their fullness by one who has analyzed them into fundamental principles and processes, and who is an expert in teaching them. Both research and manufacture may properly supplement the course

MANUAL TRAINING

in a mechanical laboratory. Moreover, for the sake of clearness and fulness, the class method of instruction should be used. Assuming a well graded class (and the assumption is as reasonable in manual training as in any other study), the exposition and demonstration is far more logical and thorough when given to the class, as a whole, than when given in fragments and gestures to individuals. The place for individual instruction is in supplementing class instruction for the benefit of special pupils. The class method means progress as a class, as is generally the case in academic branches.

Long experience justifies the class method. Let the pupils be comfortably seated about the teacher, who should be equipped with a standard set of appliances. Every pupil should be able to see, hear, and to make notes or sketches. The statement of principles and theories and practical demonstration should rarely occupy one fourth of the laboratory period. The style and workmanship of the teacher should be as nearly perfect as possible. His handwork should always be accessible for inspection and model; he should never begin work for his pupils to finish, or finish work they have begun. Be it ever remembered that not the finished exercise, but the *doing of it*, is the main thing. The course of study in a particular laboratory should always be logical, never difficult, and more or less original every year. Like a flight of steps on a steep incline, the lessons should be suited to the pupils, without useless repetitions and without needless complications. The meaning and purpose of every lesson should be clear, and at its end the sense of mastery should reward every pupil. Synthetic exercises should follow the elements at intervals, more frequently with young pupils than with older. Such combinations stimulate zeal and show the logic of the course. A finer construction may end the course in each laboratory, but its educational value must not be over-estimated.

The Programme.—Seventh and eighth grade pupils may have one lesson a week in elementary work, not exceeding 2 hours in length. The ninth, tenth and eleventh grades may have 2 lessons per week in tool-work, and 2 in the rudiments of drawing and lettering, each lesson covering two school periods. The twelfth grade may extend the length of a lesson over three periods in the machine-tool laboratory, but have fewer lessons per week. The length of the lesson should depend upon the capacity of the pupils to give close attention to the work in hand. When attention fails, education stops. With the younger classes the full length of the lesson should not be given to one kind of occupation. For instance, let the plan be: A few minutes to general criticism of last exercise; a few to exposition and demonstration; a few to making or reading the working drawing; the remainder to steady work on the "regular" or an "extra" exercise. The element of comparison and criticism, by both pupil and teacher, should never be neglected. The standard should ever be reasonable perfection.

Size and Equipment of Laboratories.—Every laboratory should have from 40 to 60 square feet of floor space per pupil; the floor should be dry and warm; the room should be well lighted and ventilated; all moving machinery should be driven by an electric motor under the

immediate control of the teacher in charge; and immediately adjoining should be a store-room and a suitable lavatory. The mechanic arts equipment of a secondary school with 300 boys should contain a series of at least five working laboratories, namely: (1) For bench work in joinery and carving, and inlaying wood. (2) For wood-turning and pattern work. (3) For modeling, molding and casting. (4) For forging, brazing and soldering. (5) For metal work with bench and machine tools.

The second and third laboratories named above should be grouped as one suite, with one lavatory and store-room. This combination is for the 10th grade, or second-year pupils in a high school. Among engineering students (who are three or four years older) one finds heavy wood-working machines, foundry cupolas, steam hammers, gear cutters and 18-inch lathes and other machinery.

It may be well to point out the difference between a mechanic arts laboratory and the ordinary commercial shop. They differ in equipment, in the character and functions of the skilled men in charge, in the method of management, and in the character of the product. (1) In the commercial shop there is a great variety of tools and machines. In the laboratory there is a large degree of uniformity. (2) In the commercial shop the men in charge are skilled workmen, but not teachers. They are there to fill orders and to execute work as mechanics. In the mechanic arts laboratory the sole function of the skilled people in charge is to teach. (3) In a commercial shop every man is kept at work at what he can do best, and everything contributes to the production of articles for the market. In a mechanic arts laboratory when a boy or a class has learned a process or mastered a material, work ceases in that direction and something else is learned. The only product of a school laboratory of any great importance is the boy himself, and everything which does not contribute to his training and culture is excluded.

From the above it is clearly evident that the more a Manual Training School is made into a factory, the less it is a school. It goes without saying that manual training is but one feature of a secondary school. It occupies but two of the six periods on the school programme, and does not require home study. When such study is counted and added to the time given to mathematics, science, language and literature, it is evident that manual training occupies, in a well organized school, not more than one fourth of the time and intellectual energy of the faithful pupil.

Drawing.—The rudiments of freehand and mechanical drawing should go hand in hand through the course, covering lettering, orthographic, cabinet, isometric, and perspective projections; intersections, developments, tinting, line and brush shading; shadows; the details of machine and building construction; ornament, ancient and modern; tracing, blue-printing, pen-sketching, with some use of water colors—such are the elements to be combined in proper proportion. Domestic science and art for the girls is the counterpart of manual training. It may properly include some light wood work, and nearly all the drawing already laid down; and in addition, art study and practice, house deco-

MANUCODIA — MANUMISSION

ration, needle and sewing-machine work, garment cutting and fitting, cooking and household economics.

CALVIN M. WOODWARD,
Washington University, Saint Louis, Mo.

Manucodia, măn-û-cô'dî-ă, in ornithology, a group of birds either belonging or closely allied to the *Paradisæida*, and peculiar to the Papuan sub-region. The plumage is glossy steel-blue; the outer and middle toes are united for some distance, and there is an extraordinary convolution of the trachea in the males, to which the loud and clear voice of the birds is owing. Mr. Sharpe divides the *Manucodia* into two genera: *Phonygama* (q.v.) and *Manucodia* proper, of which four species are admitted. *Manucodia chalybeata* (*chalybea*), from the northwest, and *M. comriei*, from the southwest of New Guinea; *M. atra*, widely distributed over the Papuan sub-region, and *M. jobiensis*, peculiar to the island whence it derives its specific name.

Manuel I., Comnenus, man'û-ël kôm-nê-nûs, a Byzantine emperor: b. about 1120; succeeded his father, Joannes II., in 1143, died in 1180. The valor which he had displayed against the Turks induced his father to bequeath the crown to him rather than to his elder brother Isaac, who was immediately imprisoned by Axuch, the minister of the deceased emperor. Returning from his campaign in Cilicia, Manuel was received with enthusiasm at Constantinople, but was at once involved in wars both in the East and the West, which lasted with brief intermissions through his reign. In 1144 he subjected Raymond, the rebellious Latin prince of Antioch. In 1145 he defeated the sultan of Iconium in successive pitched battles. In 1147 he promised his aid to the new crusade headed by Louis VII. of France and Conrad III. of Germany, and though he allowed them a passage through his dominions he gave secret information to the Turks.

In 1148 he began the most important war of his reign with Roger, the Norman king of Sicily, who had taken Corfu and prepared to invade Greece. He formed an alliance with the Venetians, who within a year joined him before the fortress of Corfu, which was surrendered after an obstinate siege. He was prevented from invading Sicily by hostilities of the Servians and Hungarians, instigated by Roger, the former of whom were vanquished in two campaigns, but the latter protracted the war till 1152. In that year he suffered a reverse from the Turks in Cilicia, but his general, John Ducas, gained so great successes in southern Italy that Manuel conceived the project of reuniting the eastern and western empires.

The defeat of Alexis, the successor of John Ducas, by William, the successor of Roger, soon followed; the Sicilian admiral Maius routed the Greek fleet off Negropont, and advanced toward Constantinople; and Manuel therefore accepted an honorable peace in 1155. Those Greek prisoners who were silk-weavers were retained in Italy, and gave origin to the flourishing Italian silk manufactures. In the following years he waged successful wars with Raymond, prince of Antioch, and Az-ed-din, the Turkish sultan. A new war soon broke out with Gejza, king of Hungary, which was terminated by a disastrous defeat of the Hungarians near the present Sem-

lin. In 1176 he experienced a terrible defeat from Az-ed-din in the mountains of Pisidia, and was obliged to sign a disadvantageous peace. By breaking the treaty and renewing the war he obtained honorable terms. Depressed by this disastrous expedition, he never recovered his former military enterprise and ambition. The heavy war taxes levied from his subjects during his reign were often employed in pensioning ministers and men of influence at foreign courts, while his troops went unpaid.

Manuel II., Palæologus, pâ-lê-ôl'ô-gûs, a Byzantine emperor, born in 1348, succeeded his father Joannes V. in 1391, died in 1425. At the death of his father he fled from the court of the sultan Bajazet, with whom he had been left as a hostage. The consequence was a war with Bajazet, in which Manuel was supported by an army of Hungarians, Germans, and French. The allies, under the command of Sigismund, king of Hungary and afterward emperor of Germany, were defeated at Nicopolis in 1396, with the loss of 10,000 men. Constantinople was besieged, and its fall seemed impending, when the conquests of Tamerlane diverted the arms of the sultan. Manuel visited Italy, France, and Germany, vainly seeking assistance from the western princes. In the conflict between the Tartars and the Turks, he acted with diplomatic skill, and secured peace to his empire. He sent ambassadors to the council of Constance with instructions to urge a union of the Latin and Greek Churches; but his real object was only to obtain aid from the kingdoms of the West, and to alarm the Turks by the negotiations with those kingdoms.

Manuel, Don John, Spanish prince and author: b. Escalona, Spain, 5 May 1282; d. 1349. He was a nephew of Alfonso X., and cousin of Sancho IV. His public life was a restless and turbulent one, but his chief claim to remembrance comes from the fact that he was one of the first and one of the best of Spanish prose writers. He wrote in a style of singular simplicity and charm, and few Spanish authors have succeeded so well in giving to their words the calmness, the weight, the richness which come only from long experience and reflection. His principal work that remains is 'Libro de Patronio,' more commonly known as 'El Conde Lucanor,' which has been translated into the French and German languages.

Manufacturers, National Association of, an American association organized in Cincinnati in 1895. It had three primary objects, increasing the export trade; influencing State and National legislation; and arbitrating labor disputes. The association maintains a general office in New York city and issues numerous confidential reports and bulletins for the exclusive use of its members. The association is opposed to trade-unionism. In 1903 it had nearly 2,000 members. It publishes 'American Industries' (semi-monthly), and 'The American Trade Index' (monthly).

Manufactures, American. See AMERICAN MANUFACTURES.

Manumis'sion, in Roman law, the solemn ceremony by which a slave was emancipated. Constantine the Great allowed the Christian masters to emancipate their slaves before the

MANURES AND MANURING — MANUSCRIPTS

altar on festival days, and especially at Easter, by placing the deed of emancipation on the head of the freedman in the presence of the congregation. See EMANCIPATION: EMANCIPATION IN LATIN AMERICA; EMANCIPATION PROCLAMATION.

Manures and Manuring. See FERTILIZERS.

Man'uscripts (Latin, *manuscriptus*, written by the hand), are literally writings of any kind, whether on paper or any other material, in contradistinction to printed matter. Previous to the introduction of printing all literature was contained in manuscripts. All the existing ancient manuscripts are written on parchment or on paper. The paper is sometimes Egyptian (prepared from the real papyrus shrub), sometimes cotton or silk paper (*charta bombycina*), which was invented in the East about the year 706 A.D., and used till the introduction of linen paper, and in common with this till the middle of the 14th century; sometimes linen paper, the date of the invention of which, though ascribed to the first half of the 13th century, on the authority of a document of the year 1243, written on such paper, is nevertheless exceedingly doubtful. The earliest mention of quill pens is in the seventh century. The most common ink is the black, which is very old. The oldest, however, was not mixed with vitriol, like ours, but generally consisted of soot, lamp-black, burned ivory, pulverized charcoal, etc. Red ink of a dazzling beauty is also found in ancient times in manuscripts. With it were written the initial letters, the first lines, and the titles, which were thence called *rubrics*, and the writer *rubricator*. More rarely, but still quite frequently, blue ink is found in ancient manuscripts; yet more rarely green and yellow. Gold and silver were also used for writing either whole manuscripts (which, from their costliness, are great rarities), or for adorning the initial letters of books. With respect to external form, manuscripts are divided into rolls (*volumina*, the most ancient way, in which the troubadours in France wrote their poems at a much later period) and into stitched books or volumes (properly *codices*). Among the ancients the writers of manuscripts were mainly freedmen or slaves (*scribae libarii*). Some of the professional copyists in Rome were women. When Origen undertook the revision of the Old Testament (231 A.D.) St. Ambrose sent to his assistance a number of deacons and virgins skilful in caligraphy. Subsequently the monks, among them the Benedictines in particular, were bound to this employment by the rules of their Order. In all the principal monasteries was a *scriptorium*, in which the *scriptor* or scribe could pursue his work in quiet, generally assisted by a *dictator*, who read aloud the text to be copied; the manuscript was then revised by a *corrector*, and afterward handed to the *miniator*, who added the ornamental capitals and artistic designs.

It is more difficult to form a correct judgment respecting the age of Greek manuscripts from the character of the writing than it is respecting that of Latin manuscripts. In general it is to be remarked that in a Greek manuscript the strokes are lighter, easier, and more flowing the older it is, and that they become stiffer in the progress of time. The absence or presence of the Greek accents is in no respect decisive. Some Greek papyri are earlier than the Christian era, but most are not earlier than about the

6th century. The characters in Latin manuscripts have been classified partly according to their size (*majuscula*, *minuscula*), partly according to the various shapes and characters which they assumed among different nations or in various periods (*scriptura Romana antiqua*, *Merovingica*, *Longobardica*, *Carolingica*, etc.), to which has been added since the 12th century the *Gothic*, so called, which is an artificially pointed and angular character; and for all of those species of writing particular rules have been established, affording the means of estimating the age of a manuscript. Before the 8th century punctuation marks rarely occur: even after the introduction of punctuation, manuscripts may be met with destitute of points, but with the words separate. Manuscripts which have no capital or other divisions are always old. The *catch-word*, as it is termed, or the repetition of the first word of the following page at the end of the preceding, belongs to the 12th or subsequent centuries. The fewer and easier the abbreviations of a manuscript are the older it is. Finally, in the oldest manuscripts the words commonly join each other without break or separation. The division of words first became general in the 9th century. The form of the Arabic ciphers, which are seldom found in manuscripts earlier than the first half of the 13th century, also assists in deciding the age of a manuscript. Some manuscripts have at the end a statement when, and commonly also by whom, they were written (*dated codices*). But this signature often denotes merely the time when the book was composed, or refers merely to a part of the manuscript, or is entirely spurious. The most ancient manuscripts still preserved are those written on papyrus which have been found in Egyptian tombs. Next to them in point of age are the Latin manuscripts found at Herculaneum, of which there is a rich collection in the Naples Museum. Then there are the manuscripts of the imperial era, among which are the Vatican Terence and Septuagint and the Alexandrine Codex of the British Museum. Since the middle of the 19th century many MSS. of Greek writings have been found in Egypt, among the chief being that containing the orations of Hyperides, several containing parts of the works of Homer, Plato, Demosthenes, etc., that in which occurs a portion of the Antiope of Euripides, and the almost complete text of Aristotle's work on the constitution of Athens. It was the custom in the Middle Ages to obliterate and erase writings on parchment for the purpose of writing on the materials anew. This custom ceased in the 14th century, probably because paper came then more into use.

Manuscripts, Illumination of. The art of illuminating manuscripts dates from the remotest antiquity. The Egyptian papyri were ornamented with vignettes or miniatures attached to the chapters, either designed in black outlines or painted in primary colors in distemper. The Greek and Roman manuscripts of the 1st century with which we are acquainted were not illuminated. The oldest ornamented manuscripts that have survived are the Dioscorides of Vienna and the Virgil of the Vatican, both of the 4th century, and having vignettes or pictures in a Byzantine style of art. The use of ornamental initial letters was introduced at an early period, and must be distinguished from the

painted pages of the Byzantine manuscripts. At first the initial letters were of the same size and color as the text, but the Syriac manuscripts of the 7th century have them with a pattern or border. They soon increased to a great size, being in some cases 24 inches in length. They were most used in the 8th and 9th centuries. They at last degenerated to the last decadence of art, the grotesque. From the 8th to the 11th century the initials in use were composed of figures of men, quadrupeds, fishes, birds, etc. The initials of the 12th century are made up of masses of conventional foliage interspersed with the animal figures of the preceding centuries. Continuous borders, with vignettes, tail-pieces, etc., were also prevalent in later times, and some manuscripts are ornamented with very artistic designs. The English and French manuscripts may be recognized by their delicate light-blue and green colors; those of Flanders by the heaviness of their drawing and the dark hues of the coloring. In Italy and Spain the tortuous patterns of animals and flowers were painted in bright colors and gold. In the early Irish manuscripts the figures are rudely drawn; the writing is large and bold, and the capitals profuse. The peculiarity of this style is the use of dots, generally in red, following the outline of the initials; delicate spiral lines, interlaced ribbons, and tessellated patterns. The most interesting specimens of this style are the Book of Kells at Dublin, and the Durham Book in the British Museum. In the 16th century the art became extinct. Some attempts have been made to revive it by adorning paper, parchment, and vellum with designs in color or metals.

Manutius, mā-nū'shī-ūs, **Aldus** (Ital. Manuzio, Manuzzi and Manucci), Italian printer: b. Sermonetta, near Belletri, in the neighborhood of Rome (and hence commonly known as Romanus) 1450; d. 6 Feb. 1515. He began his studies at Ferrara, and continued them at Rome where he was tutor to princely families. He learned Greek in Ferrara under Guarini and at the suggestion of the Prince di Carpi established a printing-press at Venice 1489. He gained the reputation of being learned in Greek, Hebrew and Latin and entertained in his house many scholars of the day, forming his "Neacademia" or New Academy, which later was styled "Academia della Fama." He was the author of 'Dictionarium Græcum' (1497); 'Institutiones Græco-Latinæ' (1501-8); 'Grammaticæ Institutiones Græcæ' (1514); 'De Metris Horatianis' (1509). His son PAULUS (b. 12 June 1512; d. 6 April 1574) continued (1533) to manage the printing-press at Venice, and subsequently (1561) presided over the papal press, Typographia Vaticana, at Rome. He wrote a commentary to Cicero's Letters, and 'Epistolæ Selectæ.' **ALDUS**, the younger, son of Paulus (b. 13 Feb. 1547; d. Rome 28 Oct. 1597), was a scholar and author from his earliest youth. He continued his father's work at Venice and Rome. Consult: Renouard, 'Annales de l'Imprimerie des Aldes' (1834); Didot, 'Alde Manuce et l'Hellénisme à Venise' (1873); Goldschmid, 'A Biographical Sketch of the Aldine Press at Venice' (1887); Omont, 'Catalogues des Livres Grecs et Latins, imprimés par Alde Manuce à Venise' (1892). See **ALDINE EDITIONS**.

Manx Cat, a breed of house-cats, originating in the Isle of Man, which are characterized

by very high hindquarters, and, as a rule, by a very short tail. See **CAT**.

Manzanillo, măn-thā-nēl'yō, Cuba, city, port of entry, in the western part of the province of Santiago de Cuba, on the Gulf of Guacanabo. It has a large harbor which is protected by a number of small islands. The city is the port for Bayamo, an inland city about 40 miles east by north from Manzanillo. The low land and the mangrove swamps around the place make it very unhealthy. It is well built and has a number of fine churches, hospitals and schools,—among the schools four are high schools. Pop. 15,115.

Manzanillo, Mexico, seaport, in the state of Colima; on the Pacific at the entrance to the Bay of Cuyuttan; about 40 miles west of Colima, the capital of the state. A railroad connects Manzanillo and the capital, and the city has steamer connections with the principal ports on the Pacific coast. Pop. (1902) 4,187.

Manzanita, a popular name for various species of *Arctostaphylos* of the order *Ericaceæ*, especially *A. fungens* and *A. manzanita*, which are considered identical by some authors. They are shrubs or small trees which sometimes exceed 20 feet in height, and often form impenetrable thickets in the Rocky Mountain region from Oregon southward. They have alternate, evergreen entire leaves, usually white or pinkish flowers in long-panicked racemes and generally smooth berry-like drupes. Another well-known species often called by this name is the bear-berry (q.v.), a trailing evergreen shrub which extends from the Arctic region to the mountains of Mexico, whose red berries form one of the principal foods of ptarmigan and other related birds. The great-berried manzanita (*A. glauca*), a California species, bears fruit more than half an inch in diameter. Of the 30 species of the genus, probably a dozen are used for ornamental purposes; some Central American ones in greenhouses where the climate prevents outdoor use; the shrubby western kinds in mild climates; and only the trailing kinds in cold localities. The gnarled roots are an important resource for fuel in the untimbered parts of California.

Manzano, Juan Francisco, hoo-ān' frān-thēs'kō măn thā'nō, Cuban poet: b. Havana, August 1797; d. there 1854. A negro slave he wrote and published several volumes of verse before he was manumitted (1837), gaining especial fame by 'Mis treinta Años' (1836), translated into French, German and English, and by 'Apuntes Autobiográficos,' which was never printed in Spanish, but was published in English by Richard Robert Madden in 1840 under the title 'Poems by a Slave in the Island of Cuba recently Liberated.' Manzano's other works include 'Cantos a Lesbía' (1821), several excellent lyrics reprinted in Calcagno's 'Poetas de Color' (1868), and a drama 'Zafira' (1842).

Manzanos, măn-zā'nōs, a natural park, in Lincoln, Bernalillo, and Santa Fe Counties in New Mexico, southeast of Albuquerque. The Manzano Range, the highest peak of this section, numerous table-lands, and valleys, with many springs and small streams, are the chief features of this park. The Rio Grande is on the west side; the base of the mountains is about 1,000 feet above the river, and about 11,000 feet above the level of the sea. The almost perpendicular,

MANZONI—MAP

stupendous red cliffs which rise above the plain and form the western face of the mountains, are almost unscalable. South of the red-cliff region is the cañon of Las Moyas; and south of this cañon Bosky Peak, the highest point of the range. Near the summit of the peak is a spring which gushes up in a lake about 50 feet wide.

The view from the summit of the range at some points includes the green valley of the Rio Grande, mountains west of Albuquerque, and north to the walls of Santa Fe, and intervening valleys and mountains. On the west of the park, or the western border, are the white Manzano salt lands, on the southeast the gypsum desert. On the level mountain tops are stretches of clearing where the grass grows luxuriantly. Between Hell Cañon and Chilili is a region of immense pine and piñon forest. Some of the animals found here are deer, bear, and wild turkey. Grains, vegetables, alfalfa, fruit and other farm products are raised. Sheep, horses, and cattle are raised extensively.

Manzoni, măn-zō'nē, **Alessandro**, Italian poet and novelist: b. Milan 7 March 1785; d. there 22 May 1873. He studied at Milan and Pavia, and published in 1806 his poem on the death of his friend Imbonati, which was followed in 1815 by his 'Sacred Hymns' ('Inni Sacri'). In 1819 appeared his first tragedy, 'Il Conte di Carmagnola,' the first drama in which an Italian defied the unities. This play was reviewed and praised by Goethe, who took a warm interest in every subsequent production of Manzoni. The death of Napoleon inspired one of the finest odes of the century, 'Il Cinque Maggio' ('The Fifth of May'). In 1823 his second tragedy, 'Adelchi,' appeared. This, as well as its predecessor, finds more favor in the closet than on the stage. After this Manzoni divided his time between country pursuits at his residence in the neighborhood of Milan, and the composition of his romance 'I Promessi Sposi' ('The Betrothed'), a Milanese story of the 17th century, published in 1827, and which has been translated into most of the European languages (Eng. in Bohn's library 1883). He strove earnestly to make Tuscan the universal language in Italy. As a poet he outlived all his Italian contemporaries. Verdi's 'Manzoni Requiem' is a magnificent musical tribute to his memory. Consult: Sauer, 'Alessandro Manzoni' (1872); Stoppani, 'I primi anni di A. Manzoni' (1874); Bersezio, 'A. Manzoni, studio biografico e critico' (1873); Cambu, 'A. Manzoni, reminiscenze' (1885); Wailie, 'Le romantisme de Manzoni' (1890).

Maoris, mā'ō-riz or mow'riz, native inhabitants of New Zealand, a people of Polynesian race, as is attested not only by ethnological considerations but by their own legend that they came from Hawaiki (Hawaii or Samoa). Their carefully kept genealogies go back less than a score of generations, so that it seems probable that their coming to New Zealand was four or five centuries ago. Remains of a previous population with Papuan characteristics have been found. The Maoris are well built, with longer bodies and shorter legs than the European type; they have black hair, little whisker on the face, and smooth bodies, wide open, straight black eyes, heads slightly macrocephalic, the index being 77, nose straight, and color slightly brown. Their costume, no doubt adopted only upon their coming to a colder country than their early

home, was a loose garment, woven from the fibre of *Formium tenax*. Tattooing they brought with them to New Zealand and perfected it. They tattooed the face, decorating in this way the young warrior after his first successful fight, and adding fresh designs for each new exploit. They also knew how to make carvings of great delicacy, and armed themselves with stone weapons. Their religious beliefs were crude, but tinged with animism; they recognized the soul as distinct from the body and surviving it; but connected an enemy's cunning and bravery so closely with his dead body that they ate it, thus to win his warlike virtues, locating intelligence in the brain and courage in the heart. Their worship combined ancestral cult with deification of natural forces and some fetishism. They were divided into tribes, six of these representing the divisions among the original settlers. A warlike people, their chief had absolute power and could pronounce "tapu" or taboo (q.v.) at will. Before the coming of the English they were mostly vegetarian, caught some fish, lived in bark or bough huts, and made canoes. Polygamy was practised, and the *ariki* or priest-chieftains acted as physicians, having some knowledge of herbs. Both their numbers and physique have suffered sadly since the introduction of civilization. For the history of the Maoris since British occupation, see **NEW ZEALAND, History**.

Map, or **Mapes**, mās, **Walter**, English scholar and poet of the 12th century. He was probably a native of Herefordshire. He studied at the University of Paris, and became a favorite at the court of Henry II. He attended the Lateran Council of 1179, and was appointed archdeacon of Oxford in 1197. Map is now generally believed to have been probably author, or in large part, author of 'Lancelot' in the Arthurian cycle. It is extremely probable, at any rate, that Map did contribute to the bringing of the cycle into its present state; but it is uncertain to what extent his work has survived. He is undoubtedly the author of a curious book 'De Nugis Curialium,' a note-book of the events of the day and of court gossip. It was edited for the Camden Society in 1850 by Thomas Wright. To Map is attributed the famous drinking-song beginning:

Meum est propositum in taberna mori.

Map, from the Latin word *mappa*, of Punic (Carthaginian) origin. It originally meant a "signal cloth," towel or napkin, and hence grew to indicate anything on which signs of distance were inscribed. A map is a delineation on a plane of the surface of the earth or of a portion thereof, exhibiting the lines of latitude and longitude, etc., and the forms and relative positions of the countries, mountain-ranges, rivers, towns, etc.; or it may be of the starry heavens, or of stars and constellations. As it is manifestly impossible to correctly represent a spherical upon a plane surface, geographers are consequently necessitated to resort to expedients in order to minimize or distribute the unavoidable distortion and disproportion. Hence the use of the various map projections or arrangements of the lines of latitude and longitude. The Egyptians under the enlightened rule of the shepherd kings and the succeeding dynasties, left many more or less accurate maps in their pyramidal store houses. Anaximander (560 B.C.) was prob-

MAP

ably the first to use cartography (chart writing) but all these early maps were, of course, constructed on the supposition that the earth was flat, a plane. The spherical theory was adopted after Aristotle and Pytheas first made use of astronomical observations in geography. To Dicæarchus is given the credit (310 B.C.) of making crude attempts at proper projection of the sphere on a plane surface, though it was not until the teaching of Ptolemy (150 B.C.) that much real progress was made. From then on the science of delineating in proper proportion the earth's surface languished until the period of discovery and enterprise of the 15th century. Italian nautical charts were at that time

easy enough to draw a few straight lines and suppose them accurate, when it was thought the world was flat. But it was manifestly impossible to portray a sphere upon a plane, like a piece of cloth or paper, in any ordinary way. So most of the early students of geography made more or less huge globes on which to trace their ideas of the relative situation of the several countries. Gradually, however, the science of projection was evolved, whereby the observer was supposed to stand at a distance from the earth's surface and *project* its image upon a flat surface, as is done on a screen by a stereopticon, or magic lantern. There are many systems of projection used in modern map-making, the most in use

fairly accurate, in so far as the earth's surface was then known. Between 1452 and 1552, great strides were made, such men as Sebastian Cabot, Johan Stoffler, Apianus and Mercator leading the way. The simple system of projection outlined by the latter remains unchanged, practically to this day, for the use of navigators. France has ever been most active in map and chart production. In the 18th century she made a state survey which was unsurpassed in accuracy up to that time. It later years, Great Britain and the United States stand in equal prominence in this field. SEE CHART.

With the knowledge of the earth's roundness came much vexation to the map-maker. It was

being the globular, or equi-distant (see plate), for representations of large parts of the earth's surface, or the whole of it.

To readily understand this method of projection, suppose an orange have a circle drawn about it at its exact centre and another circle passing through its stem, crossing the first circle at right angles, each in the exact centre of the orange. Call the first circle the equator (equi-distant from the stem, or *poles*) and the other circle the central meridian. Continue drawing circles about the orange, each equally distant from the other, one set representing the lines of latitude and the other those of longitude. This figure, cast upon a screen, would give you

MAP

the projection shown in the illustration. It is manifest that only one side of a sphere can thus be shown upon a plane surface, so the map of the world is necessarily divided into two parts each called a *hemisphere*, it being usually so arranged that the Old World, or Eastern Hemisphere, is shown as one side of the sphere and the New World, or Western Hemisphere, in the other projection.

When it is desired to show limited areas of the earth's surface, the Conical Projection is often used (see plate). Inasmuch as the cone and cylinder most nearly approximate in form the sphere, this method can be used with sufficient accuracy to answer all practical purposes. The conical projection is supposed to be made from a position somewhat above the nearest pole, which point forms the apex of the cone. From this point a central, or meridional, perpendicular is described, meeting a base line at right angles. From the apex as a centre, draw partial circles to form the parallels of latitude. The exact point to use as a centre will be the point in the perpendicular where the top of a cone, cutting the globe at the two central parallels, would meet the axis of the sphere. This point will be found to be beyond the pole, at the place from which the eye of the alleged observer is supposed to be. This is a simple form of projection for small maps and is considerably used.

But of all the various methods of projection, none was suitable to charts for the use of seamen, as, if they were followed, the course of the ship would necessarily follow in a curved line, along the circular projections of latitude and longitude. So Mercator undertook to formulate a system that could be reduced to practical working along straight lines for the navigator. It is a cylindrical projection in which all the meridians are straight lines perpendicular to the equator and all the parallels straight lines parallel to the equator. See LATITUDE; LONGITUDE; MERIDIAN.

After this difficult matter of the proper projection of the sphere upon a plane surface was satisfactorily accomplished, then came the more mechanical part of map-making. The taking of accurate surveys of the territory to be delineated (see SURVEYING) having been accomplished, the tracings of boundaries, rivers, mountains, bodies of water, etc., was laboriously done by hand on parchment, in the olden days. Each such map was necessarily very costly and difficult to reproduce. With the gradual development of printing and lithography, most of these difficulties began to disappear. Still, the original had to be laboriously engraved by an artist upon the lithographing stone or plate of steel or copper. This made the primal cost heavy. The perfecting of photo-engraving helped to reduce this cost, but it was not until the discovery, in comparatively recent years, of the simple method of wax engraving for producing map plates that real beauty and cheapness, combined, was possible.

Wax engraving has itself undergone so many improvements of late that the whole method has, practically, been changed since 1900. Now it is possible to photograph directly upon the wax plate, as a guide, infallible, for the engraver. The present method is as follows: A polished copper plate, the size of the proposed map, or a certain section of it, is coated with a nitrate of silver solution, so that the copper in the making

of the electrotype will not adhere to the plate and form a part of it. This solution spreads a thin film of oxide over the polished surface of the copper plate, without harming it. The plate is then carefully and uniformly warmed and the wax flowed over it, evenly, one-twentieth of an inch thick. This wax is composed of white beeswax, Venetian pitch and oxide of zinc. Great care must be taken in flowing this mixture over the heated plate. When this is properly done, the engraving surface is ready. It can readily be seen that this wax film is much more easily operated upon than would be lithographing stones or metal. Nevertheless, this seemingly fragile plate can be placed, when engraved, within the electrotyping bath and not be harmed.

If the article to be engraved is an original drawing (as in the case of a map), blue print or tracing, a photographic negative the size of the proposed engraving is made directly upon this wax, as a guide to the engraver. As maps are usually in several colors, a separate plate must be prepared for each color desired. A mechanical dividing machine marks all meridians and other fixed lines upon the wax, rapidly. Then the plate goes to the engraver. His tools are hand-made from sewing-machine needles, the method being too new to have developed a factory for the making of the tools needed. Their shape is various—like a V, then lozenge, flat and pointed. With these delicate, tiny instruments, the wax is cut away to the copper plate, along the lines shown in the photograph on the plate, as representing rivers, boundaries, etc. The waving coast line is traced first, then the rivers. To properly graduate the width of a river from its source to its mouth, requires the use of at least a dozen different-sized needle tools. When all has been finished except the names (lettering), the plate is slightly warmed and ordinary type pressed into the softened wax. The type is held in a little chase, which can be formed into a half circle in either direction, to print curved lines of lettering. All this formerly had to be done by hand, and where the names were many, as in a railroad map, the labor was prodigious.

The process, so far as the artistic work is concerned, is now finished, but the depth of the minute scratches in the wax is too little to enable the electrotypist to make a good printing surface for one of the swift power printing presses. So the plate is "built up." This is done with a tool similar to a tinsmith's soldering iron, only much smaller, with a tiny gas flame admitted to its point to heat it. The operator takes this tool and a piece of wax and flows the melting wax from the point of the hot iron around the edges of the map and about the clear places wherever possible. This materially deepens the resultant cut, or electrotype, and makes the method commercially a success. In electrotyping the plate, it is suspended in an acidulated solution of copper sulphate, with the negative pole of the battery attached to the mold and the positive pole to a copper plate, when a thin film of the copper is disintegrated and precipitated over the mold, following each minute hollow made by the engraver with faithful accuracy. This film is then backed up with soft metal, and the electrotype is finished. Notwithstanding the speed with which this method is followed, it still requires about two weeks to make an ordi-

MAPES—MAPLE

nary map in the several colors—red, blue, yellow, brown and black. An idea of the various stages of this decidedly American method of map-making is given in the illustration.

One of the large firms of New York City, engaged in wax engraving, did over \$75,000 worth of business in this line in 1902. The making of maps for encyclopædias, geographies, atlases, cities, counties, etc., has increased marvelously since the newer and less expensive method herein described has come into use. A map the size of the page used in this Encyclopedia can be made for from \$75.00 to \$100.00, which formerly cost as much as \$1,000. In producing very large and coarse maps, the stencil method is followed quite generally. This consists in cutting out the lines desired for one of the colors from a sheet of paper, made transparent and water-proof by the application of a pitchy compound. This sheet is then placed over the piece of cloth or paper on which the map is to be made and a workman stencils it with a stiff brush, using liquid coloring—ordinary water colors. This process is continued till all the colors are placed on the map and the lettering put in. It is a cheaper and more expeditious method where few copies are desired and where the size is great, as in very large wall maps. It is not impossible to make these large maps by wax engraving, as the plates can be made in sections, as is often done, and then joined in printing. One such wax map, for a Western railroad, was so intricate and had so many thousands of names upon it, that it took two years to finish.

PUTNAM DREW.

Mapes, mǎps, **Victor**, American playwright: b. New York 10 March 1870. He was graduated from Columbia in 1891, was Paris correspondent of the *New York Sun* 1892-6, and dramatic critic of the *New York World* 1898-9. He has written 'Duse and the French' (1897); and among plays by him may be named: 'A Flower of Yeddo' (1898); 'The Tory's Guest' (1900); 'Don Caesar's Return' (1901).

Maple, a genus (*Acer*) of trees, together with a few shrubs of the order *Sapindaceæ*; or according to some botanists, the type genus of the order *Aceraceæ*. The species, of which there are nearly 100, are indigenous to the North Temperate zone, being most numerous represented in China, Japan, the United States and Canada. They are characterized by opposite, palmate or lobed, exstipulate leaves; small polygamo-dioecious flowers in axillary corymbs or racemes; and compound, one- or two-seeded, long-winged nuts (samaras). The maples constitute one of the most widely useful genera of trees, being extensively employed for ornamental and street planting, for wind-breaks, while the wood serves well for tool-handles, furniture, flooring, and many other purposes. As fuel, they are especially valuable, being considered superior to almost all other woods except hickory. Because of their popularity for ornamental planting a great number of horticultural varieties have been produced, especially in Japan, and nearly all, but particularly the Japanese and American species and varieties, are noted for their brilliant autumnal colorings, which in the various shades of yellow and red are unequaled by any other group of northern trees. The flowers are rich in nectar and are sought by bees. Most of the species thrive best upon rich moist

land suitable for agricultural purposes and are considered an indication of the type of soil. A few grow in wet land, and many upon mountain sides. They are readily propagated by means of seeds which, in the case of the early maturing kinds, should be sown as soon as ripe, the later ones in autumn or spring, being stratified in sand during the winter. Some choice varieties are grafted or budded and others may be increased by cuttings and layers.

In America, the best known, most widely planted and otherwise most important species is probably the rock or sugar maple (*A. saccharinum* or *A. saccharum*), a stately round-headed, gray-barked tree often attaining heights of 120 feet. It is especially characteristic of rich woods from Maine to Michigan and southward in the mountains to Georgia, everywhere being noted for the surpassing splendor of its leaves in autumn. Besides great popularity for all the purposes mentioned above, some of its specimens are highly prized for their wavy grained wood, which being of satiny appearance and capable of high polish is used under the name of curly maple often as veneers for choice furniture. It is further the most important of the species which yield a saccharine sap, and is a chief source of maple syrup and sugar, to obtain which the trees are "tapped," the sap caught in buckets and evaporated. A yield of three pounds annually is considered very profitable; six pounds or even more is often obtained from many specimens whose sap is either especially abundant or particularly rich in sugar. If properly done no injury results to the trees. One of its varieties, the black maple (*A. saccharinum*, var. *nigrum*) so called from the color of its very dark-colored bark, is considered a distinct species (*A. nigrum*) by some botanists. It has the same range and habitats as the preceding and in nearly every respect the same uses, including sugar production. This form is more abundant than the preceding in the Central States.

The silver maple (*A. dasycarpum*; or according to Linnæus, *A. saccharinum*) is a widely spreading tree which attains a height of 120 feet throughout the same range as the above species. Being very ornamental in form and particularly also because of its graceful leaves, which are silvery white beneath, this tree is widely planted where rapid growth and quick effects are desired. Its chief fault is its brittleness; it quickly succumbs to high winds. It will succeed upon a wide variety of soils. Its sap, though rather sweet, is less useful for sugar than the above mentioned species.

The red, scarlet or swamp maple (*A. rubrum*) attains heights similar to the above, has about the same range, but is most frequently found in wet ground. It is named from the brilliant color of its flowers, which are borne profusely in early spring before the leaves appear and its red fruits which appear soon after. Being of good habit it is widely planted for ornamental purposes upon all kinds of soils. Its wood is used for most of the purposes enumerated above.

The Norway maple (*A. platanoides*) is somewhat smaller than the preceding species, being more compact and umbrageous. It is widely planted in private grounds and in parks, but is less valuable for street planting than the above because of its shorter trunk. It is a native of

MAPLE SUGAR INDUSTRY

Europe. The sycamore maple (*A. pseudo-platanus*) another European species is smaller still, attaining only about 70 feet. It is also widely planted in America as well as in Europe, being a vigorous, rapid grower and succeeding upon a great variety of soils. The common maple (*A. campestre*) occasionally attains 50 feet, but is usually a smaller tree or even a shrub. It is of European origin and is widely planted.

The Japanese maples (*A. japonicum* and *A. palmatum*) are both small trees or shrubs which because of the great diversity of form of their leaves, and their dainty habit have become widely popular in the parks and gardens of the United States and Europe. Their exceptionally brilliant autumnal coloring is taken advantage of in Japan where in the fall they approach the chrysanthemum in popularity.

There are many other species but these are the most important. Another group, the ash-leaved maples, are generally grouped under the generic name *Negundo*. The best known representative is the box-elder (*A. negundo* or *Negundo aceroides*), which is widely planted in the Western States for wind-breaks and shelter belts and for fuel.

The maples furnish food for a large number of insects, some of which live upon the green parts, and others upon the wood. Several species of scale insects (q.v.) are often abundant enough to do considerable damage. The cottony maple scale (*Pulvinaria innumerabilis*), *Pseudococcus accris*, a European insect, and the "gloomy" scale (*Aspidiotus tenebriosus*), a southern species, are among the most troublesome. Several caterpillars live upon the leaves, the forest tent caterpillar (*Malacosoma dissitria*), the fall web-worm (*Hyphantria cunea*), and the larvæ of the tussock moth (*Orgyia leucostigma*), being the most generally important. The maple worm (*Anisota rubicunda*) is frequently very destructive. It is the larva of a moth. Of the borers, the larvæ of *Dicerca divericata*, and *Glycobius speciosus*, which are beetles in the adult state, and those of *Ægeria acerri*, a clear winged moth, are among the best known. The second beetle mentioned is known as the sugar maple borer. Consult: 'Bailey, Cyclopedia of American Horticulture,' New York (1900-2).

Maple Sugar Industry, a trade term, in common use, pertaining to the manufacture of sugar and syrup from the sap of rock or sugar maple, *Acer saccharinum*. This production is classed under "Agriculture" by the United States Census Bureau, and note was made of its importance at a very early day in the history of the government. The product is strictly confined to North America, and the greater part to more or less limited areas in each of the geographical divisions known as New England, the Middle and Central-Western States, and Canada bordering on the North. Twenty-three States reported maple sugar or syrup in 1900. Of the 11,928,770 pounds of sugar made that year in the United States, 87.8 per cent, or 10,478,240, were produced in the North Atlantic States. The three States of Vermont, New York, and Pennsylvania reported over 80 per cent of the total. On the other hand, the States of the North Central division were credited in 1900, with 1,211,334 gallons of syrup, out of a total of 2,056,611 for the entire country. In this division the great maple sugar producing States

of Ohio, Indiana, Michigan, and Wisconsin are included. The importance of this industry may be inferred by the tables following, taken from the census years noted,—the five States reporting the greatest production in 1900, being arranged in order of precedence and compared with the total manufacture:

POUNDS OF SUGAR.

It is estimated that it costs 5 cents per pound to manufacture maple sugar or syrup. On this basis the cost of syrup will average 55 cents per gallon. In 1900 the valuation reported was: sugar, 9 cents per pound; syrup, 76 cents per gallon. In Canada the manufacture of maple sugar and syrup has assumed a relatively high importance compared with the production in the United States. The Dominion census of 1901, gives the entire volume as 17,762,636 pounds (syrup being reduced to equivalent pounds of sugar for the purposes of this enumeration); and, of this aggregate, the Province of Quebec is credited with 13,643,672 pounds of maple sugar, the Province of Ontario following with a production of 3,791,598 pounds. Maple sugar is reported from other provinces and territories as follows: New Brunswick, 207,450 pounds; Nova Scotia, 112,496 pounds; Manitoba, 5,137 pounds; Northwest Territories, 1,243 pounds; Prince Edward Island, 1,009 pounds; British Columbia, 31 pounds. The average value of this maple sugar and syrup is 10 cents per pound.

History.—Maple sugar and syrup was made at an early day by the pioneers of New England and Canada. It may have been a product of "necessity, the mother of invention," or an inheritance from the Indians, who had a spring-date of *sugar-making moon*; but, in either event, the first methods employed were crude, and the article was dark in color and not attractive. Moreover, tapping trees with an axe tended to denude the forest of its maples, and the whole *modus operandi* was wasteful in the extreme. The sap was caught in troughs, hewed out of logs, thence carried in pails to the boiling-place, and reduced to syrup in potash kettles. These kettles of the 18th century, or earlier, would be a curiosity at this day. They were suspended by chains from a horizontal pole, supported by forked or crossed sticks at each end, and surrounded by a blazing open fire. The camp-kettle, captured from General Burgoyne at the Battle of Saratoga, 17 Oct. 1777, preserved in the Bennington Battle Monument, is a fine illustration of what these kettles resembled. Primitive ways, however, did not long continue. Improved methods, both as to tapping the

MAPLESON — MARACAIBO

maples,—leading up to the use of metal spouts, —and refining sap, followed one another, until now, modern scientific principles prevail; and it is possible to reduce the sap to sugar or syrup, using evaporators, almost immediately, so that its color is nearly white, flavored only with the delightful aroma of the maple.

Production and Adulteration.—The demand, in the United States, being many times in excess of the natural production, maple sugar and syrup must be considered a luxury. This fact has led to the “manufacture” of an article of commerce in which the pure maple product plays a very inconsequential part. Good authorities assert that sugar refiners make much more sugar and syrup, labeling it “maple,” than the entire natural production; that the refuse sugar of the real maple enters into the artificial combination of glucose, cane or beet sugar, and chemicals,—to a very large degree creating a ready market for black American and Canadian sugars, and the “late runs” of the maple sugar-producing sections of both countries.

Maple Sugar Makers' Associations.—In the more important States, organizations have been formed for the mutual protection of common interests. These associations comprise in their membership the larger producers of maple sugar, and not infrequently, include State officials and their respective delegations in Congress. Influenced by these representatives of material interests to State and Nation, the United States government, through its Department of Forestry, has instituted a series of experiments for the purpose of fostering the maple sugar industry of the United States; to devise means for a more successful propagation of the sugar maple, and to enhance the quantity, quality, and value of the “orchards” now in existence.

H. L. STILLSON.

Mapleson, mā'pl-són, James Henry, English operatic impresario: b. London 4 May 1830; d. there 14 Nov. 1901. He was educated at the Royal Academy of Music, London, and went to Italy for vocal instruction, but was compelled to abandon his career as a singer, owing to throat trouble. He then entered an orchestra, playing the viola and in 1861 he became manager of the Lyceum Theatre. In 1862 he assumed the management of Her Majesty's Theatre where he made himself famous. In 1871, after the burning of Her Majesty's Theatre he managed Drury Lane but returned to the new Her Majesty's upon its completion. In 1878 he conducted the tour of an Italian opera in America and subsequently made tours with the greatest singers of the day, including Patti, Nilsson, etc.

Mapurito, mā-poo-ré'tō, one of the Mexican white-backed skunks. See SKUNK.

Maqui, mā'kwē, an evergreen shrub of the linden family found in Chile, from the juice of whose acid fruit the Chileans make a wine given to persons ill with a fever. Its wood is employed in making musical instruments, and its bark furnishes strings for them. It is the best-known species of the genus *Aristotelia* (*A. Maqui*), and is cultivated as an ornamental shrub in Europe.

Maquoketa, mā-kō'kē-tā, Iowa, city, county-seat of Jackson County; on the Maquoketa River, and on the Chicago, M. & St. P. and the Chicago & N. W. R.R.'s; about 40 miles

northwest of Clinton and 30 miles south of Dubuque. It is in an agricultural section; valuable limestone quarries are in the vicinity, and not far distant are forests which furnish excellent hardwood timber. Its chief manufactures are flour, lime woolen goods, brick, tile, foundry and machine-shop products, and wooden-ware. It has an extensive trade in manufactured articles, farm products and livestock. It has county buildings, several churches and schools, and the Boardman Library Institute. The city owns and operates the water-works. Pop. (1900) 3,777.

Mara, mā'ra, in old Runic, a goblin that seized on men asleep in their beds, and took from them all speech and motion. In Russian it was called *kiki-mora*, or ghost. Mara is another representation of incubus or nightmare (qq.v.).

Marabou, mār-a-boo', a large African pink-white pouched stork (*Leptoptilus crumenifer*), which resembles the adjutant (q.v.) of India in appearance and habits. It gives its name to the soft and drooping feathers (coverts) which cover the root of the tail and are prized for millinery and other ornamental purposes; a large part of the “Marabou feathers” sold, however, are derived from the Indian adjutant.

Marabouts, mār'a-boots, Maraboots, or Marabuts, an Arab tribe of religious devotees, saints or sorcerers, who are held in high estimation, and who exercise in some villages a despotic authority. They distribute amulets, affect to work miracles, and are thought to exercise the gift of prophecy. Throughout the Barbary States the tombs of the Marabouts are conspicuous objects, being generally built in the open country, and regarded by the people with much reverence. The living Marabouts are regarded by foreigners as little better than vagabonds.

Maracaibo, mā-rā-kí'bō, Venezuela, capital of the state of Zulia; situated on the western shore of Lake Maracaibo; has a large and safe harbor; and maintains commercial relations with foreign markets, with the interior, and with Colombia. The Red “D” Line Steamship Company, of New York, sends a vessel on regular trips to Maracaibo, and hundreds of small craft, suitable for shallow waters, carry on the trade of the coast and rivers tributary to the lake. This city is also the starting point for passenger and freight steamers and the railway lines of sections of the state of Los Andes. The most important buildings are the Executive Mansion, the public market, Legislative Palace, Municipal Building, Baralt Theatre, University, six churches, and the new jail. There are 5 hotels, 2 clubs, 24 restaurants, etc. The public plazas contain statues of the patriot, Gen. Rafael Urdaneta, and Don Rafael Baralt, author of a history of Venezuela, who was born in Maracaibo and became a member of the Royal Spanish Academy. There is a dockyard for the construction of sailing-vessels, and the city has electric lighting, telegraph and telephone service, submarine cable, street railways, etc. In 1901, its exports were: coffee, 25,626,000 kilos; cocoa, 154,000 kilos; hides, 456,000 kilos; deer and goat skins, 147 tons; copaiaba, 41 tons; fustic, 6,272 tons; dividivi, 3,368 tons; brown sugar, 283 tons; fish sounds, 36 tons. The number of vessels entering this port in the year

MARACAIBO — MARATHON

just mentioned was 431. Maracaibo, at first called Nueva Zamora, was founded in 1571 by Alonso de Pacheco. The population in 1899 numbered more than 35,000.

Maracaibo, Gulf of. See VENEZUELA, GULF OF.

Maracaibo, Lake of, Venezuela, in the northwestern part, connected with the Gulf of Venezuela by a strait about 50 miles long and from 8 to 15 miles wide. The lake is about 100 miles long and 80 miles across the widest part. At the mouth it is about 500 feet deep, but at its head it is shallow and the land near the shore is marshy. Large vessels cannot enter because of a bar at its mouth which leaves only from 8 to 13 feet of water. A number of rivers flow into the lake and keep it fresh, but when strong north winds prevail it becomes brackish. The tides do not affect the lake to any very great extent although it is a marine inlet. It was once much larger than at present, as the shore-marks indicate, but the basin has been filled in leaving this one large lake and a number of smaller lakes which are connected by creeks. See also VENEZUELA.

Marajo, *mā-rā-zhō'*, Brazil, an island at the mouths of the Amazon and Para rivers; area, about 18,000 square miles. The greater part is low, in the centre are several lakes. In the north and west are swamp lands and in the east and south forests, the rubber tree predominating. The chief settlement is Sauré on the eastern coast. There are not many residents, as in the rainy season nearly the whole island is flooded. Cattle raising and gathering rubber are the chief occupations.

Maral, the red deer of Persia.

Maranhã, *mā-rān-yān*, or **Maranhão**, Brazil, a maritime state, bounded on the north by the Atlantic Ocean; area, 177,566 square miles. The surface is uneven, but there is no range of mountains. There are numerous rivers flowing into the Atlantic, large forests, extensive plains where cattle are reared; the climate is fine, and the soil fertile. Paranhayba is the principal river. Agriculture, however, has not prospered here, and the emancipation of the slaves, on whose labor the state had depended, was followed by a period of great depression. Cotton, sugar, and rubber are the principal products. Coffee, rice, corn, cacao, and tropical fruits grow luxuriantly. The population is not great enough to properly develop the rich natural resources. Efforts are being made to colonize different sections. The present inhabitants are chiefly of Portuguese descent; but there are about 20,000 Indians and a few hundred negroes and mulattoes. The capital is Maranhã. Pop. (1900) 450,762.

Maranhã, or **São Luiz De Maranhão**, *sān loo-ēzh' dō mā-rān-yān'*, Brazil, capital of the State of Maranhã; on an island on the bay of São Marcos, and between the mouths of the Itapicurú and Mearim rivers. The first settlements were made by the French in 1612. The ground is low and the climate warm but the place is healthful. The harbor, once good, is filling with sand, and little or nothing is done for its improvement. It has considerable trade; the chief exports are cotton, sugar, hides, rubber, cotton-seed, and the skins of goats. The chief imports are cloths and clothing. The city has

many fine buildings, public and private. Pop. including the suburbs, about 40,000.

Maranhão. See MARANHAM.

Maraschino, *mār-ās-kē'nō*, or **Marasquino**, a fine liqueur prepared from the sour cherry of southern Europe (*Prunus mahaleb*). The best-known kinds come from Dalmatia, and from Corsica. An inferior kind is made in Germany.

Marat, Jean Paul, *zhōn pōl mā-rā*, French revolutionist: b. Boudry, Neuchâtel, Switzerland, 24 May 1744; d. Paris 13 July 1793. He studied medicine in Paris, traveled widely, and practised in London and later in Paris. The first breath of the Revolution converted the industrious doctor into an audacious fanatic and demagogue. He succeeded, by his violence and energy, in commanding attention. Danton instituted the club of the Cordeliers, and collected around him all the fiercest spirits; among the number, Marat, who became the editor of the 'Publiciste Parisien,' better known under its later title 'L'Ami du Peuple,' again changed to the 'Journal de la République Française.' This sheet was the oracle of the mob. Denounced to the constitutional assembly, and proceeded against by the municipal authority of Paris, he contrived to escape to London and was later in hiding in Paris. During the existence of the legislative assembly he continued his outrages, figured among the actors of 10 August, and in the assassinations of September (1792). He was a member of the committee of public safety to the convention and made the ministers, General Dumouriez, and the Girondists, the objects of his attack. Being charged in the convention with demanding in his journal 270,000 heads, he openly boasted of that demand, and declared that he should call for many more if those were not yielded to him. The establishment of the revolutionary tribunal and of the committee for arresting the suspected, was adopted on his motions. On the approach of 31 May, as president of the Jacobin Club, he signed an address instigating the people to an insurrection, and to massacre all traitors. Even the Mountain party denounced this measure and Marat was delivered over to the revolutionary tribunal, which acquitted him; the people received him in triumph, covered him with civic wreaths, and conducted him to the hall of the convention. His bloody career was closed by assassination. (See CORDAY, CHARLOTTE.) His remains were placed in the Pantheon, whence they were later removed. Consult Chevrement, 'Jean Paul Marat' (1881); Bat, 'Jean Paul Marat, the People's Friend' (1901).

Marā'thī. See MAHRATTAS.

Marathon, *mār'a-thōn*, Greece, an ancient village in Attica, about 20 miles northeast of Athens. It was situated on a plain which extends for about 6 miles along the sea shore, with a breadth of from 1½ to 3 miles. The site of the ancient village was not probably that of the present Marathon, but at a place now called Vrana, a little farther south. Through the centre of the plain runs a small brook. Here was fought the great battle between the Athenians and Persians, 490 B.C. (See MILTIADES.) A tumulus or "soros" on the plain, marks the burial-place of the Athenians who died in battle. It was excavated by the Greek Archaeological Society in 1890-1, and yielded many interesting relics.

MARATTI—MARBLE

Maratti, mǎ-răt'tē, or **Maratta**, mǎ-răt'tä, **Carlo**, Italian painter and engraver: b. Camerino 13 May 1625; d. Rome 15 Dec. 1713. While a child he amused himself with painting all sorts of figures drawn by himself on the walls of his father's house. In his 11th year he went to Rome, studied the works of Raphael, of the Caracci, and of Guido Reni, in the school of Sacchi, and formed himself on their manner. His Madonnas were particularly admired. Louis XIV. employed him to paint his celebrated picture of Daphne. Clement IX., whose portrait he painted, appointed him overseer of the Vatican gallery. We are much indebted to him for the preservation of the works of Raphael in the Vatican, and of the Caracci in the Farnese Palace. He also erected monuments to those masters in the church della Rotonda. As an artist Maratti deserves the title given him by Richardson, of the "Last Painter of the Roman School."

Maratti'ales. See FERNS AND FERN-ALLIES.

Maravedi, mǎ-r-ä-vä'dī, a name given to old Spanish copper coins in use from 1474 to 1848, varying in value from 1-7 to 1-3 of a cent. There were also, at an earlier period, maravedis of gold weighing 60 grains.

Marbeau, Jean Baptiste Firmin, zhôn bǎ-těst fēr-mǎn mǎr-bô, French philanthropist, founder of the day-nursery: b. Brives 18 May 1798; d. St. Cloud 10 Oct. 1875. He practised law in Paris, and in 1841, being deputed to inspect the charitable institutions of the first arrondissement of the city, planned the crèche or day-nursery for the care of children of working mothers. The first crèche was opened 14 Nov. 1844 at Chaillot; a Société des Crèches was founded in 1846; and his plan was described in his book, 'Des Crèches' (1845). Marbeau played a less prominent part in other charities and wrote on various problems of pauperism. Consult the life by Roussel (1875).

Mar'ble, mǎr'bl, **Manton**, American journalist: b. Worcester, Mass., 16 Nov. 1835. He was graduated from the University of Rochester in 1855 and engaged in journalism in Boston where he was on the staff of the *Journal* and later on that of the *Traveller*. In 1858 he went to New York and was on the editorial staff of the *Evening Post* and in 1862-76 was owner and editor of the *World*. He was a member of the Bimetallic Congress in Europe in 1885 and is the author of 'A Secret Chapter of Political History' (1878).

Marble (from the Greek *marmairein*, to sparkle), a compact rock which, in its pure form, is composed entirely of carbonate of lime or limestone. In its best form it is a variety of calcite, the tiny crystal facets sparkling and flashing in the sun's rays; hence its ancient name. It is seldom found in perfect purity, the tractable qualities of the limestone allowing the introduction of many foreign substances during its formation. Thus there will be seen marble with streaks of various colors running through it, caused by the action of oxide of iron or other chemicals. Almost any limestone rock is commonly called marble, even certain varieties of granite, onyx, porphyry and rock largely composed of gneiss and mica-schist.

Marble has been a favorite stone for forming into statuary and for decorative work in buildings and monuments, from the very earliest ages.

The Greeks, who were the first to endow this lifeless stone with marvelous genius in their statuary and bas-reliefs, were blessed with an almost inexhaustible supply of the very finest and purest marble yet discovered, on the island of Paros, in the Ægean Sea. This marble, so celebrated as "Parian," possesses a peculiar waxy attribute which gave the statues formed from it a beautiful polish. The 'Venus de Medici' was made from this stone, which is almost perfectly white. The Parthenon was built of marble of Pentelicus, which was a little more finely grained. The marbles of Carrara were even then known but not generally put in use till later years, being still among the finest marble in the world, though having some gray streaks.

In many other parts of Continental Europe and in Great Britain are quarries of fairly pure marble. In America, however, will eventually be found the finest supply of this useful stone in the world. Each year new jettings of it are found in wild parts of the Rocky Mountains, some of them pure white, while others are limned with variegated colorings, rivaling a rainbow in brilliancy. Perhaps the finest example of these wonderful marbles of the Rockies is found in the new State Capitol building of Colorado, at Denver. The geologists of that State have been unusually energetic in discovering useful minerals in their mountains and have incorporated in the Capitol many of them. Walls, exterior and interior, are composed of richly grained granites and marbles, more beautiful and rare than any even dreamed of by the ancients. In the same slab of stone can often be seen a variegation of lines and hues, ranging from the purest white, with sparkling granular crystals of calcite, to delicate grays, limpid blues, vivid reds and velvety onyx. To reproduce this celebrated structure in any other part of the world would be a labor almost impossible of accomplishment and infinitely costly. In the eastern part of the United States there are many quarries of marble which have been in use for many years. Vermont is probably the seat of the largest quarries. Little of this marble is finely grained and white enough to answer for the sculptor's use, but it is admirably adapted for ornamental purposes in architecture and for monuments for the dead. American sculptors still generally use the marbles from Carrara, though the merits of the American product are becoming known. Vermont, although one of the smallest States in the Union, exports more stone for commercial purposes than any other State, except one, Pennsylvania standing first. The money value in 1903 of Vermont's stone product was in excess of \$6,000,000, a large part of it being in marbles of various grades.

The quarrying of marble is now carried on extensively, the use of machinery largely taking the place of the ancient hand methods. Fifty years ago the quarries of Rutland, Vt., still the largest in the world, were operated by ox teams, and hand work of the crudest form. Today, these vast quarries have an extensive outfit of electric cranes and derricks, which move the blocks of marble in any desired direction, easily and quickly, one of these traveling cranes having a carrying capacity for 100,000 pounds. The stone is too easily broken to permit the use of blasting powders of any kind. This method is used in some of the Italian quarries, but causes great waste of material and is most unsatisfac-

MARBLE FAUN—MARBLES AND MARBLE PLAYING

tory. In the Vermont quarries, a machine called a "channeler" has been found the best for economical work, and has been exclusively adopted for about ten years. It consists of a row of long chisels set in a strong, traveling framework. This gang of chisels vibrate up and down, cutting a channel in any direction desired in the face of the marble ledge. The channel can be made any reasonable depth, according to the size of block desired. When this channel, or groove, is sufficiently long and deep, the machine is reversed and cross channels are cut and the bottom perforated. Then wedges are carefully driven in behind the block of stone and it gently falls over, to be lifted by a crane to the railroad cars or to that part of the quarry devoted to further treatment of the output. As a rule, the stone is sent in its rough state to the purchaser, who dresses it himself. When the order is for monument work or some special design in architecture, the marble is treated at or near the quarry. In thus further treating the product, a toothless saw, or gang of saws, is used. The block of stone is placed on a horse, or platform, and the saws set at work, the size of the cut being gauged by setting the saws close together, or far apart, as needed. A stream of water in which is mixed sea sand or other sharp, hard sand, falls upon each saw. The friction of the iron blade, aided by the sand and water, quickly cuts up the marble into any desired shape. Some marble cutters use saws of wire, but the best seem to be those made of strips of soft iron one sixteenth of an inch thick and, when new, four inches wide. The marble wears down one of the saw blades very rapidly. When the blocks are thus sawn into the requisite shapes by the power gang-saws, they are then placed on tables and ground down to size, a small piece of marble being rotated over them by hand or power, water flowing over the surface being ground. With surprising facility, the marble yields to this treatment. Polish, in the final stages, is given by rubbing with wood or other soft material, and finally cloth. Much hand work is, of course, necessary with the mallet and chisel and polisher, but all the rough, heavy work, which formerly made marble so costly and hard to obtain, is now done entirely by electric and steam power. One of the finishing rooms at the Rutland works, located at Proctor, Vt., is 1,000 feet long and contains scores of giant gang saws, cutting up the marble into various shapes. This one plant, the largest in the world, has an output of \$3,000,000 annually, and employs hundreds of men. Most of this output is of white marble, though brown, gray, green and other shades are found in profusion.

One ancient method of mining this delicate stone, still used entirely by the Mexicans in mining onyx, is to drill holes in a line, insert plugs of some porous wood, pour in water and allow the wood to swell. This gently forces the precious stone free, without the least injury.

One quality of marble, not usually recalled, is its ability to withstand great heat safely. In the devastating fire in 1903 at Paterson, N. J., buildings built of granite crumbled and perished. Those of marble still stand, almost as good as ever. Its use is therefore becoming more and more general in erecting fireproof buildings in the large cities, the floors and often the entire inside wall and ceiling being overlaid with it.

Some really fine examples of craftsmanship in this line are found in the public buildings of New York city and elsewhere in America, notably the new buildings of the Hall of Records and the Appellate Division of the Supreme Court, in New York. In the making of monuments for the dead, marble is most extensively used. The floors of bathrooms, tops of toilet tables, basins for washing hands and clothes, tiling of various sorts—all these and a thousand other household purposes find in marble their chief exponent. Probably more than \$25,000,000 worth of finished marble products are used in the United States annually, made from domestic quarries entirely.

PUTNAM DREW.

Marble Faun, The, a romance by Nathaniel Hawthorne published in 1860. This is the last complete work by the author, and was thought by him to be his best. It was composed carefully and maturely, Hawthorne not having written anything for seven years; and appeared simultaneously in Boston and London under different titles. The original name proposed was 'The Transformation of the Faun,' shortened by the English publisher into 'Transformation,' and changed in America by Hawthorne to 'The Marble Faun.' The scene is laid in Rome: the chief characters, four in number, are introduced in the first chapter: Kenyon, an American sculptor; Hilda and Miriam, art students; and Count Donatello, an Italian.

Marbled Godwit. See GODWIT.

Marbled Tiger-cat. See TIGER-CAT.

Marblehead, mār'bl-hēd, Mass., town, in Essex County; on Massachusetts Bay, and on the Boston & Maine railroad. The town is on a peninsula which has Massachusetts Bay on the east and south and Salem harbor on the north, and includes the villages of Marblehead, Neek, Clifton, and Devereaux. It was settled by immigrants from Guernsey and Jersey in 1629, and was a part of Salem until 1649. Its good harbor gave it advantages for fishing and for coast trade that made it for a time the second settlement in importance in the colony, Boston being the first. Fishing continues one of the industries; others are boat-building and the manufacturing of shoes. It is a favorite yachting resort. There are still, in a good state of preservation, a number of pre-revolutionary buildings. The town has three well-kept parks, and Abbott Hall, which contains the town library, art gallery, and records, and in which are the offices for the town officials.

Judge Story and Elbridge Gerry were born and lived for some years in Marblehead. Consult: Agge, 'Sketches of Marblehead'; Roads, 'The History and Traditions of Marblehead.'

Marbles and Marble Playing. Marbles are small balls of baked clay, marble, agate or other minerals, used as toys and playthings for children. They are manufactured in large quantities in Saxony for exportation to the United States, and to India and China. They are also largely manufactured in the agate mills at Oberstein on the Nahe, in Germany, particularly for the American market. The material used in Saxony is a hard calcareous stone, which is first broken up into square blocks with a hammer. These are then thrown 100 to 150 together into a mill, which is constructed of a stationary

MARBLING—MARCH

flat slab of stone, with a number of concentric furrows upon its face. Over this a block of oak of the same diameter, partially resting upon the small stones, is kept revolving, while water flows upon the stone slab. In 15 minutes the marbles are worn completely round, and are fit for sale. An establishment with three mills will manufacture 60,000 marbles in a week. Agates are made into marbles at Oberstein by first chipping the pieces nearly round with a hammer, and then wearing them down upon the face of large grindstones. The game of marbles is variously played; usually with a circular ring marked on the ground, the player taking one marble between the thumb and forefinger and dexterously shooting at other marbles within the circle, striking them with sufficient force as to throw them outside of the limits of the ring.

Marbling, in bookbinding, a process of ornamenting the edges of books. After the edges of the book have been cut by the plough (see **BOOKBINDING**) the book is tied between two boards and taken to the trough, a vessel 2 inches deep, which is filled with clean gum water. Various colored pigments, ground in spirits of wine and mixed with a small quantity of ox gall, are thrown upon the surface of the gum water, and disposed in various forms with a quill and comb, according to the required pattern. This being obtained, the edges of the book are dipped into the trough, and the colors adhere. Cold water is then dashed over the edges, which sets the colors and brings them out clear.

Marburg, mār'boorg, Prussia, a town of Hesse-Nassau, on the slopes of an acclivity above the Lahn, 46 miles north of Frankfurt, 60 miles by rail via Cassel. The principal buildings are the castle of the landgraves of Hesse, now partly used as a prison; the 13th century church of St. Elizabeth; the town-house and the celebrated university, the first founded in Germany after the Reformation, and having in 1900, 93 professors and 1,184 students. The town has manufactures of machinery, leather, pottery and toys. Pop. (1900) 17,527.

Marbury v. Madison, a well-known decision in law handed down in 1803 by the United States Supreme Court. It is important as affording the earliest instance of the declaration by the Court that a Congressional statute is null and void by reason of its repugnance to the Constitution of the United States. Marbury was appointed justice of the peace in the District of Columbia by President Adams, but the commission, though drawn up, signed, and sealed, had never been delivered. Madison, when he became secretary of state, refused to deliver it. An act of Congress empowered the United States Supreme Court to issue to executive officers a writ of mandamus to force them to attend to their duties, and on the basis of this act Marbury brought suit. Now the Constitution nowhere mentions the right to issue a writ of mandamus among the cases of original jurisdiction by the Supreme Court. Chief-Justice Marshall therefore decided against Marbury, and his argument, admittedly the only accurate one, established an important precedent which is found only in the courts of the United States.

Marcasite, in mineralogy, a bisulphide of iron. The term includes several varieties of iron pyrites, which have been named after the form

they present: namely, cellular pyrites, cockscomb pyrites, hepatic pyrites, or leberkies, etc. It is used in the manufacture of sulphur, sulphuric acid, and sulphate of iron.

Marcel, Etienne, ä-të-ën mār-sël, French political leader: d. Paris 31 July 1358. From December 1355 he was provost of the Paris merchants and actual ruler of the city. He put to death two officials of the crown, and finally persuaded the Dauphin Charles to act as regent while King John was held by the English. Not finding the Dauphin properly submissive, he obtained assistance from Charles the Bad of Navarre. He was killed during an uprising of the more wealthy and conservative citizens against his power. Consult Lazard, 'Un Bourgeois de Paris au XIV. Siècle' (1890).

Marcellinus, mār-së-l'ī'nūs, Saint: d. 25 Oct. 305. He was a pope who succeeded Caius in 306. The Donatists alleged that during the Diocletian persecution he sacrificed to idols. He was, however, vindicated by Augustine from this charge.

Marcellus, mār-sël'ūs, **Marcus Claudius**, Roman general: b. before 268 B.C.; d. near Venusia, 208 B.C. In 222 being consul with Scipio he twice defeated the Insubrians in northern Italy, and with his own hand killed their king, thus winning the *spolia opima*. After the disaster of Cannæ in the Second Punic War (216), Marcellus took command, gained several slight victories over the Carthaginians, and hence was named "the sword of Rome," Fabius Cunctator being called "the shield of Rome." His third consulship (214) was spent in Sicily, where he attacked Syracuse, and after a two years' siege prolonged by the skill of Archimedes captured the city. In his fifth consulate after two years of varying success against Hannibal in Italy he was killed in a skirmish near Venusia.

Marcellus I., Saint, pope: d. 310. He succeeded Marcellinus in 304. The Emperor Maxentius banished him from Rome for excommunicating an apostate, and according to some authorities forced him to serve as a slave in the imperial stables. He suffered martyrdom under Maxentius.

Marcellus II. (MARCELLO CERVINI, mār-chë'l'lo chër-vë'në), pope: d. 1 May 1555. He was cardinal legate at Trent of Julius III., whom he succeeded in the pontifical chair. Although originally opposed to polyphonic music, he at once withdrew his opposition to it after listening to Palestrina's famous 'Missa Papæ Marcelli.' His pontificate lasted only 22 days.

Marcellus Stage, in geology, a term introduced by the New York State Geological Survey for the thin rock mostly shale, which is the lowest group of the Upper Devonian System, and which is most typically seen in New York State at the little village of Marcellus, whence the stage is named.

March, Francis Andrew, American philologist: b. Millbury, Mass., 25 Oct. 1825. He was graduated from Amherst in 1845, studied law in New York in 1849-50, was admitted to the bar in 1850, in 1856 became adjunct professor of belles-lettres and English literature in Lafayette College (Easton, Pa.), and in 1857 professor there of the English language and comparative philology. In 1873-4 and 1895-6 he was presi-

MARCH — MARCH TO THE SEA

dent of the American Philological Association, in 1876-1903 of the Spelling Reform Association and in 1891-3 of the Modern Language Association. He was among the earliest advocates of a historical study of the English language, and of a philological study of the classic works of that language. His contributions to the transactions and proceedings of the American Philological Association and other learned societies have been very extensive. He also edited the Douglass series of Christian Greek and Latin classics (1874-6), was director of the American readers for the great 'Historical Dictionary of English' of the London Philological Society, and published: 'A Method of Philological Study of the English Language' (1865); 'Parser and Analyzer for Beginners' (1869); an 'Anglo-Saxon Grammar' (1870); an 'Anglo-Saxon Reader' (1870); and an 'Introduction to Anglo-Saxon' (1871).

March, *märn*, Austria-Hungary, the principal river of Moravia, rising on the Silesian boundary, and flowing 214 miles southward to the Danube, which it joins six miles above Presburg. It is navigable for small boats from Göding, 50 miles from its mouth. In its lower course it forms the boundary between Austria and Hungary. Its chief affluent is the Thaya.

March, in Europe, a frontier or boundary of a territory; especially applied to the boundaries or confines of political divisions; as, for example, the frontiers between England and Scotland, and England and Wales. Geneva is situated in the Marches of France, Savoy and Switzerland.

March (Latin, *Martius*), (1) the third month of the year, originally the first of the Roman year; so named in honor of the Roman deity Mars. Prior to 1752 the 25th of March was the first day of the legal year; hence, January, February, and the first 24 days of March have frequently two years appended, as January 1, 1701½ or 1701-2. (See CALENDAR.) (2) A movement by regular steps in the manner of soldiers; also a journey performed by a body of soldiers either on foot or on horseback. Soldiers on a march are subject to certain rules very necessary to keep them in good order, and fit to meet the enemy. The march in the first sense of regular step differs on different occasions. In the parade-march from 75 to 95 steps, each of about 30 inches, differing in different armies, are made in a minute; in the quick-march from 108 to 115 steps; and in the double quick 150 running paces. This last cannot be sustained for any length of time, and is only used in a charge, or in storming a commanding position, and in a few internal movements of regiments. (3) A musical composition, chiefly for military bands, with wind instruments, intended to accompany the marching of troops. There are slow and quick marches, and marches peculiar to different countries. Marches are also introduced into oratorios, the best-known examples being the 'Dead March' from the oratorio of 'Saul' and Mendelssohn's 'Wedding March.' See MUSIC.

March Flies, small, hairy, scavenging flies of the family *Bibionidae*, seen numerous in early spring, often before the snow has disappeared. The species are over 300, and some appear in vast swarms. The maggots hatch in refuse or manure upon the ground, and are believed to feed upon grass-roots.

March to the Sea. There were two plans for a march to the sea by Sherman's army, the first Gen. Grant's, the second Gen. Sherman's, modifying the first. A campaign to the sea to divide the Confederacy was decided upon by Gen. Grant in January 1864, when he was in command of the Military Division of the Mississippi, with headquarters at Nashville. His objectives on the coast were first Mobile, second, Savannah, Atlanta being the intermediate objective for both. Sherman's army was then in the vicinity of Chattanooga, Tenn., and Ringgold, Ga.

In a letter to Gen. Halleck, dated at Nashville, 15 Jan. 1864, Gen. Grant wrote: "I look upon the next line for me to secure, to be that from Chattanooga to Mobile, Montgomery and Atlanta being the important intermediate points." This he repeated on 19 January to Gen. Thomas, then in command of the Army of the Cumberland at Chattanooga, and this officer immediately began to gather information, which Gen. Grant desired, of the number of troops necessary to guard the roads and bridges from Nashville to Atlanta. These preparations were entrusted to Gen. Thomas, as Gen. Sherman was engaged with his Meridian campaign. In this connection, Gen. Thomas expressed his confidence in being able with the Fourteenth and Fourth corps in advance, covered with a strong division of cavalry, and the Eleventh corps in reserve, to overcome all opposition as far as Atlanta.

When Grant was made lieutenant-general and ordered east to command all the armies, he called Sherman to Nashville, and they traveled together as far as Cincinnati. Gen. Sherman was then made acquainted with the plans already set forth. As part of these plans, before leaving Nashville Gen. Grant ordered Banks to concentrate at least 25,000 men to move against Mobile in the spring in co-operation with Gen. Sherman.

In addition to letters to each of the commanders interested — Halleck, Sherman, Thomas and Banks — Gen. Grant, 26 March 1864, sent all army commanders a map upon which was indicated by red lines the territory occupied by the Union forces at the beginning of the War, and at the opening of the campaign of 1864. The territory which it was proposed to occupy by the campaigns about to begin was indicated by blue lines. This map reached Gen. Sherman 4 April, and its receipt was acknowledged by him. This map is reproduced in the Atlas of the 'Official Records' of the war, being plate 135 A of that publication. For Sherman's proposed campaign the blue lines extend from Chattanooga to Atlanta, and from this latter point both to Mobile and Savannah.

Gen. Sherman, in acknowledging the map, said: "That map to me contains more information and ideas than a volume of printed matter. Keep your retained copies with infinite care, and if you have occasion to send out to other commanders any more I would advise a special courier. From that map I see all, and glad am I that there are minds now at Washington able to devise; and for my part, if we can keep our counsels, I believe I have the men and ability to march square up to the position assigned me, and to hold it."

As the result of the campaign for Atlanta Gen. Slocum occupied that city 2 September. Meantime Farragut had taken possession of Mobile Bay 5 August. On 10 September Grant

MARCH TO THE SEA

telegraphed Sherman from City Point as follows: "As soon as your men are properly rested, and preparations can be made, it is desirable that another campaign should be commenced. We want to keep the enemy continually pressed to the end of the war. If we give him no peace while the war lasts, the end can not be far distant. Now that we have all of Mobile Bay that is valuable, I do not know, but it will be the best move for Major-General Canby's troops to act upon Savannah, while you move on Augusta. I should like to hear from you, however, on this matter."

To this Sherman telegraphed in reply: "If you can manage to take the Savannah River as high as Augusta, or the Chattahoochee as far up as Columbus, I can sweep the whole State of Georgia, otherwise I would risk our whole army by going too far from Atlanta."

In a letter from Atlanta, dated 20 September, Sherman gave Grant the conditions under which he could successfully co-operate in a movement on Savannah: "If you will secure Wilmington and the city of Savannah from your centre, and let General Canby have command over the Mississippi River and the country west of it, I will send a force to the Alabama and Appalachicola, provided you give me 100,000 of the drafted men to fill up my old regiments; and if you will fix a day to be in Savannah I will insure our possession of Macon and a point on the river below Augusta."

Gen. Grant thereupon conferred by letter with Gen. Halleck in regard to establishing a base on the coast for Gen. Sherman and providing supplies, giving his own opinion that Savannah could be captured by troops from the east assisted by those in the Department of the South, and that the line of Augusta and Savannah would be a better one than Montgomery, Selma, and Mobile. Grant further said in this letter 4 October: "Whichever way Sherman moves he will undoubtedly encounter Hood's army, and in crossing to the sea-coast will sever the connection between Lee's army and his section of the country."

Gen. Sherman fixes the day after his letter of 20 September as the date when his plan of a march to the sea came first into his mind. It differed from Grant's plan based upon first disposing of Hood's army, in that it involved leaving Hood in his rear, to be taken care of by Thomas, and marching through to Savannah with no enemy in his front. Upon this plan a discussion arose with Grant, who for some time held to the necessity of first dealing with Hood. This discussion between Grant and Sherman lasted for several weeks. While it was in progress Hood became active. On 20 September Forrest's cavalry began vigorous operations about Athens and Decatur, Ala., and Pulaski, Tenn. Sherman at once sent troops to Chattanooga, and 28 September Gen. Thomas was ordered to proceed to Nashville to organize a force to meet a possible northward move of Hood. The first attempt of the latter was to break Sherman's communications by heavy movements upon his railroad. These met with only temporary success, as Sherman promptly pursued. The fighting at Allatoona 5 October was the most prominent affair. Hood then moved to the westward, and occupied Gadsden, Ala. Sherman again followed as far as Gaylesville. Sherman, 10 October, again pro-

posed to Grant to leave Hood and march to the sea. Grant replied the same day. "If you are satisfied the trip to the sea-coast can be made, holding the line of the Tennessee firmly, you may make it, destroying all the railroads south of Dalton or Chattanooga as you think best." This condition of firmly holding the line of the Tennessee held Sherman for a time. Although this conditional permission had been given by Grant, he telegraphed Sherman 1 Nov.: "Do you not think it advisable, now that Hood has gone so far north, to entirely settle with him before starting on your proposed campaign? With Hood's army destroyed you can go where you please with impunity." Sherman learned, 25 October, that Hood's army had appeared about Decatur. This clearly indicated an invasion of Tennessee. Gen. Sherman then decided to strengthen Gen. Thomas, leave him to take care of Hood, withdraw his own army to Atlanta, and prepare for a march to the sea provided Gen. Grant's consent could finally be obtained. He sent the Fourth and the Twenty-third corps back to Thomas. Thus the discussion with Grant over the question of first destroying Hood continued until 1 November, when, in response to a later telegram on that day from Sherman, which represented that Hood's whole force was only from 37,000 to 40,000, while Thomas would have from 63,000 to 70,000, and that he himself had retained only 50,000 men for his proposed campaign to the coast, Gen. Grant telegraphed, "With the force, however, that you have left with Gen. Thomas, he must be able to take care of Hood and destroy him. I really do not see than you can withdraw from where you are, without giving up all that we have gained in territory. I say then go on as you propose."

Having obtained this permission Sherman pushed his preparations with the greatest energy. The entire population of Atlanta had already been deported; the various divisions of the army designed for the march were ordered to concentrate at Atlanta; all mills and factories at Rome were burned; the surplus stores, the sick, convalescent, and many thousands whose terms of service were about to expire were rushed to Chattanooga; the garrisons south of that place were withdrawn, and the railroad destroyed. Every command was carefully inspected, and soldiers found in any degree physically unsound were despatched to Nashville. Care was taken that every man's accoutrements were complete. In the same way the horses, mules, and trains were inspected. Wilson's cavalry was dismounted to make Kilpatrick's division perfect, and the remnants sent with Wilson to Nashville.

The march to the sea began on the morning of 15 November. As Gen. Sherman wrote: "It surely was a strange event—two armies marching in opposite directions, each in the full belief that it was achieving a final and conclusive result in a great war;"—Hood's army, which had required the active work of three armies from May until September to push it back to Atlanta, had crossed the Tennessee at Decatur, strengthened by Forrest's cavalry and aiming for Nashville and the Ohio River. The situation at Nashville was thus described by Sherman: "General Thomas was at Nashville, with Wilson's dismounted cavalry and a mass of new troops and quartermaster's employees amply

MARCH TO THE SEA

sufficient to defend the place. The Fourth and Twenty-third corps, under Generals Stanley and Schofield, were posted at Pulaski, Tennessee, and the cavalry of Hatch, Croxton, and Capron, were about Florence, watching Hood. Smith's (A. J.) two divisions of the Sixteenth corps were still in Missouri, but were reported as ready to embark at Lexington for the Cumberland River and Nashville. Of course, General Thomas saw that on him would likely fall the real blow, and was naturally anxious."

Sherman started with 62,204 officers and men. Of his army he wrote: "The most extraordinary efforts had been made to purge this army of non-combatants and of sick men, for we knew well that there was to be no place of safety save with the army itself; our wagons were loaded with ammunition, provisions, and forage, and we could ill afford to haul even sick men in the ambulances, so that all on this exhibit may be assumed to have been able-bodied, experienced soldiers, well armed, well equipped and provided, as far as human foresight could, with all the essentials of life, strength, and vigorous action."

The artillery, wagon, and ambulance trains were perfect. Each gun, caisson, and forge was drawn by eight horses. There were 2,500 wagons with six mules to each, and the ambulances each had two horses. Each soldier carried 40 rounds, and in the ammunition wagons were 200 rounds for men and artillery.

The right wing, Gen. O. O. Howard, was composed of the Fifteenth and Seventeenth corps; the left wing, Gen. H. W. Slocum, of the Fourteenth and the Twentieth.

The war had not produced a more thoroughly organized and equipped army, or one in which more men had passed a thorough physical inspection. As it started for the sea, Gen. Sherman in his 'Memoirs' thus describes the feelings of the men, and his own: "There was a devil-may-care feeling pervading officers and men, that made me feel the full load of responsibility, for success would be accepted as a matter of course, whereas, should we fail, this 'march' would be adjudged the wild adventure of a crazy fool." This question was to be decided at Nashville, as Gen. Sherman wrote the day after he entered Savannah: "Thomas' complete success is necessary to vindicate my plans for this campaign—" The march to the sea cannot, therefore, be fully understood without considering the Nashville campaign as one of its essential parts. See NASHVILLE, CAMPAIGN AND BATTLE OF.

Sherman's army was composed of 55,329 infantry, 5,063 cavalry, and 1,812 artillery. There were two corps, 13 infantry divisions, one cavalry division, 36 brigades of infantry, two of cavalry, and 16 batteries. There was no Confederate army between Atlanta and Savannah. Wheeler's cavalry was active on the flanks guarded by Kilpatrick's cavalry, and a considerable force of militia was encountered at Griswoldville.

The order for this historic march clearly presents its organization, its order of daily movement, its methods of living upon the country, the restrictions placed on its dealings with citizens, in short, the whole military machinery of the campaign. It therefore deserves a place in every history of the March to the Sea, Gen. Sherman himself holding that no account of

that event could be perfect without it. It was as follows:

(Special Field Orders, No. 120.)

Headquarters Military Division of the Mississippi, In the Field, Kingston, Georgia, November 9, 1864.

1. For the purpose of military operations, this army is divided into two wings, viz.:

The right wing, Major-General O. O. Howard commanding, composed of the Fifteenth and Seventeenth corps; the left wing, Major-General H. W. Slocum commanding, composed of the Fourteenth and Twentieth corps.

2. The habitual order of march will be, wherever practicable, by four roads, as nearly parallel as possible, and converging at points hereafter to be indicated in orders. The cavalry, Brigadier-General Kilpatrick commanding, will receive special orders from the commander-in-chief.

3. There will be no general train of supplies, but each corps will have its ammunition-train and provision-train, distributed habitually as follows: Behind each regiment should follow one wagon and one ambulance; behind each brigade should follow a due proportion of ammunition-wagons, provision-wagons, and ambulances. In case of danger, each corps commander should change this order of march, by having his advance and rear brigades unencumbered by wheels. The separate columns will start habitually at 7 A.M., and make about fifteen miles per day, unless otherwise fixed in orders.

4. The army will forage liberally on the country during the march. To this end, each brigade commander will organize a good and sufficient foraging party, under the command of one or more discreet officers, who will gather, near the route traveled, corn or forage of any kind, meat of any kind, vegetables, corn-meal, or whatever is needed by the command, aiming at all times to keep in the wagons at least ten days' provisions for his command, and three days' forage. Soldiers must not enter the dwellings of the inhabitants, or commit any trespass; but, during a halt or camp, they may be permitted to gather turnips, potatoes, and other vegetables, and to drive in stock in sight of their camp. To regular foraging-parties must be entrusted the gathering of provisions and forage, at any distance from the road traveled.

5. To corps commanders alone is entrusted the power to destroy mills, houses, cotton-gins, etc.; and for them this general principle is laid down: In districts and neighborhoods where the army is unmolested, no destruction of such property should be permitted; but should guerillas or bushwhackers molest our march, or should the inhabitants burn bridges, obstruct roads, or otherwise manifest local hostility, then army commanders should order and enforce a devastation more or less relentless, according to the measure of such hostility.

6. As for horses, mules, wagons, etc., belonging to the inhabitants, the cavalry and artillery may appropriate freely and without limit; discriminating, however, between the rich, who are usually hostile, and the poor and industrious, usually neutral or friendly. Foraging parties may also take mules or horses, to replace the jaded animals of their trains, or to serve as pack-mules for the regiments or brigades. In all foraging of whatever kind, the parties engaged will refrain from abusive or

MARCHAND

threatening language, and may, where the officer in command thinks proper, give written certificates of the facts, but no receipts; and they will endeavor to leave with each family a reasonable portion for their maintenance.

7. Negroes who are able-bodied and can be of service to the several columns may be taken along; but each army commander will bear in mind that the question of supplies is a very important one, and that his first duty is to see to those who bear arms.

8. The organization, at once, of a good pioneer battalion for each army corps, composed if possible of negroes, should be attended to. This battalion should follow the advance-guard, repair roads and double them if possible, so that the columns will not be delayed after reaching bad places. Also, army commanders should practise the habit of giving the artillery and wagons the road, marching their troops on one side, and instruct their troops to assist wagons at steep hills or bad crossings of streams.

9. Captain O. M. Poe, chief-engineer, will assign to each wing of the army a pontoon-train, fully equipped and organized; and the commanders thereof will see to their being properly protected at all times.

By order of Major-General W. T. Sherman,
L. M. Dayton, Aide-de-Camp.

Leaving Atlanta in ruins, 15 November, the left wing, which Gen. Sherman accompanied, marched by Decatur, Stone Mountain, and Covington. At this point it turned toward Milledgeville, the capital of Georgia, which was the first objective. It was reached on the 22d. Meantime the right wing had marched by Jonesboro, McDonough, and Monticello, and was in communication with Sherman at Gordon. Kilpatrick's cavalry, which was operating on the right of the advance, kept in contact with Wheeler's cavalry, and reached the defenses of Macon, thence retiring to Griswoldville, where Walcutt's brigade of Wood's division was halted as a rear-guard. Gen. G. W. Smith attacked Walcutt, but was repulsed (see GRISWOLDVILLE, BATTLE OF). Gov. Brown, the State officers, and members of the legislature left the capital on Sherman's approach. The arsenal and various public buildings were destroyed.

The march was resumed 24 November, with Millen as the next objective. The two wings followed the general line of the railroad. Millen was reached 3 December. From Millen the army proceeded by the four main roads for Savannah. The effort of the Confederate authorities to organize a force at Augusta to attack Sherman in flank failed, and the march to Savannah was only slightly disturbed by the persistent skirmishing of Wheeler's cavalry. McLaw's division of Hardee's force had advanced to Ogeechee Church, but fell back to the city upon Sherman's approach. The several corps reached the defenses of Savannah 9 and 10 December, and occupied a line from the Ogeechee River on the right to the Savannah River on the left. Hardee occupied the city with something less than 10,000 men. Sherman's effective force numbered a little over 60,000. Hood held the Savannah River below Sherman's lines.

The march had cut a swath of many miles in width through the richest part of Georgia. The heads of the columns and the flanks swarmed with foraging parties, and a country

which was daily scoured to supply food for a marching column of 60,000 soldiers was of necessity stripped of provisions, and of everything else that could contribute to the use or comfort of an army. Railroads had been destroyed for long distances, and all factories and other buildings burned which could contribute to army purposes. There had been no fighting worth mentioning, Griswoldville excepted, and that had only involved one Union brigade.

Gen. Sherman had left Atlanta with 62,204 officers and men of all arms. He reached Savannah with 60,057. On the march 103 were killed, 428 wounded, 278 missing, and 1,338 captured. Of those captured, a large proportion were foragers, better known in army vernacular as "bummers."

The night of 12 December a bridge had been completed over the Ogeechee, and the next morning Hazen's division crossed and marched at once to assault Fort McAllister (q.v.) and open the way to the sea. An hour before sunset the assault was delivered and the fort taken.

This success gave Sherman communication with the fleet which was awaiting him with supplies, and mails for the army.

Gen. Slocum, upon establishing his flank on the Savannah River, had captured two steamboats and sent a force to Hutchinson and Argyle Islands just above the city, and sought permission to transfer a corps to the left bank of the river to close Hardee's only line of escape, Gen. Slocum having already sent a brigade under Col. E. A. Carman to the South Carolina shore. Gen. Sherman did not deem this prudent, and as a result Hardee later withdrew his entire force intact and without molestation.

On 17 December Gen. Sherman sent in a flag of truce demanding Hardee's surrender on the ground that he (Sherman) had received guns that could "cast heavy and destructive shot as far as the heart of the city"; that he controlled all avenues by which the city could be supplied with food; that he would grant liberal terms, but if forced to assault he should "feel justified in resorting to the harshest measures," and should make little effort to restrain his army.

Gen. Hardee returned a defiant reply, saying he was not shut in, but had free and constant communication with his department. To the specific call for surrender he replied: "Your demand for the surrender of Savannah and its dependent forts is refused."

Gen. Sherman then proceeded by boat to Gen. Foster's headquarters at Hilton Head to request that a division be sent to occupy the road north of the Savannah River, which line of communication was still open to Hardee. On his return he received the news that during his absence Hardee had put down his bridges and withdrawn with his entire force. The next day Gen. Sherman's forces occupied Savannah.

Marchand, mār-shān, **Félix Gabriel**, Canadian legislator and author: b. St. John's, P. Q., 9 Jan. 1832. He was educated at St. Hyacinth College, was admitted a notary public in 1855, entered practice at St. John's, and from 1867

sat for the county of St. John's in the legislative assembly of the province of Quebec. From 8 March 1878 to 19 March 1879 he was provincial secretary, from 19 March to 30 Oct. 1879 was commissioner of crown-lands, and from 29 Jan. 1887 to 1892 speaker of the assembly. In 1897 he became premier, with the treasury portfolio. Subsequent to the invasion at Eccles Hill during the Fenian troubles (1870), he commanded a militia brigade. He did much to improve Canadian journalism, and for many years was proprietor and editor of *Le Franco-Canadien*. He published a 'Manuel et Formulaire du Notariat'; and also the comedies 'Fatenville' and 'Erreur n'est pas Compte' in prose, and 'Un Bonheur en Attire un Autre' and 'Les Faux Brillants' in verse.

Marchand, Jean Baptiste Thomas, zhôn bā-těst tō-mā, French officer and explorer: b. Thoissey 22 Nov. 1863. He attended the military school at St. Maixent, entered the marine service in 1883, was sent to Senegambia in 1889, and in 1890 explored the sources of the Niger. In 1898 he occupied Fashoda, having established a line of posts between French possessions in West Africa and on the eastern coast, but on the demand of England he was forced to withdraw. He took part in the expedition against China in 1900. Consult: Castellani, 'M. l'Africain' (1902); Poirier, 'De l'Oubanghi à Fachoda' (1900).

Marches, The, Italy, a territory now included in the kingdom, but formerly constituting one of the legations of the Papal States. It comprises the region lying between the Apennines and the Adriatic, and is divided into the modern four provinces—Urbino and Pesaro, Ancona, Macerata, and Ascoli Piceno. See ITALY.

Marchesi, mār-kā'sē, Mathilde, German singer: b. Frankfurt-on-Main, 26 March 1826. Her maiden name was Graumann; she studied under Nicolai in Vienna, and in Paris under Garcia, whose assistant she became. A splendid mezzo soprano she toured Europe for several years, married Salvatore Marchesi, a baritone, in 1852, and in 1854 became professor at the Vienna Conservatory. After three years at Cologne in a like position she removed to Paris in 1868. She was a teacher of rare merit, and author of a method of singing, of two volumes of personal recollections in German (1877; 1888), and of 'Marchesi and Music' (1897).

Marchiali, mār-kē-ā'le, or Marchialy. See IRON MASK, MAN WITH THE.

Marching Through Georgia, a popular ballad sung during the American Civil War, and commemorating Sherman's March to the Sea. It was written by H. C. Work (q.v.) 16 Nov. 1864.

Marcion, mār'shī-on, founder of a Gnostic sect, called Marcionites: b. Sinope about the beginning of the 2d century, A.D.; d. about 160. He was a son of the bishop of Sinope, who had become a bishop in his later years, but so much error was mixed with his religious opinions that he was excommunicated by his father. Expecting that his views would meet with a better reception at Rome he set out for that city, but was there a second time excommunicated, 140. He attached himself while there to the Gnostic teacher Cerdo of Antioch, and

founded a system antagonistic in many respects to Christianity. Its principal feature was the irreconcilable opposition which it supposed to exist between the Creator and the Christian God, and between the religious systems, the law and the gospel, which it believed they respectively founded. The sect held the existence of three original principles—the supreme and invisible, whom Marcion called the Good; the visible God, the Creator; and the devil, or perhaps matter, the source of evil. Marcion could not perceive in nature, or in the Old Testament, the same love which was in the gospel of Christ. He accordingly made the Creator, the God of the Old Testament, the author of suffering. Jesus was not the Messiah promised by this being, but the son of the unseen God, who took the form, but not the substance of man. Marcion denied the resurrection of the body; he condemned marriage, thinking it wrong to increase a race born in subjection to the harsh rule of the Creator. He rejected the whole of the Old Testament, and of the New all except a few epistles and a mutilation of the Gospel of Luke. Consult: Tertullian, 'Contra Marcionem'; Harnack, 'History of Dogma.'

Marco Polo. See POLO, MARCO.

Marcomanni, mār-kō-mān'nī ('men of the marches,' "borderers"), ancient German tribe, belonging to the confederation of the Suevi. About 10 B.C., under their King Marbod or Maroboduus, they retired from their territory between the Elbe and the Oder before the advance of the Romans, settled in Bohemia, and there built up a powerful state, with which Tiberius made a treaty 6 A.D. Thirteen years later Maroboduus was defeated by Hermann, or Arminius, leader of the Cherusci, who also drove from power Catualda, Marbod's successor. About the middle of the 2d century the Marcomanni, with other Teutonic tribes, attempted to make inroads into Pannonia; they were defeated by Marcus Aurelius in 178; Commodus made peace with them in 180; they furnished Roman troops and were heavily subsidized till the time of Aurelian, when in 270 they were again rebellious and again driven across the Danube. In the 4th century the Marcomanni drop out of history.

Marconi, Guglielmo, gool-ē-ē'l'mō mār-kō'nē, Italian inventor and electrical engineer: b. Marzabotto, near Bologna, Italy, 23 Sept. 1875. He was educated at the universities of Bologna and Padua, and so early as 1896 undertook experiments in demonstration of his theory that the electric current readily passes through any substance, and when started in a given direction follows a direct course without the assistance of any sort of conductor. He finally invented an apparatus for wireless telegraphy, which was successfully tested in England and Italy by Sir William Henry Preece, engineer and electrician-in-chief of the English postal-telegraph service. Marconi was the first to perfect the appliances used in space telegraphy, and the first to patent the application of the electric waves discovered by Heinrich Hertz to the purposes of actual telegraphy as distinguished from mere signaling. This remains true in spite of all the discussion respecting the originality of Marconi's work. It was he who combined the important elements of the wire-

MARCOU — MARCY

less telegraph that had previously been invented, and to him the scientific triumph of space telegraphy is due. He came to the United States in 1899, there continued his experiments, and in 1900 employed his method in reporting the presidential election of that year. He had already (27 March 1899) sent messages across the English Channel from the vicinity of Boulogne, France, to the South Foreland, England, 32 miles distant. In December 1901 he began his first experiments in transatlantic telegraphy without wires at Signal Hill, at the entrance to the harbor of St. John's, N. F. When his success became apparent through his receiving and plainly distinguishing signals from the Poldhu Station, England, the Anglo-American Cable Company, which holds a monopoly from Newfoundland, compelled him to withdraw, and he selected another station at Table Head, on the east of Glace Bay, Cape Breton Island. On 25-6 Feb. 1902, Marconi, on his way to the United States on board the steamship Philadelphia, received signals at a distance of 2,099 miles and worded messages at a distance of 1,551.5 miles. On 21 Dec. 1902 the first official transatlantic telegrams were sent from Table Head. Marconi later (18 Jan. 1903) sent from the South Wellfleet station, Cape Cod, Mass., direct to Poldhu (3,000 miles), a message from President Roosevelt to King Edward. The Italian government introduced the Marconi system on its warships, and granted an annual subsidy of \$200,000. The English government pays royalty for the use of the system on its ships. Thus far (1903), the United States is not committed to the Marconi system, but is impartially testing that and other methods. See WIRELESS TELEGRAPHY.

Marcou, mār-koo', **Jules**, American geologist: b. Salins, France, 20 April 1824; d. Cambridge, Mass., 17 April 1898. He studied at Besançon and the Collège de St. Louis in Paris; devoted himself to geology after several journeys through Switzerland, in which he made the acquaintance of Jules Thurmann, to whom he owed an introduction to Louis Agassiz. In 1846, after taking part in the geological survey of the Jura Mountains he was appointed assistant mineralogist in the Sorbonne; in 1848 having been appointed traveling geologist to the Jardin des Plantes came to America, explored the Lake Superior country together with Agassiz and made wide and important geological studies in Virginia, Pennsylvania and New Jersey, and after several trips back to Europe settled in Cambridge, where he assisted Agassiz in the Museum of Comparative Zoology. From 1853 to 1855 he was in government employ, and from 1875 till shortly before his death was again in the service. Marcou made a section map of the 35th parallel from the Mississippi to the Pacific, and published: 'Geological Map of the United States and British Provinces of North America' (1853); 'A Catalogue of Geological Maps of America' (1884); 'Geology of North America' (1858); 'Life, Letters, and Works of Louis Agassiz' (1896).

Marcus Aurelius, mār'kūs â-rē'li-ūs. See AURELIUS ANTONINUS, MARCUS.

Marcus Græcus, grē'kūs, pyrotechnist and alchemist, with regard to whose life nothing is known. He must have lived not later than the 11th century, since he is cited by an Arabian

physician of that date. In the National Library at Paris are two manuscript copies of a small treatise, entitled 'Liber Ignium ad Comburendos Hostes, Auctore Marco Græco,' one of which appears to belong to the 14th and the other to the 15th century. The work contains an account of an explosive substance the ingredients of which are the same as those used in making gunpowder, though differently proportioned. It may have been that Schwartz, the reputed inventor of gunpowder, did nothing more than experiment on the receipts of Marcus Græcus. The treatise also contains the first account that has come down to us of the method of making Greek fire.

Marcy, **Randolph Barnes**, American general: b. Greenwich, Mass., 9 April 1812; d. Orange 22 Nov. 1887. He was educated at West Point in 1832; and served in the Black Hawk War. During the Mexican War he was active at Palo Alto and Resaca de la Palma; and was made inspector-general, U. S. A., with the rank of colonel, in August 1861, serving as chief of staff to his son-in-law, General George B. McClellan throughout the Civil War. He was appointed brigadier-general of volunteers, 23 Sept. 1861, was inspector-general, U. S. A., with rank of brigadier-general from December 1878. He was retired in the year last named. He published: 'Exploration of the Red River in 1852' (1853); 'The Prairie Traveler, a Handbook for Overland Emigrants' (1859); 'Thirty Years of Army Life on the Border' (1866); 'Border Reminiscences' (1871).

Marcy, **William Learned**, American statesman: b. Southbridge, Mass., 12 Dec. 1786; d. Ballston Spa, N. Y., 4 July 1857. He studied at Leicester Academy, in Massachusetts, and was graduated at Brown University in 1808. At Troy, N. Y., he studied law and was admitted to the bar. When the War of 1812 broke out he volunteered as a lieutenant, was sent at once into active service, and 22 Oct. 1812 led an attack resulting in the capture of a Canadian post at Saint Regis. He was soon promoted to be captain, and served almost to the end of the war. Returning to Troy, he engaged in newspaper work and in politics, opposed Clinton and became prominent in the Albany Regency (q.v.). He had already held several offices when, in 1823, he was elected comptroller of the State. This position he filled six years, and in 1829 was appointed associate justice of the New York supreme court. The Democrats in 1831 elected him to the United States Senate, but the next year he was chosen governor of New York and resigned his senatorship. While in the Senate he was chairman of the Judiciary Committee, and in debate with Clay made a memorable defense of Martin Van Buren. It was during a speech in the Senate vindicating the course of the President in giving offices to his political supporters that Marcy uttered the words associated with the beginning of the spoils system (q.v.): "We can see nothing wrong in the maxim that to the victors belong the spoils." Having served three terms as governor, he was once more nominated, in 1838, but was defeated by W. H. Seward (q.v.). In the following year Marcy was appointed by President Van Buren a commissioner on Mexican claims, serving till 1842. In 1845 he became secretary of war under Polk, and in that office bore arduous

GUGLIELMO MARCONI

MARCY — MAREOTIS

responsibilities created by the Mexican War. He also used his official influence in the settlement of the momentous Oregon boundary question. In 1848 he supported Cass as presidential candidate, and when Taylor was inaugurated Marcy retired to private life. But during the administration of Pierce he served from 1853 to 1857 as secretary of state, greatly distinguishing himself at home and abroad by his handling of grave matters,—the Mexican boundary dispute, the reciprocity treaty with Canada, the British fishery question, the Koszta affair (see *INGRAHAM, DUNCAN NATHANIEL*), etc. On the inauguration of President Buchanan, in 1857 Marcy finally retired from office, dying four months afterward. Among statesmen of administrative ability and thorough training, both for domestic and foreign affairs, he holds a high and permanent place.

Marcy, Mount, N. Y., the highest peak of the Adirondack Mountains, in the northeastern part of the State, in Essex County; about 28 miles west of Lake Champlain. The altitude is 5,344 feet. Lake Tear of the Clouds, 4,327 feet above sea-level, usually considered the main source of the Hudson River, is just southwest of Mount Marcy. The Indian name for this peak was "Tahawas," meaning the "cloud-divider."

Marden, Orison Swett, American editor and author: b. Thornton, N. H. He was graduated at the Boston University in 1877; at the School of Oratory there in 1879; at the Law School of the same institution in 1881; and in 1882 at the Harvard Medical School. He is founder and editor of 'Success,' and vice-president of the Success Company, and is the author of many works, among which are: 'Pushing to the Front' (1894); 'How to Succeed' (1896); 'The Secret of Achievement' (1898); 'Character the Grandest Thing in the World' (1899); 'The Hour of Opportunity' (1900); 'Talks with Great Workers' (1901); and 'Stepping Stones' (1902).

Mardi Gras, mār'dē grā, Shrove Tuesday, the last day before Lent. (See *CARNIVAL*.) In the United States the day is observed in New Orleans and Memphis with processions, masquerade balls, and other gay entertainments.

Mardonius, mār-dō'nī-ūs, Persian general, was the son of the Satrap Gobryas, and son-in-law of Darius Hystaspes. He commanded the first Persian armament sent against Greece, 492 B.C., when a storm at Mount Athos destroyed his fleet, and his army was beaten in Macedonia. He accompanied Xerxes in his invasion of Greece, of which he had been the chief promoter; and after the battle of Salamis, and the return of Xerxes to Asia, Mardonius was left in occupation at Athens, which he held for 10 months. According to Herodotus he was defeated by Pausanias, and probably killed at the battle of Plataea, 479 B.C.

Mare Clausum, mār-rē klā'sūm, a Latin phrase meaning closed sea, or that portion of the sea under the jurisdiction of a particular nation or government, as distinguished from the high sea. See *INTERNATIONAL LAW*.

Mare Island, Cal., in San Pablo Bay, and a part of Solano County; 28 miles north of San Francisco, and opposite the city of Vallejo. A United States naval station, one of the largest in the country, is on this island. It has wet

and dry docks, ordnance yards, marine barracks, a hospital, an observatory, repair shops, and at the southern extremity of the island, a lighthouse.

Maree, Loch, lōi mā-rē', Scotland, a lake in the west of Ross-shire, forming a long and comparatively narrow expanse, stretching southeast to northwest for 12½ miles with an average breadth not exceeding 1½ miles. Its depth in most places is 60 fathoms; it has never been known to freeze. The scenery along its shores is bold and picturesque, and its surface is studded with 24 wooded islands, on one of which are found the remains of an ancient chapel, with a graveyard. The loch discharges itself into Loch Ewe by a small river of the same name.

Marcia, mā-rā'a, Lake. See *MAREOTIS, LAKE*.

Maremma, mā-rēm'mā, Italy, low swampy tracts extending along the west coast of Tuscany from the mouth of the Cecina to Orbetello; length, 92 miles; breadth, from 6 to 20 miles; area, about 1,000 square miles. Formerly these regions were fruitful, healthful, and populous; but after the 15th century the neglect of the water-courses of the district allowed the formation of marshes, and now they generate tertiary fevers, and present an aspect of dreary desolation during the summer months, when the inhabitants flee from the pestilential exhalations of the soil. In winter, on the other hand, the Maremma are inhabitable, and afford a luxuriant pasturage for cattle, which graze in summer on the Apennines. The district is gradually being reclaimed and improved.

Marengo, mā-rēng'gō, Italy, a northern village, near the Bormida, three miles southeast of Alessandria. Its name is connected with the defeat of the Austrians by Napoleon 14 June 1800. The Austrians under Melas were at first successful, but French reinforcements arriving, the cavalry charge of the younger Kellermann turned what looked like certain defeat into a decisive victory. The forces engaged were 33,000 French, and 30,500 Austrians; the French lost in killed and wounded 7,000, the Austrians 6,400, while 3,000 were made prisoners.

Maren'jo, Iowa, city, county-seat of Iowa County; on the Iowa River, and on the Chicago, Rock Island & Pacific railroad; about 85 miles east by north of Des Moines. It is in a fertile agricultural and stock-raising locality. The chief manufactures are dairy products, agricultural implements, and flour. It is the trade centre for a large part of Iowa County. Pop. (1900) 2,007.

Mareotis, mā-rē-ō'tis, or **Mariut**, mā-rē-oot', Egypt, a lake separated from the Mediterranean on the west by the long narrow belt on which Alexandria stands, and communicating on the north with Lake Madieh. In the southwest it terminates in a long narrow creek; the main expanse is about 28 miles long by 20 broad. It was at one time deep enough for inland navigation, and had its shores covered with beautiful gardens and vineyards; but having been cut off from the Nile, which supplied its water, it became dry and its area was cultivated. During the siege of Alexandria in 1801 the British let the sea into it, and it now yields much salt by evaporation.

MARE'S TAIL — MARGARET OF NAVARRE

Mare's Tail, a genus (*Hippuris*), of plants with whorled narrow leaves and small inconspicuous flowers set in their axils. They are aquatic or marsh plants. *H. vulgaris* is very common in Europe and has become naturalized in the interior of the United States.

Maretszel, mǎ-rě tsěk, **Max**, American musician: b. Brunn, Austria, 28 Jan. 1821; d. Pleasant Plains, Staten Island, 14 May 1887. He was educated at the University of Vienna, but desirous of a wider field went to London and was connected for a time with its Italian Opera as chorus-master, writing in addition some music. In 1848 he came to New York, where he was appointed leader of the orchestra at the Italian Opera and subsequently at the Astor Place Theatre and the Grand Opera House. He wrote the operas of 'Hamlet,' 'Sleepy Hollow,' and 'Crotchets and Quavers' (1858). Under his management many notable operas and artists, among the latter Adelina Patti and Pauline Lucca, were presented to American audiences.

Marforio, mǎr-fō-rī-ō, the popular name of a colossal statue representing the river Rhine, or Danube, or river God, standing in the court of a wing of the Capitol at Rome. The name Marforio is a corruption of *Martis forum* (the forum of Mars), in the entrance of which the statue originally stood.

Margaret, Saint, queen of Scotland, elder sister of Edgar Ætheling, and granddaughter of Edmund Ironside: b. Hungary about 1045; d. Edinburgh 16 Nov. 1093. Shortly after William the Conqueror had established himself on the English throne she and her brother Edgar went to Scotland and placed themselves under the protection of Malcolm Canmore, the Scottish king, who in 1070 became her husband. She was characterized by great devotion to the church, and it was largely through her influence with the king that the Scottish Church was brought into conformity with those of England and the Continent. She is said, moreover, to have elevated the manners of the Scottish court, and introduced great improvements in needlework, embroidery, and other similar arts. In her personal life, and the great care with which she educated her children, she set a noble example to the people of the somewhat rude and uncultured kingdom. In 1250 she was canonized. Her daughter Matilda married the English king, Henry I., and thus the old Anglo-Saxon line became united with that of the usurping Normans. There is an ancient life of Saint Margaret, written in Latin, it is commonly believed by her confessor Turgot, bishop of St. Andrews. The Bodleian library at Oxford contains a copy of the Gospels which once belonged to her.

Margaret, queen of Denmark, Norway, and Sweden, daughter of Waldemar III., king of Denmark: b. Copenhagen 1353; d. 28 Oct. 1412. She was married to Hakon, king of Norway, in 1363, and the death of her husband in 1380 placed Norway in her hands; that of her son Olaf in 1387 enabled her to secure the throne of Denmark, to which she had previously brought about his election; and after defeating Albert, the Swedish king, she also obtained possession of the throne of Sweden. She endeavored to place the union of the three kingdoms on a permanent basis by the celebrated Act of Union, or Treaty of Calmar (1397). She

died after having raised herself to a degree of power then unequaled in Europe from the time of Charlemagne. She is sometimes styled "The Semiramis of the North."

Margaret of Anjou, ǎn-joo or ǎn-zhoo, queen consort of Henry VI. of England: b. probably at Pont-à-Mousson, Lorraine, 23 March 1430; d. near Saumur in Anjou, 15 Aug. 1482. She was the daughter of René the Good, of Anjou, titular king of Naples, and was married to Henry in 1445. The imbecility of the king made her practically regent, and her power being contested by the Duke of York, a claimant of the throne by an older line, the protracted Wars of the Roses began. At first victorious, she was afterward compelled to flee to Scotland, but raising an army in the north, she secured, by the battles of Wakefield (1460) and Saint Albans (1461), the death of York, and the release of the king. Her army, however, was soon afterward annihilated at Towton (1461), and Edward (IV.), the son of the late Duke of York, was declared king. She succeeded in obtaining assistance from Louis XI. of France, but was once more defeated, and took refuge in that country. Warwick then became embroiled with the young king, and determined to replace Henry on the throne. Edward was in turn obliged to escape to the Continent, but obtaining assistance from the Duke of Burgundy, returned and defeated Warwick at Barnet (1471). Margaret, collecting her partisans, fought the battle of Tewkesbury (1471), and was totally defeated. She and her son were made prisoners, and the latter, when led into the presence of the royal victor, was killed. Henry soon after died or was murdered in the Tower, and Margaret remained in prison four years. Louis XI. ransomed her for 50,000 crowns. See HENRY VI.; ROSES, WARS OF THE.

Margaret of Austria, governor-general of the Netherlands, and daughter of Maximilian I. of Austria: b. Brussels 10 Jan. 1480; d. Mechlin 1 Dec. 1530. She was educated at the French court; was betrothed to the Dauphin Charles, who married Anne of Brittany; married John, the Spanish crown-prince, in 1497; and, after his death in the same year, married Philibert of Savoy in 1501, only to be widowed again in 1504. Three years afterward her father made her regent of the Netherlands, where she ruled with much ability although a bitter enemy of the Reformation. She took a prominent part in the peace of Cambrai in 1529, which is called, because negotiated by her and Louise of Savoy, the "Paix des Dames."

Margaret of Flanders, countess of Flanders and Hainault, sometimes called Margaret of Constantinople: b. Valenciennes about 1200; d. Lille 1279. She was a daughter of Baldwin IX. of Flanders and Hainault, who was succeeded by Margaret's older sister, Jeanne. Margaret's husband, Bouchard, was seized and killed by Jeanne, upon whose death Margaret came to the crown in 1244. Her reign was peaceable, save for the quarrels between her children by Bouchard and those by Guillaume of Dampierre.

Margaret of Navarre, nǎ-vār, or of Valois, or of France, French princess, daughter of Henry II.: b. St. Germain-en-Laye, France, 14 May 1553; d. Paris 27 March 1615. She married in 1572 Henry of Navarre, afterward Henry IV. of France. It was entirely a marriage of policy,

MARGARET OF PARMA — MARGAY

and on Henry's accession to the throne, their marriage was dissolved by mutual consent. She resided thereafter in Paris where her house became the rendezvous for the learning and fashion of the time. Some very agreeable poems by her are extant, and her 'Memoirs' (1842) are extremely curious.

Margaret of Parma, regent of the Netherlands, a bastard of Charles V. of Spain by a Flemish woman: b. Oudenarde 1522; d. Ortona 1586. Brought up in Brussels, she was married to Alessandro de' Medici in 1536, and in 1538 to Ottavio Farnese, duke of Parma, to whom she bore the great general Alexander Farnese. In 1559 Philip II. made her staathouder of the Netherlands. There she sided with Granvella, introduced the Inquisition, and provoked the provinces to revolt by her strong, masculine policy. She resigned in 1567 when Alva was sent to the Netherlands.

Margaret Tudor, queen of Scotland, wife of James IV., and daughter of Henry VII. of England: b. Westminster 29 Nov. 1489; d. Methven Castle 18 Oct. 1541. She was married to the king of Scotland when 14; bore him three children, of whom two, James, later fifth king of Scotland of that name and father of Mary Stuart, and Margaret, mother of Lord Darnley, survived her; and after the king's death (1514) married Douglas, Earl of Angus, from whom she was divorced in 1527, to marry soon after Henry Stewart, Lord of Methven. By descent from Margaret Tudor her great-grandson, James VI. of Scotland, was Elizabeth's successor as James I. of England.

Margaret, or Marguerite of Valois, väl-wä, Queen of Navarre: b. Angoulême 11 April 1492; d. Paris 27 March 1549. (Various known as Margaret of Angoulême, of Alençon, and of Navarre.) She was the sister of Francis I. of France, was brought up at the court of Louis XII., married the Duke of Alençon in 1509, became a widow in 1525, and in 1527 married Henry d'Albret, titular king of Navarre. She never reigned over Navarre, but resided at the French court or kept a court of her own at Nérac and Pau. She was acquainted with the principles of the Protestant reformers, and not only afforded protection to reformed divines, but used her influence with her brother Francis to the same purpose, and was a great patroness of men of letters. In 1553 she published a religious poem, 'Le Miroir de l'Ame Pécheresse,' which incurred the censure of the Sorbonne as heretical. In 1547 a collection of her poems and other pieces was printed under the title of 'Marguerites de la Marguerite des Princesses.' The 'Heptaméron, ou sept Journées de la Reine de Navarre,' a famous collection of tales long attributed to her, is at present regarded as of composite authorship. She left one child, Jeanne d'Albret, afterward mother of Henry IV. Her letters have been published in modern times. Consult: Comtesse d'Haussonville, 'Marguerite de Valois' (1870); Lotheissen, 'Königin Margarete von Navarre' (1885); Freer, 'Life of Marguerite d'Angoulême' (1895).

Margaret Sidney. See LOTHROP, HARRIET MULFORD STONE.

Margar'ic Acid, or **Heptadecic Acid**, a name now applied to an acid having the formula

$C_{17}H_{34}O_2$, which is said to occur in adipocere (q.v.), and which may also be prepared by boiling cetyl cyanide in alcoholic potash. It was formerly given to a supposed acid having the same formula, which was believed to occur in connection with the saponification of natural fats; but it has been shown by Heintz that the earlier 'margaric acid' was merely a mixture of palmitic and stearic acids.

Mar'garin, or **Margarine**, a fatty substance, obtained from lard, and from certain vegetable oils. It was formerly believed to be a distinct fat, or compound of glycerin with "margaric acid" (q.v.); but it is now known to be merely a mixture of stearin and palmitin. See OLEO-MARGARINE.

Margarita, mär-gä-rē'tä, Venezuela, an island off the northeast coast, in the Caribbean Sea, about 30 miles north of Cumana. In 1901 it was made a province and is known by the name of Nueva Esparta. Its area is 450 square miles. This island was discovered by Columbus in 1498. The name Margarita, meaning "pearl" was given to it because of the valuable pearl fisheries once found in its surrounding waters.

The surface is broken by two mountain chains, the highest point of one is nearly 4,000 feet. Near the centre is a lagoon, surrounded by low land. Much of the soil is fertile, but the chief industries are fishing, preparing salt for market, and cattle-raising. The capital of the province is Asunción. The inhabitants are nearly all Indians who have long been civilized. Pop. about 40,500.

Margarite, or **Pearl Mica**, a native hydrous silicate of aluminum and calcium, having the formula $H_2CaAl_2Si_2O_{10}$, and usually occurring in laminated forms, like mica. Its crystals, when they occur, belong to the monoclinic system. Margarite is translucent or sub-translucent, with a vitreous or pearly lustre. It occurs in various colors, but predominantly in gray, with perhaps a reddish tint. It has a hardness of from 3.5 to 4.5, and a specific gravity of about 3. Margarite usually occurs in connection with emery or corundum, from which it is often obviously derived.

Margate, mär'gät, England, a seaport and popular summer watering resort of Londoners, in Kent, on the Isle of Thanet, 64 miles by rail east by south of London. The restored parish church of Saint John the Baptist dates from 1050. There is a fine harbor with promenade piers, and the town has bathing establishments, and numerous places of recreation and amusement. Margate is patronized annually by about 200,000 visitors. Pop. (1901) 23,057.

Margate-fish, a handsome, pearly white, brown-striped fish (*Hamulon albus*) of West Indian waters, important as a food-fish, and ordinarily weighing about five pounds. It is caught about rocky reefs, in deep water, where it spawns in summer; and at night it comes in shore to obtain the small animals which swarm in the shallows. It is called jallao by Spanish-speaking fishermen, and market-fish, margaret-grunt, etc., by the English-speaking fishermen of Key West and the Bahamas.

Marg'ay, a South American forest-dwelling wildcat (*Felis tigrina*), which is most variably colored and spotted. It is sometimes domesticated in Brazil.

MARGHERITA — MARIA LESZCZYŃSKA

Margherita, mār-gā-rē'tā, queen dowager of Italy: b. Turin 20 Nov. 1851. She is the daughter of Ferdinand, Duke of Genoa. In 1868 she was married to Humbert, then crown prince of Italy, who ascended the throne of Italy in 1878. In that same year an attempt was made upon the life of the king, and the nervous shock to the queen seriously affected her health for a number of years. Her winning personality and dignified performance of her duty as queen gained her wide popularity in Italy. In 1900 her husband was assassinated and their son, Victor Emmanuel III., succeeded him as king.

Margoliouth, mār-gō'li-oot, **David Samuel**, English Oriental scholar: b. London 17 Oct. 1858. He was educated at Winchester and Oxford and has been professor of Arabic at Oxford from 1889. Among his published works are: 'Analecta Orientalia ad Poeticam Aristotelem' (1888); 'Chrestomathia Baidwiana' (1894); 'Letters of Abul 'Ala' (1898); 'Lines of Defence of the Biblical Revelation' (1900); 'Religions of Bible Lands' (1902).

Margrave (German, *Markgraf*), in mediaeval times in continental Europe, a commander intrusted with the protection of a *mark*, or district on the frontier. As early as the times of Charlemagne marks and margraves appear. The margraves stood immediately under the German kings and emperors. In the 12th century margraviates became hereditary, and at last the margraves acquired the rank of princes of the empire, between counts and dukes.

Marguerite, mār-gē-rēt, a popular name for several flowers of the order *Compositae*. The blue marguerite (*Felicia amellodes*), or blue daisy, is a native of southern Africa, and has long been popular in greenhouses and window gardens because of its simple culture and large solitary flower-heads. The Paris daisy or marguerite (*Chrysanthemum frutescens*), a native of the Canary Islands, was introduced into cultivation in Great Britain about the close of the 18th century and has continued a popular florist's flower ever since. It is the one usually obtainable throughout the year in the stores, but especially during the winter. Because of a close resemblance, the name is applied to its near relative, the ox-eye daisy (*C. leucanthemum*), which is common in mismanaged pastures and fields especially in the New England and adjacent States. The Reine marguerite (*Callistephus hortensis*), is better known in America as China aster (see *ASTER*) and is one of the most popular out-of-door annuals of the garden, being easily grown from seed and readily adaptable to any garden soil. The English daisy (*Bellis perennis*) is also called marguerite, but less frequently. See *DAISY*.

Maria Christina, ma-rē'ā krīs-tē'nā, queen of Spain: b. Naples 27 April 1806; d. Havre, France, 22 Aug. 1878. She was a daughter of Francis I., king of the Two Sicilies and was married to Ferdinand VII. of Spain in 1829. Upon Ferdinand's death in 1833, Maria Christina by her husband's will became regent until her daughter, Queen Isabella, should become 18. A civil war which was waged until 1840 ensued, its purpose being to place Don Carlos on the throne, and its outcome was for a long period doubtful, but the queen-regent appeared to care only for her chamberlain, Don Fernando Muñoz, with whom she secretly contracted amorganatic

marriage. Her policy as regent was entirely subject to the will of the minister of the day which naturally resulted in a reign alternately liberal and despotic. When she affixed her signature to the law concerning the Ayuntamientos the public protested so strongly that she was obliged to resign the regency to the prime-minister Espartero in 1840. In 1843, after the fall of Espartero, she returned to Madrid and in 1844 publicly married Muñoz, who was made Duke of Rianzares. A revolution in 1854 compelled her to flee the country and her return to Spain in 1864 was followed by the revolution which dethroned Queen Isabella in 1868 and she was again exiled and though allowed to return to Madrid after the accession of Alfonso XII., she died in exile.

Maria Christina, queen of Spain: b. Austria 21 July 1858. She was an Austrian archduchess, daughter of Archduke Karl Ferdinand of Austria and was married by proxy to Alfonso XII. of Spain in 1879. At the death of Alfonso XII. in 1885, she was appointed queen-regent during the minority of her daughter Queen Mercedes, who was succeeded six months later by Alfonso XIII., a posthumous son. The queen-regent faced a difficult problem; she was a foreigner, the people were unsympathetic, and the political and financial condition of the country was in a precarious state. She formed a new cabinet with Sagasta, the Liberal leader at its head, and soon won the hearts of her people by her wise and able rule. Throughout the time of her regency she commanded the respect and admiration of the world as well as her own country for her clear far-sighted administration of the affairs of state and her careful training of the young king whom she endeavored to inspire with her own high sense of the responsibilities of his position. Even the disastrous outcome of the Spanish-American war failed to unsettle the stability of her government which on 17 May 1902 she surrendered into the hands of her son, Alfonso XIII.

Maria II. da Gloria, dā glō'rē-ā, queen of Portugal: b. Rio de Janeiro, 4 April 1819; d. Lisbon 15 Nov. 1853. She was a daughter of Dom Pedro I. of Brazil and on the death of her grandfather, John VI. of Portugal in 1826, her father ceded to her the succession to the throne. Her uncle, Dom Miguel, to whom she was betrothed was appointed regent, but in 1828 upon the sailing of the young queen for Spain he usurped the throne and barred the landing of the queen. In 1832-3 Dom Pedro instigated a civil war against his brother and through the intervention of England and France, Maria was placed on the throne in 1834. She married Duke Ferdinand of Saxe-Coburg and though retaining her throne had a troubled and rather unsuccessful reign. Upon her death her son Pedro V. ascended the throne.

Maria Leszczyńska, lēs-chīn'skā, queen of France: b. Breslau 23 June 1703; d. Versailles 24 June 1768. She was a daughter of Stanislas Leszczyńska, king of Poland, and shared the obscurity which followed upon his exile. Her marriage to Louis XV. in 1725 was arranged by the regent Duc de Bourbon and the minister Fleury and was regarded as an intrigue to further their interests since it antagonized Spain by sending back the young infanta with whom an alliance had been projected. The queen after

MARIA LOUISA—MARIANA

a brief period in which she tried to control state matters lived very quietly and was noted for her charities. Consult: d'Armaillé, 'La Reine Marie Leszczyńska' (1870); Des Reaux, 'Le Roi Stanislas et Marie Leszczyńska.'

Maria Louisa, loo-ě-zā, second wife of Napoleon I.: b. 12 Dec. 1791; d. Vienna 17 Dec. 1847. She was the eldest daughter of the Emperor Francis I. of Austria and Maria Theresa, daughter of Ferdinand, king of Naples. Her marriage with Napoleon in 1810, after his divorce from Joséphine, seemed to promise permanency to his dynasty and peace to the Continent, and her progress toward Paris through the different provinces of the kingdom formed a kind of triumph. In 1811 she bore him a son, to whom was given the title of King of Rome. In 1813, during Napoleon's absence at the war, he named her regent of the kingdom. After his overthrow she returned to Vienna, and remained there during the Hundred Days. In 1816 she received, with the title of Imperial Majesty, the Duchies of Parma, Piacenza, and Guastalla, and at a later period made a morganatic marriage with her chamberlain, Count Neipperg. She governed her duchies generally with mildness, but the latter part of her reign was much disturbed by revolutionary outbreaks and the very violent means taken to repress them.

Maria Louisa, Order of. See ORDERS AND DECORATIONS.

Maria Theresa, tē-rē-sa (Ger. tā-rā-zā), German empress, queen of Hungary and Bohemia, archduchess of Austria: b. Vienna 13 May 1717; d. there 29 Nov. 1780. The oldest daughter of the emperor Charles VI., she was carefully educated, was named heir to the throne by the Pragmatic Sanction, and in 1736 married Stephen, duke of Lorraine, who became grand-duke of Tuscany in the next year, and who in November 1740, a month after Maria's accession to the throne of Hungary, Austria and Bohemia, was named joint regent with her. France and Bavaria invaded Bohemia; and at the same time she was beset by Frederick the Great in Silesia, by Spain and Naples in Italy, and by the counter-claims of Charles Albert, who was proclaimed first archduke of Austria and then German emperor. She fled from Vienna to Presburg, convoked the Diet, raised a Hungarian army, won the alliance of England, made a secret peace with Prussia, surrendering Silesia and Glatz, and gained peace by the treaty of Aix-la-Chapelle, October 1748, securing the election of her husband as German emperor in return for the cession to Spain of Parma, Piacenza and Guastalla. To revenge herself on Frederick she formed an alliance with Russia, and, by the help of her chancellor, Kaunitz, with France. With the further help of Sweden and Saxony she was preparing to strike at Prussia, when Frederick forestalled her by striking the first blow and opening the Seven Years' War (q.v.). This terrible struggle availed Austria nothing and Maria Theresa had to admit Prussia's right to Silesia in the Peace of Hubertsburg 15 Feb. 1763. Francis I., her husband, died 18 Aug. 1765, and Maria associated with her as emperor her oldest son, Joseph II., but kept in her own hands everything save military administration. Seven years afterward, upon the first partition of Poland, she received Galicia and Lodomeria; and in 1775 Bukovina was granted to Austria

by Turkey. The Peace of Teschen, closing the War of the Bavarian Succession, brought Austria the Inn valley in 1779; but the Princes' League (Fürstenbund) under the lead of Frederick II., struck a heavy blow at Austrian supremacy. Though best known for her part in European politics, Maria Theresa was equally great in interior administration; Austrian finance was revived, agriculture encouraged and higher education fostered. The Empress was a strict Catholic and an enemy of the Protestant Reformation, but in the latter part of her reign under the influence of her free-thinking son's policies, she was induced to enact some anti-ecclesiastical legislation, which he subsequently developed into persecutions. She was a pure and noble woman, strikingly beautiful in her youth. Ten of her 16 children survived her. Monuments to Maria Theresa are to be found in Klagenfurt, Vienna, and Presburg. Her letters to her children and her friends were edited by Arneth (1881), who wrote 'Maria Theresia' (1888). Consult also de Broglie, 'Marie Thérèse' (1888); de Villermont, 'Marie Thérèse' (1895); Wolf and Zwiedineck-Südenhorst, 'Oesterreich unter Maria Theresia' (1884); Bright, 'Maria Theresia' (1897).

Maria Theresa, Order of. See ORDERS AND DECORATIONS.

Mariamne, mā-rī-ām'nē, granddaughter of Aristobulus and Hyrcanus, the high-priest, and wife of Herod the Great. Her history is related by Josephus from whom we learn that Herod was devotedly attached to her. She was condemned to death through the machinations of Salome, her husband's sister, on a false charge of adultery, 28 B.C. She met her fate with an intrepidity worthy of her noble ancestry, and was bitterly deplored by the king after her decease.

Mariana, Juan, hoo-ān' mā-rē-ā'nā, Spanish historian: b. Talavera 1536; d. Madrid 17 Feb. 1623. Taking holy orders he entered the Society of Jesus. To his training at the University of Alcalá he owes the pure taste and eloquence of his writings. He taught theology for 13 years with distinction in Rome, Sicily, and Paris, returning to the Jesuits' College at Toledo in 1574, where he wrote his 'Historia de Rebus Hispaniæ' (first edition, Toledo, 1592), in elegant Latin, but afterward translated it into Castilian. His tone is impartial, though he loves Spain and admires Spanish virtue. Though a Jesuit he complains of Pope Alexander VI. Though a Spaniard he is not blindly prejudiced in favor of his king. He describes with sorrow the conquest of Naples; and his censure of Ferdinand is moderated only by considering his good qualities as personal, his bad ones as common to all princes. He has not, however, much claim to originality and borrows largely from Zurita (q.v.). Four editions of the translation appeared during his lifetime, each with corrections and additions. An English translation was made by Stephens, the continuator of Dugdale's 'Monasticon' (London, 1699, folio).

Mariana, mā-rē-ā'nā, in American colonial history, a name given by John Mason to the tract or territory granted to him between the Salem River and the Merrimac. Here he founded an agricultural settlement and formed the Laconia company in 1620. Mason returned

MARIANA ISLANDS — MARIE DE MÉDICIS

to England in 1633 and died there two years later. In 1691 his heirs sold all his lands and rights in New Hampshire to Gov. Allen.

Mariana (mā-rē-ā'nā) Islands. See LADRON ISLANDS.

Marianna, mā-rī-ā'nā, Ark., town, county-seat of Lee County; on L'Angeuille River, and on the Saint Louis, Iron Mountain & Southern railroad; about 158 miles east of Little Rock. It is in a fertile agricultural region in which cotton is one of the principal crops and in the vicinity are large forests. The chief industrial establishments are lumber-mills, cotton-gins, cotton-compresses, and cottonseed-oil mills. The town is at the head of navigation and has considerable trade by steamers and railroad. The town owns and operates the waterworks. Pop. (1900) 1,707.

Mariazell, mā-rē-ā-tsēl', Austria, a picturesque mountain village in the north of Styria, near the Salza, 60 miles southwest of Vienna. It is a noted pilgrim resort, annually visited by about 200,000 persons, attracted by the celebrated image of the Virgin and child, enshrined in a handsome church founded in 1363, and rebuilt in 1827. Pop. (1890) 1,152.

Maribois. See NAGRANIANS.

Maribojoc, mā-rē-bō-hōk', a pueblo of the province of Bohol, situated on the southwestern coast on Maribojoc Bay, eight miles north of Tagbilaran, two miles from the mouth of the Abalan River. It is an important road centre. Pop. 10,900.

Maricopa, mā-rē-kō'pā, or **Coco-Maricopa**, an Arizona tribe of Indians, a branch of the Yumans, formerly inhabiting the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are now to be found in the Gila River Reservation to the number of about 400. In their aboriginal state their dress was of the scantiest description, and their dwellings and storehouses were of woven straw and cornstalks over a pole framework. They were an agricultural people and raised large crops by irrigation. Under missionary influence they have been civilized and are now noted for their industry, their efforts at self-improvement, and their manufactures of cotton cloth, baskets, and pottery.

Marie Antoinette, mār'ī ān-toi-nēt' (Fr. mā-rē ān-twā-nēt), queen of France: b. Vienna, Austria, 2 Nov. 1755; d. Paris 16 Oct. 1793. She was the daughter of the Emperor Francis I. and the celebrated Maria Theresa. She left Vienna for Versailles in 1770, when only 15 to marry the young Duc de Berri, afterward Louis XVI. of France. When her husband ascended the throne in 1774, she gained the affections of the people by repeated acts of generosity. It was, however, soon observed that her natural freedom of manner brought on her the criticism of enemies about the court. It was thought, too, as many believe, with reason, that she was to a certain extent controlled by her mother as an Austrian spy. An extraordinary occurrence added fresh force to calumny and tarnished the fair name of the queen, who was not to blame. This was the affair of the "Diamond Necklace," in which the Cardinal Louis de Rohan, the great quack Cagliostro, and the Countess de Lamotte were the chief actors. It

was certain that Marie Antoinette had great influence over the king, and that she constantly opposed such measures of reform and economy as had been proposed. Her extravagance was regarded by the people as one of the chief causes of their poverty. Her unpopularity increased, and the general indignation was raised to the highest pitch by the enthusiastic reception given her at the banquet on 1 Oct. 1789, where the white Bourbon cockades were worn and the national cockade trampled under foot. The insurrection of women, the attack on Versailles, and the transfer of the royal family to Paris followed in a few days. It was the queen who advised the flight of the royal family from Paris to join Bouille's army in June 1791, which ended in their capture at Varennes. From that time they were viewed as traitors. On 10 Aug. 1792, the last day of the royalty, the queen exerted all her power to induce the king to resistance. This he thought was vain, and he was led with his consort before the legislative assembly. She heard his deposition announced, and then accompanied him to the prison of the Temple. There, deprived of every semblance of royalty, she displayed magnanimity and patient endurance. In August 1793, she was removed to the Conciergerie, and in October was brought before the revolutionary tribunal. She was charged with having dissipated the finances, exhausted the public treasury, corresponded with foreign enemies of France, and favored its domestic foes. She replied with firmness and decision, and heard her sentence pronounced with perfect calmness. On the same day she was guillotined. Marie Antoinette's faults were due in great measure to her defective education and difficult position. Her expiation of them made her a general object of pitying interest. Consult: Lescure, 'La vraie Marie Antoinette' (1863); Campan, 'The Private Life of Marie Antoinette' (1887); and Bicknell, 'The Story of Marie Antoinette' (1897).

Marie de France, mā-rē dē frāns, French poetess of the 12th century, a native of Ile-de-France, whence her surname, who spent her life in England, where she was well known at the court of Henry II. Her 'Lais,' largely based on Breton stories, and full of Celtic spirit and pathos; fables, a revision under the title 'Isopet' (that is, Æsop) of an English collection; and a tale, 'Le Purgatoire de St. Patrice,' make up the body of her work. The 'Lais' are edited by Warnke (1900), and the 'Purgatoire' by Jenkins (1894); each edition has a valuable preface.

Marie Galante, gā-lānt, West Indies, an island, one of the Lesser Antilles, belonging to France, about 15 miles southeast from Guadeloupe. The area is about 60 square miles. The chief productions are sugar, coffee, tobacco, indigo, and cotton. It is a dependency of Guadeloupe. Columbus discovered it in 1493, and named it from his vessel, the Santa Marie. The French occupied it in 1647, and lost it several times. In 1825 it suffered severely from the hurricane which desolated Guadeloupe. Pop. 14,268, chiefly negroes.

Marie de Médicis, dē mā-dē-sēs, queen of France: b. Florence 26 April 1573; d. Cologne 3 July 1642. She was the daughter of Francis I., grand-duke of Tuscany, and was married by proxy, 5 Oct. 1600, to Henry IV. of France, with

MARIE PAULINE—MARIETTA

whom she constantly quarreled, partly because of his inconstancy and his open favor to the Marquise de Verneuil, and partly because of her own haughty, obstinate character, which was not unmixed with ambition. For years she urged him to have her crowned queen; the ceremony took place 13 May 1610, and on the next day the king was assassinated. Marie was accused of complicity in the plot, but the charge is not proven. For seven years she acted as regent and showed a strong friendship for Spain and the Catholic Church, being advised by the nuncio and the Spanish ambassador as well as by such favorites as the Concinis. She quarreled with her son, later Louis XIII., was reconciled to him by Richelieu, and upon her attempt to displace the latter was forced by that great minister again to leave court in 1630. Her last years were spent in exile in Belgium, England, and Cologne. The story of her poverty during these years is untrue. Consult Miss Pardoe, 'Life and Memoirs of Marie de Medici' (1852); Lord, 'The Regency of Marie de Médicis' (1903).

Marie Pauline, Princess Borghese. See BORGHESSE, MARIE PAULINE.

Marienbad, mā-rē'n-bād, Austria, one of the most frequented and picturesque of the Bohemian watering-places, near the western frontier, in a kind of triangular basin formed by several mountain ranges, about 28 miles northwest of Pilsen. The village, built on a slope, surrounded with woods of pine and fir-trees, except in front, has a town-house with assembly-room and reading-rooms; several bathing establishments, theatre, etc. The springs utilized are eight in number and are cold; some are alkaline and containing Glauber's salts, others alkaline and chalybeate, etc. Seven are used externally and internally, one is used for bathing alone. Great quantities of the water are exported. Pop. (1900) 4,588.

Marietta, mā-rī-ēt'a, Ga., city, county-seat of Cobb County; on the Nashville, Chattanooga & Saint Louis railroad; about 15 miles north by west of Atlanta. Kenesaw Mountain (q.v.) is west of the city. It was settled about 1840-1 and incorporated in 1852. A city charter was granted in 1885. It is in a fertile agricultural region in which stock-raising is one of the prominent occupations. Large marble quarries are in the vicinity. The chief manufactures are chairs, dressed marble, and machine-shop products. The chief buildings are the churches and schools. The Clarke Library, which contains about 5,500 volumes, is in Marietta. A National Cemetery located here contains the graves of 10,279 soldiers; the unknown dead number 2,967. The mayor and council are chosen at a popular election. Pop. (1890) 3,384; (1900) 4,446.

Marietta was an intermediate objective point in Gen. Sherman's campaign for Atlanta, and when he crossed the Etowah 23 May 1864, his columns were headed for that place by way of Dallas and New Hope Church, but Gen. J. E. Johnston threw his army in his front and checked him at New Hope Church and Dallas. After many hard-fought battles and constant severe skirmishing, Johnston abandoned his Dallas lines (see DALLAS, GA., BATTLE LINES AT) on 4 June, and took position covering Marietta, his left on Lost Mountain, his right beyond the railroad and behind Noonday Creek, with a strong advanced

position on Pine Mountain. Sherman repaired the railroad, established a secondary, fortified base at Allatoona Pass, and joined by Blair's Seventeenth corps, advanced 10 June and confronted Johnston in his new and strong position, and by the 14th was strongly entrenched before it in a continuous line of 10 miles. Johnston abandoned Pine Mountain on the night of the 14th, and Sherman advanced his lines, bringing on the engagement at Pine Mountain (q.v.) 15 June. The general movement was continued on the 16th and the right thrown forward to threaten the railroad below Marietta. On the 18th Johnston fell back to a new line, including Kenesaw Mountain, which was strongly fortified, and Sherman pressed in closely on the centre and left, north of Marietta, still continuing the extension of his line to the right, south of it. Johnston, making a corresponding movement by his left, encountered Sherman's right at Kolb's Farm (q.v.) on the 22d. Sherman assaulted Kenesaw Mountain (q.v.) on the 27th, and was repulsed. Flanking operations were then renewed to the right to reach the railroad, and Johnston, finding it in danger and his communications with Atlanta threatened, after being 26 days under an uninterrupted cannonade and infantry fire, abandoned Marietta on the night of 2 July and fell back to a new line, previously selected and entrenched, ten miles south of Marietta, and covering the railroad and his pontoon-bridges across the Chattahoochee, with an advanced position at Smyrna Camp-ground. Sherman occupied Marietta on the morning of 3 July. The Union loss in the operations around Marietta was 1,790 killed and missing, and 5,740 wounded, an aggregate of 7,530. Johnston reported a Confederate loss of 468 killed and 3,480 wounded. Consult: 'Official Records,' Vol. XXXVIII.; Sherman, 'Memoirs,' Vol. II.; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Johnston, 'Narrative.'

Marietta, Ohio, city, county-seat of Washington County; on the Ohio River at the mouth of the Muskingum, and on the Cleveland & M., the Toledo & O. C. Extension, the Baltimore & O. S. W., the Zanesville & O., and the Columbus N. R.R.'s; about 95 miles, in direct line, southeast of Columbus, the capital of the State. The first settlement was made in 1788 by people from New England, under Gen. Rufus Putnam, acting for the "Ohio Company" (q.v.) who had secured a grant of lands on both sides of the Muskingum River. The place was named in honor of Marie Antoinette. Arthur Saint Clair organized here July 1788 the Northwest Territory (q.v.). In 1800, Marietta was incorporated as a town. Fort Harmar, built in 1785, was opposite Marietta, and in 1890 the village of Harmar, once the site of the fort, was annexed to the city. The building used as the land office for the "Ohio Company" and an old church, the oldest in the State, are still standing here and in good condition. Many of the pioneers of New England as well as of Ohio, and many of the Revolutionary soldiers, were buried in the Marietta cemetery.

The city is in a coal, iron, petroleum, and gas region, with fertile agricultural lands in the valleys. Some of the manufacturing establishments are the chair factory, employing 650 persons; glassworks, employing 200; tool shops, with 150 employees; brick plant, 300 employees;

MARIETTA COLLEGE — MARINE INSECTS

boat yards, 75; foundries, 300; other manufacturing having in all fully 300 more employees. There are five banks with a combined capital of \$500,000; the annual business amounts to over \$3,000,000. The principal buildings are the Marietta College (q.v.), public and parish schools, the churches, and the county-buildings. The government is vested in a mayor and council and is administered according to the "Ohio Municipal Code." The council is composed of six members, two of whom are elected each year. The site of Marietta was once part of a remarkable group of ancient works which consisted of two sections, one containing about 40 acres, the other about 20 acres. The remains of mounds, truncated pyramids, walks, walls, and other ancient works still exist, although the city covers a large part of the original enclosures. Remains of the walls, about five or six feet high by 20 or 30 feet base, may still be seen. Pop. (1890) 8,273; (1900) 13,348. Consult: King, 'History of Ohio'; Hoar, 'Oration at the Celebration of the Centennial of the Founding of the Northwest at Marietta.'

A. D. ALDERMAN,
Editor of Marietta 'Register.'

Marietta College, in Marietta, Ohio, founded in 1835 for men and women. It has college and preparatory departments, the latter is known as Marietta Academy. The courses lead to the degrees of A.B., Ph.B., and B.L. Courses are provided for work in music, art, and military science, and short summer schools are given for work in the arts and sciences. The library, which has about 61,000 volumes and 30,000 pamphlets, is noted for its books on the history of the Northwest. In 1903 there were connected with the college 24 instructors and about 300 students. The grounds and buildings were valued at \$251,000, the productive funds at \$266,000, and the total income \$22,500.

Marigold, a popular name for several unrelated plants. The pot marigold (*Calendula officinalis*) is one of the most widely popular of garden plants. It is grown for its brilliant flowers which range from white to rich orange, and for its flower-heads, which are often used to flavor soups, stews, and dressings. The African marigold (*Tagetes erecta*) and the French marigold (*T. patula*) are also widely used for ornament. Their flowers are usually some shade of yellow, but some are brown and some striped. The Cape marigold (*Dimorphotheca* spp.) are also grown for ornament but are less popular than the above. The corn-marigold (*Chrysanthemum segetum*) is a weed especially common in European grain-fields, but also cultivated for its flowers, for which the plant is sometimes forced in greenhouses. All these belong to the natural order *Compositae*. The marsh marigold (*Caltha palustris*) is a member of the natural order *Ranunculaceae*. It is a well-known plant in marshes and wet meadows. The leaves, gathered before flowering, are widely used as a pot-herb under the name of "cowslip greens." The name fig marigold is applied to various members of the genus *Mesembryanthemum*, several of which are cultivated for their grotesque forms, their peculiar foliage, etc.

Marikina, mār-ī-kē'na, a Brazilian name for a marmoset (q.v.).

Marinduque, mā-rēn-doo'kā, Philippines, an island lying southwest of the province of

Tayabas, Luzon; it is circular in shape, being 24 miles north and south and 23 miles east and west; area 667 square miles. A mountain range runs from north to south across the island, and near its centre are short spurs running east and west. The staple products are rice, coconuts and hemp; the island is heavily wooded, and fruits are abundant and an important article of food among the natives. The chief industry is the raising of rice, of which large quantities are exported, the hemp of Marinduque is of a peculiar fine quality, and is used for weaving. At the southern end of the island there is excellent pasturage, and horses and cattle are raised. It is in the route of steamers in the local trade between Manila and the Visayan Islands and Mindanao, and its two chief towns are ports of call for these steamers. In the winter of 1898-9 Marinduque was occupied by the United States troops, it being the first important position in the south taken after leaving Verde Passage. In 1901 it, with the small islands adjacent, was created a province under civil government; 23 June 1902 the provisions of the provincial government act were extended to the island of Mindoro and the Lubang group by incorporating them with the province of Marinduque. Pop. 48,000, mostly Tagalogs.

Marine Corps. See NAVY OF THE UNITED STATES.

Marine Hospital Service. See HOSPITAL; NAVY OF THE UNITED STATES, THE.

Marine Insects. Insects have not only invaded rivers and lakes, they have established themselves to some extent at least, along the margin of the sea. On a sunny day by the shore myriads of flies may be seen hovering over the seaweed cast up by the tide. These have been developed from grubs which live and feed in the decaying weed, and are able to bear immersion twice daily. Around the rock-pools many midges may be noticed. Their grubs feed on growing green seaweed, and spend their whole life in the salt water, breathing the dissolved air, as do their fresh-water relations, by means of gill-filaments, or simply through the surface of the skin. Many species of beetles inhabit the shore, and are submerged twice daily, when they lurk under stones or burrow into the sand; their hairy bodies are not easily wetted, and in one of the best known marine beetles (*Aëpus*) there are paired air-sacs in the hind-body which are believed to act as reservoirs for breathing while the tide is up. Several kinds of very small springtails may be seen on the surface of the rock-pools at low-tide; probably when the water rises they retire into crevices of the rocks. They are covered with a very fine, dense pile, and it seems impossible to wet them.

The absence of wings is a common character among the sea-shore insects. The beetles of the genus *Aëpus* are wingless, and so is the small bug *Aëpophilus* often found in their company, as well as the female of the midge *Clunio*, whose mate, though winged, appears not to fly, but to use his wings as sails as he skims over the surface of the rock-pools. "The tendency of insects on oceanic isles to lose their wings has often been noticed," says Carpenter, "and the loss of the power of flight explained as an advantage, since insects which do not fly cannot be blown out to sea. Possibly the absence of wings in so many sea-shore insects can be explained in like

MARINE INSURANCE — MARION

manner. Several genera of pond-skaters have one or two species which frequent the water of estuaries and harbors; these are in all cases wingless, though their fresh-water relations are, as a rule, winged."

The extreme of adaptation to marine life is shown by the bugs of the genus *Halobates*, also belonging to the family *Hydrometridæ*, with their short anchor-like fore-legs and their immensely long and slender middle and hind-legs, the middle shin and foot being fringed with long hairs. The elongate wingless fore-body of these insects and the greatly reduced hind-body give them a most peculiar and characteristic appearance, and the dense pile wherewith they are clothed keeps them dry. They have been observed gliding over the calm seas of the tropics, often hundreds of miles from land, or clinging to drifting substances whence they could suck food. Consult G. H. Carpenter, 'Insects, their Structure and Life' (1899); Miall, 'Natural History of Aquatic Insects' (1895).

Marine Insurance. See INSURANCE, MARINE.

Marines, are troops enlisted for service either on board ship or on shore. They are drilled, disciplined, clothed, equipped, and paid similarly to the land forces. Their duties are to maintain the necessary guards, man some of the guns, form part of the armed crews of the various boats when called away for service, and form a permanent force for landing with the seamen if necessary. In all these matters they are commanded by their own officers. The marines of the European continental nations are not designed for service permanently on board ship; the American navy is the only one besides that of Great Britain in which the marine forms a necessary and definite fraction of a ship's company. United States marines, who are designated as the Marine Corps, distinguished themselves greatly in the operations in Cuban waters in 1898 and in those which led to the rescue of the foreign legations in Peking in 1900. The name marines is also used in the expression: "Tell that to the marines," signifying utter disbelief in a statement made or story told; it arose from the fact that marines, being ignorant of seamanship, were made butts of by the sailors. See NAVY OF THE UNITED STATES.

Marinette, măr-i-nĕt', Wis., city, county-seat of Marinette County; at the mouth of the Menominee River, on Green Bay, and on the Chicago & N. W., the Wisconsin & M., and the Chicago, M. & St. P. R.R.'s; about 50 miles north by east of Green Bay and opposite Menominee, Mich. The harbor is large and safe, and the river affords opportunity for bringing logs from the forests along its upper course in both Wisconsin and Michigan. Marinette was settled about 1849-50 and in 1887 was incorporated. The water-power is extensive and the lumber industry of Marinette is most important. The large lumber mills are the chief manufacturing establishments of the city. Other industrial establishments are pail factories, paper and pulp mills, box and broom factories, gas and traction engine and iron works, threshing machine factories, furniture factories, and cabinet shops. The city carries on a lake commerce with all the important lake ports. The chief buildings are the city and county buildings, two hospitals, a public library, 20 churches, fine public and parish school

buildings, and Our Lady of Lourdes' Institute. In the vicinity is large assembly ground where various religious and educational conventions are held each summer. Pop. (1890) 11,523; (1900) 16,195.

Marini, Giambattista, jām-bā-tĕs'tā mā-rĕ-nĕ, Italian poet: b. Naples 18 Oct. 1569; d. there 25 March 1625. He was assisted by the Cardinal Pietro Aldobrandini at Rome, with whom he went to Turin, where he became secretary to the Duke of Savoy, Charles Emmanuel, but the envy of his enemies and his satirical humor involved him in various disputes. Marini's most famous work is the long epic 'Adone' (1623). His other works include 'La Lira' (1602-14); and a great collection of miscellaneous poems. Some of his sonnets are among the most perfect in the Italian language. He is the founder of the Marinist school of poetry, of which false, overstrained imagery, far-fetched metaphors, and forced conceits are characteristic features. Consult Menghini, 'La vita e le opere di G. B. Marini' (1888).

Marinoni, Hippolyte, ĕ-pō-lĕt mā-rĕ-nō-nĕ, French inventor: b. Paris 1825. He has invented many appliances for printing which have been of world-wide adoption, among them are a rotary printing-press which turned out 40,000 copies an hour, another which printed in six colors 20,000 copies an hour, and at the Paris Exposition he exhibited a press which printed at a rapid rate two colors on each side of a sheet by one revolution.

Mario, Giuseppe, joo-sĕp'pĕ mā-rĕ-ō, MARQUIS DI CANDI, Italian tenor: b. Cagliari, Sardinia, 18 Oct. 1810; d. Rome 11 Dec. 1883. After serving in the Sardinian army he went to Paris, where after two years of musical study he was appointed first tenor of the opera, changing his name at the same time from De Candia to Mario. He made his debut 2 Dec. 1838 as Robert in 'Robert the Devil,' and soon became the leading tenor of the world. His répertoire embraced all the great works of Rossini, Bellini, Donizetti, and Verdi. He married the famous singer Giulia Grisi in 1854 and together they made an operatic tour of the United States. In his later years after his retirement from the stage in 1871 he lost his fortune through speculations, and the next year made a concert tour in this country.

Mariol'atry. See MARY.

Marion, măr'i-ōn, Francis, American soldier: b. near Georgetown, S. C., in 1732; d. Pond Bluff 27 Feb. 1795. He was the youngest in a family of six children. His grandfather, Benjamin Marion, was a Huguenot exiled from France in 1690. At 16 Francis showed his adventurous disposition by embarking on a small vessel bound for the West Indies. It was wrecked and he barely escaped death by starvation. He returned home and worked several years on a farm. In 1760-1 he served in campaigns against the Cherokees. Thenceforth until 1775 he lived on his plantation at Pond Bluff in the parish of St. John.

In 1775 Marion was elected member from St. John in the South Carolina Provincial Congress, which adopted the bill of rights and voted money for raising troops. He was chosen captain (21 June 1775) and took the field against the British and the Tories. He took part in the capture of Fort Johnson (14 Sept. 1775), and because of his ability in organizing and discipline was pro-

MARION

moted to major. He participated in the patriot victory (28 June 1776) at Charleston, which gave the Southern States respite from active fighting for nearly three years. Appointed lieutenant-colonel, he led his regiment in the unsuccessful attack on Savannah (September 1779). In 1780 Marion, now a brigadier-general, was obliged to take refuge in forest and swamp. Beginning with a handful of men, less than 20, he gathered recruits, fearless riders and good marksmen, who formed the famed "Marion's brigade." At times they numbered several hundred. They came and went at their leader's bidding, providing their own equipment and rations. Part of the time they were at work on their farms, planting crops. These rough and ready troopers became the terror of the British regulars and the Tories, although in justice to Marion's men it should be said that they committed no acts of wanton cruelty and burned no buildings on Tory homesteads. The stories of his adventures read more like fiction than history. His scouts kept close watch of the enemy's movements, and detachments of the brigade struck blow after blow, surprising and capturing small parties of soldiers. At times they united with larger bodies of troops for important engagements. After a vain pursuit, Tarleton named Marion the "Swamp Fox." Failing in his attempt against Georgetown (December 1780), he retired to Swan Island and prepared for a second attack (13 Jan. 1781), which was also unsuccessful. Then he joined with Colonel Henry Lee in reducing Fort Watson (April 1781). After raiding 200 miles of country he commanded the first line in the battle of Eutaw Springs and took many prisoners. For his gallantry in this engagement he received the thanks of Congress. From 1782 to 1790 Marion served in the State Senate and was a member of the State Constitutional Convention in 1790. He opposed harsh treatment of the Tories and condemned the confiscation act of 1782. In 1784 he married a wealthy lady, Mary Videau, who survived him with no children. He was a man of attractive personality. Of slight figure, he was capable of great endurance and accustomed to abstinence. As a leader he was admired and beloved. He justly ranks among the heroes of the Revolution. Consult: Biography by Horry and Weems (1815), Simms, 'Life of Francis Marion' (1844), Tarleton, 'History of the Campaigns of 1780-1781' (1787).

Marion, Ala., town, county-seat of Perry County; on the Southern railroad; about 60 miles west by north from Montgomery. It is situated in a fertile agricultural region, and its industries are connected with the farm products. It is the seat of the Marion Female Seminary, established in 1836; the Judson Female Institute (Baptist), established in 1839; Lincoln Normal School for colored pupils (Congregationalist); and the Marion Military Institute. Pop. (1900) 1,698.

Marion, Ill., city, county-seat of Williamson County; on the Illinois Central railroad; about 150 miles south by east of Springfield. It is situated in an agricultural region in which are large deposits of coal and near which are extensive timber tracts. The chief industries which contribute to the support of the city are coal-mining, lumbering, fruit raising, manufacturing flour and raising cattle. Marion is the chief

trade centre of a large portion of Williamson and adjoining counties. Pop. (1890) 1,338; (1900) 2,510.

Marion, Ind., city, county-seat of Grant County; on the Mississinewa River, and on the Toledo, St. L. & K. C., the Cleveland, C. C. & St. L., the Cincinnati, R. & M., and the Pittsburgh, C. C. & St. L. R.R.'s; about 68 miles northeast of Indianapolis. It is situated in a fertile agricultural region and in a natural-gas belt, and the Mississinewa furnishes abundant water-power. The chief manufactures are flour, lumber, pulp, paper, brick, foundry products, window glass, bottles, glass jars, furniture, linseed oil, and rolling-mill products. The trade is extensive and is chiefly in its own manufactures and farm products. Some of the principal buildings are the public library, which cost \$65,000, a large normal college, a court-house, and the churches and schools. Three miles south of the city is a National Soldiers' Home, which cost about \$1,510,000. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1890) 8,769; (1900) 17,337.

Marion, Iowa, city, county-seat of Linn County; on the Chicago, Milwaukee & Saint Paul railroad; about 110 miles northeast of Des Moines. It was settled in 1839 and in 1852 was incorporated. It is situated in a rich agricultural region in which the chief products are corn, broom-corn, wheat, and vegetables. Considerable attention is given to stock-raising. Marion is the headquarters of a railroad division and has large railroad repair shops, freight yards, and a round-house. Other industrial establishments are broom factories, greenhouses, flour mills, a large creamery, and cigar factories. Pop. (1890) 3,094; (1900) 4,102.

Marion, Kan., city, county-seat of Marion County; on the Cottonwood River, and on the Chicago, R. I. & P., and the Atchison, T. & S. F. R.R.'s; about 115 miles southwest of Topeka. It is situated in a fertile agricultural region in which considerable attention is given to stock-raising. The chief manufactures are flour and dairy products. Pop. (1890) 2,047; (1900) 1,824.

Marion, Ohio, city, county-seat of Marion County; on the Erie, the Cleveland, C. C. & St. L., the Columbus, H. V. & T., the Columbus, S. & H., and the Pennsylvania R.R.'s; about 45 miles north of Columbus, the capital of the State.

Marion was settled in 1815 by people from Rhode Island, and was incorporated in 1820 and chartered as a city in 1890. It is situated in a fertile agricultural section; considerable limestone is in the vicinity. The number of employees engaged in the chief industries of the city are, in the steam-shovel works, 500 persons; the foundries, 300; the lime-kilns and quarries, 600; engines and threshers, 550; buggies, carriages, etc., 150; agricultural implements, 100; wood-pulleys, 50; silk-mills, 50; mattress factory, 20. There are 13 churches, public and parish schools, and a Home for Aged Women. The four banks have a combined capital of \$850,000. The government is vested in a mayor and a council of seven members, chosen annually by popular election. The inhabitants are chiefly native born. Pop. (1890) 8,327; (1900) 11,862.

W. G. HARDING,
Editor of 'Star.'

MARION—MARITZA

Marion, S. C., city, county-seat of Marion County; on the Carolina N., and the Atlantic C. L. R.R.'s; about 100 miles west of Columbus. It is surrounded by rich farm lands, the chief products of which are tobacco and cotton. It has large cotton mills, cottonseed-oil mills, lumber and flour mills, and foundries. It ships to the large markets considerable tobacco and cotton products. Pop. (1900) 1,831.

Marion, Va., town, county-seat of Smyth County; on the Marion & R. V., and the Norfolk & W. R.R.'s; about 140 miles southwest of Lynchburg. Marion was settled in 1832 and in 1871 was incorporated. The chief industrial establishments are flour and lumber mills and wooden-ware factories. Mining and quarrying in the vicinity contribute to the industrial wealth of the town. It is the seat of the Marion Female College (Lutheran) and the Southwestern State Hospital for the Insane. The water for drinking and domestic purposes is brought from springs in the hills about three miles distant, and the waterworks plant is owned and operated by the town. Pop. (1900) 2,045.

Mariotte, Edme, *éd-mě mā-rē-ôt*, French physicist: d. 12 May 1684. He lived for the most part at Dijon, and was made prior of Saint-Martin-sous-Beaune. He became a member of the Academy of Sciences upon its formation, and was one of the founders of experimental physics. "It is Mariotte," said Condorcet, "who first in France introduced into physics a spirit of observation and of doubt." He discovered independently the law known by his name—also discovered by Robert Boyle (q.v.) and known as Boyle's law,—that if the temperature remain constant, the volume of a gas will vary inversely as the pressure.

Mariotte's Law, in physics, the principle that the volume of a gas, under ordinary conditions of temperature and pressure, is sensibly proportional to the reciprocal of the pressure, so long as the temperature remains constant. It is identical with Boyle's law, the latter name being applied to it in the United States and England, and the former in continental Europe. See *Boyle's Law* under GASES, GENERAL PROPERTIES OF, and GASES, KINETIC THEORY OF.

Mariposa (mă-rî-pô'să) Grove, Cal., a celebrated grove of gigantic redwood trees in Mariposa County. See SEQUOIA.

Mariposa Lily, or *Butterfly Lily*, popular names for various species of *Calochortus* of the order *Liliaceæ*. The numerous species, all of which are natives of the western United States and British Columbia, are characterized by coated corms; rather leafy, generally branched stems; and showy, six-segmented flowers. Almost all the species are in cultivation for ornament, some, natives of the Colorado desert, being suited to arid conditions, others to fairly moist soils, still others to very cold localities, as species indigenous to the mountains of Sierra Nevada. All will stand extreme cold, but not alternate freezing and thawing, hence their failure under such conditions. The bulbs should be planted in late autumn in any kind of soil. After the tops have become yellow subsequent to flowering in the following year the bulbs should be taken up, divided and kept dry until planting time. They are often grown in pots under glass.

Mariposan Indians, or Yokuts, a linguistic stock of North American Indians formerly occupying a large part of California. They were divided into 24 small tribes or divisions and displayed great political solidarity. Every large natural division, such as a river valley, constituted a tribal territory which had its hereditary chief. The Mariposans were largely vegetarians; but grasshoppers and certain worms were included in their diet. They were very superstitious and considered the coyote and the rattlesnake as sacred. They were a peaceful people, and although they celebrated the war dance they took no scalps. They were devoted to gambling in all its variations. Marriage was a matter of barter and sale, and cremation was a common practice. In 1850 there were 3,000 Mariposans still living, but in 1890 they had been reduced to 170. In 1903 there were scarcely a score of them remaining in the California mission agencies, where they were classed as "desert Indians." (See also INDIANS.) Consult: Bancroft, 'History of California' (1884); Powers, 'Tribes of California' (1877).

Mariquina, *mā-rē-kē'nā*, Philippines, a pueblo of the province of Rizal, Luzon, situated seven miles northeast of Manila, on several roads of importance. A medicinal iron spring called the Chorillo is in the vicinity. It is the centre for the manufacture of native shoes, and leather work of various kinds. Pop. 10,300.

Maris, mā'rîs, Jakob, Dutch painter: b. at The Hague 25 Aug. 1837. He early began his art studies at the local academy, choosing landscape as a specialty, and receiving instruction from Ströbel and Van Hove, which latter he followed on his removal to Antwerp. He studied also under Keyser, director of the Antwerp Academy. Going to Paris he came under the influence of the Barbizon school, and reached his full power as a painter of figures and landscape in combination. In 1871 he returned to his native town. He is quite modern in his artistic conceptions and methods of handling, and shows no sympathy with the style of the early Dutch school. His brush work and use of chiaroscuro are essentially French. Among his numerous works are, 'View of Schiedam'; 'View of a Town in Holland'; 'On the Sea Shore'; 'Mother and Children'; 'Bridge and Canal in Rotterdam'. He has also executed water colors and etchings.

Marists, mā'rîsts, term applied to two modern religious congregations in the Roman Catholic Church. The Marist Fathers, or Society of Fathers of Mary, originated in Lyons (1816), where a number of religious devoted themselves to missionary work, which extended over the Pacific islands and in 1845 passed on to Australia. The Marist Brothers, whose object was the education of youth, were founded a year later at Marseilles, and chose for its field of labor the south of France. The Marist Fathers have 156 members in the United States which they entered 1849. Their headquarters is at Brookland, D. C. They have schools at Manchester, N. H.; Lowell and Lawrence, Mass., and New York.

Maritime Law. See LAW, MARITIME.

Maritza, mā-rēt'sā, Turkey, a river, the ancient Hebrus, rising as the Topolnitsa, near the Bulgarian frontier, in the Balkan Mountains, and flowing through Eastern Rumelia, south-

east to Adrianople, where it bends to the south-west, and falls into the Ægean Sea by the Gulf of Enos. It is over 300 miles long, and navigable to Adrianople, about 100 miles from its mouth.

Marius, mā'rī-ūs, **Gaius**, Roman general: b. 156 B.C., in Cereata, in the Volscian territory; d. Rome 86 B.C. He won his first military repute at Numantia in 134, beginning his rapid rise from the ranks; was made tribune of the people in 119; increased his political power by marrying Julius Cæsar's aunt; became prætor in 115; went to Spain in the next year, suppressing brigandage there; and in 109 accompanied Metellus to Africa. Two years later he was chosen consul, displaced his superior officer, and made a brilliant campaign. His success was so great that he was elected consul four times in succession (104-101 B.C.)—a proceeding counter to law and entirely unparalleled—so as to meet the invasion of Italy by the Cimbri and Teutones. He defeated the latter tribe at Aquæ Sextiæ in 102, and the Cimbri at the Raudian Fields in 101. In 100 he was again elected consul. He made the fatal mistake of plunging into party politics, allied himself with the most disreputable leaders of the popular party, and, in his envy of the rising fame of the patrician Sulla (q.v.), attempted to remove him from his command in the Jugurthine War. Civil war broke out in 88. Sulla was victorious. Marius fled to Africa, whence he returned to Italy on the successful rising in Rome under Cinna. The first great proscription followed and many of Marius' opponents were killed. Marius was elected consul for the seventh time for 86 B.C., but died soon after he entered upon the office. Consult Beesly, 'Marius and Sulla' (1878).

Marius, **The Epicurean**, a philosophical romance by Walter Pater, published in 1885. The book has but a shadowy plot. It is, as the subtitle declares, a record of the hero's "sensations and ideas," a history of a spiritual journey. Marius is a young Roman noble, of the time of Marcus Aurelius. Like the philosophic emperor himself, he is the embodiment of the finer forces of his day; his temperament being at once a repository of the true Roman greatness of the past, and a prophecy of the Christian disposition of the New Rome. In his earliest manhood he goes to Rome, meets there the philosophic emperor, mingles in the highly colored life of the time, studies, observes, reflects. The book is a remarkable story of spiritual development, as well as of the strange, luxurious, decaying Rome of the 2d century of the Christian era.

Mariut, mā-rē-oot', **Lake**, Egypt. See MAREOTIS.

Marivaux, **Pierre Carlet de Chamblain de**, pē-ār kār-lā dē shān-blān dē mā-rē-vō, French dramatist and novelist: b. Paris 4 Feb. 1688; d. there 12 Feb. 1763. Of his life practically nothing is known save that he became an Academician in 1742 or 1743. He wrote essays in periodical form, the 'Spectateur Français' having a hint of English influence in both matter and name. His novels, especially the unfinished 'Vie de Marianne' and 'Paysan parvenu,' were a protest against the literary morals of contemporary fiction. But he is best known for such plays as 'Les Jeux de l'Amour et du Hasard' (1730), 'Les Fausses Confidences' (1738), 'Le Legs' (1736), and 'La Mère confi-

dente' (1735), which are marked by a total opposition to the style and manner of Molière, by much skill in intrigue and in portraying women, and by the peculiarly artificial and elaborate style, which takes its name 'Marivaudage' from the author. Consult: Savollée, 'Marivaux inconnu' (1880); Fleury, 'Marivaux et le Marivaudage' (1881); Gosset, 'Marivaux Moraliste' (1881); Larroument, 'Marivaux, sa Vie et ses Œuvres' (1894); Deschamps, 'Maurivaux' (1897).

Marjoram, a genus of annual or perennial herbs and a few shrubs (*Origanum*) of the natural order *Labiata*. The species of which there are about 25, are mostly natives of the Mediterranean region and southwestern Asia. They have several-flowered whorls of labiate flowers arranged in spikes. Two species are widely cultivated in gardens for culinary purposes, being used fresh, dried or in decoction for flavoring soups, stews, dressings, sauces and salads. Common or pot marjoram (*O. vulgare*) is a hardy perennial with pink or purple flowers and highly aromatic leaves. It succeeds best upon warm garden soils well exposed to the sun, and may be propagated by seeds, divisions, or cuttings. Sweet marjoram (*O. marjorana*) is also a perennial, but is tender and consequently treated as an annual, hence the popular name annual marjoram. It is usually raised from seeds sown in a hothed or green-house and transplanted to ground like the above.

Mark, Saint, the Evangelist. See GOSPELS.

Mark Antony. See ANTONIUS, MARCUS.

Mark Twain. See CLEMENS, SAMUEL LANG-HORNE.

Mark, an old English term for a money of account, and in some other countries for a coin. The English mark was valued at \$3.33, and the Scotch mark, or merk, was \$3.42. In the coinage of the German empire the mark is a coin of nearly the same value as the English shilling. A mark banco used to be a money of account in Hamburg equal to 37 cents, nearly. The mark was also used as a weight in several parts of Europe, being divided into 24 carats.

Mark, Order of Saint, a Venetian order of knighthood. The doge, as well as the senate, elected knights of Saint Mark, who enjoyed a pension. Foreigners also, particularly scholars, were elected. Saint Mark the Evangelist was the patron saint of the Venetian Republic.

Markham, mār'k'am, **Albert Hastings**, English admiral and Arctic explorer, cousin of Sir Clements Markham (q.v.): b. Bagnères, 11 Nov. 1841. He entered the navy in 1855, saw active service in the China Seas for several years, took part in the Polar expeditions of Adams (1873) and of Nares (1875), and in the latter expedition attained what was then the farthest north, 83° 20' 26". With Sir Henry Gorn-Booth he attempted to reach Franz Joseph Land in 1879, but was unsuccessful; in the next year Markham explored the Galapagos Islands. Rear-admiral in 1892 and second in command of the Mediterranean fleet in 1893, he is now a vice-admiral. He has written: 'The Cruise of the Rosario amongst the New Hebrides' (1873); 'The Great Frozen Sea' (1878); 'The Voyages and Works of John Davis' (1884); 'A Polar Reconnaissance' (1879); and 'Life of Sir John Franklin' (1891).

MARKHAM — MARKS' MILLS

Markham, Sir Clements Robert, English geographer and traveler: b. Stillingfleet, near York, 20 July 1830. He was educated at Westminster School, entered the navy in 1844, accompanied the Franklin Search Expedition of 1850, and then retired from the service. He traveled in Peru in 1852-4 and 1860-1, the second journey being undertaken to get cinchona seeds for planting in India, an experiment described in his 'Peruvian Bark; Cinchona Culture in British India, 1860-1880' (1880). After spending 1865-6 in Ceylon and India, he became secretary of the India Office in 1867 and curator of its Geographical Department in 1868. In 1858 he had been appointed secretary of the Hakluyt Society, of which he became president in 1890. Since 1863 he was secretary of the Royal Geographical Society, and in 1893 became its president. His more important works, several of which were translated into German, are: 'Cuzco and Lima' (1856); 'Travels in Peru and India' (1862); 'The Arctic Navy List' (1875); 'Life of John Davis' (1880, in a series, 'The World's Great Explorers'); 'Major James Rennell' (1895); 'Richard Hakluyt' (1896); and an English version of a Peruvian drama, 'Ollanta' (1871). He edited 'The Geographical Magazine' from 1872 to 1878 and was knighted in 1896.

Markham, Edwin, American poet: b. Oregon City, Ore., 23 April 1852. He spent his boyhood on a ranch in central California, herding cattle and sheep, and later graduated from the California State Normal School at San José and from Santa Rosa College. He studied law, but did not practise; subsequently took up educational work, and was superintendent and head master of schools in California, and principal of the Observation School of the University of California in Oakland. He had for some time been an occasional contributor to some of the leading American magazines, but first gained wide reputation through the publication of his poem, 'The Man with the Hoe,' suggested to him by Millet's picture of the same name. This first appeared in the San Francisco *Examiner* and was later published in a collection entitled 'The Man with the Hoe and Other Poems' (1899). This poem, which had a wide influence and caused much discussion, is intended by the author not merely as a picture of the peasant but as "a symbol of the toiler brutalized through long ages of industrial oppression." His other publications include: 'Lincoln and Other Poems' (1901); and 'Field Folk, Interpretations of Millet' (1901).

Markham, Jared Clark, American architect: b. Tyringham, Mass., 18 Nov. 1816. He designed the battle monument at Saratoga and has published 'Appeal to the American People in Behalf of National Monuments' (1872); 'Monumental Art' (1884); 'Historic Sculpture' (1886).

Markham, William, English colonial governor in America: b. England about 1635; d. Philadelphia 12 June 1704. When William Penn obtained a charter for Pennsylvania, he made Markham, a first cousin of his, his deputy. Markham had all rights granted to Penn save that of convoking a legislative assembly. On 3 Aug. 1681 he established a council, later chose the site for Philadelphia, and conferred with Lord Baltimore as to the Maryland-Pennsylvania

boundary. Penn himself arrived on 27 Oct. 1682, and Markham, whose commission accordingly lapsed, was elected to the council. In 1684-99 he was secretary to the province, in 1686 became land commissioner, and in 1689 an auditor of accounts. When in 1691 the territory now constituting the State of Delaware was detached from the province, he was appointed its deputy-governor, and in 1694-9, as lieutenant-governor, administered both this territory and the province.

Markhor, mār'kōr or -koor, a remarkable goat (*Capra falconeri*) of the mountains of Afghanistan and northwestern India, where it keeps among the highest wooded valleys, ascending and descending only as compelled to do so by the seasonal changes in the depth of the snow. It is of large size, standing about 3 feet tall at the shoulders, and is reddish brown in summer and light gray in winter. "The magnificent beard, extending in the adult males on to the chest and shoulders, and sometimes reaching nearly to the knees, is black in front and gray behind; in the young bucks and the does at all ages it is confined to the chin." The horns are very different from those of other goats, rising straight up from the forehead, spreading sideways, so as to form a V when seen from in front, and spirally twisted. Specimens have measured 50 inches along the spiral keel. Several distinct local varieties of markhor are known to the Himalayan hunters, who regard this animal as one of the most excellent objects of sport in that region of prime game animals. "Unlike the ibex, which keeps to the rugged crags and steep ravines above the limits of the forest, the markhor delights in rocky forests, and although it occasionally comes out into the open glades, it seeks concealment as much as possible." Hence its hunting calls for the greatest skill as well as endurance. This goat is often captured, tamed and crossed with domestic goats; and it is believed to have had some influence in originating the Angora breed. Consult: Lydekker, 'Wild Oxen, Sheep and Goats of All Lands' (1898).

Marking-nut, an East Indian tree (*Semecarpus Anacardium*) of the cashew family, having a fruit the receptacle of which is roasted and eaten. The black juice of the unripe fruit serves with quicklime to make an indelible marking-ink.

Markings of Animals. See COLORATION, PROTECTIVE.

Marks' Mills, Engagement at. On 23 April 1864, a train of 240 wagons, escorted by 1,200 infantry, 400 cavalry, and five guns, all under command of Lieut.-Col. F. M. Drake, 77th Ohio Infantry, left Camden, Ark., for Pine Bluff, to get supplies for Gen. Steele's army, then co-operating with Banks' Red River expedition. At 10 A.M. of the 25th, when at Marks' Mills, on the Camden and Pine Bluff road, about eight miles beyond Saline River, Drake was attacked front and rear, by Gen. Fagan's force of 3,000 men—cavalry, mounted infantry, and two batteries—and after a hard fight of more than three hours, during which Drake was severely wounded, and had lost 250 in killed and wounded, the entire train, guns, and the greater part of the cavalry and infantry were captured. About 300 escaped and made their way to Little Rock and Pine Bluff. Incomplete Confederate

MARL — MARLBOROUGH

returns show a loss of 41 killed, 108 wounded, and 144 missing. Fagan's entire loss was about 420. When Steele heard of the disaster he immediately abandoned the idea of joining Banks, left Camden on the night of the 26th for Little Rock, was followed by Sterling Price, had a rear-guard fight at Jenkins' Ferry on the 30th, and continued his retreat to Little Rock. Consult: 'Official Records,' Vol. XXXIV.

E. A. CARMAN.

Marl, a mixture of carbonate of lime and clay in various proportions. If the lime predominate the marl is called calcareous; clay marl, or argillaceous marl, has a larger proportion of clay. As marl is hard or not it is called indurated or earthy. Even the more solid marls crumble soon on exposure to the atmosphere, and form a paste if dipped in water; they effervesce in acids, because of the presence of carbonate of lime. Marl occurs in masses and beds, is associated with chalk, gypsum, sand, clay, or compact limestone, and contains important fossil remains. To the presence of carbonate of lime in its composition, marl owes its use as a fertilizer. Hence it happens that many natural mixtures used as manures are called marls, such as the New Jersey green sand-marls, which contain as their principal constituents clay and greensand and usually only 1 or 2 per cent of carbonate of lime. The latter use of the word is scarcely justifiable, especially as it is sometimes applied, notably in England, to substances containing no lime at all.

Marlboro, mār'l'būr-ō, Mass., city, in Middlesex County; on the Boston & M. and the New York, N. H. & H. R.R.'s; about 28 miles west of Boston and 15 miles east of Worcester. Marlboro was settled in 1656 by a colony from Sudbury, Mass., and four years after was incorporated as a town. In 1890 it was chartered as a city. During King Philip's War (1676) the Indians destroyed nearly the whole town. The chief manufactures are boots and shoes, shoe-making machinery, automobiles and automobile-tires, bicycles, carriages and wagons, lamps, electrical machines and supplies, boxes, hose-pipe, wooden-ware, cigars, and machine-shop products. The principal buildings are the high school, city-hall, Saint Ann's Convent and Academy, a public library, G. A. R. building, and a number of churches and schools. The mayor is elected annually and has power to appoint, subject to approval by the council, the police and the members of the street and fire departments. He also appoints the members of the license department. The council elects the members of the health, poor, and water departments. The waterworks are owned and operated by the city. Pop. (1890) 13,805; (1900) 13,607. Consult Hudson, 'History of the Town of Marlboro, Massachusetts.'

Marlborough, mār'l'būr-ō, or māl'būr-ō, John Churchill, Duke of, English general and statesman: b. Ashe, Devonshire, 1650; d. Blenheim 16 June 1722. At 12 he became page to the Duke of York (afterward James II.), by whom at 16 he was appointed an ensign. He was present at the siege of Tangiers, and soon after his return rose to the rank of captain. In 1672 he accompanied the Duke of Monmouth to assist Turenne against the Dutch. At the siege of Maestricht he distinguished himself so highly as to obtain the public thanks of the king of

France. On his return to England he was made lieutenant-colonel, and his advancement was rapid. He had a regiment of dragoons presented to him, and strengthened his influence at court by his marriage with Sarah Jennings, an attendant upon the princess, afterward Queen Anne. In 1682 he obtained the title of Baron of Aymouth, and on the accession of James II. was sent ambassador to France, and soon after his return created Baron Churchill of Sandbridge, and raised to the rank of general. The same year he suppressed the rebellion of the Duke of Monmouth. On the arrival of the Prince of Orange he joined him at Axminster, and was rewarded by the earldom of Marlborough, and the appointment of commander-in-chief of the English army in the Low Countries. The following year he served in Ireland, where he reduced Cork, Kinsale, and other places. In 1691 he was suddenly dismissed from all his employments and committed to the Tower on the charge of high treason, but soon obtained his release: though it appears that the suspicions against him were not without foundation. On the death of Queen Mary he was made a privy-councillor, and appointed governor to the young Duke of Gloucester; and in 1701 was created by King William commander-in-chief of the English forces in Holland, and ambassador plenipotentiary to the States-General. On the accession of Queen Anne in 1702, he was created captain-general of all the forces at home and abroad, and sent plenipotentiary to The Hague. There he was also made captain-general by the States. In the campaign of the same year he drove the French out of Spanish Guelders, and took Liège and other towns, for which he was created Duke of Marlborough. In 1704 he stormed the French and Bavarian lines at Donauwörth, and in the same year, with Prince Eugene, gained the victory of Blenheim (13 August) over the French and Bavarians, headed by Marshal Tallard and the Elector of Bavaria. The nation testified its gratitude by voting him the manor of Woodstock and Blenheim Palace, one of the finest seats in the kingdom. In the campaign of 1707 his antagonist was the famous Duc de Vendôme, over whom he gained no advantage; and on his return he found that his popularity at court was on the decline. In 1708 with Prince Eugene, he gained the battle of Oudenarde. In 1709 he defeated Marshal Villars at Malplaquet (11 September) though at a cost ill repaid by the capture of Mons, and in 1710 with Prince Eugene gained another victory over Villars. During his absence a new ministry, hostile to himself, was chosen, and on his return his command was taken from him, and a prosecution commenced against him for applying the public money to private purposes. He went in disgust to the Low Countries in 1712, but returned a short time before the queen's death, and on the accession of George I. was reinstated in the supreme military command. Consult: Coxe, 'Memoirs of the Duke of Marlborough' (1847-8); Alison, 'Military Life of the Duke of Marlborough' (1879); Saintsbury, 'Marlborough' (1879).

Marlborough, New Zealand, the north-eastern provincial district of South Island, bounded by the sea and the provincial district of Nelson. Its extreme length is 130 miles, breadth 60 miles; area, about 3,000,000 acres.

MARLIN — MARMONTEL

The coast is deeply indented by bays and natural harbors, from which the hills rise abruptly, clothed with magnificent forests. The district is generally hilly or mountainous, with splendid scenery. The amount of arable land is restricted; in the south are the Wairau Plains, one of the finest sheep tracts in New Zealand. Blenheim, the capital, is connected by rail with the seaport of Picton on Queen Charlotte Sound. Pop. (1901) 13,326.

Marlin, Texas, city, county-seat of Falls County; on the Houston & T. C. and the International & G. N. R.R.'s; about 150 miles northwest of Houston and 26 miles southeast of Waco. It is situated in an agricultural region in which cotton is the chief product. The industrial establishments include a large cottonseed-oil mill, several cotton gins, and a cotton compress. The trade is chiefly in cotton and live stock. Marlin has a hot water artesian well, 3,350 feet in depth, with a temperature of 147° F. The waters possess medicinal properties which attract a large number of health seekers to the city. Some of the principal buildings are a central school building, fine hotels, sanatoriums, an opera house, and a court-house. Pop. (1890) 2,058; (1900) 3,092.

Marlin, a sportsman's name for the god-wit (q.v.).

Marling Spike, or **Marline Spike**, an iron pin tapering to a point, and principally used by sailors to separate the strands of a rope in splicing or knotting. A large wooden pin used for the same purpose is called a *fid*.

Marlitt, E. See JOHN, EUGENIE.

Marlowe, *mār'lō*, **Christopher**, English poet and dramatist: b. Canterbury, February 1564; d. Deptford June 1593. He was educated at Cambridge, afterward settled in London, and became an actor as well as a writer for the stage. Besides his tragedies of his own composition, the best known of which are 'Tamburlaine the Great' (1590); 'Edward II.' (1594); 'Dr. Faustus' (1604); and the 'Jew of Malta' (1633), he left some translations. Marlowe was the greatest genius of all the English dramatic writers before Shakespeare, between whom and the moralities (see MORALITY) he may be considered one of the connecting links. Notwithstanding defects in construction, and a certain amount of extravagance or even bombast, Marlowe's tragedies are works of high ability. Popular in his own day, it is only in recent times that his eminence as a poet and dramatist has been duly appreciated. His hand has been traced in the 2d and 3d parts of Shakespeare's 'Henry VI.' in 'Titus Andronicus' and in 'Edward III.' There are complete editions of works by Dyce (1850), Cunningham (1871), and Bullen (1888); and five plays are edited by H. H. Ellis in the 'Mermaid Series' (1887). Consult: Symonds, 'Shakespeare's Predecessors' (1884); Lewis, 'Christopher Marlowe' (1886); Verity, 'Marlowe's Influence on Shakespeare' (1886); Fisher, 'Zur Charakteristik der Dramen Marlowes' (1889).

Marlowe, **Julia** (MRS. TABER), American actress: b. (Sarah Frances Frost), Caldbeck, Cumberlandshire, England, 17 Aug. 1870. She came with her parents to the United States in 1875. In 1882 she joined the Juvenile Opera Company, which presented 'Pinafore,' 'The

Chimes of Normandy,' and other light operas, in which she was known as Frances Brough. Subsequently she took a child's part in 'Rip Van Winkle.' She then retired, studied in New York for three years, and then made her metropolitan debut as Parthenia in 'Ingomar.' In 1888 she began to star in the United States in Shakespearian and other romantic and tragic roles.

Mar'maduke, **John Sappington**, American soldier: b. Saline County, Mo., 14 March 1833; d. Jefferson City, Mo., 28 Dec. 1887. He studied at Yale and Harvard and graduated from West Point in 1857, and served in the United States army in the West. At the outbreak of the Civil War he entered the service of the Confederate States and rose to the rank of major-general. In 1864 he was captured and was not released until after the close of the war, when he went abroad for a time, and on his return engaged in business and also in journalism. He was defeated for the governorship of Missouri in 1880, but in 1884 was elected and served until his death.

Mar'mala Water, a fragrant liquid distilled in Ceylon from the flowers of the Bengal quince (*Ægle Marmelos*). It is used by the natives as a perfume.

Mar'malade, a jellied or gelatinous preparation made from quinces, peaches, apricots, or oranges, and portions of their rinds, with a mixture of sugar and spice. It is made like the ordinary jams, poured out warm into pots or jars, and sold in commerce as a confection.

Mar'mion, a narrative poem by Sir Walter Scott (q.v.), published in 1808. Its hero is an English knight of that name, who, after various adventures in Scotland, dies at Flodden.

Marmol, *José, hō-sā' mār-mōl'*, Argentine author: b. Buenos Ayres 5 Dec. 1818; d. there 12 Aug. 1871. He was a pronounced Democrat, was banished by Rosas, led the opposition against that dictator, and on its successful termination became senator and librarian of Buenos Ayres. A fervent orator Marmol is better known as the author of 'La Amalia' (1866), a historical novel dealing with Rosas' dictatorship, of the popular patriotic poem 'El 25 de Mayo de 1843,' and of various dramas.

Marmont, **Auguste Frédéric Louis Viesse de**, *ō-güst frā-dē-rēk loo-ē vē-ēs de mār-mōn*, Duke of Ragusa and Marshal of France: b. Chatillon-sur-Seine, France, 20 July 1774; d. Venice 2 March 1852. He entered the army as a lieutenant of infantry in his 15th year. In 1792 he changed to the artillery, and at Toulon became acquainted with Bonaparte, who chose him for his aide-de-camp. In the campaign of 1813 he held the command of an army corps in Germany, and fought in the battles of Lützen, Bautzen, and Dresden. In 1814 he fought a final battle under the walls of Paris, but opposition appearing fruitless surrendered to the allies. This proceeding was one main cause of Napoleon's immediate abdication, and brought Marmont into favor with the Bourbons. After the Restoration Louis XVIII. made him a peer of France, but he was compelled to withdraw from Paris by the revolution of 1830, and his name was struck off the army list.

Marmontel, **Jean François**, *zhōn frān-swā mār-mōn-tēl*, French writer: b. Bort, Limousin.

MARMORA — MARONITES

sin, France, 11 July 1723; d. Abbeville, Eure, 31 Dec. 1799. He was educated for the Church, but turned to letters, and became a journalist and dramatist at Paris. In 1758-9 he edited 'Le Mercure,' and in 1763 was elected to the Academy. He wrote tragedies, including 'Denys le Tyran' (1748) and 'Aristomène' (1749); 'Contes moraux' (1761); and the works of fiction, 'Béhsavie' (1767) and 'Les Incas' (1778). His 'Poétique Française' (1763) and 'Eléments de Littérature' (1787) have perhaps a more permanent worth. A collected edition of his writings appeared in 1786-7.

Marmora, mār'mō-rā, or **Marmara**, Sea of (anciently *Propontis*), an inland sea, lying between southeastern Europe and the westernmost part of Asia, communicating with the Mediterranean by the narrow strait called the Dardanelles, and with the Black Sea by the Bosphorus. Length from Gallipoli to the head of the Gulf of Izmid, 177 miles; greatest breadth, which is near the centre, rather more than 50 miles; average depth, over 600 feet; maximum depth, 4,000 feet. The gulfs of Izmid and Moudania, on the Asiatic side, are the chief indentations. The largest of several islands is Marmora, famous for its quarries of marble and alabaster, situated near its western end; at the eastern end, on the Asiatic coast, and not far from Constantinople, is a group called the Princes Islands. A current sets from the Black Sea into the Sea of Marmora, which in turn runs into the Archipelago. The tides are hardly perceptible, and the navigation is easy.

Mar'moset, a small American monkey of the family *Hapalidae*. They inhabit the Brazilian forests, possess long, non-prehensile tails, have a thick woolly fur, and bear a close resemblance to squirrels in appearance and movements, having long hind legs and penciled ears. They are notable, further, for the relatively large size of the brain and the few teeth (32), likening the family more to the monkeys of the Old World than to those of the other American family (*Cebidae*). They are favorite pets, not only on account of their quaint prettiness, but because of their gentleness and intelligence; but they are exceedingly delicate and rarely survive a change of climate. Their food is varied.

The family includes many species which fall into two divisions—the genus *Hapale* and the genus *Midas*. The former contains the typical marmosets, or oquistis, as the French call them, of which one species (*H. jacchus*) has long been a familiar pet; and the latter, the silky marmosets or tamarins, which are larger and more varied in their colors and in their ornamental tufts and crests. The best known species is the marikina (*M. rosalia*).

Mar'mot, a large ground-squirrel of the genus *Arctomys*, having terrestrial habits, rather coarse fur, no cheek-pouches, short limbs, and powerful digging claws. In size they vary from about 15 to 25 inches in length, the tail adding from 3 to 12 inches. Several species inhabit the northern parts of the world, in southerly climates, keeping themselves mostly upon mountain heights, but farther north inhabiting lower levels, preferring open or thinly wooded plains. All dig and dwell in burrows, some species gathering into extensive colonies, the hillocks about

the mouths of the burrows forming communities similar to the "towns" of the prairie-dogs; while other species dwell in families far apart from one another. They feed upon herbage and grow very fat in the autumn preparatory to hibernation during the cold months, when their dormancy is complete. Their underground sleeping-chambers are warmly furnished with dry leaves and hay.

The European marmot (*A. alpinus*) is found in plenty on the Alpine range, equals a rabbit in size, and is light brown in color. It lives immediately below the snow line, and subsists on vegetables, insects, and roots. They come forth from their burrows during the month of April, and are said to be readily tamed. The bobac, another European species (*A. bobac*), inhabits Poland, Russia and all northern Asia. A third species is found in the Himalayan ranges; and a fourth (*A. caudatus*), the largest and handsomest of the family, dwells in the valleys of their southerly slopes. These little animals are of great value to the wandering natives of northern and central Asia, who utilize both their skins and flesh. America has two marmots, one of which is the siffleur or whistler of the tops of the northern Rocky Mountains, and the other the familiar eastern woodchuck. The former takes its name from the loud eerie whistle with which it wakes the echoes of the crags about the lone pastures above timber-line, where it makes its home; it was of great service to the mountain Indians. Other species or varieties occur in the southern mountains of the Western States.

The woodchuck, or ground-hog (*A. monax*), is a heavy, broad-headed, grizzled animal of the woods and fields, yellowish to whitish gray in color, blackish on the back and crown, and chestnut on the belly; with the feet and tail brownish black. It abounds throughout the whole country east of the dry plains, and flourishes in spite of civilization, as the farmers' meadows and gardens supply it with an increased supply of good food, and mankind thins out its worst enemies, such as wildcats, foxes, weasels, the larger serpents and birds of prey; none of these save the first is much to be feared by the full-grown woodchucks, but may kill many of the young. As a result the animals have become unpleasantly numerous in some districts of the Eastern States, where their depredations upon gardens and certain plantations, as of lettuce and celery, are often serious. Consult: Lydekker, 'Royal Natural History,' Vol. III. (1895); Stone and Cram, 'American Animals' (1902).

Marne, mār'n, France, a river, the chief affluent of the Seine, rising in the plateau of Langres, flowing northwest past Châlons to Eprenay, thence westward, joining the Seine at Charenton, four miles above Paris. Its length is 326 miles, 126 of which are navigable to Saint Dizier. It is connected by canals with the Rhine, the Aisne, and the Seine.

Marocco, ma-rōk'ō. See MOROCCO.

Maronites, mār'ō-nits, a sect of eastern Christians, whose origin was a consequence of the Monothelite controversy. In the 7th century the opinion that Christ, though he united in himself the divine and human natures, had but one will arose among the eastern nations. But when their last patron, the Emperor Philipppus Bardanes, was deposed and exiled in 713, the

MAROONS — MARQUESAS

Monothelites were condemned and banished by his successor, Anastasius. The remnant of this party survived in the Maronites (so named from their founder Maron),—a society of monks in Syria, about Mount Lebanon, which is mentioned as early as the 6th century. Another monk, John Maro, or Marum, also preached Monothelitism there in the 7th century. Regarded as rebels by the Melchites (q.v.), or Christians who adhered to the opinions of the emperor, they became, in the country of Lebanon, which is now called Kesrawan, a warlike mountain people, who defended their political as well as their religious independence boldly against the Mohammedans, and who even now, under the Turkish government, resist the payment of a tribute, like the Druses. The political constitution of the Maronites is that of a military commonwealth. Governed by their ancient customary rights, defended from external attacks, they support themselves among the mountains by husbandry and the produce of their vineyards and mulberry-trees. The revenues of all their orders of ecclesiastics are very small, but a common spirit unites them, and in simplicity of manners, temperance, and hospitality, they resemble the ancient Arabians. Revenge for murder is permitted among them, and as a sign of nobility they wear the green turban. Their church constitution resembles very much that of the old Greek Church. Since the 12th century they have several times submitted to the Pope, and joined the Roman Catholic Church, without giving up their own peculiarities. At last Clement XII. induced them to accept the decrees of the Council of Trent at a synod held in 1736 at their convent of Marhanna. After this synod their priests still retained the right to marry, after the manner of the Greek Church; and they continued to administer the sacrament under both forms. The use of the Arabic language was preserved in the church service. Mass was read only in the ancient Syriac. Their head is called the Patriarch of Antioch, although his residence is in the monastery of Kanobin, upon Mount Lebanon; and he gives an account every 10 years to the Pope of the condition of the Maronite Church. Under him are the bishops and other clergymen, who form seven degrees of rank. In Kesrawan are over 200 Maronite convents and nunneries, containing in all from 20,000 to 25,000 members who profess the rule of St. Anthony, and devote themselves to agriculture and gardening. Since 1584 there has been a Maronite college established at Rome for the education and training of their clergy. At present the Maronites are supposed to number about 350,000, and these are distributed into 150 parishes. In consequence of the sanguinary conflicts between the Maronites and Druses, June 1860, both communities are now subject to one governor appointed by the Porte, with the title of governor of the Lebanon. See DRUSES.

Maroons', the name given to runaway negro slaves in Jamaica and in some parts of South America. The name seems to be equivalent to mountaineers, being derived from Spanish, *cimarron*, a fugitive negro or maroon, from *cima* (same as French *cime*), a summit or hill-top. In many cases runaway negroes, taking to the forests and mountains, rendered themselves formidable to the colonists, and sustained a long and brave resistance against the whites. When

Jamaica was conquered by the English in 1655 about 1,500 slaves retreated to the mountains. They continued to harass the island till 1795, when they were finally reduced by the aid of bloodhounds. Some of them were removed to Nova Scotia, and afterward to Sierra Leone. Consult: Dallas, 'History of the Maroons.'

Maroquin, mār-ō-kēn'. See MOROCCO (leather).

Marozia, mā-rō'zī-a, Roman lady of infamous reputation, known for her influence at the Papal court: d. Rome 938 A.D. She was the daughter of Theodora (q.v.). According to Luitprand she was the mistress of Pope Sergius, but this is now denied as lacking historical foundation. As mother of John XI., and grandmother of John XII. and Leo VII., she exercised great influence on the political affairs of her time in Italy. She repented and died in a convent.

Marquand, mār-känd', Henry Gurdon, American banker and philanthropist: b. New York city 11 April 1819; d. 26 Feb. 1902. He was educated in Pittsfield, Mass., and for 20 years was in the real estate business, afterward becoming a banker and acquiring an interest in various railways and other commercial enterprises. He was a generous patron of the Metropolitan Museum of Art, to which he gave valuable paintings, etc., and among his other benefactions are a pavilion to Bellevue Hospital and a gymnasium and a chapel to Princeton University.

Marque, mārĕ, **Letter of**, a commission granted to the commander of a merchant ship or privateer to cruise against and make prizes of the enemy's ships and vessels, either at sea or in their harbors, under pretense of making reprisals for injuries received. The ship so commissioned is also called a letter of marque or mart. These letters are grantable by the law of nations, but the sovereign power must be called in to determine when reprisals may be made.

Marquesas, mār-kā'sās, or **Mendaña** (mēn-dā'ña), **Islands**, or **Les Marquises**, Polynesia, an island group in the South Pacific Ocean, lat. 8° to 11° S.; lon. 138° 30' to 143° W. belonging to France since 1842, and composed of 12 islands and islets divided into two groups, the northern and southern. The largest islands are Nukahiva and Hiva-ōa. The coasts are generally inaccessible, rising from the water like walls; but in Nukahiva there are some excellent natural harbors. The islands are generally high, some of their mountains reaching an elevation of over 4,000 feet; the intervening valleys are fertile, picturesque, and copiously watered by streams which form numerous cascades. The principal food productions are pulse, yams, cocoanuts, sugar-cane, cotton, and bamboos; hogs also are numerous. The men are well-formed, active, powerful, and all tattooed. The women have regular features, good complexions, fine teeth, and neat hands, and are the finest of the sex to be met with in Polynesia. The people of these islands were formerly cannibals, and though this practice has been discontinued cruelty and ferocity are prevailing characteristics, and the efforts of the missionaries have met with but little success. The Marquesas were discovered in 1595 by Alonzo Mendaña de Neyva. They were subsequently visited and described by Cook and

MARQUETRY — MARQUETTE

the Forsters in 1774, when Hood's Island was added to the group. In 1797 three more were discovered by Ingraham, an American captain, and were named Washington Islands. In 1842 they acknowledged the sovereignty of France. The population steadily decreased during the 19th century, in 1876 being 5,420, in 1900, 4,300.

Marquetry, mār'ket-rī (French, *marqueterie*), inlaid cabinet-work in which thin slices of different colored wood, sometimes of ivory, pearl, shell, or metal, are inlaid on a ground usually of oak or fir, well seasoned to prevent warping. The marquetry of Italy possesses much artistic merit. See INLAYING; MOSAIC.

Marquette, Jacques, French Jesuit missionary and explorer: b. Laon, France, 1 June 1637; d. near site of the present Ludington, Mich., 18 May 1675. His recent biographers, M. Alfred Hamy, in 'The Mississippi,' and the Rev. Samuel Hedges, in his book on the burial place of Marquette, tell us that his family was of good social position in his native city. It is evident that he must have had the advantages of early education, as he entered the Jesuit College at Nancy, in 1654, with the intention of joining the Society. He studied and taught, as Jesuit scholastics usually do, at Pont-à-Mouson, Rheims, Charleville, and Langres. In 1666 he was to go as a missionary priest to New France. He arrived at Quebec, 20 Sept. 1666. In the next month, he began his preparation for life among the savages by the study of the Indian languages, at Three Rivers, under the direction of Father Druillettes, who knew all the ways of missionary life. He spent two years in the wilderness, with Father Druillettes's log house as his "home," learning the forest and lake and living, as near as possible, the life of the Redmen. In 1668, Father Marquette was ready to begin work among the Ottawas. From Montreal, he went to Sault Ste. Marie, known to-day as the "Soo," then marked in French records "Sanda Maria" of the Algonquins. The term "Ottawa," as used by the Jesuits, included the Sioux, the Miamis, the Sacs, the Winnebagoes, Foxes, Pottawatomies, Chippewas, Beavers, Creeks, Ottawas, Hurons, Menominees, Illinois, and Hurons. From Sault Ste. Marie, he was sent to La Pointe Mission in Lake Superior. The place selected for his work was at Chequamegon Bay. From 14 Sept. 1669, until 1671, when the mission was given up because of the inability of the Hurons to defend themselves against the Sioux, he served and learned much. Father Marquette probably did not foresee that this abandonment meant that there would be no Christian mission on Lake Superior "for over a hundred years"; as the Rev. Samuel Hedges remarks, "There can be little doubt that the Blackrobe sat in their council circle, and took part in their deliberations, which determined their flight." He says Marquette joined the Hurons in their rush to the South toward the Island of Mackinac, then Machillimackinac. The little town of St. Ignace, named in honor of the founder of the Jesuits, St. Ignatius Loyola, on Moran Bay,—claims the honor of being the spot where Father Marquette built his chapel in 1671. Mackinac Island disputes with St. Ignace the right of precedence, but there can be no doubt, whether a previous mission existed in Mackinac Island or not, that it

was from St. Ignace Father Marquette set out in his search for the Mississippi,—of the existence of which traditions and rumors lived among the tribes.

The quarrels that had deflected the course of Sieur René de la Salle did not, in the end, prevent him from tracing the course of the Mississippi to the sea, and De Soto, earlier, had crossed the valley near its mouth, but it was Marquette who, having equipped himself with the Indian lore added to such scientific knowledge as he could acquire, actually discovered the wonderful stream of the Indian legends. Count Frontenac was the devoted friend of La Salle, but he could not overcome the jealousies raised by the clashing of commercial interests. It has been the fashion to accuse the Jesuits of merely mercenary motives in opposing the opening of the territory of their missions in New France to all trappers and traders. It is plain, human,—putting aside all imputed motives,—that Jesuits like Jogues, Albourg, Druillettes, and a hundred others did not lead lives of unspeakable deprivations and amazing self-sacrifice merely for temporal gain for their Society or their country. When it is known that they were French, it is at once known that they were patriots. And if the Jesuits opposed the mercantile designs of the supporter of La Salle, it must be admitted in the light of after events, that they were safeguarding the interests of their charges. The fate of Jogues and of René Goupil did not deter men like Marquette. It only made them more anxious to teach Christianity or to die. Marquette, like all the missionary priests of his Society, held that it was his duty to contribute to the knowledge of the world. Whether it was the analysis of a dialect or the bending of a river, the Jesuit made each his duty, always remembering the motto of his Society, "To the greater glory of God." Marquette had kept in mind all the talk about the great river and the natives that dwelt upon its banks. He was sent, he believed, as one who must teach all nations, and he did not disdain any knowledge that might help him to this, valuing the knowledge itself, for every Jesuit was a student both of nature and of books. "In fishing and boating about the straits," the Rev. Samuel Hedges writes, "the writer has often been puzzled by what he took for currents from Lake Michigan, as it empties into Lake Huron. But observation and experience showed him that the currents, as he thought them, as often tended toward Lake Michigan as from it. Marquette had noticed this long ago, and in one of his reports to his superiors offers an explanation. Louis Joliet had started to become a Jesuit, but had, instead, become a fur trader. When he was commissioned by the Governor of New France, to look for the great stream that, it was rumored, opened into the Pacific, Father Marquette, who earnestly desired it, was sent by his superiors to accompany him. On 8 Dec. 1672 Joliet reached St. Ignace under his own authorization from De Frontenac and one from Father Marquette's provincial, to claim for God and the king all the land and water they could find.

When the ice broke, on 17 May 1673, Marquette and Joliet set forth. Father Pierson took Father Marquette's place at the mission. Father

MARQUETTE

Marquette was something of a surveyor, and his maps are yet in evidence and very valuable. Two birch canoes that could only hug the shore and not dare the open lakes, and seven men,—five *voyageurs*—made up the expedition. Their stores were barely sufficient, their scientific instruments were, as one can easily imagine, inadequate. They were hopeful, hardy, and they knew every mood of the treacherous lakes and the meanings of all the changes in the weather. Marquette had acquired the quick eye and ear of the Indian, and his mind was supple and well-trained; Joliet was not far behind him in wood and water craft. Still, they followed dim rumors. The most interesting of Marquette's reports is that of the second halt at the Indian village of Mascouten, on Lake Winnebago. They had reached the "jumping off" place. Their first halt was at De Pere, the Mission St. Francis Xavier, to which Father Marquette had been recently assigned. They reached Lake Winnebago by way of the Fox River. From Green Bay,—the Mission St. Francis,—they went to Lake Winnebago, and, from thence, accompanied by the Indian guides, they ascended the upper Fox River and entered the Wisconsin, on 10 June 1673. After seven days of hard paddling, they entered the Mississippi on 17 June. The report of this expedition on which we must rely for information is Marquette's,—Joliet's having been lost in the upsetting of his canoe at the La Chine Rapids, near Montreal. It is included in the 'Jesuit Relations,' and quoted by John Gilmary Shea, Sparks, Parkman, Thwaites, Hedges, and all who have written of the early days of the Northwest. Dr. Shea, in his 'Discovery and Exploration of the Mississippi Valley,' estimates the distance traveled by Marquette and Joliet from St. Ignace to Green Bay (Mission St. Francis Xavier), at 218 miles. General Wood, Inspector-General United States Army, makes the whole distance traveled 2,549 miles, but he omits the distance from St. Ignace to Green Bay. Marquette and Joliet explored the Mississippi for 300 miles in solitude. Marquette describes the river at its junction with the Missouri as turbulent in the extreme. Marquette was pleased by the treatment received at the first village of Illinois Indians. They met Indians who showed traces of civilization; they were tormented with mosquitoes and they saw traces of iron. At the mouth of the Arkansas, they met with great kindness from the Indians. From the Illinois,—believing the route to be shorter,—they went, it is asserted, to a point near Chicago. By portage, at Sturgeon Bay, they saved time and strength, and from the Green Bay into the Fox River, they reached the Mission St. Francis,—having spent, from the beginning of their ascent of the newly discovered river, on 17 July, about two months,—four months, in all, of almost incessant hardship since they began their voyage on 17 May 1673. Further journeying was out of the question. Marquette and Joliet had not much strength left. A journey of nearly 3,000 miles, in birch canoes, had told on them, hardy as they were. Marquette spent 13 months at De Pere, endeavoring to regain his health. He knew well the stupendous importance of what he had done for France and for the world; but his business was with souls. While Joliet went to Montreal to report, Marquette started

to found a new mission in Illinois. He left the Mission St. Francis on 25 Oct. 1674, with 10 canoes; he arrived at the Chicago River 4 December. The description of the carrying of the canoes through the forests gives a glimpse of the difficulties the missionary expected to encounter. The inundations of 30 March 1675 destroyed their hovel. At Haskasian Marquette's heart was filled with gratitude by the kindness he received. His desire for exploration led him, while using his strength in ministering to the Indians, to explore Lake Michigan farther. He grew weaker, and turned to the North. Through the river,—now Pere Marquette,—he made his homeward way. On Saturday, 18 May 1675, he died. The Ottawas,—under that name were included the tribes under the Jesuits in the Lake regions,—had among them several Hiskakons, to whom Marquette had been much devoted. These, going northward in the spring, raised his body, reverently prepared it according to the mode of their tribe, took it to the Mission St. Ignace, where Fathers Nource and Piersin awaited it. On Tuesday, 9 June 1676, Marquette was buried in the centre of the chapel of St. Ignace, a building which was destroyed by fire in 1706. In September 1877, Father Edward Jacker, pastor of St. Ignace, discovered the grave and remains of the great and good explorer, and they rest under a monument erected by the citizens of St. Ignace in 1882.

Marquette, mār-kēt', Mich., city, county-seat of Marquette County; on Lake Superior, and on the Duluth, S. S. & A., and the Lake Superior & I. R.R.'s; about 58 miles north by west of Escanaba, on Lake Michigan. The first permanent settlement was made in 1809 after public accounts had been given of the mineral wealth of the Upper Peninsula. It was incorporated in 1851 and chartered as a city in 1869. It was named after Père Marquette (q.v.) who had visited this section as a missionary to the Indians. It has a fine harbor with a break-water 3,000 feet in length, and the best of facilities for loading steamers with the minerals, especially iron ore, which are shipped from here in large quantities. The ore docks are the largest and best fitted of any in the country. It has steamer communication with all the important lake ports. Near the city are large quarries of brownstone which furnish employment to a number of people. The chief industrial establishments are a planing-mill, two blast furnaces, steam-engine works, and the stone quarries, all employing about 800 men. Other smaller industries are the manufacturing of furniture, sash, door, and blinds, and bricks. The principal buildings are a government building which cost \$150,000, a county court-house, cost \$250,000; Peter White Library, the building cost \$75,000, and the 15,000 volumes are valued at \$30,000; a city hall, cost \$60,000. The educational buildings are a State Normal School, which cost \$150,000, eight public schools, cost \$500,000, a manual training school, and Saint Joseph's Academy. It has Protestant Episcopal and Roman Catholic cathedrals, Saint Mary's Hospital, the Upper Peninsula State Prison, and a House of Correction. The Federal Government presented to the city Presque Isle, about 400 acres, a short distance north of the city

MARQUEZ — MARRIAGE AND DIVORCE

proper. The place has been improved and made into a beautiful park. A statue of Père Marquette is in a city square, near the shore. The three banks have a combined capital of \$400,000, and the annual business amounts to \$7,500,000. The government is vested in a mayor and a council of 16 members who are elected annually. The electric-light plant and waterworks are owned and operated by the city. Pop. (1890) 9,093; (1900) 10,058.

Editor 'Mining Journal.'

Marquez, José Arnaldo, hō-sā' ār-nāl'dō mār-kāth, Peruvian poet: b. Peru about 1825; d. Lima 15 Jan. 1881. For participation in civil wars he was several times banished in the earlier part of his career and he lived variously in Chile, Cuba, and the United States. Among modern Peruvian poets Marquez takes high rank. He published: 'Lost Notes' (1862); 'Flor de Abel,' etc., and in prose 'El Peru y la Espana moderna'; and 'Recuerdos de un viaje á los Estados Unidos de America.' He lost his life in the defense of Lima against the Chileans.

Marquez, Leonardo, Mexican soldier: b. Mexico about 1820. In 1849 he appeared as the leader of a movement in support of Santa Anna, and under Santa Anna's last administration he had important posts in the army (1853-5). He fought against Juarez in the "Reform" war, and favored the establishment of Maximilian's empire. In October 1866 Maximilian made him a division commander, and in March 1867 sent him to Mexico City to form a cabinet and raise troops for the relief of Querétaro. But he was hemmed in by Diaz, and after Maximilian's execution, resigned and went to Havana. He was frequently called "the tiger of Tacubaya," from his execution there of a large number of prisoners (11 April 1859); though he alleged the express order of Miramon as an explanation. He was exempted from the amnesty of 1870.

Marquis, mār'kwis, or **Marquess** (Italian, *marchese*; French, *marquis*; German, *markgraf*), a title of honor next in dignity to that of duke. Marquises were not known in England till King Richard II., in the year 1385, created his great favorite Robert Vere, the earl of Oxford, Marquis of Dublin. In 1397 the same king raised John de Beaufort, earl of Somerset, to the rank of marquis, a dignity which he afterward refused to bear from its being an innovation. The title fell into disuse until the reign of Edward VI., who created the Marquisate of Winchester in 1551. The title given a marquis in the style of the heralds is *most noble and potent prince*.

Marrakesh. See MOROCCO.

Marriage, a solemn contract between a man and woman, by which they are united for life, and assume the legal relation of husband and wife. It has existed in all ages and probably in all nations, though with very different degrees of strictness. It is not the invention of legislators, but arose from the instincts and necessities of society, and its continuance has been provided for by the dictates of experience. Different localities have different forms of the institution, the most broadly marked of which are connected with the right to have only one wife — *monogamy*; or a plurality of wives — *polyg-*

amy. The latter, in addition to its implying permission to have more wives than one — *polygamy*, is held to include the permission for a woman to have several husbands — *polyandry*, a state of society which, however repugnant to our notions, is known to have existed in ancient times, and still exists in various localities, as in Tibet. Among the most civilized communities monogamy is the prevailing practice, possessing among other advantages a simplicity in defining the obligations of parents to their progeny not easily attainable where polygamy is allowed. There are three modes of acquiring property — capture, gift, or sale; and as in the earliest times a man's daughters were regarded as his property, he parted with them only on recognized commercial principles. Hence in ancient law the marriage relation is founded on the contract of sale, and the wife came into the possession of her husband, like other chattels, when delivery had been made after payment of the stipulated price. Therefore the conducting of the bride to her husband's house was an important and generally an imposing ceremony. The parties themselves were seldom consulted in cases of marriage, the arrangements being instituted and completed, and the contract carried out, by the heads of the families. In the progress of civilization, however, the children were allowed greater freedom of action, and effect was given to individual likings by permitting a choice. The common law now treats marriage as a civil contract, and holds it to be valid only where it is entered into by persons able and willing to contract according to established solemnities. It is essential that each of the parties must have exercised free-will, for it is the consent which constitutes the marriage. Though the Roman Catholic Church ranks it among the sacraments, and religious observances are almost everywhere customary on its celebration, the law regards it as nothing more than a civil contract. For a detailed survey of modern matrimonial methods see MARRIAGE AND DIVORCE IN THE UNITED STATES.

Marriage and Divorce in the United States. I. MARRIAGE.—The foundation of the marriage laws of the United States was laid long before the Revolution. Important features have been pruned away and others have been changed or added; but in outline the existing forms of celebration, the modes of registration, and the essential elements of matrimonial jurisprudence had already arisen. After the Reformation it was inevitable that the state should sometime take control of the marriage institution. This was first realized by the Puritans in the Netherlands. On 1 April 1580, after the independence from Spain had been declared, the provinces of Holland and East Friesland established a civil marriage form, permissively even for the members of the Reformed Church, and in principle this law was adopted by the States-General for the United Provinces in 1656. Already in England Milton was arguing that ministers should not "meddle" with marriages; and in 1653 the great civil marriage ordinance of Cromwell was passed. By this act obligatory celebration before a justice of the peace was instituted; and a careful system of lay notice, certificate, and record was established. Furthermore the same ideas actuating their brethren in England and Holland were bearing fruit among the Puritans and Independents in America.

MARRIAGE AND DIVORCE

From the beginning, in all the New England colonies, obligatory civil marriage was either practised or authorized by law. Considering the times an excellent system of notice, license, and registration was speedily developed. Save for the brief period of the Commonwealth, the mother country had nothing to compare with it until the civil marriage laws of 1836 appeared. For many years celebration before a clergyman as such was illegal. The first marriages solemnized by religious rites took place in the Andros period. But later throughout New England the religious ceremony was sanctioned; and long before the close of the provincial era the present dual system of lay or religious celebration, at the option of the contracting parties, was in full use. In the middle colonies also the optional plan existed; but the matrimonial laws of the South were enacted mainly under the influence of the Established Church. In Maryland, however, until 1777 either the religious or the lay celebration was permitted; except that after 1717 members of the Established Church were required to conform to the English ritual. Under restrictions in favor of the church civil marriage was likewise permitted in the Carolinas; and by custom the optional system seems also to have existed in Georgia, where before the Revolution there was no legislation on the subject. In Virginia the religious ceremony according to the forms of the English Church was prescribed. Not until 1780 were dissenters there allowed to celebrate wedlock according to their own rites; while three years later was taken the first step toward civil marriage. But in Virginia as well as in the Carolinas the dissenters often took the law into their own hands, marrying in accordance with their own religious customs, or resorting to the civil magistrate. At the Revolution, therefore, it seemed clear that the American type of matrimonial law and administration, as first developed in the New England colonies, must eventually triumph throughout the land. Yet, if after a century and a quarter of legislation, the fifty-three codes of matrimonial law now existing in the States—using "States" in this article to include the continental and insular districts and territories—reveal in their broader features an approximation to a common system; in their details they disclose almost infinite diversity and conflict, often attended by a want of clearness and precision.

State Laws.—Everywhere in effect, though not always expressly, matrimony is treated as a relation partaking of the nature of both contract and status. Many of the States have enacted formal definitions. In Indiana, Oregon, and Washington marriage is defined briefly as a civil contract; in Arkansas, Colorado, Indian Territory, Iowa, Kansas, Missouri, Nebraska, New Mexico, Oklahoma, and Wyoming, as a civil contract to which the consent of parties capable in law of contracting is essential; in Michigan, Minnesota, Nevada, New York, and Wisconsin it is such a contract "so far as its validity in law is concerned"; while in Alaska it is a civil contract which may be entered into by males of 21 and females of 18 years, otherwise capable. The code of Porto Rico declares that "marriage is a civil institution, originating in a civil contract whereby a man and a woman mutually agree to become husband and wife

and to discharge toward each other the duties imposed by law. It is valid only when contracted and solemnized in accordance with provisions of law." Several commonwealths have sanctioned a definition which seems to imply the element of status in the marital relation. Thus by the laws of California, Idaho, Montana, North Dakota, and South Dakota, marriage is a personal relation, arising out of a civil contract to which the consent of parties capable of making it necessary. In North Dakota, although marriage is a personal relation so arising, it must be "entered into, maintained, annulled, or dissolved" only as provided by law; in California, since the reform of 1895, consent must be followed by a solemnization authorized by the code; and in South Dakota the consent to a marriage "must be to one commencing instantly, and not to an agreement to marry afterwards." The law of Ohio is similar; and in Idaho and California neither party to a nuptial contract is "bound by a promise made in ignorance of the other's want of personal chastity, and either is released therefrom by unchaste conduct" of the other, unless both participated therein. The law of Louisiana "considers marriage in no other view than as a civil contract. . . . Such marriages only are recognized by law as are contracted and solemnized according to the rules which it prescribes." Since they are thus considered by the law merely as civil contracts, "it sanctions all those marriages where the parties, at the time of making them, were (1) willing to contract; (2) able to contract; (3) did contract pursuant to the forms and solemnities prescribed." In Georgia, "to constitute a valid marriage . . . there must be (1) parties able to contract; (2) an actual contract; (3) consummation according to law." To constitute an actual contract "the parties must be consenting thereto voluntarily, and without any fraud practised upon either. Drunkenness at the time of marriage, brought about by art or contrivance to induce consent," is held to be a fraud.

The Age of Consent.—The statutes of most of the States prescribe the minimum age of consent to marriage—not to be confused with the "age of consent" to carnal union under the criminal laws enacted to protect a child from legally agreeing to her own ruin; and where the statute is silent the common law age of 12 years for females and 14 for males is probably in force. For males the age is 21 in Alaska and Washington; 18 in Arizona, California, Delaware, Idaho, Indiana, Michigan, Minnesota, Montana, Nebraska, Nevada, New Mexico, New York, Ohio, Oklahoma, Oregon, Porto Rico, South Dakota, West Virginia, Wisconsin, and Wyoming; 17 in Alabama, Arkansas, Georgia, Illinois, and Indian Territory; 16 in District of Columbia, Iowa, North Carolina, North Dakota, Texas, and Utah; 15 in Kansas; and only 14 in Kentucky, Louisiana, and Virginia. For females the age is 18 in Alaska, Idaho, New York, and Washington; 16 in Arizona, Delaware, Indiana, Michigan, Montana, Nebraska, Nevada, Ohio, Porto Rico, West Virginia, and Wyoming; 15 in California, Minnesota, New Mexico, Oklahoma, Oregon, South Dakota, and Wisconsin; 14 in Alabama, Arkansas, District of Columbia, Georgia, Illinois, Indian Territory, Iowa, North Carolina,

MARRIAGE AND DIVORCE

Texas, and Utah; 13 in New Hampshire and North Dakota; and only 12 in Kansas, Kentucky, Louisiana, and Virginia. But the Porto Rico code provides that a marriage under the age of consent "shall, nevertheless, be valid *ipso facto* and without an express declaration, if one day after having arrived at the legal age of puberty the parties shall have lived together without the representatives of either of them having brought suit against its validity, or if the woman shall have conceived before the legal age of puberty or before having established such suit."

The age below which the consent of parent or guardian is required for the marriage of a minor is prescribed in the majority of the States. Such consent must precede the granting of license; or, where the license system has not been adopted, it must be made known by certificate or otherwise to the person or society conducting the celebration before the ceremony may be performed. For males the age is 21 years in Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Florida, Illinois, Indiana, Indian Territory, Iowa, Kentucky, Louisiana, Maryland, Massachusetts, Maine, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Jersey, New Mexico, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Porto Rico, Rhode Island, South Dakota, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming; 18 in Idaho and North Carolina; and 16 in Tennessee (1899). For females the age is 21 years in Connecticut, Florida, Kentucky, Louisiana, Pennsylvania, Porto Rico, Rhode Island, Virginia, West Virginia, and Wyoming; 18 in Alabama, Arkansas, California, Colorado, Delaware, Illinois, Indiana, Indian Territory, Iowa, Massachusetts, Maine, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Texas, Utah, Vermont, Washington, and Wisconsin; and only 16 in Arizona, District of Columbia, Idaho, Maryland, and Tennessee. The age for females is 18 in Georgia; but by the statutes of that State parental consent does not seem to be required for male minors, nor for females when publication is by banns. In effect the same appears to be the case in South Carolina, since a penalty is affixed for marrying a female under 16 without parental consent; while for male minors such consent is not prescribed. In some cases the statute contains important special provisions regarding the marriage of minors which modify the general rule as to age and parental consent. Thus in Maine and Massachusetts consent is only required when the minor has a parent or guardian living in the commonwealth. The Rhode Island law expressly provides that a license may be issued to a person of over 18 years when such person has no parent or guardian residing in the State; and the same is true in Connecticut of a female under age when a selectman of the town where she has last resided six months gives his consent. In Alabama, Florida, Maryland, Virginia, West Virginia, and the District of Columbia, as in some other States, it is expressly provided that parental consent is not required if the minor has been previously mar-

ried. By a law of Kentucky, if a female under 16 marry without legal consent, a court in her county having general equity jurisdiction may commit her estate to a receiver, who under direction of the court, may pay out the profits, after due compensation, to her separate use, during infancy. At the age of 21, the estate is to be delivered to her, unless the court think fit to continue it longer in the receiver's hands. Under similar conditions in West Virginia the county court is empowered, "upon petition of her next friend," to commit the estate of a girl between 12 and 14 years of age to a receiver, who is to give bond for the faithful performance of his trust.

Licenses.—With few exceptions, the simple license system now prevails throughout the country. Only in Delaware, Georgia, Ohio, and Maryland does the ancient optional plan of either oral ecclesiastical banns or civil license survive. Neither banns nor license is required in New York. Instead, the person conducting the celebration is authorized to identify the parties by examining them or any other persons under oath. New Jersey has a similar plan, except that since 1897 non-residents are required to obtain a license from the county clerk five days before the wedding. All the other States, except Alaska, New Mexico, and South Carolina, where there is no statute on the subject, have each a law for civil license, the same in its purpose, but varying widely in the forms and procedure prescribed. Thus in Minnesota, to take a typical example, "previous to persons being joined in marriage, a license shall be obtained from the clerk of the district court of the county in which the female resides," or, if she be not a resident of the State, then from the same officer "in the county where the marriage is to take place in the State." The clerk may inquire of the parties under oath as to the legality of the proposed marriage. If he "shall be satisfied that there is no legal impediment thereto," he shall grant a license and make a record thereof. Persons under age and not having had a former husband or wife must have the consent of the parents or guardians personally given or certified under their hands and seals, "attested by two witnesses, one of whom shall appear before said clerk, and make oath or affirmation that he saw said parent or guardian subscribe, or heard him or her acknowledge the same." If a "clerk shall in any other manner issue or sign any marriage license, he shall forfeit and pay a sum not exceeding \$1,000," to the parties aggrieved. In this State the statute allows the clerk a fee of two dollars for each license issued. Similar powers and functions are exercised by the clerk of the district court in Iowa, Louisiana, and Montana; county clerk in California, Colorado, Illinois, Kentucky, Michigan, Nevada, Oregon, Utah, Wisconsin, and Wyoming; clerk of the circuit court in Indiana, Iowa, Mississippi, Maryland, South Dakota, and Texas; probate judge in Alabama, Kansas, and Ohio; county judge in Florida, Nebraska, and North Dakota; clerk of the probate court in Arizona; clerk of the Supreme Court in the District of Columbia; clerk of the county court in Arkansas, Tennessee, and West Virginia; clerk of the court of chancery in Virginia; county register or recorder of deeds in North Carolina and Missouri; county re-

MARRIAGE AND DIVORCE

corder in Idaho; county ordinary or his deputy in Georgia; and the county auditor in Washington. In the six New England States the license, or "certificate," as it is usually called, is issued by the clerk or registrar of the city or town; and in Massachusetts a town of more than 2,000 inhabitants may choose a person other than the clerk to be registrar. The laws of the various States show great diversity and lack of precision regarding the place of obtaining the license and that of making return of the celebration. In some States the license must be secured in the place of the bride's residence; in others, in that of the marriage; while in a third group, it may be issued in the place where either person dwells. Indeed, Pennsylvania, more liberal still, allows a choice among all three places. The same laxity exists as to the place of return; and sometimes the place of return is not the same as that of issue. There are other grave defects in the license laws. The oath administered to the bride or bridegroom by the officer, to guard against illegal contracts, is usually permissive, not obligatory; and where parental consent to the marriage of minors is given in writing, the affidavit of at least one witness is not always required. In Porto Rico the municipal judge may not grant or refuse a marriage license until ten days after the examination on oath of the persons applying therefor. Nowhere else is there any adequate provision regarding notice or the filing and trial of objections to a proposed marriage. Maine and Wisconsin have each made a good beginning by requiring the certificate or license to be procured five days before the celebration; and New Jersey exacts the same delay in case of non-residents. No other State seems to have a similar provision; and in all cases, apparently, except in Porto Rico, the license is issued at the time the notice of intention to marry is filed. But some of the States have provided special safeguards against clandestine marriages. Massachusetts has thus taken wise precautions regarding the licensing of young minors. By an act of 1894 no town or city clerk is permitted to receive a notice of the intention of marriage of any male under 18 or any female under 16 years of age, unless the "judge of probate in each county after due hearing" shall "make an order allowing the marriage under the age specified"; but such order may be issued only when the minor resides in the county where the judge holds court, or when the father, mother, or guardian gives consent. A law of 1899 allows the probate judge to make a similar order in case of a person of either sex whose age is alleged to exceed that just specified, but who is unable from any cause to produce official record of his or her birth, to overcome the reasonable doubt of the clerk or registrar. In Alabama, before issuance of a license for the marriage of persons under the ages of 21 and 18 respectively, the judge of probate, in addition to parental consent, "must also require a bond to be executed in the penal sum of two hundred dollars" payable to the State, "with condition to be void if there is no lawful cause why such marriage should not be celebrated." In all cases a similar bond is required in Arkansas, Indian Territory, and Tennessee; as also in Kentucky when the persons are personally unknown to the clerk. By

the code of Porto Rico (1902) the "persons desiring to contract marriage shall first present themselves before the municipal judge of their domicile if they shall have the same domicile, otherwise to their respective municipal courts and first being duly sworn, shall be examined by the municipal judge as to their legal capacities and incapacities to enter into matrimony."

Ceremony.—With two exceptions the optional civil or religious celebration is now authorized by all the States. In West Virginia, and in Maryland since 1777, only the religious ceremony is provided for. Elsewhere marriage may be solemnized before the ministers or priests of every denomination; religious societies having no priests; or before the civil magistrate. The laws are lax regarding the district within which the civil or clerical celebrant may act. Only in a very few instances, as in Massachusetts, Rhode Island, and Vermont, is authority conferred only upon ministers dwelling within the State; while in the great majority of States, although the statutes are often far from clear, all qualified ministers, residing anywhere in the United States, may act. Indeed, Louisiana is still more generous, granting full privilege to celebrate wedlock to any clergyman or priest, "whether a citizen of the United States or not." Nowhere are the minister's functions confined to the town, county, or other local district of his permanent residence, as was the case under the early laws of some of the older commonwealths. Only in a few cases are adequate proofs of ordination exacted. Virginia and West Virginia each require from the minister a bond for the faithful performance of his trust, in addition to credentials of ordination and good standing. Rhode Island has a careful system of registration; in Maine and New Hampshire the clerical celebrant must secure a "commission" from the governor; in Nevada, Minnesota, Wisconsin, and Arkansas, he must file his credentials with the proper county officer and receive a certificate; Ohio demands a license from the county judge of probate; but usually no such precautions are required. Throughout the country the justice of the peace is the "normal" civil magistrate for the celebration of wedlock; but usually the judges of the county and higher courts of record are given like authority. In Vermont the justice of the peace is the sole officer empowered. On the other hand, in Rhode Island, only justices of the supreme court may perform the lay ceremony; while in Virginia the justice of the peace as such is not recognized; but "the court of every county which deems it expedient, may appoint one or more persons resident in such county to celebrate the rites of marriage within the same, or a particular district thereof," provided a bond be given as in the case of the ordained minister. Besides the judicial magistrates, authority to solemnize wedlock is conferred *ex officio* upon a variety of other functionaries; as upon aldermen and police magistrates in New York; the governor in Idaho; city mayors in Iowa, Montana, Idaho, Utah, and South Dakota; speakers of the house and senate in Tennessee; and the county supervisors in Mississippi. At present only in 21 States is the justice of the peace or corre-

MARRIAGE AND DIVORCE

sponding local officer, in the discharge of his duties as celebrant, confined to his own county or district. Elsewhere he may act anywhere within the State; and this is almost universally the rule with the higher judges and officials who are granted the same power. In no case, except in Virginia and Massachusetts, is there any provision for the appointment of a person to celebrate wedlock for an area of less extent than the county; and nowhere, unless in Virginia, does the law provide for the special office of marriage celebrant. Massachusetts has, however, taken a step in the right direction. By an act of 1899 no justice of the peace may solemnize a marriage unless he also holds the office of city or town clerk, city registrar, clerk of a court, or that of assistant in each case; or "unless he shall have been specially designated by the governor." The latter may at his discretion name justices of the peace "who may solemnize marriages in the city or town in which they severally reside." Each place is to have at least one such designated magistrate; but otherwise the number is not to exceed one for every 5,000 of its inhabitants. No justice may act without a certificate of designation, which the governor has power to revoke whenever he thinks fit.

No definite formula for the celebration is anywhere prescribed. Sometimes the statute contains a statement to that effect. Thus in Tennessee it is expressly enacted that no formal ceremony is required, except that the parties "shall respectively declare, in the presence of the minister or officer, that they accept each other as man and wife"; and substantially the same declaration is specified in the laws of California, Idaho, Michigan, Minnesota, Nebraska, Nevada, North Dakota, South Dakota, Oregon, Pennsylvania, Washington, Wisconsin, and Wyoming. The same is true of New York when the ceremony is performed by a magistrate; but when a clergyman officiates, it may be "according to the forms and customs of the church or society to which he belongs." The Oklahoma law requires the marriage to be "contracted by a formal ceremony" in the presence of two witnesses. The consent of persons "who may be lawfully married," according to the North Carolina statute, "presently to take each other as husband and wife, freely, seriously, and plainly expressed by each in the presence of the other and in the presence" of a minister or justice, and the consequent declaration by him that they "are man and wife, shall be a valid and sufficient marriage." In New Hampshire persons living together and acknowledging each other as husband and wife, and generally reputed to be such for the period of three years or until the death of one of them, shall thereafter be deemed to have been lawfully married. A similar law exists in Arizona, except that the requisite period of living together is one year.

Witnesses.—The statutes of many of the States require witnesses at the ceremony. One witness must attend in South Dakota; two in Alaska, Idaho, Michigan, Montana, Minnesota, Nebraska, Nevada, North Dakota, Oklahoma, Oregon, Porto Rico, Rhode Island, Washington, Wisconsin, and Wyoming; three in Louisiana; while in New York one witness is sufficient when the celebration takes place before a minister or magistrate and two when the marriage is

by a written contract. In Maryland, in the case of Quaker weddings, the marriage certificate must be signed by 12 persons present. The statutory requirement of 12 witnesses in Pennsylvania is no longer enforced; but in that State two witnesses must attend "when any marriage is solemnized by the parties themselves." Sometimes, as in California and New Jersey, the statute seems to take for granted the presence of witnesses without expressly requiring it.

Certificates.—Provision for giving a certificate to the persons married, by request or otherwise, is made in Alaska, California, District of Columbia, Idaho, Iowa, Maryland, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New York, Oregon, Pennsylvania, Porto Rico, South Dakota, Washington, Wisconsin, and Wyoming. Elsewhere by custom certificates are doubtless usually given without direct legal requirement.

Records.—In California, Delaware, Idaho, Iowa, Kentucky, Michigan, Missouri, Nevada, New Mexico, New York, New Jersey, Ohio, South Dakota, and Wisconsin the celebrant is required to keep a record. The same is true of the Quakers in Maryland; and of the pastors of all religious societies in Alabama and Mississippi. Almost universally the clerk or other officer of the county or town must register the facts contained in the license issued or the certificate returned. Moreover 22 commonwealths have established State systems of registration. These are Arkansas, California, Connecticut, Delaware, Indiana, Iowa, Kansas, Kentucky, Massachusetts, Maine, Michigan, Minnesota, New Hampshire, New Jersey, New York, Pennsylvania, Ohio, Rhode Island, Vermont, Virginia, West Virginia, and Wisconsin. The New England States, in particular, have made careful provision for the completion and preservation of their marriage records; and for the collection and publication of marriage and divorce statistics.

Prohibitions.—The laws of all the States contain each a list or a definition of the kindred by blood or affinity with whom marriage is prohibited. In all cases, unless in Tennessee, expressly or by implication, marriage with a niece or a nephew is forbidden; while first cousins may not lawfully wed in Arizona, Arkansas, Illinois, Indiana, Indian Territory, Kansas, Louisiana (1900), Michigan (1903), Missouri, Nevada, New Hampshire, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania (1901), South Dakota, Washington, Wyoming, and apparently in Colorado. In Alaska persons related within the fourth degree either of the whole or the half-blood may not marry; while in Porto Rico (Code, 1902) the restraint extends to all descendants by blood or affinity and to "collaterals of consanguinity" within the fourth degree. In no case is marriage with a deceased wife's sister or a deceased husband's brother prohibited by the existing laws. As a general rule marriages within the forbidden degrees are void or voidable; but there are some exceptions, the statutes being often far from clear. The code of Porto Rico expressly provides that "the district courts may for good cause, on petition of an interested party, waive the impediment of the fourth degree of consanguinity." Marriages are everywhere prohibited and are rendered void or voidable for a great variety of causes other than

MARRIAGE AND DIVORCE

kinship or affinity; but the statutes are in this respect exceedingly conflicting and confusing, disclosing a great diversity of conditional or qualifying clauses which make any attempt at a summary here impracticable.

Miscegenation.—Nearly all the southern and some other States have enacted rigorous laws to prevent miscegenation, often defining the exact fractional part of African or Mongolian blood which shall vitiate a marriage. Such statutes against marriage with persons of negro blood exist in Alabama, Arizona, Arkansas, California, Colorado, Delaware, Florida, Georgia, Idaho, Indiana, Indian Territory, Kentucky, Louisiana, Maine, Maryland, Mississippi, Missouri, Nebraska, Nevada, North Carolina, Oklahoma, Oregon, South Carolina, Tennessee, Texas, Utah, Virginia, and West Virginia. The prohibition includes persons of Chinese or "Mongolian" blood in Arizona, California, Mississippi, Nevada, Oregon, and Utah.

Pauperism.—The statutes of several States are particularly interesting as indicating the most recent trend of social legislation. Thus Delaware has attempted to put some limit upon the increase of the indigent and incapable classes, the marriage of paupers being forbidden under penalty. Maine has a similar law; while in Vermont a license may not be issued for the marriage of paupers without the written consent of the selectmen or overseer of the poor of each of the towns where the parties reside, or which are liable for their support. Michigan has taken a still more important step in advance. By a stringent act of 1899 no person afflicted with certain syphilitic diseases "shall be capable of contracting marriage," transgression of the law being severely punished as a felony. In 1895 Connecticut prohibited the marriage of a couple either of whom is epileptic, imbecile, or feeble-minded, when the woman is under 45 years of age; and this enlightened policy was followed in laws containing the same prohibition by Minnesota in 1901 and by Kansas in 1903.

Common Law Marriages.—It remains to consider the so-called "common-law marriage" in its relation to the statutes. According to the prevailing doctrine of the courts the laws requiring license, solemnization, or other formalities must be interpreted as "directory," not "mandatory," unless they contain "words of nullity" clearly declaring marriages void if contracted contrary to their provisions. Thus the canonical conflict between "legality" and "validity" is in effect perpetuated in the United States; and it is a most fruitful source of evil. At present the validity of the informal or common-law marriage is sustained by the decisions of the courts in Alabama, Arkansas, Colorado, District of Columbia, Florida, Georgia, Illinois, Iowa, Indiana, Kansas, Louisiana, Michigan, Minnesota, Missouri, Nebraska, Nevada, Ohio, Pennsylvania, South Carolina, and Wisconsin; by the later decisions in Tennessee (1860-70), and Texas (1894-9); while it is favored by those of New Jersey. On the other hand, in 1810, Chief Justice Parsons of Massachusetts repudiated the common-law agreement, holding that a solemnization according to law was essential to a valid marriage. This precedent has been followed by the courts of Maryland, North Carolina, Oregon, Washington, Vermont, and West Virginia; and favored by the early de-

cisions of Maine and New Hampshire, although in those States the law is regarded as not conclusively settled. Furthermore Kentucky in 1852, Mississippi in 1892, California in 1895, Utah in 1898, and New York in 1901 have superseded the common-law contract through statutes containing the nullifying clause. In the remaining States the courts have not yet reached a decision; but were the question brought to a judicial test, the statutes remaining as they are, it is almost certain that, with one or two exceptions, all these commonwealths would sustain the validity of the informal agreement. It is clear that the needed reform can only be attained through stringent legislation.

II. DIVORCE.—The American type of divorce legislation has its origin in the provincial era. In the five southern colonies before the Revolution no instance of either full divorce or separation from bed and board has been discovered. The statute-book is entirely silent on the subject. Separations by mutual consent or for bad conduct or parol separations in some form did indeed occur; and in such cases the courts sometimes granted separate alimony. But in the South tribunals with either common law or statutory jurisdiction in divorce suits were not established; and no example of legislative divorce appears. The case is somewhat different for the middle colonies. In New York during the period of Dutch rule divorces were granted by the courts; and for a time after the English conquest in 1664 the magistrates may have continued the practice, doubtless under the supposed sanction of the Dutch law. But, unless on this ground during the brief period of transition, judicial divorce *a vinculo* ceased in New York with the English conquest. Courts competent to grant decrees for dissolution of marriage were not created. Except for a passage in the Duke's 'Laws'—which was a "dead letter"—there was no legislation on the subject. What has just been said of New York for the provincial era applies also to New Jersey. On the other hand, in Pennsylvania, a few absolute divorces were granted by the legislature; but there has been found no instance of a judicial decree for dissolution of wedlock.

Civil Divorce.—It was perhaps inevitable that civil divorce, the counterpart of civil marriage, should arise in the New England colonies. Liberty of divorce is the fruit of the Reformation; and it was especially favored by the more advanced or extreme Protestant societies. In most respects throughout New England the broad modern doctrines of the *Reformatio Legum* of Edward VI.'s commission, though even now not fully accepted in the mother country, were from the outset put in practice by Puritan and Separatist alike. The American conception of divorce as belonging, not to the criminal, but exclusively to the civil jurisdiction, has its birth in the 17th century. For more than 100 years in the New England colonies the canonical decree of separation from bed and board was practically though not wholly abandoned; while, on the other hand, a dissolution of the bond of matrimony was freely granted for adultery, desertion, and even on other grounds. For Massachusetts the records are but partially preserved. Between 1639 and 1692 some 40 actions for divorce or annulment have been discovered; while between 1739 and 1776

MARRIAGE AND DIVORCE

at least 47 such suits were tried by the courts. The complete record would doubtless disclose many more. The grounds of divorce are not formally specified in the statutes, but from these cases it appears that desertion by either party and adultery of the wife were accepted as adequate causes for dissolving a marriage. It should be noted that before the Revolution there is no clear instance in Massachusetts of granting a full divorce for the husband's adultery alone, unaccompanied by other offenses such as cruelty. The first discovered case of judicial separation from bed and board falls in the year 1754. Cruelty alone was deemed adequate ground for such separation, though, apparently, not for a full divorce. From 1650 onward Rhode Island authorized divorces *a vinculo*. By an act of that year, supplemented by other statutes in 1655 and 1685, adultery and desertion on the part of either spouse were recognized as legal grounds. This colony was especially afflicted by the evil of legislative divorce. Throughout nearly the entire provincial period the assembly, side by side with the courts, acted on divorce petitions, particularly when the grounds of complaint were not those recognized by statute. According to Judge Durfee, even after 1747, when the power to grant divorces came to the superior court, the jurisdiction of the assembly continued "to be invoked in exceptional cases, which either were not provided for by the statute or were too flimsy or too whimsical for judicial treatment" (*Gleanings*, 35-6). The divorce legislation of Connecticut gained a surprisingly early maturity. In the middle of the 17th century no society in the world, with the possible exception of Holland, possessed a system so modern in character. Separation from bed and board was rejected. Reasonable grounds of absolute divorce were sanctioned. Husband and wife were treated with even justice; and, although legislative divorce was permitted and liable to abuse the greater part of the litigation seems always to have been entrusted to the regular courts. As early at least as 1655 marriages were dissolved by the assembly; and in 1667 the first statute on the subject appeared. The court of assistants was then empowered to grant bills of divorce from the bond of wedlock, with the privilege of remarriage, for adultery, fraudulent contract, three years' wilful desertion with total neglect of duty, or for seven years' "providential" absence unheard of. These four grounds of absolute divorce, with scarcely the change of a word in the terms of the statute, were sanctioned by the laws of Connecticut until 1849, when two new causes—"habitual intemperance" and "intolerable cruelty"—were added.

State Legislation.—The essential principles of American divorce law were thus developed in the colonial period. Under the Federal Constitution the States within their respective borders have exclusive control of matrimonial and divorce legislation. Congress has conferred the same power upon the organized territories; but it legislates directly for the District of Columbia, Indian Territory, and Alaska. As a result there are fifty-two distinct divorce codes, whose provisions are inharmonious or conflicting, although in some of their vital features they are slowly approaching a common type. Almost everywhere exclusive jurisdiction in divorce suits is now vested in the district, superior, circuit, chancery,

or other higher courts, sitting usually in the various counties. In New Jersey the court of Chancery has entire control; but apparently in every other State a number of tribunals are open to hear and determine divorce petitions. In 1887, according to the report of Commissioner Wright, there were in the whole country about 2,624 such tribunals. But in no instance has a special divorce court been created. Formerly the granting of divorces by the legislature was a widespread evil. In nearly all the States, directly or indirectly, it is now prohibited by constitutional enactment; and since 1886 Congress has put a stop to it in the Territories. Delaware discontinued the practice only under the constitution of 1897; while in Connecticut it still survives.

Divorce is not provided for by law in South Carolina. In the other 52 States divorce is permitted; while separation from bed and board is likewise allowed in Alabama, Arkansas, Delaware, District of Columbia, Georgia, Indiana (1903), Indian Territory, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Nebraska, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, Tennessee, Vermont, Virginia, West Virginia, and Wisconsin. Furthermore, in Florida, Iowa, Kansas, Montana, Ohio, Utah, and Wyoming, the courts may decree separate maintenance which is practically the same as separation from bed and board. The number of statutory grounds of divorce *a vinculo* varies from one (adultery) in New York and the District of Columbia to 14 in New Hampshire. Adultery is a cause in all these States; desertion (abandonment, wilful absence) in all except New York and the District of Columbia; cruelty (actual violence, inhuman treatment, etc.), in all except these two with Maryland, New Jersey, North Carolina, Tennessee, Virginia, and West Virginia; habitual drunkenness (intoxication, intemperance) in all except Arizona, District of Columbia, Maryland, New Jersey, New York, North Carolina, Pennsylvania, Texas, Vermont, Virginia, and West Virginia; failure to provide for wife (or family) in Arizona, California, Colorado, Delaware, Idaho, Indiana, Maine, Massachusetts, Michigan, Montana, Nebraska, Nevada, New Mexico, North Dakota, Rhode Island, South Dakota, Utah, Vermont, Washington, Wisconsin, and Wyoming. Incurable insanity is a legal cause in Florida and Idaho; lunacy of the wife in Pennsylvania; "incurable, chronic mania or dementia" of either party in Washington; and vagrancy of the husband in Missouri and Wyoming. By the statute of Rhode Island a marriage may be dissolved when either party is guilty of "habitual, excessive, and intemperate use of opium, morphine, or chloral"; and a similar law exists in Maine, Massachusetts, Mississippi and Porto Rico. Many other legal causes of divorce are recognized, each in one or more States. For the whole country in 1887, according to the government report, 42 grounds of absolute, and 32 grounds of partial divorce were thus sanctioned by statute.

RE-MARRIAGE.—There is equal lack of uniformity in the laws regarding re-marriage after divorce. No restraint whatever is placed on the immediate re-marriage of either party with another in Arizona, Arkansas, Connecticut, Illinois, Indian Territory, Iowa, Maryland, Kentucky,

MARRIAGE AND DIVORCE

Missouri, Nevada, New Hampshire, New Jersey, New Mexico, Ohio, Porto Rico, Texas, Utah, West Virginia, and Wyoming. Elsewhere restrictions are placed upon one or both of the parties either as a penalty or to allow time for proceedings in error or on appeal. Thus in Delaware since 1832 the person divorced for adultery is absolutely forbidden to marry the paramour. Marriage with the accomplice during the life of the former spouse is likewise unlawful in Pennsylvania since 1785, Tennessee since 1799, and Louisiana since 1827. Moreover, in Louisiana since 1808, the wife may not re-wed until 10 months after dissolution of the marriage, whether by death, divorce, or decree of nullity. Under the same conditions in Porto Rico the woman must wait 301 days, or until a child is born if pregnant at the time of the husband's death. By the North Carolina statute, where the ground of divorce is abandonment of the wife or such cruel treatment of her after removal to another State as to force her to return, the defendant is forbidden to marry again during the life of the aggrieved. The same restraint is laid on the defendant guilty of adultery in South Dakota and New York, although the parties to the action may re-marry. In New York, however, the defendant may marry again in case the court shall modify its judgment, "which modification shall only be made upon satisfactory proof that the complainant has re-married, that five years have elapsed since the decree of divorce was rendered, and that the conduct of the defendant since the dissolution of said marriage has been uniformly good." The person who is the guilty cause of the divorce is restrained from marriage in Florida. By the act of 1901, in the District of Columbia the defendant is absolutely restrained from re-marriage except with the former spouse. In several States the placing of a restraint on further marriage is left to the court's discretion. So in Michigan the court may decree that the person against whom any divorce is granted shall not re-wed within any period not exceeding two years. Since 1857 in Mississippi the decree may provide "that a party against whom a divorce is granted because of adultery shall not be at liberty to marry again." The same power is given the court in Virginia; but for good cause shown the tribunal rendering the decree of divorce may at any time remove the restraint on the marriage of the guilty party. By the existing code of Alabama, in all cases, the chancellor may in the decree direct whether the adverse party shall be permitted to marry again. In Georgia the jury according to whose verdict a decree of absolute divorce is granted determines the question of re-marriage, subject to the revision of the court; but provision is made for subsequent removal of any disability through the verdict of a new jury. Three of the New England States discriminate in this regard against the defendant. Since 1878, in Vermont, the libellee may not marry any person other than the libellant for three years, unless the latter dies. In Massachusetts since 1881 the offending party, without petition to the court, may re-marry only after two years. Since 1883 the statute of Maine forbids the party obtaining the decree to re-wed in two years without the court's permission; while during that period the adverse party is absolutely restrained; nor at any later

time may he marry without the court's consent. In Massachusetts, following the English precedent, the decree in the first instance must be a decree *nisi*, "to become absolute after the expiration of six months," unless the court on the application of some interested person otherwise orders. Since 1883 the law of Maine in this regard has been practically identical with that of Massachusetts; while in 1902 an act of Rhode Island declares that no decree shall become final and operative until six months after trial and decision. In New York the decree in the first instance must be "interlocutory," and three months must elapse before it can be made final. The latest legislation of California is somewhat similar. Until 1903 neither party was permitted to marry again within a year after the divorce. But persons evaded the law by going to Nevada, to get married, and then at once returning to California to reside. The validity of such contracts was sustained by a decision of the Supreme Court. To overcome the effect of this decision in the year named it was enacted that when the court "determines that a divorce ought to be granted an interlocutory judgment must be entered, declaring that the party in whose favor the court decides is entitled to a divorce." After the expiration of a year the court may enter final judgment. In no case can a marriage of either party during the life of the other be valid, if contracted within one year after the interlocutory decree. This act is believed to be unconstitutional, and one of the superior courts has so decided.

A number of States have fixed a period within which neither party may marry again; and usually, if proceedings in error or on appeal be instituted, the restraint is further extended to the final judgment. The period is three months after the decree in North Dakota since 1901; six months in Kansas since 1881, Minnesota since 1901, Nebraska since 1885, Oklahoma since 1893, Oregon since 1862, Washington since 1893; and "more than six months" in Idaho since 1903. It is one year in Colorado since 1893 and in Wisconsin since 1901; while in Montana since 1895 the innocent person must needs wait two years and the guilty person three years before renewing the marital bond with anyone save the former spouse. In Alaska neither party may marry a third person until proceedings are determined on appeal, or if there be no appeal, within one year after the decree. The Nebraska law, in addition to the general restraint on both parties during six months, is unique in forbidding the defendant in error or appellee to marry again during the pendency of proceedings in error or on appeal under the penalty prescribed for bigamy; while in Kansas and Oklahoma, if appellate proceedings be had, the restraint on both parties extends to 30 days after final judgment on appeal. Since 1831, by the Indiana statute, either party is free to marry again immediately after divorce, except that when the defendant has been "constructively" summoned without other notice than publication in a newspaper, the person obtaining a decree is not permitted to re-wed until the expiration of two years, during which period the judgment may be opened at the instance of the defendant. In Wisconsin the court or judge granting the divorce "may authorize" marriage within the year. Expressly or by implication a number of States

MARRIAGE AND DIVORCE

except from the prohibition the re-marriage of the divorced couple. Such is the case in Alaska, California, Colorado, Idaho, Kansas, Montana, New York, Oklahoma, Oregon, South Dakota, Vermont, and Washington. On the question whether in the absence of statutory authority such re-marriage of the divorced persons with each other comes within the restriction, the decisions of the courts are conflicting (see *Moore v. Moore*, 8 Abb., N. C., 171; *Colvin v. Colvin*, 2 Paige, 385; *Moore v. Hegeman*, 92 N. Y., 521). Owing to the want of precision and uniformity in the legislation of the States the restraints placed on the marriage of divorced persons are practically futile. In 1829 the supreme court of Massachusetts (in *Putnam v. Putnam*, 8 Pick., 433-5) decided that if a man, "being a resident in this State, for the sake of evading the law goes into a neighboring State where such a marriage is valid, and is there married and immediately returns and continues to reside here, the marriage is valid here, and after his death his widow is entitled to dower in his estate." This precedent was followed by New York in 1881 (*Van Voorhis v. Brintnall*, 86 N. Y., 18); Washington in 1900 (*Wiley v. Wiley*, 22 Wash., 115-121); and California in 1903, *Estate of Wood*, 137 Cal., 129). The prevailing doctrine of the courts appears to be that a marriage good where it is contracted is good everywhere; but there are opposing decisions.

Residence.—With the exception of Louisiana and, of course, South Carolina, all of the States make some statutory provision regarding the residence of the parties to a divorce suit. To prevent migration for divorce, the minimum requirement, where the plaintiff comes into the State after the cause of petition arose, has gradually been raised; but in some States the law is still too lax. At present the term of previous residence for the plaintiff, or at least for one of the parties, varies from six months to five years. It is six months in Nebraska since 1856, except when the marriage was solemnized in the State and the plaintiff has there dwelt since the marriage to the time when the suit is commenced; in Idaho since 1864; in South Dakota since 1899; while in Nevada since 1861 the plaintiff must have resided six months in the county where suit is brought, unless the action is begun "in the county in which the cause thereof shall have accrued, or in which the defendant shall reside, or be found, or in which the plaintiff shall reside if the latter be the county in which the parties last cohabited." In Texas likewise the term for the plaintiff is six months in the county. The prevailing requirement is one year. Such is the case in Arizona, Arkansas, Indian Territory, New Mexico, Ohio, and Oklahoma; in California since 1891; Colorado since 1861, unless the application is made upon "grounds of adultery or extreme cruelty" and the offense is "committed within the State"; Georgia, where six months in the county is also prescribed; Illinois since 1827; and Porto Rico since 1902, unless the cause arose in the State or while one or both of the parties resided there; Iowa since 1838, except when the defendant is a resident of the State served by personal service; Kansas since 1855; Kentucky, where, as in Arkansas and Indian Territory, if the cause of divorce arose without the State the plaintiff must have been a resident of the State

at the time, unless it was also a legal ground where it occurred or existed; Minnesota since 1851, except when the suit is on the ground of adultery committed while the plaintiff was a resident of the State; Missouri since 1835, unless the offense or injury complained of was committed within the State or when one or both of the parties resided there; Montana since 1865; North Dakota since 1899; Oregon since 1862; Pennsylvania since 1785; Utah since 1878; Vermont since 1878, three months' residence in the county of the action being also required; Washington since 1854; Wyoming since 1901; and Wisconsin since 1838, except when the cause is adultery committed while the plaintiff was a resident of the State, or when the marriage was solemnized in the State and the plaintiff has there resided since the marriage to the time of bringing suit, or when the wife is plaintiff and the husband has resided in the State for one year. The term of domicile or residence for at least one of the parties is also one year in New Hampshire, Virginia, and West Virginia; while in Mississippi the courts of chancery have jurisdiction when both parties are domiciled in the State when suit is brought; or when the complainant is so domiciled and the defendant is personally served with process in the State; or when one of the parties is thus domiciled and one or the other of them has been an actual resident for the preceding year. In Maine a divorce may be granted for legal cause if the libellant resided in the State when the cause of action occurred, or had so resided for one year before commencement of the suit, or if the libellee is a resident of the State (1903). A two years' term is prescribed for the plaintiff in North Carolina and Tennessee; in Florida unless the offense charged is adultery; in Maryland, for at least one of the parties, since 1842; in Indiana since 1873, six months in the county being also essential; and in Rhode Island since 1902, unless during that period the defendant has been a resident and domiciled inhabitant of the State and has actually been served with process. In Michigan since 1899, if the marriage was not solemnized in the State, the term of previous residence for the plaintiff is one year when the ground of action arises within, and two years when it arises outside the State. By Federal law two years' residence is required in Hawaii (1900), and two years' inhabitancy in Alaska (1903); while in the District of Columbia since 1901 the term of previous residence for the plaintiff is three years. A three years' period of "continuous" residence is likewise exacted in Connecticut, unless the cause of divorce arose after the plaintiff's removal into the State; or unless the defendant had in like manner there resided for three years and actual service was made upon him; or "unless the alleged cause is habitual intemperance, or intolerable cruelty, and the plaintiff was domiciled in the State at the time of the marriage" and before bringing the complaint has returned with the intention of there remaining. In Alabama, when the defendant lives outside the State, the plaintiff must have been a *bona fide* resident for one year before bringing suit; or for three years when abandonment is the cause alleged. By the New Jersey statute, in case of abandonment, one of the parties, at the time of filing the bill and for the term of two years during which the

MARRIAGE AND DIVORCE

desertion shall have continued, must be a resident of the State; but when the cause is adultery committed outside the State, three years' residence on the part of either the complainant or the defendant is required. New York has no fixed term, except that in case of partial divorce, when the marriage was solemnized outside the State, the parties must have "continued to be residents" for at least one year, and the plaintiff must be resident at the time the action begins. No definite term is prescribed by the Delaware law; but a divorce from the bond of matrimony will not be decreed when the assigned cause took place out of the State and the "petitioner was a non-resident thereof at the time of the occurrence, unless for the same or like cause such divorce would be allowed by the laws of the State in which it is alleged to have occurred." Finally, it may be noted that Massachusetts has the most stringent requirement. A divorce will be granted for any lawful cause, occurring in the State or elsewhere, when the libellant has lived for five years in the commonwealth; or, when the parties were inhabitants of the State at the time of the marriage, if the libellant has been such an inhabitant for three years before the libel was filed, provided neither came into the State for the purpose. With these exceptions, as expressly provided in the statute, a divorce will not be granted for any cause, if the parties have never lived together as man and wife in the commonwealth; nor for any cause occurring in another State or country, unless, before it occurred, they had so lived together in the commonwealth, and one of them was there living at the time it took place.

Massachusetts, like Maine, Delaware, and Tennessee, has attempted to prevent clandestine divorce through the evasion of the laws. When an inhabitant of the commonwealth goes outside the State to obtain a divorce for a cause which occurred in the State while the parties there resided, or for a cause which would not be recognized as lawful therein, the "divorce so obtained shall be of no force or effect" in the commonwealth.

Notice by Publication.—Nearly all of the States have made some provision regarding notice to the defendant in divorce suits. The majority are content to prescribe the usual procedure employed in ordinary civil or equity cases, according to the system in use. But some States have adopted special rules; and during the last 15 years a number of the older and a few of the younger commonwealths have enacted rigorous laws governing notice to the defendant when personal service cannot be had. But the abuse of constructive service through publication in the newspapers is still a widespread evil.

Alimony.—Everywhere the laws provide for temporary and permanent alimony to the wife, for the care and custody of the minor children, and for the disposal of the property. In a few instances, as in Massachusetts, New Hampshire, Oregon, Vermont, Virginia, Washington, and West Virginia, the courts are authorized to decree alimony or an allowance in the nature of alimony to the husband as well as to the wife. Generally divorce may be refused when there is collusion, connivance, condonation, or recrimination. Special provisions for defending divorce petitions exist in a number of States.

Thus in Indiana and Washington the prosecuting attorney must resist all undefended petitions; in Kentucky the county attorney must resist every application for divorce whether defended or not; in Louisiana, when the defendant is absent or incapable of acting, an attorney shall be appointed by the court to defend him; in Michigan the prosecuting attorney shall appear in all suits where there are children under 14 years of age, and oppose the granting of a decree if he thinks their interest or the public good so requires; and similar laws exist in Idaho, Colorado, Oregon, and the District of Columbia. Soliciting divorce business by advertising or otherwise is sometimes prohibited under severe penalty; such being the case in California, Indiana, Minnesota, Ohio, and Washington. Only in Connecticut, Illinois, Indiana, Maine, Massachusetts, Michigan, New Hampshire, Ohio, Rhode Island, and Vermont apparently, is any adequate provision made for the collection or publication of divorce statistics.

Statistics.—Thus the divorce laws of the States, though still very defective and conflicting, show distinct improvement during recent years. More stringent provisions for notice have been made; longer terms of previous *bona fide* residence of the plaintiff required; more satisfactory conditions of re-marriage after the decree prescribed; while some of the dangerous "omnibus" clauses in the list of statutory grounds have been repealed. All this is due to a better informed public sentiment in the creation of which much credit must be given to the State Commissions on Uniform Legislation and especially to the National Divorce Reform League and its successor, the National League for the Protection of the Family. By the League, at the instance of its secretary, the Rev. Samuel Dike, was suggested the compilation of the elaborate 'Report on Marriage and Divorce in the United States,' prepared by Hon. Carroll D. Wright, Commissioner of Labor, and published in 1889. This report for the first time revealed something like the real facts regarding divorce in the United States. In the entire country during the period of 20 years (1867-86) covered by it, 328,716 petitions for full or partial divorce were granted. From 9,937 decrees in 1867, the number rose to 11,586 in 1871; 14,800 in 1876; 20,762 in 1881; and to 25,535 in 1886; showing an increase in 20 years of 157 per cent, while there was a gain in population of but 60 per cent during the same period. Comparing the last year with the first, only four States—Delaware, Connecticut, Maine, and Vermont—show a decrease in the divorce rate; while, more fairly, comparing the fourth quinquennium with the first, only the three States last named show such a decrease. Of the whole number of divorces during the period, 112,540 were granted to the husband, and 216,176 to the wife. Among the principal causes, at each stage of the wedded life, only for adultery, were more decrees granted on the husband's petition than on that of the wife. But the relative number granted on the wife's petition varies greatly; from 39.3 per cent in North Carolina to 77.9 in Nevada. "As regards the ratio of divorces to marriages, six States report marriages fully enough for a trustworthy comparison. Of these, Connecticut has for the entire period a divorce to 11.32 marriages, and for the worst year, 1875, one to

MARRIED WOMAN—MARRYAT

88.1; Rhode Island gives one to 11.11 for the period and one to 9.36 in 1884, closely approaching that for three preceding years; Vermont one to 16.96 for the period and at its worst, 1871, one to 13; Massachusetts gives one to 31.28 for the period, its worst being one to 22.54 in 1878; Ohio averages one to 20.65, with an almost unvarying progress downward to one to 15.16 in 1886; and in the District of Columbia the rate for the period is 31.28, while at the best it is 74.65 in 1868, and at the worst 20.82 in 1877 (Dike in 'Political Science Quarterly,' iv., 607, summarizing Wright's Report, 135-39). This method of obtaining the rate is defective; for it disregards the large number of married couples whose marriages were solemnized before the period began. Hence, estimating the number of existing married couples, on the basis of the 11th census, in 1867, there were 173 divorces to 100,000 couples, and 250 in 1886 (Willcox, 'The Divorce Problem,' 2d ed., 16-19). The divorce rate in the United States is higher than in any other country for which divorce statistics are collected and published, with the single exception of Japan, being lowest in the southeastern and highest in the western and southwestern States. As in Europe, the divorce rate is higher and the marriage rate lower in the city than in the country. Again, as in Europe, while the marriage rate per capita of population is steadily descending, the divorce rate is on the average rising, although during the 20 years in the North Atlantic group of States—from Maine to Pennsylvania inclusive—there was no increase in the divorce rate.

According to Willcox the number of persons divorced (not the number of divorces) to every 100,000 of the population is as follows for various countries, the date being 1886 unless otherwise stated: Ireland, .28; Italy (1885), 3.75; England and Wales, 3.79; Canada, 4.81; Australia (including New Zealand and Tasmania), 11.14; German Empire, 25.97; France, 32.51; Switzerland, 64.49; United States, 88.71; Japan, 608.45 ('A Study in Vital Statistics,' in 'Political Science Quarterly,' viii., 78). In the United States, as elsewhere, both the marriage rate and the divorce rate fall during war times and in periods of general industrial depression. According to the statistics presented in Wright's Report, the evil of migration for easy divorce has been much exaggerated in popular opinion. The improvements in the laws since 1886 have placed further restraints upon it; so that it can no longer, if ever, be regarded as the centre of the divorce problem. In the want of a later report—for which there is urgent need—the present divorce rate for the whole country cannot be determined. But from the available statistics furnished by the few States publishing reports it appears that in Rhode Island, Michigan, Ohio, and notably in Indiana the rate is rising; while it is falling in Connecticut and Massachusetts. It is probable that some other State would show a decreasing rate.

Generalization.—In conclusion it may be noted that the earlier movement for a uniform Federal law of divorce, to be secured through constitutional amendment, has in the main been abandoned. Instead it is preferred, through the State Commissions on Uniform Legislation, to urge the adoption by the separate commonwealths of a model statute governing procedure,

which has been recommended by the commissions. See also **DIVORCE**.

Bibliography.—A digest of the laws of all the States for 1886-7, the time of compilation, is contained in Wright's 'Report on Marriage and Divorce in the United States' 1867-86 (Washington 1889); reprinted without change (1897)*. See also the summaries in Stimson, 'American Statute Law (1886)'; Noble, 'Compendium and Comparative View of the Thirty-Eight State Laws of Marriage and Divorce' (1882); Hirsh, 'Tabulated Digest of the Divorce Laws of the United States' (1901); Lloyd, 'Treatise on the Law of Divorce' (1887); Convers, 'Marriage and Divorce in the United States' (1889); Snyder, 'The Geography of Marriage or the Legal Perplexities of Wedlock in the United States' (1889); Whitney, 'Marriage and Divorce' (1894); Woolsey, 'Divorce and Divorce Legislation' (1882); Pearson, 'National Life and Character' (1893); answered by Muirhead, in 'International Journal of Ethics,' vii. In favor of radical reform are Stetson, 'Women and Economics' (1900); Besant, 'Marriage; as it was, as it is, and as it should be'; Pearson, 'Ethics of Free Thought' (1888); and Caird, 'The Morality of Marriage' (1897).

Marrow, a substance of low specific gravity filling the cells and cavities of the bones of mammals. See **BONE**.

Marryat, mār'i-at, Florence, English novelist, daughter of Frederick Marryat (q.v.): b. Brighton 9 July 1838; d. London 27 Oct. 1899. She was successively Mrs. Church (1854-90) and Mrs. Francis Lean. Her many novels, although not at all remarkable, were popular, and were published in various versions throughout Europe. They include 'Nelly Brooke,' 'Fighting the Air,' 'Facing the Footlights,' and more than 80 others, many being occupied with spiritualism. She published and edited her father's 'Life and Letters' (1872).

Marryat, Frederick, English naval officer and novelist: b. London 10 July 1792; d. Langham, Norfolk, 9 Aug. 1848. In 1806 he entered the navy, served on the coast of North America in 1811 in the *Æolus* and in 1823 was commander of the *Larne* during the first Burmese war, in 1825 had the naval command of a successful expedition up the Bassein River, and in the same year was made captain of the *Tees*. From 1828 until his resignation in 1830 he commanded the *Ariadne*. He received the gold medal of the Royal Humane Society (1818) for saving life at sea; adapted to the mercantile marine Sir Home Popham's system of signaling; was elected fellow of the Royal Society in 1819; and was also something of a caricature artist. He is best known, however, for his stories of the sea, beginning in 1829 with 'The Naval Officer.' The most familiar of them is 'Midshipman Easy' (1836), in which his chief characteristics, lifelike and circumstantial narration and a rollicking humor, appear perhaps at their best. Others of the series are 'The King's Own' (1830), probably the best constructed of his works; 'Newton Forster' (1832); 'Peter Simple' (1834); 'Jacob Faithful' (1834); 'The

MARS — MARSEILLAISE

Pacha of Many Tales' (1835); 'The Pirate, and the Three Cutters' (1836); 'Snarleyvow' (1837); 'The Phantom Ship' (1839); 'Poor Jack' (1840); 'The Privateer's Man' (1846). He wrote also a series of juveniles, chief of them 'Masterman Ready' (1841). He visited Canada and the United States in 1837-8; and recorded his impressions in 'A Diary in America' (1839), which gave some offense to the people of the nation, then hypersensitive to foreign criticism. In 1832-5 he edited the 'Metropolitan Magazine,' in which he published a review of N. P. Willis' 'Pencilings by the Way,' which the latter, then in England, considered abusive. Willis challenged Marryat, and they exchanged shots at Chatham without injury. Consult F. Marryat (q.v.), 'Life and Correspondence' (1872); Hannay, 'Life' (In 'Great Writers' series).

Mars, Anne Françoise Hippolyte Boutet Monvel, än frän-swäz ē-pō-lēt boo-tā mōn-vël mäs, usually called **MADEMOISELLE MARS**, French actress: b. Paris 5 Feb. 1779; d. there 20 March 1847. As Célimène in Molière's 'Misanthrope,' and Elmira in 'Tartuffe,' as well as in several similar characters in the plays of Marivaux, she was very great. Louis XVIII. settled on her, as well as on Talma, a pension of 30,000 francs. She retired in 1841.

Mars, mār-z, in astronomy, a planet, 141,000,000 miles from the sun. Its diameter is 4,200 miles. Its years contain 687 days. Its mean distance at opposition from the earth is 48,000,000 miles. The day on Mars is half an hour longer than ours, or about 24 hours and 37 minutes. It has two moons. It moves at the rate of 15 miles a second. Mars is the fourth planet from the sun, and is called the red planet, from its well-known color. The combination of its motion with ours causes it to pass behind us, or opposite to the sun, once in two years. For two months at this period it is best seen, and appears as a red lamp in the sky; at other times it looks small and unimportant. Its density and size are less than ours; a man weighing 200 pounds here would weigh but 75 pounds on Mars. The orbit of this planet is decidedly elliptical; it is 26,000,000 miles nearer the sun at the nearest part of its orbit than it is at the farthest, consequently the variation in heat from this cause alone is considerable. In many ways Mars resembles our earth: it has atmosphere, seasons, land, water, storms, clouds, and mountains. Snow and ice cover both its poles, and produce great white patches at those points, which are clearly seen through a large telescope; such an instrument also shows the markings on the land known as the canals. Fairly accurate maps have been made of Mars, showing its natural divisions of land and water. It has been suggested that the vegetation on Mars, for the most part at least, is yellow or orange, instead of green, as with us, thus giving the planet its color. It is but 3,700 miles from the surface of Mars to its nearest moon, and that satellite revolves round it in seven hours and a half, showing all the phases of our moon in a night; to an inhabitant of Mars it has the appearance of an enormous shooting-star slowly moving through the sky, and would take our breath away if we saw anything like it from our earth. Percival Lowell, of Boston, who has devoted his life and fortune to the observation of Mars, has erected an extensive observatory at Flagstaff, Ariz., and has been using

it for this purpose for several years. Mr. Lowell's extended observations lead him to believe that Mars is inhabited by a highly civilized race of beings, who are now carrying on great engineering works, including the famous canals, which have been the subject of so much speculation.

Mars, in Roman mythology, contracted from *Mavers* or *Mavors*, in the Sabine or Oscan language *Mamers*, was at an early period identified by the Romans with the Greek *Ares*. As the Italian Mars was originally a divinity of a very different nature, the two conceptions must be treated separately. Originally Mars was an agricultural deity surnamed *Silvanus*, and propitiatory sacrifices were offered to him as the tutelary god of fields and flocks. As the Italian shepherds were familiar with war, the transition from the idea of Mars as an agricultural to that of a warlike deity was natural and easy. He was regarded as the father of the Roman people, for, according to tradition, Romulus and Remus, the founders of Rome, were the fruit of his intercourse with Rhea Sylvia. Several temples in Rome and the Campus Martius were dedicated to him, the most important of which was that outside the Porta Capena, on the Appian Road, and that of Mars Ultor, built by Augustus in the forum. His service was celebrated not only by particular *flamines* devoted to him, but by the College of the Salii, or priests of Mars. The month of March, the first month of the Roman year, was sacred to him, and his festivals were celebrated every year in the Circus on the 1st of August. The Campus Martius, where the Roman youth engaged in athletic and military exercises, was named after him. See **ARES**.

Marsala, mār-sä'lä, Sicily, a seaport town, near the mouth of a river of the same name, on the low promontory of Cape Boeo, 18 miles southwest of Trapani. It obtained its name from the Saracens, who valued the port so highly that they called it Marsa Alla, or Port of God. The harbor, which had become silted up, has been greatly improved. The most important export is Marsala wine, which resembles sherry. Under the Carthaginians there was a famous fortress here known as Lilybæum (see **CARÆ BOEO**). Pop. (1901) 57,567.

Marsden, mār-z'den, **Samuel**, English Anglican missionary: b. Horsforth, near Leeds, 28 July 1764; d. Windsor, England, 12 May 1838. He was educated at Hull and after some time as tradesman at Leeds left the Methodist Church which he had joined and entered St. John's College, Cambridge, and took orders in the English Church in 1793. In 1794 he went to Australia as chaplain to the penal colony at Parramatta and spent the greater share of his life in missionary work in Australia and New Zealand, where his labors accomplished much toward Christianizing the natives. Consult 'Life' by J. B. Marsden (1859).

Marseillaise, mār-sē-yāz, the celebrated song of the French Revolution, and the national anthem of the French. It was composed by Joseph Rouget de Lisle (q.v.) while an officer in the engineer corps at Strasburg, early in the French Revolution, with a view of supplanting the vulgar songs then in vogue. He composed the song and the music in one night. It was at first called 'Chant de Guerre de l'Armée du Rhin,' but subsequently received its present

MARSEILLES — MARSH

name because it was first publicly sung by volunteers from Marseilles in July, 1792. It became the national song of the French republicans, and was soon known through Europe and America. The tune is peculiarly stirring. It was suppressed under the first empire and the Bourbons, but the revolution of 1830 called it up anew, and after being suppressed under the second empire it is again the recognized national anthem of the French.

Marseilles, *mär-sälz'*, or **Marseille**, *mär-sä-yě*, France, the principal commercial seaport of the country, a first-class military and naval station, the second city of France as regards population, and the capital of the department of Bouches-du-Rhône, 508 miles southeast of Paris. It stands on the northeastern shore of the Gulf of Lyons, and on a bay containing a group of islets, one of which, the Château d'If, has world-wide celebrity in connection with the elder Dumas' 'Monte Cristo.' The city is strongly defended by various works, and lies in the form of an amphitheatre round a natural harbor of moderate size (about 70 acres), known as the Old Harbor. The New Harbor consists of a series of extensive docks or basins along the shore to the northwest, with a protecting breakwater in front. From the Old Harbor one of the finest of the city thoroughfares, called the Cannebière, runs inland in a straight line; while at right angles to this another great thoroughfare traverses the city, planted with trees, lined with fine edifices, and bearing different names at different points. In the older part of the town the streets are narrow and irregular, but in general the streets are spacious and regular, and lined with handsome houses. Marseilles, however, is not rich in public edifices. The chief are the large cathedral, in the Byzantine style, consecrated in 1893; the church of Notre Dame de la Garde, a modern Romanesque building, on a hill of same name, whence a splendid view is obtained; the church of St. Victor, a building of great antiquity; the Hôtel de Ville, the Prefecture, the Palais des Arts de Longchamp, containing a picture-gallery and natural history museum; the exchange; the public library (102,000 vols.); the palace of justice or law courts; the episcopal palace, etc. Marseilles is the see of a bishop, and possesses a court of first instance, a mint, an Academy of Sciences, Belles-lettres, and Arts, various learned societies and educational institutions.

Marseilles improved greatly in regard to street architecture, sanitary matters, etc., and made great progress in extent, population, and commerce, largely owing to the conquest of Algeria and the opening of the Suez Canal. Since 1855 some 200 acres have been added to the previous harbor accommodation. From the Durance an abundant water supply has been derived. A canal irrigates the neighboring slopes and plains, and has transformed them from arid tracts into fruitful fields. The surrounding districts are now occupied by a new population, employed in raising vegetables, fruit, etc., on the reclaimed and improved lands.

The most important manufactures are soap, soda, and other chemical products; also olive and other oils, sugar, machinery, iron and brass work, matches, candles, glass, earthenware, oriental hosiery, etc. In the building-docks a great number of war and other vessels are built. The

trade consists chiefly of soap, olive-oil, wine, brandy, corn, flour, dried fruits, oranges, and other products of the southern departments; salt provisions, tobacco, wool, skins and hides, iron, raw cotton, cotton twist, dye-woods, and other articles of colonial produce.

Marseilles was founded by a colony of Greeks from Asia Minor about 600 years before Christ, the original name being Massalia, and the Greek language is said to have been spoken here for several centuries before Christ. Its progress for centuries was rapid and almost without interruption. Having taken the part of Pompey in the great contest for supremacy between him and Caesar, it was besieged by the latter and taken in 49 B.C. On the decline of the Roman Empire it became a prey to the Goths, Burgundians, and Franks. In 735 it fell into the hands of the Saracens, who completely destroyed all the ancient monuments which previous barbarians had spared. In the tenth century it fell under the dominion of the counts of Provence, and for some centuries after followed the fortunes of that house. Pop. (1901) 494,769.

Marsh, George Perkins, American scholar and diplomat: b. Woodstock, Vt., 15 March 1801; d. Vallombrosa, Italy, 23 July 1882. He was graduated at Dartmouth in 1820; studied law at Burlington; was elected to the Supreme Executive Council of Vermont in 1834; sat in Congress from 1842 to 1849, when he went to Constantinople as minister for four years; and in 1852 was sent on a special mission to Greece. In 1861, after seven years in the United States, he went to Italy as minister, and held that post until his death. An able English philologist, Marsh wrote 'Lectures on the English Language' (1861), 'The Origin and History of the English Language' (1862), 'Man and Nature,' in which he urged forest planting and forest preservation (1864), etc. He edited Wedgewood's 'Etymology' and translated Rask's 'Icelandic Grammar.' Consult the 'Life and Letters' edited by his widow (1888).

Marsh, Othniel Charles, American palæontologist: b. Lockport, N. Y., 29 Oct. 1831; d. New Haven, Conn., 18 March 1899. He was graduated from Yale in 1860, studied in 1860-2 at the Yale (now the Sheffield) Scientific School, in 1862-5 at the German universities of Berlin, Heidelberg, and Breslau, and from 1866 until his death was the first professor of palæontology at Yale. From 1882 he was vertebrate palæontologist to the United States Geological Survey, his field-work for the survey ceasing in 1892. His investigations in regard to extinct vertebrates are very important, and were declared by Charles Darwin to furnish some of the most satisfactory evidence of the evolutionary theory. He made particular study of the Rocky Mountain region, and from 1868 almost annually organized and conducted expeditions into that district. In these explorations he discovered over 1,000 new fossil vertebrates, of which he classified and described more than one half. Among his discoveries are those of the *Odontornithes*, a sub-class of cretaceous birds, with teeth; the *Dinocerata*, ungulate animals of the Eocene period, elephantine in size; the first known American pterodactyls, or flying lizards; and several new families of dinosaurs. Perhaps he was best known for his study of the primitive horse, the *Eohippus*, *Orohippus*, and *Epihippus*. In 1890-9 he made

MARSH — MARSH-WREN

researches in the geology of the region between the Appalachian range and the Atlantic. He was curator of the geological collection of the Yale museum of natural history in 1867-99, and in 1898 presented to the university his own collections. He was a nephew of George Peabody (q.v.), and it is said to have been at his suggestion that the Peabody Museum at Yale was established. In 1887 he was made honorary curator of vertebrate palaeontology in the United States National Museum, and in 1898 received the Cuvier medal of the French Academy of Sciences. He was president of the American Association for the Advancement of Science in 1878, and of the National Academy of Sciences in 1883-95. From a bibliography of 237 titles, these works by him may be cited: 'Odontornithes: A Monograph on the Extinct Toothed Birds of North America' (1880); 'Dinocerata: A Monograph of an Extinct Order of Gigantic Mammals' (1884); and 'The Dinosaurs of North America' (1896). Consult memoir by C. E. Beecher in the 'American Journal of Science,' June 1899.

Marsh, Richard, English novelist. Among his novels, several of which have been reprinted in this country, are 'Mrs. Musgrave and her Husband' (1895); 'The Crime and the Criminal' (1896); 'The Beetle: a Mystery' (1897); 'Tom Ossington's Ghost' (1897); 'Frivolities' (1899); 'Ada Vernham: Actress' (1900).

Marsh, Sylvester, American engineer: b. Campton, N. H., 30 Sept. 1803; d. Concord, N. H., 30 Dec. 1884. In 1826 he established a provision business in Boston, in 1833 in Chicago, and from 1837 was in the grain trade at Chicago. He originated the meat-packing industry and is regarded as one of the founders of Chicago. From 1864 he resided in New Hampshire. On 25 June 1858, he obtained a charter for a railway to the summit of Mount Washington, a project deemed so impossible that he was called "crazy Marsh." The railway, 2.81 miles long, with an ascent of 3,625 feet, was completed in July 1869. The chief feature in the operation of the road is a central cog-rail. Similar roads were built on the Rigi, Switzerland, and on Green Mount, Mount Desert, Maine.

Marsh Crocodile, or **Muegger**, the common inland crocodile of India, locally venerated by the Hindus, to whom it is known as "Muegger." It inhabits the tanks and marshes of India and Ceylon; and suitable places westward almost to the Persian coast, and eastward throughout the Malay peninsula and islands. It is dark, olive-brown in general color above, lighter on the ventral surface; the young are paler, with black spots. A specimen 12 feet long is considered large, but instances of a length of 18 feet have been recorded. The head is rough-coated, but has no ridges; the snout is broad, and the teeth number 76. These crocodiles swarm in river-marshes, weedy ponds and artificial reservoirs, throughout their range, feeding on fish and small animals, and little feared by horses, cattle or human beings, for in general they are cowardly and reluctant to attack men or even to resist injury. In case the water of their home dries away, they migrate to other pools; and in seasons of drouth are likely to be met with anywhere wandering in search of water: as a last resort they will bury themselves in the mud and remain in a torpor until revived by the

coming of rains. These reptiles display considerable cunning in capturing their food and in avoiding harm, feigning death very cleverly. They are kept in a semi-domesticated condition in many parts of India by pious Hindus, whose priests build temples near the great ponds, protect and feed the reptiles, and imagine the service pleasing to the gods as well as profitable to themselves. Extensive descriptions of the animal and of its worship may be found in the zoological works of Blanford, Jerdon, Tennent, Gadow and others, and in such volumes as Adams' 'Wanderings of a Naturalist in India' (Edinburgh 1867), and Hornaday, 'Two Years in the Jungle' (New York 1885).

Marsh Gas. See METHANE.

Marsh Hare. See HARES.

Marsh Hawk, or **Harrier**, a migratory hawk (*Circus cyaneus*) of medium size, commonly known in one or another of its varieties throughout the north temperate zone, which frequents marshy meadows, where it makes its nest upon the ground in a tussock of grass, and lays five to seven roundish, dirty white eggs. In such places it finds its food, chiefly mice and frogs, and sails slowly back and forth close to the ground watching keenly for movements in the grass and ready to pounce upon its prey. Its wings are long and its flight may be swift and powerful when occasion demands, but it was accounted "ignoble" among falconers. It rarely seizes birds or even young poultry, although one of its names is "hen-harrier," and should be protected and encouraged by farmers as one of the most useful and persistent mousers. This hawk may be readily recognized by the broad patch of white on the rump displayed by both sexes. The male is dull grayish-blue, in general tint, and the female rusty brown, both streaked with white. Consult Coues, 'Birds of the Northwest' (1874).

Marsh-hen. See MUD-HEN.

Marsh Mallow, a coarse, large-leaved herb (*Althea officinalis*), of the Old World, but naturalized in marshy places along the eastern coast of the United States, which is related to the hollyhocks (q.v.); the flowers are pale rose-color, some in a terminal spike and some axillary. Its root is mucilaginous, and of service as a demulcent in medicine, but it is mainly used as a basis for the confection called "marsh-mallow." Compare MALLOW.

Marsh-marigold. See COWSLIP.

Marsh-trefoil, a handsome marsh plant. See BUCK-BEAN.

Marsh-wren, either of two species of American wrens that inhabit reedy marshes. They have the diminutive brown bodies, short wings and tails, the latter often held cocked up over the back, awl-like bills and inquisitive activity characteristic of wrens (q.v.) generally. One is the long-billed (*Cistothorus palustris*), most numerous in the salt-marshes along the Atlantic coast; and the other the short-billed, better known about inland lakes and rivers. The former is somewhat the larger, has a decidedly longer bill, and lays eggs dark chocolate in color, while the eggs of the short-billed species are pure white. Both make elaborate nests in the form of ball-like baskets, with a little entrance at the side, woven of leaves of wild rice

MARSHAL — MARSHALL

or marsh grasses, and fastened to the stems of the reeds. A curious habit of the species is that each pair will make several nests each season, only one of which serves the purposes of incubation. These wrens give in the spring an exceedingly pretty chattering song, and when dozens are singing together in a patch of reeds the effect is most pleasing.

Mar'shal, a Federal officer appointed by the President in each judicial district, and corresponding to the sheriff of a county. His duty is to execute all precepts directed to him, issued under the authority of the United States, and is under the jurisdiction of the United States district and circuit courts. Sometimes police officers in American towns are known as marshals. In some European countries the title of marshal confers the highest military distinction, that of Marshal of France being especially prized. The word is derived from the Old High German word *marah*, a horse; and *scalh*, a servant; hence *Marascalc*, a man appointed to take care of horses. The marshal of the German empire derived his origin from the Frankish monarchs, and was equivalent to the *comes stabuli* or *connétable*. He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He was called *arch-marshal*, a dignity belonging to the electorate of Saxony. At the coronation it was his duty to bring oats in a silver vessel from a heap in the open marketplace, and to present the vessel to the emperor. His duties were discharged by a hereditary marshal (*Erbmarschall*). In Prussia general field-marshal is the highest military honor. In England field-marshal is given as an honorary rank to general officers who may have no immediate command. Marshal also signifies a person who regulates the ceremonies on certain solemn celebrations or, as in the United States, at parades, street processions, etc.

Marshall, mār'shal, Alfred, English economist: b. London 26 July 1842. He was educated at St. John's College, Cambridge, and in 1877 was principal of University College, Bristol. In 1883-4 he was lecturer at Balliol College, Oxford, and has been a member of various public boards. He has published: 'Economics of Industry' (1879); 'Principles of Economics' (1890); 'Elements of Economics' (1891); etc.

Marshall, Edward, American journalist: b. Enfield Centre, N. Y., 31 May 1868. He was educated in the public schools at Rochester and entered journalism in New York city, where he conducted an editorial crusade against the conditions existing in tenement buildings. He has been connected with leading New York newspapers and was special correspondent during the Spanish-American war. He has published 'The Rough Riders.'

Marshall, Emma Martin, English novelist: b. North Repps, near Cromer, Norfolk, 29 Sept. 1830; d. Clifton, near Bristol, 4 May 1899. She was married to H. G. Marshall in 1851, and her life thereafter was mainly spent in the cathedral towns of Wells, Exeter, Gloucester, and Bristol. She wrote more than 100 volumes, nearly all of them stories intended mainly, though not entirely, for young people. In spite of their number the even excellence of the tales is remarkable, and they may be called historical pictures

rather than historical tales. Her plan was to introduce into each story several historical personages, as secondary characters, the principal figures being imaginary. Her books have had a wide reading in the United States and still continue popular. Among them are: 'Under Salisbury Spire' (1889); 'In the East Country with Sir Thomas Browne'; 'Haunts of Ancient Peace'; 'In the Choir of Westminster Abbey in the Time of Henry Purcell' (1897); 'Under the Dome of St. Paul's' (1898). Consult: B. Marshall, 'Life of Emma Marshall' (1900).

Marshall, Henry Rutgers, American author and architect: b. New York city 22 July 1852. He was graduated at Columbia in 1873, and in 1878 entered practice as an architect. In 1902 he was appointed a member of the Art Commission of the City of New York. Besides contributions to literary, philosophical, and psychological periodicals, he wrote: 'Pain, Pleasure, and Aesthetics' (1894); 'Aesthetic Principles' (1895); and 'Instinct and Reason' (1898).

Marshall, Humphrey, American botanist: b. West Bradford (the present Marshallton), Pa., 10 Oct. 1722; d. there 5 Nov. 1801. He followed the stonemason's trade, but devoted his leisure to astronomy, building a small private observatory, and to natural history. He began the collection and cultivation of the more interesting indigenous plants, and in 1773 established the Marshallton botanical garden, where were assembled trees and herbaceous plants of the United States. For years he was treasurer of Chester County, Pa., and in 1786 he was elected to the American Philosophical Society. His 'Arboretum Americanum,' described as 'an Alphabetical Catalogue of Forest Trees and Shrubs, Natives of the American United States' (1785), was translated into several European languages.

Marshall, Humphrey, American politician: b. Westmoreland County, Va., 1756; d. near Frankfort, Ky., 1 July 1841. He joined the Continental army at the outbreak of the Revolution, became captain of Virginia cavalry (1778), in 1780 established himself on a Kentucky plantation, opposed the separation of Kentucky from Virginia, and as a delegate to the Danville convention of 1787 was prominent in defeating the measure. He was also a delegate to the Virginia convention that ratified the Constitution of the United States, and in 1793 was a representative from Woodford County in the Kentucky legislature, where he declared his opposition to the plans for raising in Kentucky troops under General George Rogers Clark for an attack on the Spanish settlements near the mouth of the Mississippi River. From 7 Dec. 1795 to 3 March 1801 he was a Federalist senator in the Congress of the United States, and in 1806 was active in denunciation of Aaron Burr. He represented Franklin County in the Kentucky legislature in 1807-9, and had a dispute with Henry Clay which resulted in a duel in which Clay received a slight wound. He sat again for Franklin County in 1823. He published the first 'History of Kentucky' (1812; rev. ed. 1824).

Marshall, Humphrey, American soldier: b. Frankfort, Ky., 13 Jan. 1812; d. Louisville, Ky., 28 March 1872. He was graduated from the United States Military Academy in 1832, entered the mounted rangers, served in the Black Hawk

MARSHALL

war (1832), and resigned from the army 30 April 1833. Admitted to the bar in 1833, he practised in Frankfort (1833-4) and Louisville (1834-6), became a lieutenant-colonel of Kentucky militia in 1841, and raised for the Mexican War the first regiment of Kentucky cavalry, of which he was made colonel 9 June 1846. He fought at Buena Vista (22-3 Feb. 1847). From 3 Dec. 1849 to 4 Aug. 1852 he served as a Whig in the 31st and 32d Congresses, in 1852-4 was minister plenipotentiary to China, and from 3 Dec. 1855 to 3 March 1859, was again in Congress, this time as an American, or Know-Nothing. In 1861 he was commissioned a brigadier-general in the Confederate army, with command of the Army of Eastern Kentucky. On 10 Jan. 1862 he was defeated by General Garfield at Middle Creek (Floyd County) in one of the most important of the minor battles of the Civil War. In May 1862 he surprised General J. D. Cox at Princeton, Va., and was thus of much service to Lee through the relief of the Lynchburg and Knoxville railway. Having resigned his commission in 1862, he represented Kentucky in the congress of the Confederate States (1863-5). From 1867 he practised law with much success at Louisville.

Marshall, John, Chief Justice of the United States: b. Germantown (now Midland), Fauquier County, Va., 24 Sept. 1755; d. Philadelphia, 6 July 1835. He was the eldest son of Colonel Thomas Marshall of Westmoreland County, Va., a distinguished officer in the French War and in the War of Independence, and of Mary Keith a member of the well known Randolph family. Thomas Marshall removed from Westmoreland County to Fauquier soon after his marriage; this community was sparsely settled and the educational advantages which he could give his children were meager, consequently he became their earliest teacher and succeeded in imbuing them with his own love of literature and of history. For two years John Marshall had, as tutor, James Thompson of Scotland and he was sent for one year to the academy of the Messrs. Campbell of Westmoreland County, where James Monroe was also a pupil. He had no college training except a few lectures on law and natural philosophy at William and Mary in 1779. He was always fond of field sports and excelled in running, leaping and quoit throwing. He loved the free natural life of the country, and his long tramps through the woods around his father's home, Oak Hill, together with his athletic exercises gave him great strength and agility. At 18 he began the study of law but soon left his studies to enter the Revolutionary army. He was active in endeavoring to enlist men for the service and helped to form and drill a company of volunteers. As a member of his father's regiment he took part in the battle of Great Bridge where he displayed signal valor. In 1776 he became a lieutenant in the 11th Virginia, and the next year was made captain. He served in Virginia, New Jersey, Pennsylvania and New York, always displaying great courage and valor and a cheerful acceptance of hardships and privations. This experience was of untold value to Marshall, it broadened his views and quickened his insight in governmental questions. As he says, he entered the army a Virginian and left it an American. In 1780 during a period of military inactivity he attended a course of law

lectures at William and Mary and in 1781, after leaving the army was granted a license and began the practice of law in Fauquier County. The next year he was elected to the Virginia Assembly, and shortly afterward was made a member of the Executive Council. He served his State as legislator during eight sessions. In 1784, although he had then removed his residence to Richmond, he was again elected delegate from Fauquier County, and in 1787 served as member from the County of Henrico. When the city of Richmond was granted a representative in the legislature Marshall had the honor of this office which he held from 1788 to 1791. He was also a member of the Federal Convention which met in 1788 to discuss the ratification of the Constitution of the United States, and it was largely due to his convincing arguments that ratification was carried, as the question was hotly debated and the anti-Constitution party had able and determined representatives. For several years he held no public office and devoted himself entirely to his extensive law practice, but in 1795 was again elected to the legislature. During this session he defended the unpopular "Jay Treaty" with England, and by his overwhelming arguments completely refuted the theory of his opponents that the Executive has no power to negotiate a commercial treaty. Marshall's attitude during his service as legislator toward all questions concerning Federal power demonstrated his increasing belief that a strong central government is necessary to real efficiency. In 1783 he had married Mary Ambler, daughter of Jacqueline Ambler, Treasurer of the State, and soon after his marriage made his permanent home in Richmond. The honors bestowed on him testify to the esteem in which he was held by the State and by the Nation. He refused the Attorney-generalship and the ministry to France, but in 1789 accepted the office of special envoy to France with Charles Cotesworth Pinckney and Elbridge Gerry. This mission related to the indignities which the French had offered the American navy and attempted to adjust the commercial relations between the two countries. It failed on account of the arrogant attitude of France, but "Marshall's dignified correspondence added greatly to the prestige of America," and on his return he was welcomed with many evidences of approbation from his grateful countrymen. Yielding to the earnest solicitation of Washington he became a candidate for Congress and was elected a member of that body in 1798. In Congress he was the leader of the Administration party and the greatest debater in the house on all constitutional matters. In one of his most noted speeches he defended the action of President Adams in the case of Jonathan Robbins and proved conclusively that this case was a question of executive and not of judicial cognizance. In 1800 he was made secretary of state, and in 1801 appointed Chief Justice of the United States, which office he held until his death in 1835. In 1829 he, like Ex-President Madison and James Monroe, was a member of the Virginia Convention which met to alter the State Constitution, and by his wisdom and moderation did much to prevent radical changes and to thwart the attempts of politicians against the independence of the judiciary. In 1831 his health, hitherto unusually vigorous, began to fail; he underwent a severe surgical operation in Philadelphia and was seemingly restored, but

MARSHALL — MARSHALL ISLANDS

the death of his wife was a great shock and a return of the disease in 1835 proved fatal. He died in Philadelphia whither he had gone for medical relief and was buried by the side of his wife in the New-Burying-Ground, now Shockhoe Hill Cemetery, Richmond. The sorrow over the country was deep and widespread, even his bitterest political enemies mourned for the kindly, upright man.

Though somewhat ungainly Marshall was always dignified in appearance; his tall loosely-jointed figure gave an impression of freedom while his finely shaped head and strong penetrating eyes bespoke intelligence and power. Directness and simplicity were his dominant characteristics. He was free from any display of pomp, air of office or studied effect. His unfeeling good humor, his benignity, his respect for women, his devotion to wife and family and his well-known reverence for religion made him loved and admired even by those who heartily disliked his political opinions. As chief justice for more than 30 years he rendered numerous decisions which were of prime importance to a nation in process of formation. The faculty which made Marshall invaluable as a jurist was his power of going directly to the core of any matter. No subtleties, no outside issue confused him, his analysis was unerring, his logic incontrovertible; he cared nothing for the graces of rhetoric and made no appeal to the emotions; his power lay in his deep conviction and in his illuminating and progressive argument. At a period when the powers of the Constitution were ill-defined, when our government was experimental, Marshall's decisions in Constitutional and international cases were invaluable factors in forming a well-organized Federal government. "He made the Constitution live, he imparted to it the breath of immortality, and its vigorous life at the present hour is due mainly to the wise interpretation he gave to its provisions during his long term of office." Marshall was the author of numerous reports and papers, of a History of the colonies, and of a 'Life of Washington,' a book of small literary merit, but containing a mass of valuable authentic information. Consult: Cooley, 'Constitutional History of the United States' (1889); Margruder, 'John Marshall' (1885); Thayer, 'John Marshall' in 'Beacon Biographies' series (1901). EMILIE W. McVEA,

Of the University of Tennessee.

Marshall, Thomas, American Presbyterian clergyman: b. East Weare, N. H., 4 April 1831; d. Olney, I. T., 15 Dec. 1903. He was graduated from Dartmouth in 1847, entered the ministry in 1864, and held pastorates at Mankato, Minn., 1865-9 and in St. Louis 1869-81. As synodical missionary of Missouri he traveled around the world (1881-8) and since 1890 has been field secretary of the Presbyterian Board of Foreign Missions.

Marshall, Ill., city, county-seat of Clark County; on the Vandalia Line and the Cleveland, C. & St. L. R.R.'s; about 122 miles east by south of Springfield and 15 miles west by south of Terre Haute, Ind. It is in an agricultural and stock-raising region. Its chief manufactures are flour, woolen goods, condensed milk and other dairy products, and lumber. It has considerable trade in farm products, live-stock, and condensed milk. Pop. (1900) 2,077.

Marshall, Mich., city, county-seat of Calhoun County; on the Kalamazoo River, and on the Michigan C. and on the Cincinnati, J. & M. R.R.'s; about 38 miles south by west of Lansing and 100 miles west of Detroit. The surrounding country is devoted chiefly to agriculture. The principal manufactures are school and church furniture, hot-air furnaces, patent medicines, breakfast food, flour, bicycles, wagons and carriages, windmills, bathtubs, electrical supplies, caskets, and agricultural implements. Marble and granite works employ a number of men. The grounds of the County Agricultural Society are located in Marshall. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 4,370.

Marshall, Minn., city, county-seat of Lyon County; on the Redwood River, and on the Chicago & N. W. and the Great N. R.R.'s; about 160 miles west by south of Saint Paul. It is in an agricultural section in which wheat is the principal product. The industrial establishments are a flour mill, grain elevators, and a creamery. The principal buildings are the county court-house and the jail. The educational institutions are the public and parish schools, Holy Redeemer Academy, and a public library. The city has some good church buildings. Pop. (1900) 2,088.

Marshall, Mo., city, county-seat of Saline County; on the Missouri P. and the Chicago & A. R.R.'s; about 80 miles east of Kansas City. It was settled in 1839 by people from Virginia and Kentucky, and was incorporated as a city in 1866. It is situated in an agricultural region; in the vicinity are valuable deposits of coal and salt, and nearby are stone quarries. The manufactures are lumber, tile and brick, flour, canned goods, creamery products, wagons and carriages. It is the seat of the State Institution for Feeble Minded and Epileptics; the Missouri Valley College (Cumberland Presbyterian), established in 1889; San Saviour Academy (R. C.). There are eight churches and public and parish schools. Marshall has four banks with a combined capital of \$300,000. The government is vested in a mayor, city marshal and a council of six members, who are elected every two years. Pop. (1890) 4,297; (1900) 5,086.

O. P. STURM,
Editor of 'Index.'

Marshall, Texas, city, county-seat of Harrison County; on the Texas S. and the Texas & P. R.R.'s; about 142 miles east of Dallas and 42 miles northwest of Shreveport, La. The city is in the midst of rich farm land, adapted to the cultivation of fruit and cotton. In the vicinity are forests of pine and oak. The chief industrial establishments are planing-mills, car-wheel works, foundry and machine-shop products, carriage factories, a cotton compress, and the railroad shops of the Texas and Pacific. The city owns and operates the waterworks. The court-house and opera house are fine buildings. Marshall is the seat of Bishop College, a Baptist institution for negroes, and Wiley University, under the auspices of the Methodist Episcopal Church. Pop. (1900) 7,855.

Marshall Islands, Polynesia, an archipelago in the western Pacific Ocean, belonging to Germany since 1885. They are situated eastward of the Carolines and northward of the

JOHN MARSHALL
CHIEF JUSTICE U. S. SUPREME COURT

MARSHALLTOWN — MARSTON

Gilbert Islands, and are intersected by the parallel of lat. 10° N. The group consists of two parallel chains, the Ratak group of 15 islands in the east, and the Ralik group of 18 islands in the west; total area, 154 square miles. The islands rise nowhere more than 10 feet above the sea, and are not very fertile, the chief vegetable productions being the coconut palm, the breadfruit, and the pandanus. The natives are of a brown color, and of a friendly and good-natured disposition. They are skilful in weaving mats, and in the construction of large canoes. Copra is the only commercial product. Pop. (1901) 15,063.

Mar'shalltown, Iowa, city, county-seat; on the Chicago & N. W., the Chicago G. W., and the Iowa C. R.R.'s; about 70 miles northeast of Des Moines. It was settled in 1860 and in 1863 was incorporated as a town. In 1868 it received a charter as a city of the second class. It is in an agricultural and stock-raising region in which wheat and corn are the chief farm products. Some of the industrial plants are flour-mills, grain elevators, glucose factories, meat-packing plants, furniture factories, carriage works, foundry and machine shops, and bottling works. It has the Iowa State Soldiers' Home, Saint Mary's Institute (R. C.), and public and parish schools.

The city is governed by an administration elected under a general law of the State, passed in 1808, which provides for a mayor, a unicameral council, and a school board to be chosen by popular vote. The council elects the waterworks committee. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1890) 8,914; (1900) 11,544.

Marshalsea, mār'shal-sē, a jail in London, attached to the Marshalsea Court, originally established under the earl-marshal of England for the trial of servants of the royal household. Later it was used as a prison for debtors and defaulters, as well as persons convicted of piracy on the high seas. It stood near the church of St. George, Southwark, and existed in the reign of Edward III. It was abolished in 1840. The Marshalsea will be longest remembered as the home of 'Little Dorrit.' Dickens' father was for some time an inmate of the Marshalsea, and in 'Little Dorrit' the novelist has given us a vivid picture of the life of a debtor and his family in this prison.

Marshbunker, **Marsbunker**, etc. See **MOSSBUNKER**.

Marshall'sfield, Wis., city, in Wood County, on the Wisconsin C., the Chicago, St. P., M. & O., and the Chicago & N. W. R.R.'s; almost in the centre of the State, about 190 miles northwest of Milwaukee. It was settled in 1871 by Louis Rivers, and was incorporated as a village in 1875, and chartered as a city in 1883. It is situated in an agricultural region and near extensive forests. The industries of the city are chiefly connected with manufacturing and farming. The chief industrial establishments are a furniture factory which employs 300 persons; veneer factory, 125; bed and mattress factory, 40; lumber-mills, 50; brick yards, 25; cooperage and excelsior factory, 40; other establishments employing about 30 persons. The city has a fine city hall, a public library, seven churches, a high school, four public and two parish schools.

Vol. 10—19

The two banks have a combined capital of \$800,000. The government is vested in a mayor and 12 aldermen, who are elected every two years. About two thirds of the inhabitants are of German descent. Pop. (1890) 3,450; (1900) 5,240.

ADAM PAULUS,
Editor of 'News.'

Marsh'man, **Joshua**, English Baptist missionary and Orientalist: b. Westbury Leigh, Wiltshire, 20 April 1768; d. Serampore, India, 5 Dec. 1837. He was, like his father, a weaver, but had an insatiable thirst for learning, and always kept a book on his loom. Thus he fitted himself to teach in a Baptist school in Bristol; and thence, in 1799, he went to Serampore as a Baptist missionary, and there founded, in 1810, a missionary college. He was an able linguist, and published: 'The Works of Confucius, containing the Original Text' (1809); 'Clavis Sinica' (1814); a Chinese version of the Bible; etc. He co-operated with Carey in the preparation of Telegu version of the Bible, a Bengali-English dictionary, and a Sanskrit grammar. Consult Carey, 'Marshman and Ward' (1864).

Mar'sipobran'chii, the group of fishes which includes the hagfishes and lampreys (qq.v.). See also **ICHTHYOLOGY**.

Mar'ston, **John**, English dramatic author: b. about 1575; d. London 25 June 1634. He was graduated at Brasenose College, Oxford, in 1595, took orders, and obtained, in 1616, the living of Christchurch, Hampshire, which he resigned in 1631. Little more of his personal history is known, except that he was sometimes on friendly terms, at other times at enmity, with Ben Jonson, who ridiculed him in the 'Poetaster.' He was the author of several tragedies, including 'The Malcontent' (1604), and 'Sophonisba' (1606); and comedies such as 'The Fawn' (1606); and 'What You Will' (1607). With Ben Jonson and Chapman he wrote the comedy 'Eastward Ho' (1605). His works were edited by Bullen in 1887.

Marston, **John Westland**, English dramatic poet: b. Boston, Lincolnshire, 30 Jan. 1819; d. London 5 Jan. 1800. Among his dramas were: 'The Patrician's Daughter' (1842); 'Donna Diana' (1863); 'The Favorite of Fortune' (1866). He wrote also 'Our Recent Actors' (1888), a valuable work; a novel; two collections of short stories; and poems—among the latter 'The Death-Ride at Balaklava' (1854), which became very popular.

Marston, **Philip Bourke**, English poet: b. London, England, 13 Aug. 1850; d. there 13 Feb. 1887. He was the son of John Westland Marston (q.v.). From the age of 3 he was partially blind, for many years completely so. Many of his sonnets are exquisite, but when examined collectively reveal a certain monotony of diction, and most of them would be judged too sad for a world that sees. 'Song-Tide' (1871); 'All in All' (1875); and 'Wind Voices' (1883) were the three volumes of poetry that he published in his lifetime. Latterly he found a public in the United States for his short stories, of which a posthumous collection, 'For a Song's Sake, and Other Stories' (1887), was made by W. Sharp. Consult: Moulton, 'The Collected Poems of Philip Bourke Marston, with Biographical Sketch and Portrait' (1892).

MARSTON MOOR—MARSUPIALIA

Marston Moor, England, in Yorkshire, is celebrated for the defeat there in 1644 of the royal forces under Prince Rupert, by the Parliamentary troops under Fairfax and Cromwell.

Marsupial Frog, any of several small tree frogs (*Hyladæ*) of the South American genus *Nototrema*, which incubate their eggs in brood-pouches formed by infoldings of the skin on the back of the female. The eggs are few, of large size, and abundantly provided with food-yolk, and the young sometimes remain in the pouches after hatching until they have completed their metamorphosis and attained considerable growth; but the species vary in this respect. In one case the opening is a longitudinal slit along the middle of the back, with a brood-pouch on each side; but in the other species the double pouch opens cross-ways, near the caudal extremity of the body, and may be closed by a sphincter muscle. About half a dozen species are catalogued, all natives of the forests of tropical America, and none is common or thoroughly well known. Gadow ('*Amphibia and Reptiles*,' 1901) concedes that the best account of them is still that of Weinland in '*Archiv für Anatomie und Physiologie*' for 1854.

Marsupial Mole, a small burrowing marsupial of southern Australia (*Notoryctes typhlops*), called "*urquamatæ*" by the natives, which has a remarkable similarity to a true mole in appearance (except its reddish color), adaptations of structure to an underground life, and habits. It feeds upon ants and other insects, and often emerges and travels above ground, though the front feet have been so transformed into digging organs as to make them of little service for walking. It represents a family (*Notoryctidæ*) first described by Stirling in the '*Transactions*' of the Royal Society of South Australia for 1891.

Marsupialia, the marsupial mammals, a group ranked as an order, yet embracing the whole of the superior group *Metatheria* or *Didelphia*, as it has been variously named. The latest investigations, however, tend to invalidate the distinctions upon which these groups were formerly sharply separated from the higher mammals, and to cause the marsupials to be regarded only as an order of *Eutheria* (q.v.), now distinguished chiefly by their extremely local distribution and degenerate non-placental type of reproduction. Their origin was extremely ancient, and its sources are not known; but the group appears to have arisen in Mesozoic times among the earliest of mammalian forms, and to have begun, even before the advent of the Tertiary period, a course of special modification and degeneration, especially in the line which has survived to the present. The former belief that the marsupials stood in the direct line of ancestry of mammals generally, which were thus considered as modified and diversified offshoots from this stock, is no longer held; on the contrary, the marsupials are regarded as a branch from some very early generalized stock, if not a group of independent origin. It is noteworthy, says Woodward ('*Vertebrate Palæontology*,' 1898), that the earliest known complete mammalian skeletons, which pass upward by insensible gradations into undoubted *Eutheria*, are scarcely distinguishable from the skeletons of the more generalized existing mar-

supials (for example, *Thylacinus*). In the later Mesozoic Age the marsupials were apparently scattered over all the land-area of that time, as their remains have been discovered in many parts of both hemispheres; but even previous to the Eocene epoch they had disappeared entirely from north of the equator. From the first they are divisible into the two branches or sub-orders of *Polyprotodontia* and *Diprotodontia*. The former, characterized by numerous small incisor teeth, includes a majority of the most ancient forms, and such modern groups as the opossums and desyuies; while the latter, characterized by only about six upper incisors and two, much enlarged, lower incisors, contain, besides some ancient forms, the majority of modern representations of the order, as the kangaroos, phalangiers, wombats, etc.

The marsupials take their name from the ventral pouch of skin, covering the mammary glands, in which the young are nourished or protected in most families, and which is indicative of the peculiar method of reproduction characteristic of the order, and for the support of which two bones (the epipubic bones), not present in higher mammals, project forward from the pelvis. The internal organs of reproduction are double, the two oviducts not uniting into a single uterus or vagina, although the separation of the two parts is often imperfect; hence the term *Didelphia* (q.v.). The testes of the male are suspended in a scrotum in front of the penis, the *glans* of which is often double. As a rule no allantoic placenta is present, but there is reason to suppose that the primitive marsupials were placental, and rudiments of this structure persist in the existing Australian bandicoots,—a fact which invalidates the former prime distinction made between the marsupials and higher *Eutheria*.

The young are dropped from the mother's womb as minute, undeveloped fetuses, those of the largest kangaroos being not half as large as mice when born. These larvæ (for they are that) are then taken by the lips of the mother and placed, one by one, within her ventral pouch, where each is attached to one of her teats, where it clings by means of its temporary sucking-mouth, and is nourished by the milk which oozes or is pressed down its throat. They remain there a length of time varying with the size of the species, until they have grown to an advanced stage of development, when they gradually emerge; but for a long time afterward return to the mother's pouch for refreshment, rest, or safety when alarmed. The pouch varies in its capacity and completeness, in some families being quite absent, so that the young are shielded only by the long hair upon the mother's belly.

While this strange method of reproduction is the most prominent peculiarity of the marsupials, they differ from other orders of mammals in several anatomical features, such as the simplicity of the brain, in which the cerebellum is completely exposed, and the tendency to separation of bones of the skeleton, usually solidly ankylosed in other mammals.

Since early Tertiary times marsupials have been confined to South America and the Australasian region, with the single exception of the few North American opossums (q.v.). This family (*Didelphyidæ*) is restricted to the western hemisphere, and alone remains of the large number

MARSUPIALS

1. Sugar Glider (*Hoplomys signatus*).
2. Mouse-pouch (Thomomys talpae).
3. Wombat (*Phascoloncha vombat*).

4. Tasmanian Wolf (*Thylacinus potens*).
5. American Opossum (*Didelphis virginiana*).
6. Koala (*Phascoloncha koala*).

of Tertiary forms once prevalent in South America, save a single Patagonian diprotodont, the opossum-rat (q.v.). The home of the group, then, is Australia, Tasmania, and the Papuan group, where about 125 species are known; and the race seems to have survived in that insular region owing to the absence of destructive enemies, for most of them are almost defenseless vegetable feeders. They have, however, developed into a great variety of forms under the influence of varying conditions and long competition, and present a most curious parallel to the diversities observable among the higher and more widely diffused mammalia. Some have large size, go in herds, and occupy grassy plains; others are smaller, more agile, and confined to mountainous districts. Others are still smaller, burrow, and feed upon roots, or resemble little terrestrial rodents in appearance and habits; while many forms dwell altogether in trees, and often simulate squirrels of various kinds. In another direction have been evolved a variety of predatory marsupials, whose needs have developed bodies, teeth, and powers resembling those of wolves or bears, and which are wholly flesh-eaters. There is, in fact, hardly a group of mammals which does not find a counterpart among the marsupials,—even the moles and shrews.

The classification of the order divides it into 10 or 12 well-defined families, some of which are wholly extinct, as follows:

POLYPROTODONTIA:

Doubtful primitive forms,—*Triconodon*, *Ambitherium*, etc.

Didelphidae.—Opossums (q.v.).

Dasyuridae.—Dasyures, Thylacines, etc. (qq.v.).

Peramelidae.—Bandicoots (q.v.).

Notoryctidae.—Marsupial Moles (q.v.).

DIPROTODONTIA:

Epanorthidae; *Abderitidae*, etc.—Fossil in the Miocene strata of Patagonia; but surviving in *Canollestes* (q.v.).

Phalangeridae.—Phalangers (q.v.).

Diprotodontidae.—Extinct gigantic phalangers.

Pharcolomyidae.—Wombats (q.v.).

Macropodidae.—Kangaroos (q.v.).

Consult: Beddard, 'Mammalia' (1901); Thomas, 'British Museum Catalogue of Marsupialia,' etc. (1888); Gould, 'Mammals of Australia' (1863); and scientific works on Australia, especially those of Waterhouse, Aflalo, and Lydekker.

Marsyas, mār'sī-as, mythological son of Olympos, Egeus, or Hyagnis. Athena, having seen the reflection of herself in the water, had thrown away the flute which she had invented, displeased because it disfigured the countenance in playing, and had pronounced the severest maledictions against any one who should take it up. Marsyas accidentally found this instrument, on which he soon acquired such skill that he dared to challenge Apollo to a contest, the conditions of which were that the victor should do what he pleased with the vanquished. The Muses, or according to others the Nysæans, were invited to be the umpires. The Muses decided in favor of Apollo, who put to death his rash competitor by binding him to a tree and flaying him alive. In this way was the curse of Athena accomplished.

Martel', Charles. See CHARLES MARTEL.

Martello Towers, so called by corruption from *Mortella*, in Corsica, where a strong tower maintained a determined resistance to a superior English force in 1794. In consequence of the great strength exhibited by this fort the British government erected a number of similar towers round the coast of Great Britain, and especially on the Kentish coast, as a defense against the threatened invasion from France. They are circular, with walls of great thickness, and roofs bomb-proof, and consist of two stories, the lower for the reception of stores, and the upper for the casement of troops. One traversing gun was mounted upon each, in working which the men were secured by the lofty parapet. The ordinary guard was from six to twelve men. Martello towers having come to be considered a failure, were in many places dismantled, but some have received a new and more powerful armament, or have been adapted to the use of the coast guard, or revenue officers. In some instances they are rented to private individuals. Martello towers are still to be found in New Brunswick and Nova Scotia. There are also several on the Gulf of Mexico and one still remains at Kingston, Canada.

Marten, the name of several fur-bearing animals of the weasel family (*Mustelidae*), which are mainly arboreal in their habits, and do not change their color to white in winter. The common European marten (*Martes*, or *Mustela*, *foina*), or "fou-mart," is found in Europe generally, as also is the pine marten (*M. abietum*), although the latter is rarer in Britain. The former breeds in hollow trees, and produces from three to seven young at a birth. They feed on the smaller wild mammals, such as rats, mice, etc., but also attack birds and devour eggs. They are said to be fond of honey, and even to eat fruits and grain. The pine marten occurs chiefly in North America and in the northern parts of Asia. It is of smaller size than the common marten, has a finer fur, and possesses a yellowish mark on the throat. It burrows in the ground, carries the young about six weeks, and brings forth from four to seven in a litter about the end of April. The fur is used for trimmings, and upward of 100,000 of these animals are annually hunted and killed in the fur countries, yet this marten remains fairly numerous. The famous sable marten (*M. sibirica*), which furnishes the highly valuable sable fur, is nearly allied to the pine marten. It inhabits Siberia, and vast numbers of this species are killed annually for the sake of the fur. The pursuit of these animals is described as a task involving much difficulty, discomfort, and even peril. The American sable is furnished by the *M. Americana*, and Pennant's marten (*M. canadensis*), or the fisher, pekan or black cat, as it is popularly called among northern hunters, is another well-known species. Both these last named are now almost restricted to the remote Canadian woods, although formerly numerous in the northern part of the United States. Various opinions are held by naturalists as to the specific distinction of several of the species above named, which furnish few very definite characters for separation from one another. Consult Coues, 'Fur-Bearing Animals' (1877).

MARTHA'S VINEYARD — MARTIN

Martha's Vineyard, Mass., an island off the southern coast, in the County of Dukes. It is separated from the mainland by Nantucket and Vineyard Sounds, from Nantucket Island by Hukeget Channel, and from Elizabeth Islands by Vineyard Sound. It is about 20 miles long and 11 miles across the widest part. The northern coast is high and rocky, with a few indentations, the largest of which is Vineyard Haven. The southern coast is low and irregular, with sand bars and shallow lagoons. On the southwest is Gay Head, 200 feet above the water. A lighthouse is on Gay Head Point. Edgarton, the county-seat, is the principal town on the island. Bartholomew Gosnold discovered and named the island in 1602. The Indians, who then occupied the place, were quiet and friendly, and all became Christians. They remained loyal to the whites even during King Philip's War. The island is a favorite summer resort; annual camp-meetings and summer schools have been held here for a number of years. Pop. (1900) 4,561.

Martí, José Julián, ho-sá' hoo-lě-án' măr'tě, Cuban author and patriot: b. Havana, 28 Jan. 1853; d. Dos Rios, Cuba, 19 May 1895. He studied in Havana, was sent to the quarries while only a boy as a political suspect, then went to Spain, where in Madrid and Saragossa he studied for the bar and made himself famous for his liberal views, and on his return to America was professor in the University of Guatemala, whence he came to New York city as consul for Uruguay, Paraguay, and Argentina. In 1894 he attempted to land armed men in Cuba, but was intercepted in Florida; in the next year he succeeded in landing, joined Gomez, and was killed in a skirmish with the Spanish at Dos Rios. Martí founded the Cuban organ of independence in New York city, 'La Patria,' was a poet, and wrote a Spanish translation of Helen Hunt Jackson's 'Ramona' (1888).

Martial, măr'shāl (MARCUS VALERIUS MARTIALIS), the most celebrated of the Roman epigrammatical writers: b. Bilbilis, in Celtiberia, 1 March 43 A.D.; d. there not earlier than 104 A.D. He was educated at Calagurris, the birth-place of his friend Quintilian. He went to Rome when young, during the reign of Nero, and lived under the reign of Galba and the following emperors; from some of whom he received marks of esteem and favor. Martial continued to reside in Italy till 100 A.D., when he returned to Spain to his native city. His celebrity is founded on 14 books of epigrams, of which he himself modestly says, 'Sunt bona, sunt quædam mediocria, sunt mala plura.' The number and value of his epigrams gave a high idea of the wit of the poet. Most of them are ingenious and cutting; many are full of grace and Attic salt. He is the true father of modern epigram, which is distinguished from the simple Greek epigram by the convergence of all its parts to one witty point.

Martial Law, a law that supersedes municipal law, or State law, yet is not a military law. When in time of extreme peril to the State, either from without or from within, the general safety cannot be trusted to the ordinary administration, or the public welfare demands the adoption and execution of extraordinary measures, it may become necessary to declare the existence of martial law. This is, indeed, no law

at all in its ordinary sense; it is in fact the abrogation of it. That which is done under martial law has not an immediate constitutional or legislative sanction, as the military or the statute law, for example, has. Yet remotely and indirectly martial law expresses the will of the people. The Supreme Court of the United States has held that a State legislature may proclaim its existence whenever the public safety demands it; and the Constitution, by implication at least, also permits its proclamation by that clause which provides that the privileges of the writ of *habeas corpus* shall not be suspended, unless when, in cases of rebellion or invasion, it is essential to the general welfare. See also COURT-MARTIAL; LAW, MILITARY.

Martin, Saint, of Tours: b. about 316; d. about 400. He attended the catechetical school at Pavia. His father was a military tribune, and compelled him in his 16th year to take up arms. He is said to have early escaped from his father, and received instruction in a Christian Church. He served under Constantius and Julian, and went to Gaul, where he appeared as the model of all virtue. Among other acts he divided his cloak with a poor man whom he met at the gates of Amiens (Ambianum). The legend says that Christ appeared to him in the following night covered with the half of this cloak. Soon after this vision Martin was baptized, in 337. After living many years in retirement he made a visit to his native place, during which he converted his mother, and opposed with zeal the Arians who prevailed in Illyria. For this he was scourged from the country, on which occasion he manifested the firmness of a martyr. He now established a monastery in Milan, but when he found himself again exposed to persecution took refuge on the Island of Gallinaria, in the Ligurian Sea. He next settled at Poitiers, where he assembled a number of monks, and is said to have wrought many miracles. In the year 375 (according to others 371 or 374) the bishopric of Tours was conferred on him against his will. In order to withdraw himself from the world he built the famous convent of Marmoutiers, between the Loire and a steep rock. This is regarded as the oldest abbey of France.

Martin, the name of five popes, as follows:

Martin I., Saint: b. Todi, Tuscany; d. Cherson, Crimea, 16 Sept. 655. He was elected pope in 649, succeeding Theodore I. He summoned the first Lateran Council at which he caused the doctrine of two wills and operations in Christ to be affirmed. The Emperor Constant II. upholding the doctrines which the Council had condemned, took the pope prisoner and brought him to Constantinople on a charge of treason and then banished him to the Crimea. On account of his sufferings he is numbered among the saints. His day is 12 November.

Martin II., or Martinus I.: b. Montefiascone; d. Rome 14 Feb. 884. He was elected pope in 882 after the death of John VIII. While bishop of Caere he had been legate for three popes in their negotiations with the East. To English King Alfred he sent a piece of the wood of the Cross.

Martin III., or Martinus II.: b. Rome; d. 946. He succeeded Stephen VII. in 942 and was greatly esteemed for his learning and nobility of character.

MARTIN

Martin IV. (SIMON DE BRION, sê-môn dè brê-ôn): b. France; d. Perugia 28 March 1285. He succeeded Nicholas III. in 1281, having previously been canon of Tours, and cardinal from 1261. He owed his election in great measure to the influence of Charles of Anjou, whom he supported thereafter and did all in his power to enable that monarch to retain possession of Sicily. In his pontificate occurred the famous massacre known as 'The Sicilian Vespers.'

Martin V. (OTTONE COLONNA, ôt-tô'nâ kô-lôn'nâ): b. Rome 1363; d. there 20 Feb. 1431. He was elected pope in 1417, after the abdication of Gregory XII., and the deposition of John XXIII. and Benedict XIII., during the Council of Constance. His first act was to promulgate a bull against the Hussites, remarkable for the circumstance that in it the pope seems to recognize the supreme authority of the councils. He was one of the ablest of the popes, and through his efforts unity was finally secured to the Church and peace to Italy. In 1418 he dissolved the Council of Constance, though a number of difficulties were not then adjusted, and dissensions continued in the Church. Benedict XIII. still lived; and at his death, in 1424, a new anti-pope was elected in Clement VIII., who at length renounced his pretensions in 1429, when he received the bishopric of Minorca as an indemnification.

Martin, Alexander, American soldier and statesman: b. in New Jersey about 1740; d. Danbury, Rockingham County, N. C., November 1807. He was educated at the College of New Jersey, and after removing in 1772 to Guilford County, N. C., became a member of the colonial assembly. He participated in the assemblies of the people which met in 1774-5; in 1776 was appointed colonel of a regiment of the Continental line, with which he fought at Brandywine and Germantown; and at the conclusion of the war re-entered the general assembly of North Carolina, of which he became speaker. In 1782 he was elected governor of the State, and again in 1789; was a member of the convention which framed the Federal Constitution; and from 1793 to 1799 filled the office of United States senator from North Carolina.

Martin, Artemas, American mathematician: b. Steuben County, N. Y., 3 Aug. 1835. He was educated in the district schools and in Franklin Academy and was engaged in various pursuits until 1885, when he was appointed to the United States Coast and Geodetic Survey. He edits and publishes the 'Mathematical Magazine' and the 'Mathematical Visitor,' and is a member of many learned societies at home and abroad.

Martin, Charles Cyril, American civil engineer: b. Springfield, Pa., 30 Aug. 1831; d. Far Rockaway, N. Y., 11 July 1903. He was educated at Rensselaer Polytechnic, Troy; taught there a year; in 1858 went to Brooklyn, where he worked in the city waterworks; in 1860 was sent by the Trenton Locomotive Works to build a bridge over the Savannah River; returned to Brooklyn on the outbreak of the Civil War, during which he was engineer in the navy yard; after the war he was chief engineer of Prospect Park, Brooklyn; and was appointed John A. Roebling's 2d assistant in building the Brooklyn

Bridge, of which he became chief engineer after Roebling's retirement.

Martin, Edward Sanford, American author: b. Willowbrook, Owasco, N. Y., 2 Jan. 1856. He studied at Phillips Exeter and at Harvard, where he was graduated in 1877; was admitted to the bar in 1884; but devoted himself to literature, and removed from Rochester to New York. He is particularly happy in criticism of men, books, and events, in light verse, in his descriptions of out-doors, and in his papers on children. He published 'Sly Ballades in Harvard China' (1882); 'A Little Brother of the Rich' (1890); 'Pirated Poems' (1890); 'Windfalls of Observation' (1893); 'Cousin Anthony and I' (1895); 'Lucid Intervals' (1900); and 'Poems and Verses' (1902).

Martin, François Xavier, American jurist: b. Marseilles, France, 17 March 1764; d. New Orleans 11 Dec. 1846. He emigrated to Martinique when 18; later removed to New Berne, N. C.; taught French there and became a printer; studied law, being admitted to the bar about 1789; and in 1792 was requested by the State legislature to compile the British statutes in force before the Revolution. He was himself a member of the Assembly in 1806-7; was judge of the Mississippi Territory in 1809; went to Louisiana in the same capacity in 1810; and in 1813 became attorney-general of the new State of Louisiana. From 1815 until just before his death Martin was a member of the Supreme Court of the State. Although blind for the last 10 of these 31 years, his ability was not at all impaired, and it is due to him that the law of the State was in some measure evolved from the tangle of French and Spanish statutes in which he found it. He wrote a 'History of North Carolina' (1829); 'History of Louisiana' (1827), and a version of Pothier on Obligations; and besides edited law reports of the Territory and of the State of Louisiana.

Martin, Helen Faucit, LADY. See FAUCIT, HELEN.

Martin, Henry Austin, American surgeon: b. London 23 July 1824; d. Boston 7 Dec. 1884. He came to the United States at an early age and was graduated from the medical school at Harvard in 1845, when he established a practice in Boston. He served as a surgeon until nearly the close of the Civil War, when he resigned and was brevetted lieutenant-colonel for gallant service. He devoted his attention principally to surgery and to the treatment of smallpox, upon which subject he was a generally recognized authority. He was the originator of many important innovations in the field of surgery and published valuable professional articles in periodicals. He was a member of the International Medical Congress held at London in 1881, where he delivered a paper explaining a method of treatment which he had originated and which commanded much favorable attention.

Martin, Homer Dodge, American painter: b. Albany, N. Y., 28 Oct. 1836; d. St. Paul, Minn., 12 Feb. 1897. He opened a studio in New York city in 1862; was elected a member of the National Academy of Design in 1875; and resided in France in 1882-6. While he was influenced somewhat by the Barbizon School of painters, he succeeded in developing a style entirely his own, which was of so high a quality as to place him among the best known of American

landscape painters. His works include 'Landscape on the Seine'; 'An Equinoctial Day'; 'Brook in the Woods'; 'In the Adirondacks'; 'Sand Dunes on Lake Ontario'; 'White Mountains, from Randolph Hill'; etc.

Martin, John, English painter: b. near Hexham, Northumberland, England, 10 July 1789; d. Douglas, Isle of Man, 17 Feb. 1854. He attracted notice by his large picture, 'Sadak in Search of the Waters of Oblivion.' He afterward produced a number of striking works; among the most attractive of these pictures are: 'Belshazzar's Feast'; 'The Seventh Plague'; 'The Fall of Nineveh'; 'The Eve of the Deluge'; and the 'Destruction of Herculaneum.'

Martin, Josiah, English colonial governor in America: b. probably in Antigua, West Indies, 23 April 1737; d. London, England, July 1786. He rose to the rank of lieutenant-colonel in the British army in 1771, and in the same year was appointed to the royal governorship of North Carolina. He was successful in pacifying the "regulators," many of whom remained zealous Tories; and took a firm and energetic attitude in the maintenance of British authority. But on 24 April 1775 he was compelled to escape to the sloop *Cruiser*, from which on 8 August he issued a prodigiously long proclamation which the Whigs ordered burnt by the hangman. He was with Sir Peter Parker at Charleston (June 1776), and accompanied Cornwallis into North Carolina after the British victory over Gates at Camden; but in March 1781 withdrew to Long Island, and thence went to England.

Martin, Luther, American lawyer: b. New Brunswick, N. J., 9 Feb. 1748; d. New York 10 July 1826. He was graduated from the College of New Jersey (Princeton) in 1766; studied law at Queenstown, Md., was admitted to the Maryland bar in 1771; in 1774 was one of the commissioners appointed to oppose the claims of Great Britain; in 1778 became attorney-general of Maryland; and in 1787 was a delegate from Maryland to the convention that framed the Constitution of the United States. His opposition to the instrument was so strong that, rather than sign it, he left the convention, thus earning from Jefferson the sobriquet of "the Federal bull-dog." In 1804 he defended Samuel Chase (q.v.) in the latter's impeachment trial before the Senate, and in 1805 resigned his attorney-generalship and resumed private practice. He was counsel for Burr in Burr's trial at Richmond in 1807, in 1814-6 was chief judge of the Baltimore court of oyer and terminer, and in 1818-20 was again attorney-general of Maryland. Among his writings was the series of pamphlets, 'Modern Gratitude' (1801-2). Consult Goddard, 'Luther Martin, the Federal Bull-Dog' (1887).

Martin, Sir Theodore, English lawyer and author: b. Edinburgh 16 Sept. 1816. He was educated at the University of Edinburgh and became a solicitor in Edinburgh in 1840. In 1845 he went to London, where he became a Parliamentary solicitor. He has been deeply interested in art and music and has made extensive contributions to the literature of the day, including translations and original work. With Aytoun he published the once famous 'Bon Guallier Ballads' (1855). His translations comprise many of the works of Goethe (with Aytoun), Schiller, Horace, Catullus, etc., and

he has written: 'Essays on the Drama'; 'Madonna Pia' (1855); 'Life of Lord Lyndhurst' (1884); 'Life of the Prince Consort' (1875-80); 'Helena Faucit, Lady Martin' (1901).

Martin, William Alexander Parsons, American educator: b. Livonia, Ind., 10 April 1827. He was graduated from the Indiana State University and studied theology. He went to China as a missionary in 1850 and has spent the greater share of his life there engaged in educational and missionary work. He performed various services for the United States government and assisted in making the treaty between that government and China in 1858, and was an authority in China on questions of international law. He was professor and president of Tung Wen College 1868-98, and then president of the New Imperial University until 1900, when it was destroyed in the siege of Peking, in which city he was imprisoned with the American legation. In 1902 he was appointed president of the University of Wuchong. He has edited in Chinese the 'Peking Scientific Magazine,' and the 'Science Monthly,' and has published: 'Siege in Peking' (1900); 'Cycle of Cathay'; 'Chinese Legends'; 'The Lore of Cathay' (1901); etc.

Martin, a swallow (q.v.). In the United States the name is restricted to the purple martin (q.v.), several other species of which (genus *Progne*) are familiar garden birds in South America. The bank-swallow (q.v.) is sometimes called sand-martin, especially in England, where the term is more generally used as a synonym of "swallow" than in America. It is also given carelessly to some other birds of a very different sort, as kingbirds (flycatchers), which are called bee-martins in the South because they sometimes dash at hives and snatch flying bees.

Martin Chuzzlewit, chūz'l-wit, the title and the hero of a novel by Charles Dickens (1844). The scene is partly in England, partly in America, the description of American life being very unflattering. The theme of the story is the vice of selfishness, and the characters, notably Mr. Pecksniff, Mrs. Gamp, and Betsey Prig, are among Dickens' best.

Martineau, mār'tī-nō, **Harriet**, English author: b. Norwich 12 June 1802; d. Ambleside 27 June 1876. She was a sister of James Martineau (q.v.). Her first work, 'Devotional Exercises for the Use of Young Persons,' appeared in 1823; and in 1830-1 she won three prizes offered by the Central Unitarian Association for as many essays designed to convert respectively the Catholics, the Jews, and the Mohammedans. "The essays," observes a biographer, "probably converted nobody, but brought in 45 guineas." Next came several stories, mostly intended to inculcate some useful lesson, such as those having the title, 'Illustrations of Political Economy' (1831-4), which were followed by 'Illustrations of Taxation' (1834), and gained an immediate recognition. After a sojourn in the United States (19 Sept. 1834—1 Aug. 1836), she published 'Society in America' (1837), intended as a comparison of "the existing state of society in America with the principles on which it is proposedly founded," and 'A Retrospect of Western Travels' (1838), including some criticisms of slavery that were not well received in this country. Up to about 1851 Miss Martineau

MARTINEAU — MARTINENGO-CESARESCO

had been known as a Unitarian, but she now showed a decided leaning towards Positivism, and in 1853 published a condensation of Comte's 'Positive Philosophy.' Among her other works of importance may be mentioned her 'History of England during the Thirty Years' Peace' (1849). During the last twenty years of her life her writings consisted mainly of pamphlets and contributions to newspapers and periodicals. A remarkably candid autobiography which had been written for many years was published after her death (1877). Consult also Miller, 'Harriet Martineau' (1884).

Martineau, James, English Unitarian clergyman and philosopher: b. Norwich 21 April 1805; d. London 11 Jan. 1900. His father, Thomas Martineau, the great-grandson of a Huguenot surgeon who left France after the revocation of the Edict of Nantes, was a manufacturer of bombazines. Harriet Martineau (q.v.) was an elder sister. He was sent to Derby in 1821 to study civil engineering, but in the following year became a student of Manchester College, now at Oxford, then at York. On the completion of his college course in 1827 he took charge for a year of Dr. Lant Carpenter's school in Bristol, and in 1828 he accepted a call to the co-pastorship of Eustace Street Presbyterian Church, Dublin. In 1831 he published 'Hymns for Christian Worship,' and next year resigned his pastorate, but shortly afterward accepted the co-pastorate of Paradise Street Chapel, Liverpool, of which, in 1835, he became sole pastor. In 1836 appeared his first separate original work, 'The Rationale of Religious Inquiry,' which attracted considerable attention. In 1839 he was associated with J. H. Thom and Henry Giles in the defense of Unitarianism against attacks by orthodox clergymen, and of the 13 addresses published in 'Unitarianism Defended' (1839) five were by Martineau. In 1840 he published his collection of 'Hymns for the Christian Church and Home,' and in the same year was appointed professor of mental and moral philosophy and of political economy in his old college, now located in Manchester and named Manchester New College. On the removal of the college to London in 1853 he retained his professorship, but did not settle in London till 1857. In 1848-9 he spent 15 months on the Continent, mostly in Germany, during which his philosophical opinions were profoundly influenced by the study of Greek and German philosophy under Trendelenburg. The remaining publications of his first Liverpool period are an essay on 'The Five Points of Christian Faith' (1841), and the well-known collection of sermons entitled 'Endeavors after the Christian Life' (1843-7). During the period 1849-57, when he was pastor of Hope Street Church, Liverpool, he published many articles in reviews, among them that on 'Mesmeric Atheism,' which finally completed his sister Harriet's estrangement from him. In 1859, being now in London, he and J. J. Taylor, principal of Manchester New College, were chosen joint ministers of Little Portland Street Chapel, but from 1860 till his resignation in 1872 Martineau alone supplied the pulpit. On Taylor's death in 1869 he became principal of the college, a post which he held till his resignation in 1885. In 1866 he was a candidate for the chair of logic and mental philosophy in University College, London,

but the united opposition of orthodoxy and secularism led by George Grote managed to defeat him by a single vote. His publications during his connection of 28 years with Manchester New College in London comprise: 'Studies of Christianity' (1866), a volume of sermons; 'Why Dissent?' (1871); 'Hymns of Praise and Prayer' (1873); 'Religion as affected by Modern Materialism' (1874); 'Modern Materialism: Its Attitude towards Theology' (1876), a masterly attack on Tyndall and the scientific materialists; 'Essays, Theological and Philosophical' (1875); 'Hours of Thought on Sacred Things' (1876-80), a collection of the sermons of his maturer period; 'Ideal Substitutes for God Considered' (1880), a criticism of Moral Idealism; 'The Relation between Ethics and Religion' (1882); 'A Study of Spinoza' (1883), his first great philosophical work; and 'Types of Ethical Theory' (1885), the earlier of his two masterpieces. During the remaining years of his life he published his great defense of the essential principles of religion entitled 'A Study of Religion: Its Sources and Contents' (1888); and his freely critical 'Seat of Authority in Religion' (1890); besides a volume of 'Home Prayers with Two Services for Public Worship' (1891), and a collective edition in four vols. of many of his 'Essays, Reviews, and Addresses' (1891). The first academical degree conferred upon him was that of LL.D. by Harvard in 1872, but he received later the degrees of S.T.D. from Leyden (1875), D.D. from Edinburgh (1884), D.C.L. from Oxford (1888), and Litt.D. from Dublin (1892). Martineau was one of the most eminent preachers of his time, but his greatest work was done in the fields of ethics and philosophical theology. At first a necessarian and utilitarian, he was latterly the greatest modern champion of free-will and intuitionism. In the development of his Christology from a sort of Arianism to complete Humanitarianism, and in his ever-increasing insistence upon the continuity of revelation and the purely internal character of ultimate religious authority, he sums up more than any other the history of Unitarianism, and indeed of liberal theology generally during the 19th century. He was a powerful and eloquent champion of Theism against scientific agnosticism and materialism. All his works are written in a uniquely rhythmic style, characterized by a profuse and happy use of figurative language. Consult Jackson, 'James Martineau: A Biography and a Study' (1900); Sidgwick, 'Lectures on the Ethics of Green, Spencer and Martineau' (1902); Drummond, 'Life and Letters of James Martineau'; and Upton, 'A Survey of Philosophical Work' (1902).

Martinelli, mār-tě-něl'le, Sebastian, papal delegate to the United States: b. Lucca, Tuscany, 20 Aug. 1848. He was educated at the College of St. Augustine in Rome and was ordained to the priesthood in 1871. He became superior-general of the Augustinian Order throughout the world and in 1894 was sent to America to visit the monks of that order and shortly afterward was designated apostolic delegate to the United States. In 1896 he was made a special archbishop, and in 1901 was elevated to the cardinalate.

Martinengo-Cesaresco, mār-tě-něn'go chā-zā-rēs'kō, Countess Evelyn Lilian Hazeldine

MARTINEZ — MARTINIQUE

Carrington, Anglo-Italian author: b. England. She was married to the Count Eugenio Martinengo Cesaresco, an Italian writer, and has published 'Essays in the Study of Folk Songs'; 'Italian Characters'; 'The Liberation of Italy'; 'Cavour' in the 'Foreign Statesmen' series; (all these books have been translated into Italian); 'Lombard Studies' (1902); etc.

Martinez, Enriquez, ěn-rĕ-kĕth mār tĕ neth, or **Enrico**, Mexican engineer: b. about 1570; d. in Mexico, 1632. His birthplace is variously given as Germany, Holland, Spain (in Ayamonte, Andalusia), or Mexico. He studied engineering in Spain; went to Mexico as interpreter to the Inquisition and with the title of cosmographer royal; and in 1607 undertook to drain the valley of Mexico, threatened by lakes Zumpango and San Cristobal. His canal was fairly successful but inadequate, and after various experiments on the part of other engineers, with whose work Martinez was accused of tampering, he was bidden enlarge his tunnel and canal. He died before the work was much more than started. Martinez established a printing-press in the City of Mexico, and wrote on the natural history of Mexico, on astronomy, and on trigonometry.

Martinez de Cam'pos, Arsenio. See CAMPOS, ARSENIO MARTINEZ.

Martinez de Rozas, Juan, hoo-ān' mār tĕ-nĕth dā rō'zās, Chilean statesman: b. Mendoza, Argentina, 1759; d. there 3 March 1813. He was educated at Cordova; studied law at Santiago; became professor at San Carlos, Chile, in 1781; in 1787 was made assistant intendant of the province of Concepcion; and in 1796 had risen to the second command in the presidency. He took a prominent part in planning the revolution of 1810; was a member of the governing junta until 1811, when he became its president; and showed himself an able administrator and a brave soldier. Carrera quarreled with him, got the upper hand, and banished him to his birthplace, only a few months before his death.

Martinez, mār-tĕ'nĕz, Cal., town, county-seat of Contra Costa County; on the Strait of Karquines, and on the Southern Pacific railroad; about 30 miles northeast of San Francisco, and 85 miles southwest of Sacramento. It is near valuable mines and also rich farm lands, on which large quantities of wheat are raised. A novitiate of the Christian Brothers is here, and the Brothers maintain a library which has about 6,000 volumes. Pop. (1900) 1,380.

Martini, mār-tĕ'nĕ, **Simone**, Italian painter, sometimes mistakenly called Simone Memmi: b. Siena 1284; d. Avignon 1344. He was the founder of the Siennese school of painting and executed frescoes in the churches of Siena, Assisi, Naples, and Orvieto. At the invitation of Pope Benedict XII. he went to Avignon, and in collaboration with his brother Donato decorated the papal palace. He seems to have aimed at flat decorative effect, rather than artistic boldness and originality in his wall painting, and his color is harmonious and fresh, though his faces are conventional. The large painting of the Madonna on the walls of the Palazzo Pubblico is his most important work at Siena (1315); at Florence is to be seen an 'Annunciation' of his in the Uffizi, and fragments of his work also

survive at Avignon. His other more important pictures are 'The Way to Golgotha' (1333) in the Louvre; 'The Blessing of Christ' in the Vatican; 'Christ as a Child with His Parents' in the Royal Institution, Liverpool. Consult: Berenson, 'Central Italian Painters of the Renaissance.'

Martinique, mār-tĭ-nĕk', West Indies, an island of the Lesser Antilles, and, except Guadeloupe, the largest in the Caribbean chain. Area, 381 square miles. It is very mountainous (Mt. Pelée, in the northwest, 4,450 feet; Mt. Carbet but a little lower, while a peak near the southern coast rises to the height of 3,950 feet). The thermometer ranges between 76° and 88° F., the summers being hot and dry, autumn and a part of winter hot and rainy, and spring comparatively cool. In 1901 the inhabitants numbered 203,781. About 3 per cent were Caucasians, who resided chiefly in St. Pierre; the balance of the population—those who, in the main, suffered least from the disaster of 1902—are described as negroes, mulattoes, "cobre, chabun, and matés"—that is, blends of the African, Carib Indian (q.v.), Mongolian, and French races. A large part of the surface is covered with forests of silk-cotton, species of mahogany, etc. The flora is closely related to that of South America; the fauna abounds in minor reptiles and insects. Of the snake kind the most dreaded is the fer-de-lance, whose bite is fatal. The principal crop is sugar, and in former years about 60,000 tons were produced annually; but the output has fallen to 25,000 or 28,000 tons. Attempts to raise coffee and cacao on a large scale have not been successful. The total foreign trade in 1901 was: exports \$5,203,320, and imports \$5,394,686. Imports increased by about \$300,000 during the 12 months from May 1902 to May 1903. Martinique is a colony of France, sending one senator and one deputy (two deputies until 1903) to the French legislature. Its affairs are administered by a governor and general council. Educational institutions are: a law school at Fort-de-France, several secondary or normal schools, and about 100 primary schools. The island was acquired by the French in 1635. Toward the close of the 18th and beginning of the 19th centuries it was temporarily held by the British. In May 1902 volcanic eruptions from Mt. Pelée destroyed St. Pierre, which was the largest city on the island, with a population of 26,011, and the residents of that place perished, almost without exception; but the statement commonly made, that "a great part of the island was overwhelmed," is incorrect. The scope of Pelée's work was limited. (See PELÉE MONT.) About 10,000 persons besides those in St. Pierre lost their lives (in all, 20 per cent of the total population); the best agricultural regions, however, in the south and along the eastern coast, were uninjured. The capital, Fort-de-France (population 22,164) is situated in the southwest, and is important as being the military and naval headquarters and rendezvous in the French Antilles; the terminus of the French transatlantic steamers and West Indian cable system. A statue of the Empress Josephine, who was born in Martinique, is one of the ornaments of the public gardens of Fort-de-France. In 1903 the military force consisted of 1,116 French soldiers. The capital has had its share of misfortunes in the past: it was nearly consumed

MARTIN'S FERRY—MARTYN

by fire in 1890, and partially destroyed by an earthquake in 1839.

MARRION WILCOX,
Authority on Spanish America.

Mar'tin's Ferry, Ohio, city, in Belmont County; on the Ohio River, and on the Pennsylvania, the Cleveland, L. & W., the Wheeling B. & T., and the Wheeling & L. E. R.R.'s; almost opposite Wheeling, W. Va. The first settlement was made in 1769 and in 1865, nearly a century later, it was incorporated as a village. The charter under which it is now governed was granted in 1885. It is situated in a region noted for its abundance of bituminous coal, iron, and limestone. The chief manufactures are iron, steel, stoves, shovels, nails, glass, tin, machine-shop products, lumber, barrels, and boxes. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 6,250; (1900) 7,760.

Martinsburg, mār'tinz-bërg, W. Va., city, county-seat of Berkeley County; on the Cumberland V. and the Baltimore & O. R.R.'s; about 65 miles northwest of Washington, D. C. It is in the vicinity of valuable stone quarries and forests which furnish timber for many mills. The chief manufactures are hosiery, woolen goods, lime, wagons, lumber, and canned goods. The repair shops of the Baltimore & Ohio Railroad and slate and limestone quarries furnish employment for a number of people. The chief buildings are the government building, which cost \$100,000; the Berkeley Female Seminary, the Berkeley Female Institute, and the King's Daughters' Hospital. The waterworks are owned and operated by the municipality. Pop. (1900) 7,564. Martinsburg, as the chief city of the lower Shenandoah Valley, on the main road leading across the Potomac, the converging point of several roads, with the Baltimore & Ohio Railroad running through it, was an important point in the military operations of the valley during the Civil War. Then it was in Virginia. Early in July 1861 Gen. Patterson, after a slight skirmish, occupied the place, the Confederates falling back to Winchester. Patterson soon abandoned it, and it was reoccupied by the Confederates. Early in March 1862 it was again occupied by the Union forces under Gen. Banks, the Confederates falling back up the Valley. It was abandoned 25 May 1862, after Banks' defeat at Winchester, but soon reoccupied by Banks. On 8 Sept. 1862 Gen. Julius White was in command of the place with about 2,500 men of all arms. At this time Gen. Lee had crossed the Potomac and was at Frederick, Md. On the 10th Jackson led a column from Frederick, crossed the Potomac at Williamsport, and moved on Martinsburg. White retreated during the night of the 11th to Harper's Ferry. In June 1863, when Ewell's corps moved down the valley on the Gettysburg campaign the place was held by Col. B. F. Smith with 1,200 infantry and a battery. On 13 June Ewell, at Cedarville, detached Jenkins' cavalry brigade and Rodes' infantry division to surround and capture the Union forces at Berryville and Martinsburg. Both garrisons escaped, Smith, with the greater part of his infantry, crossing the Potomac at Shepherdstown and making his way to Maryland Heights. The battery retreated by the Williamsport road, was pursued, and lost five of its six guns, with 200 infantry accompanying it. On 1 July 1864 the place was held

by Gen. Sigel with about 3,200 infantry and dismounted cavalry, and a battery. On the 2d Early arrived at Winchester on his campaign to menace Washington and, under Gen. Lee's instructions, first to clear out the lower Valley and wreck the Baltimore & Ohio Railroad. Parties were sent north and west against the railroad, and on the 3d Bradley T. Johnson, with a cavalry brigade, was ordered to move through Smithfield and Lee Town, cross the railroad at Kearnsysville, east of Martinsburg, and, pushing north, unite with McCausland at Hainesville beyond Martinsburg. Johnson arrived at Lee Town early in the morning, where he was met by Col. J. A. Mulligan with about 2,000 men and a battery, and after a hard fight was driven back on the divisions of Rodes and Ramseur, which were supporting him. Breckinridge's division, which marched on the main road to Martinsburg, drove before it Stahl's cavalry, on outpost at Darkesville. Sigel, warned of approaching danger, burned his stores, collected his command, and, leaving Martinsburg on the night of the 3d, crossed the Potomac at Shepherdstown and occupied Maryland Heights. Early cleared the Valley and advanced on Washington, and on the 11th Martinsburg was occupied by Sullivan's division of Hunter's command, and remained in Union occupation until the 25th, when Crook, being defeated by Early at Kernstown, was driven through Winchester, made a short stand at Martinsburg, and recrossed the Potomac at Williamsport. Early again occupying the town and destroying the railroad on either side of it, and continuing in possession until 10 August, when, upon Sheridan's advance to Halltown, he abandoned Martinsburg and Winchester and fell back to Strasburg. He advanced from Strasburg on the 17th and reoccupied Martinsburg on the 19th with his cavalry. From this time until 17 September the place was held alternately by Union and Confederate cavalry, on the 17th by Averell's Union division. On that day Early left Winchester with a heavy force of infantry, cavalry, and artillery, and on the 18th attacked and drove Averell from Martinsburg across the Opequon. Sheridan defeated Early on the Opequon on the 19th, and drove him up the Valley; and Martinsburg was again occupied by Union troops, to remain in their possession until the close of the war.

E. A. CARMAN.

Mar'ty, Martin, Roman Catholic bishop: b. Schwyz, Switzerland, 12 Jan. 1834; d. St. Cloud, Minn., 19 Sept. 1896. He received a collegiate education in Switzerland and Austria, was ordained to the priesthood in 1856 and in 1860 came to the United States. He assisted in the founding of a priory at St. Meinrad's, Ind., and was its first superior; through his efforts the priory became an abbey in 1870 and Marty was raised to the rank of mitred abbot. He resigned his office several years later in order to perform mission work among the Indians of Dakota, over whom he gained a wide influence. He mastered their language and wrote a Sioux grammar and dictionary. In 1880 he became the first bishop of Sioux Falls, and in 1894 was transferred to St. Cloud, Minn.

Martyn, mār'tin, **Henry**, English missionary to India: b. Truro, Cornwall, 18 Feb. 1781; d. Tokat, Asia Minor, 16 Oct. 1812. He was

MARTYN—MARVIN

graduated from St. John's College, Cambridge, in 1801; became a fellow of the same college in the next year; and, turning from the law, took orders, and landed in India in 1806. After three years at Dinapore he was transferred to Cawnpore, where he opened a church in 1810, in spite of violent opposition, and where he completed a Hindustani version of the New Testament. To perfect a translation of the New Testament into Persian and to recover his health in 1811 he traveled into Persia. In Tabriz he was taken ill with a fever; and on his hurried journey home was compelled to stop at the plague-stricken town of Tokat, where he died. He was the great missionary hero of the Church of England up to the early part of the 19th century. Martyn's works include 'Controversial Tracts on Christianity and Mohammedanism,' and versions of various parts of the Bible into Hindustani, Persian, and Judæo-Persic. Consult the lives by Sargent (1819), Bell (1880), and George Smith (1892); as well as Martyn's 'Journals and Letters' (1837). The beautiful baptistery of the modern cathedral of Truro is a memorial to Martyn.

Martyn, William Carlos, American Presbyterian clergyman and historical writer: b. New York 15 Dec. 1843. He was graduated from the Union Theological Seminary in 1869, was ordained to the Presbyterian ministry in that year, and has held several important charges, but has devoted his later years to literary work. Since 1897 he has been director of the Abbey Press. He has published: 'Life of John Milton' (1866); 'Pilgrim Fathers of New England' (1870); 'Wendell Phillips—the Agitator' (1890); 'Christian Citizenship' (1896); 'Sour Saints and Sweet Sinners' (1898); etc.

Martynia, a genus of annual and perennial herbs of the order *Pedaliaceæ*, or according to some authors, *Bignaniaceæ*. The ten species have tuber-shaped roots; thick sub-erect stems; opposite or alternate heart-shaped leaves; showy catalpa-like flowers in short terminal racemes; and horned capsules which suggest the names unicorn plant and proboscis-flower. When ripe the capsules split and expose numerous black wrinkled seeds. The stems and foliage are clammy and malodorous, but the flowers of some species not unpleasantly perfumed. The species are all natives of warm parts of America, especially of the lower Mississippi Valley. They are often planted for ornament, as curiosities, and for their capsules, which while young and tender are used as material for pickles. *M. proboscidea*, to which the popular names are generally applied, is the most commonly grown. The seeds are started under glass and transplanted to the garden as soon as danger of frost has passed. They do well in most garden soils.

Martyr, mār'tér, **Peter**. See **PETER MARTYR**.

Martyr (Greek for "witness"), a designation applied by the Christian Church to those persons in particular, who, in the early ages of Christianity, suffered death rather than renounce their faith, and thus testified their confidence in the truth of the new doctrines. Martyrs are sometimes classified as of three classes: martyrs in will and deed, like St. Stephen; those in will, but not in deed, like St. John, who escaped from the death ordained for him by Domitian; and those in deed but not in will, like the Holy Innocents. An account of the life, persecutions,

and death of the Christian martyrs is called a martyrology (q.v.). A tomb or oratory erected on the spot where a martyr suffered was called martyrium, martyr. Festivals in honor of the martyrs seem to have been observed as early as the 2d century. The Christians offered prayers, at the martyr, and thanked God for the example which they had given to the world. The rite was concluded with the sacrament of the Lord's supper and the distribution of alms. Eulogies were also delivered, and accounts of the lives and actions of the deceased read. These festivals were called the birthdays of the martyrs, because on the day of their death they were born to eternal life.

Martyrology, called also calendar of the saints, the acts of the saints, menology, anology, synaxary, a list of martyrs and other saints, in which was sometimes noted, the character of their lives, and in the case of a martyr the place and date of his martyrdom, and the nature of the sufferings which he underwent. Baronius, an ecclesiastical historian of the 16th century, attributes to St. Clement of Rome, almost contemporary with the apostles, the first idea of collecting the acts of the martyrs. In the time of Gregory the Great (end of the 6th century) the Church possessed a general martyrology, the author of which is said to have been St. Jerome, who made use of materials collected by Eusebius of Caesarea. The only part of it now extant is a catalogue of the martyrs who suffered in Palestine during the last eight years of the persecution of Diocletian. There is a martyrology attributed to Bede (beginning of 8th century), but if not altogether spurious it is at least interpolated. Numerous martyrologies were produced in the next century and subsequently. In 1586, under the auspices of Sixtus V., a martyrology was printed at Rome, with notes by Baronius, with the title of 'Martyrologium Universale.' Ruinart's 'Acta Primorum Martyrum Sincera' appeared at Paris in 1680, and a new edition of it was published in 1859. The 'Acta Sanctorum' (q.v.) of the Bollandists comprises over 60 volumes issued at various times from 1643, but the work is still incomplete. The well-known English work of John Foxe, 'The Book of Martyrs,' may also be mentioned.

Marut, ma-root', in Hindu mythology, the god of the wind and tempest. His wife is Anjana, and his son Hanuman Bhima.

Mar'vel, Ik. See **MITCHELL**, DONALD G.

Mar'vell, Andrew, English poet and satirist: b. Winestead, Holderness, Yorkshire, 31 March 1621; d. London 18 Aug. 1673. He was graduated from Trinity College, Cambridge, in 1638; after activity as poet and tutor became colleague of Milton in the Latin secretaryship in 1637; was three times elected to Parliament for Hull; and under the Restoration attacked Charles II. and advocated a republic. His chief poem is the 'Horatian Ode Upon Cromwell's Return from Ireland' (written 1650; first printed 1776). The shorter poem, 'The Bermudas,' is also well known. He was well known in his own time as a vigorous pamphleteer. Consult the 'Life' by Cooke prefixed to an edition of Marvell's works (1726).

Marvin, Charles Frederick, American meteorologist: b. Putnam, Ohio, 7 Oct. 1858. He

MARX — MARY

was graduated as a mechanical engineer from the Ohio State University in 1883, where he had been instructor in mechanical drawing and laboratory practice since 1879. In 1884 he was appointed to the United States signal service, and later was made professor of meteorology in the weather bureau. He has made many important investigations and discoveries in connection with the work of the weather bureau, and has written quite extensively concerning them.

Marx, märks, Karl, German socialist: b. Trèves 5 May 1818; d. London 14 March 1883. He was educated at the universities of Bonn and Berlin, and in 1842 took up journalism, becoming editor of the 'Rheinische Zeitung,' a democratic journal; his socialistic articles in this paper caused its suppression in 1843. Marx then proceeded to Paris, where he became one of the editors of the 'Deutsch-Französische Jahrbücher,' to which he contributed articles on the 'Hegelian Philosophy of Right.' He was expelled from France in 1845, and retired to Brussels, where he assisted in organizing the German Workingmen's Association, was also active in the organization of the Communist League, and with Engels issued the famous Communist Manifesto in 1847, which was the first public declaration of international socialism. In 1848 Marx returned to Germany, started the 'Neue Rheinische Zeitung,' and was active in the revolutionary movements of that year. Banished from Germany in 1849, he went first to Paris, then to London, where he lived till the time of his death. He devoted himself largely to the study of economic questions, and was correspondent of the New York *Tribune* and other papers. In 1864 he took a leading part in the organization of the International Workingmen's Association (q.v.), was selected to formulate its programme, and practically shaped its policy for a number of years; he was also interested in the organization of the German Social Democrats who united with the International in 1869. After 1873 he took no active part in politics, but devoted his time to the completion of his work on capitalism, 'Das Kapital' ('Capital'), the first volume of which had been published in 1867 (English translation, 1886); the second and third volumes were left in MS., and Vol. II. was published in 1885, Vol. III. in 1894, under the editorship of Engel. He also wrote: 'Zur Kritik der Politischen Oekonomie' (1859); 'Lohnarbeit und Kapital' (English translation, 'Wage Labor and Capital'); 'Misère de la Philosophie' (1847); 'The 18th Brumaire of Louis Bonaparte' (1852); 'Life of Lord Palmerston' (1850); and 'Revolution and Counter-Revolution,' a reprint of a series of letters in the New York *Tribune*, in regard to the revolution of 1848 in Germany.

Marx was undoubtedly the founder of the modern socialistic school, in that he first gave definite scientific statement to the principles of modern socialism. His greatest and best-known work, 'Das Kapital,' is a monument of acute reasoning, extensive reading and knowledge, and skilful exposition. In this he analyzes carefully his theory of value, which is that the measure of the value of a commodity is the amount of labor "socially necessary" to produce it, and shows how under the capitalistic system the laborers are exploited of what they produce over and above their wages (surplus value). He

also traces the development of capitalistic production, the growth of the working class or proletariat which is finally to transform or revolutionize society, and lays down the principle that the fundamental factor in the development of society is the method of production and exchange; hence the socialist movement must simply assist and hasten the changes in progress. Marx was not only a scholar and thinker, but an organizer and agitator of unusual power, a strong and virile personality whose influence is still felt upon the labor movement of to-day. See SOCIALISM. Consult: Aveling, 'The Student's Marx'; Deville, 'The People's Marx,' for epitomes of 'Capital.'

Ma'ry (in the Greek text *Mariam*; the same as *Miriam*), distinctively known as the Virgin Mary, the mother of Jesus, is described in the gospel history as a virgin in humble circumstances, but of the stem of David, who lived in obscurity in Nazareth, a city of Galilee, and was betrothed to Joseph, a carpenter. A heavenly messenger broke in upon her solitude with a salutation of the deepest veneration. The Virgin was astonished at the appearance: her humility could not account for such a mark of distinction. The angel saluted her as the highly-favored of God, and announced to her that she should bear a son who should be called the Son of God, the long-expected Saviour of the Jews. "How shall this be," she replied, "seeing I know not a man?" The angel informed her that the power of God should overshadow her, and make that which seemed impossible a reality. She bowed in submission to the will of the Supreme — "Behold the handmaid of the Lord: be it unto me according to thy word." Her apprehension of her exalted prerogative is shown in the wonderful song of praise and joy into which she bursts at the greeting of her cousin Elizabeth, the mother of John the Baptist, and now called the *Magnificat*, in which she predicts that all generations shall henceforth call her blessed. It was in a stable at Bethlehem, whither she and Joseph had come from Nazareth to be enrolled in the census ordered by the Emperor Augustus, that she gave birth to the Saviour. It was to the stable at Bethlehem that the shepherds, instructed by the angels, came to do homage to the new-born infant; and thither also the Magi, led by the strange star, came to offer Him their gifts. All this she evidently understood as the right of the Divine Babe, who had been conceived in her womb by the power of the Most High. Nor was she astonished at the prophecy of Simeon, when the babe, according to the Jewish custom, was presented in the temple. At the wedding of Cana she sought the miraculous powers of her Son to relieve the embarrassment of their hosts occasioned by the want of wine. She attended Him through all his perilous course to Golgotha with ever watchful anxiety, for we find her absorbed in silent sorrow at the foot of the cross with the beloved disciple, St. John. To his care Jesus entrusted her as to a son: "Woman, behold thy son." After that He said to the disciple, "Behold thy mother." She appears for the last time in Scripture in the "upper room" in Jerusalem, praying with the Apostles when the Holy Ghost descends upon them. There is a tradition that she died at Jerusalem 63 A.D.

MARY

By the time of the 4th century the religious veneration of Mary had become distinctly marked in the cultus of the Church. From the earliest period she had been spoken of by writers as *theotokos*, or the mother of God. "This term," says Cardinal Newman, "was familiar to Christians from primitive times, and is used, among other writers, by Origen, Eusebius, St. Alexander, St. Athanasius, St. Ambrose, St. Gregory Nazianzen, St. Gregory Nyssa, and St. Nilus." Theologians in general began to maintain the opinion as a doctrine of faith, that Mary always remained a virgin, and her perpetual virginity is held both by the Greek and the Roman Catholic Church. A party in Arabia, which regarded her as the actual wife of Joseph and the mother of several children by him, was called in the 4th century *Antidikomarianites*, that is, the adversaries of Mary. At the end of the 4th century Helvidius in Palestine and Bishop Bonosus in Illyria were declared heretics for the avowal of similar opinions. The sentiment of veneration for the Virgin grew fuller and deeper as the Church emerged from the shadow of the persecutions and became the public worship of the Empire. When the teaching of Nestorius, who held that Jesus, the son of Mary, was begotten a mere man, and that the divine nature was afterward added to him, was condemned by the Council of Ephesus in 431, which declared that the divine nature already existed in the son, that was born to Mary, at the time of his birth, and that that son was from the first both God and man, her cultus greatly increased, and in course of time the veneration that was felt for her came to express itself in a more formal devotion. In the 6th century the Christian Church began to celebrate festivals in her honor, of which the Purification, the Annunciation, and the Visitation (the visit of Mary to Elizabeth) are still retained among some Protestant bodies. The Greeks and Roman Catholics observe various feasts besides the above in honor of the Virgin; for instance, the immaculate conception of Mary, her birth, her espousals, and her ascension to heaven; that is, her death and the reception of her body into heaven (in English known as the *Assumption*). Catholics object to the statement that they worship or adore Mary, preferring to use rather such words as veneration, reverence, and devotion. Their veneration in fact has a distinct term applied to it by theologians, namely *hyperdulia*, being higher than that given to saints—*dulia*—and lower than that offered to God alone—*latria*. She is far from being regarded as in any way on an equality with God or her Divine Son. She is but a creature, but she is looked upon as the highest of all creatures, who has been especially honored by God himself in selecting her above all others to be His mother; to her, therefore, is due a special veneration in keeping with her high prerogative. Several religious orders have been instituted in honor of the Virgin Mary, among which are the mendicant order of Servites, and all the orders of females called by her name; for example the nuns of the Conception, of the Annunciation, of the Visitation. In Christian art Mary as the Madonna occupies a most important position, and all the chief events in her life have formed the subject of paintings executed by some of the greatest artists, bearing such titles as the

Nativity, Adoration of the Magi, Marriage with Joseph, Flight into Egypt, etc.

Sacred history mentions several other Marys (in the Greek text *Maria*):

1. Mary of Bethany, the sister of Lazarus, the ready disciple and tender worshipper of Jesus, to whom he vouchsafed his peculiar friendship and an imperishable name (Mat. xxvi. 13).

2. Mary of Magdala, or Mary Magdalen, who was cured by Christ of an inveterate disease, and proved her gratitude by the most devoted adherence to him. She served him with her property, attended him on his journeys, and wept at his crucifixion. She was the last to leave his grave, and the first to visit it on the morning of the resurrection, and to behold her risen Lord. See also MAGDALEN.

3. Mary, the sister of the Virgin Mary, supposed by some to be the same with Mary the wife of Clopas (not Cleophas, as in John xix. 25) or Alphæus (another Greek form of the same Aramaic name), and the mother of the Apostle James the Less.

Mary I., queen of England, known popularly as "Bloody Queen Mary": b. London Feb. 1510; d. there 16 Nov. 1558. She was a daughter of Henry VIII. After the death of her mother, Catharine of Aragon, she was declared illegitimate; but was restored to the succession in 1544. She was bred by her mother in the Roman Catholic faith, on which account she was treated with rigor under Edward VI. She ascended the throne 16 July 1553, after an abortive attempt to set her aside in favor of Lady Jane Grey (q.v.). One of her first measures was the reinstatement of the Roman Catholic prelates superseded in the late reign. Her marriage to Philip II. of Spain, united as it was with a complete restoration of the Catholic worship, produced much discontent. Insurrections broke out under Cave in Devonshire, and Sir Thomas Wyatt in Kent, which, although suppressed, formed sufficient excuses for the imprisonment of the Princess Elizabeth in the Tower, and the execution of Lady Jane Grey and her husband Lord Guilford Dudley. England was now formally declared to be reconciled to the pope; the original laws against heretics were revived, and about 200 perished at the stake, including Cranmer, Latimer, and Ridley (qq.v.). Under Philip's influence a war began with France, which ended in the loss of Calais in 1558, after it had been in the hands of the English for above 200 years. This disgrace, and the aversion alike of her subjects and of her husband, told acutely upon Mary's already disordered health, and she died after a reign of five years. Consult the 'Life' by Strickland in 'Lives of the Queens of England' (new ed. 1864-5); Lingard, 'History of England'; Froude, 'History of England.'

Mary II., queen of England: b. London 30 April 1662; d. there 28 Dec. 1694. She was the daughter of James, Duke of York, afterward James II. She was married in 1677 to William, prince of Orange, and when the Revolution was effected which dethroned her father, Mary was declared joint-possessor of the throne with her husband, King William, on whom the administration of the government devolved. During the absence of William in Ireland in 1690-1, Mary managed parties at home with extreme prudence,

MARY OF THE INCARNATION — MARYLAND

and acted with equal ability as regent in 1693 and 1694. She was strongly attached to the Protestant religion and the Church of England. She endowed William and Mary College, Va., originally intended for the training of missionaries. Consult: Doebner, 'Memoirs and Letters of Mary II., Queen of England'; Marshall, 'Kensington Palace in the Days of Queen Mary.'

Mary of the Incarnation, French-Canadian Ursuline: b. Tours, France, 1599; d. Quebec 1672. Her maiden name was Guyard and in her 18th year she became the wife of M. Martin, but was left a widow with an infant son at 19. She eventually took the veil in the Ursuline Convent at Tours, and in 1639 went to Canada as superior of the convent established at Quebec by Madame de la Peltre (q.v.). She was extremely successful in administering the school for girls which the Ursulines opened, impressed all with her strong and beautiful personality, which was emphasized by her fine manners and tall stature, and she is one of the most stately and interesting figures in early Canadian history. She wrote an autobiography and her son wrote her life also. Consult: 'Lettres de la vénérable Mère Marie de l'Incarnation' (1681).

Mary Magdalen. See MAGDALEN; also MARY.

Mary Stuart, queen of Scotland: b. Linlithgow Palace 8 Dec. 1542; d. 8 Feb. 1587 at Fotheringay Castle. The only child of James V. of Scotland, she was proclaimed queen upon his death, 14 Dec. 1542, and was crowned 9 Sept. 1543 at Stirling Castle. Negotiations for her hand by the future Edward VI. of England came to nothing in spite of the attempt to effect the betrothal by force of arms. In 1548, having been betrothed to the French Dauphin, she was sent to Paris, where 10 years later she married the Dauphin, who died in 1560 soon after coming to the throne. Mary returned to Scotland, where her French Catholic training and the new Scottish Reformation made her position a hard one. She diplomatically yielded to the force of circumstances and surrounded herself with Protestant advisers. A match between the Scottish queen and Don Carlos of Spain, heir of Philip II., was all but arranged when Mary, in 1565, met Lord Darnley, her cousin, whom she married 29 July 1565. She had hoped to win by this marriage the English Catholics, with whom Darnley had great influence, and to unite all Catholic claims to the English throne, Darnley (see MARGARET TUDOR) being next in succession to Mary; but her husband's weak ambition made him the tool of the Protestant plot against Rizzio, an Italian favorite of the queen, who was killed 9 March 1566, being brutally dragged from Mary's dining-room. Three months later Mary gave birth to a son (later James I. of England). She was temporarily reconciled to Darnley; but on 10 Feb. 1567, Darnley's house was blown up and he was killed. Mary had been in the house late the evening before, and the murder was laid to the Earl of Bothwell, whom Mary married 15 May 1567. This act turned all the nobles against her; she was forced to surrender to her enemies, and 24 July 1567 to abdicate the crown. She was imprisoned in Loch Leven Castle; escaped thence in May 1568; was unsuccessful in her attempt to raise an army; crossed into

England, entrusting herself to Elizabeth; and was almost immediately imprisoned. Elizabeth wished to put Mary out of the way, seeing in her a dangerous rival for the English crown, but fear of France and Spain held her back until 1585, while Mary was imprisoned at Tutbury and entrapped into the Babington conspiracy against Elizabeth. Although her complicity was not clearly proved she was beheaded at Fotheringay. The moot point in Mary's tragic history is whether she was a party to Bothwell's assassination of Darnley. That she was, is apparently proved by letters from her to Bothwell, which the Scottish nobles declared they found in Bothwell's jewel-case; but the originals of these letters are not to be found, and their authenticity is doubtful. The matter is ably discussed in Cowan's 'Mary, Queen of Scots' (1901), and Lang's 'The Mystery of Mary Stuart' (1901). The point at issue is, however, confused by making it depend on the authenticity of these letters, for Mary's guilty knowledge of the plot against Darnley seems indubitable. But her career had more than a personal significance since in her person were combined the last hopes of Catholic rule in England, and an intense devotion to Catholicism. Personally she was of a dazzling complexion, apparently her main claim to beauty, marvelously winning, as her early career shows, and clever in argument, as was evidenced nowhere more plainly than in her trial for treason. Consult: Swinburne's sketch in 'Encyclopædia Britannica'; De Peyster, 'Mary Stuart' (1890); Bell, 'Life of Mary, Queen of Scots' (1890); Mignet, 'Histoire de Marie Stuart' (1851); Froude, 'History of England' (1881); Hume, 'Love Affairs of Mary, Queen of Scots' (1903).

Maryland is one of the 13 Original States and was the seventh to join the Union. It is on the South Atlantic coast, between lat. 37° 53' and 39° 43' N., and lon. 75° 4' and 79° 33' W. It is bounded on the north by Pennsylvania and Delaware, east by Delaware and the Atlantic Ocean, and south and west by Virginia. The extreme length of the State from east to west is 240 miles; its width from north to south is 125 miles. The total area is 12,210 square miles. Land surface, 9,880 square miles; water surface, 2,350 square miles. The number of incorporated cities, towns, and villages is 98. Population (1900) 1,188,044. Capital, Annapolis. Baltimore is the chief commercial city and financial centre.

Topography.—The most marked physiographic feature of Maryland is its division by the Chesapeake Bay into two unequal parts known as the Eastern and Western Shores. Into this bay many affluents pour their waters. On the Eastern Shore the principal rivers are the Elk, the Sassafras, the Chester, the Choptank, Nanticoke, Wicomico, and Pocomoke; on the Western Shore the Gunpowder, the Patapsco, the South, the Severn, the Patuxent, and the Potomac. At the head of the Bay the Susquehanna River draining a large section of New York and the whole of Central Pennsylvania, brings its tribute of waters gathered from a hundred streams to freshen this inland sea. This body of water exercises a most genial and tempering influence on the climate of the bordering region. The winters are short and rarely severe. The average temperature of this part of the State is in summer 75.5; winter, 36.9; for the

MARYLAND

year, 55.6. The soil of this section is of a light loam, favorable to the production of all the cereals, and all kinds of fruits and vegetables in great abundance. The average elevation of the land above tide-water of this coastal region is about 50 feet in the lower part, and 100 feet in the upper part of the Eastern Shore; and about 125 feet in the peninsula part of the Western Shore, that is, that part of the State lying between the Chesapeake Bay and the Potomac River. In the central or northern part of the State lying between the upper waters of the Bay and the Blue Ridge Mountains, the elevation is from 300 to 400 feet above tide-water, increasing to 600 and 700 feet, as it stretches from the bay shore to the mountains in the western part of the State. This part of the State is undulating in its surface, is intersected by numerous streams, some of very considerable size, as the Gunpowder, the Patapsco, the Patuxent, the Monocacy, Great Pipe Creek, the Antietam, and the Conococheague. These streams, generally called falls by the early settlers of this region on account of their rapid descent from the uplands, furnish abundant water power for manufacturing purposes. This region is also intersected by several ridges of an elevation of about 800 feet, dividing the country into rich and fertile valleys. This section is traversed by the Blue Ridge range of mountains, some of whose peaks are from 2,000 to 2,400 feet high. The great Appalachian chain passes through the western part of the State, through Allegany and Garrett counties. The highest peak of this range is Backbone Mountain in Garrett County, 3,700 feet high. Other peaks range from 1,500 to 3,500 feet in elevation.

Geology.—The geological formations vary with the surface elevations. The southern section of both the eastern and western shores is alluvial; north of the alluvial deposit is a Tertiary formation; northwest of this come metamorphic rocks; west of them a wide belt of Silurian and Devonian formation; and still farther west Carboniferous strata beginning at Cumberland. In the Tertiary we find marl in abundance; in the metamorphic rocks gneiss, granite, limestone, and iron; in the Carboniferous extensive veins of bituminous coal of the best quality. Over 200 kinds of marble have been found in the State, some of them equal to the Italian marbles.

Mineral Resources.—Maryland is rich in mineral resources. Iron ore is extensively distributed throughout the western part of the State, and in the northern part of the Eastern Shore, and is of good quality for casting and other purposes. The iron industry is of early origin. Forges and furnaces were in operation in the colony as early as 1649, and their products were used in the province and sometimes exported to other colonies. Limestone also abounds throughout the middle and western parts of the State, furnishing a valuable fertilizer and an excellent material for roadbeds, for both of which purposes it is extensively used. Clay and kaolin of an excellent quality for bricks, tiles, and water mains and for pottery use, are found in great abundance throughout this region, especially in Harford and Baltimore counties. Baltimore brick ranks high for building purposes in fineness and durability. Of building stone there is a great variety and of

superior quality in Maryland. Marble, granite, gneiss and sandstone are found abundantly in Harford, Baltimore, Howard, Carroll, and Montgomery counties. The white marble of Baltimore County is of a high character and reputation for monumental and building purposes, and for more than fifty years has been extensively used for public structures, churches, and private buildings in Washington, Baltimore, and other cities. The monoliths in front of the Capitol at Washington are from these quarries. The noble shaft erected by the nation to the father of his country was constructed almost wholly of this material. There are extensive quarries of granite and gneiss in Harford and Howard counties, which are profitably worked. Variegated marbles of a superior quality and susceptible of a high finish are found in Frederick County. There are immense and almost inexhaustible deposits of coal and iron in Allegany and Garrett counties. The coal is of the rich, semi-bituminous variety, especially valuable for its steam-producing quality. The famous George's Creek Big Vein, 14 feet thick, is located just west of Cumberland. The total value of the mineral product of Maryland in 1900, including coal, iron, clay, and building stones, was \$8,653,000. Coal heads the list with a value of \$5,000,000; brick and tile follow with a value of \$1,100,000.

Agriculture.—In the Colonial period agriculture was the principal employment of the people. Along the shores of the Bay and the rivers emptying into it, plantations were large and were cultivated by slave labor. Tobacco was the staple crop for which there was generally an active demand in the European markets on account of its quality. This led to an extensive commerce for that period, and brought wealth to the planters. Tobacco was for a long time the currency of the Colonies. Debts, dues, and fines were paid in that currency. The constant cultivation of this plant gradually exhausted the soil. The planters took up new land, which, in time, underwent the same process of deterioration. The growth was discouraged. Fertility has been restored to these impoverished soils by the application of guano and other fertilizers; and other kinds of crops are raised, and the average yield of wheat per acre in some sections is as large as the average is in some of the Western States. Tobacco is still cultivated largely, and a State inspection of it is made. But the crops are much more diversified, wheat and corn being the principal ones. In the central and northern parts of the State, the soil is of a clayey nature and very fertile. Carroll, Frederick, and Washington counties contain some of the best farming lands in the United States. The soil is rich, and the yield of wheat and corn per acre is large. The lands in Baltimore, Harford, and Montgomery counties are of the same general character, producing abundantly the same cereals, and also heavy vegetable and fruit crops for the markets and for canning purposes. Their proximity to large cities and the facilities they possess by railroad transportation make vegetable, truck, and dairy farming very profitable. Throughout the coastal region vacant land can be bought at from \$5 to \$10 and \$15 per acre; with improvements farms can be bought for from \$20 to \$35 per acre. In the central and northern sections there is very little vacant land. But good farming lands in this

MARYLAND

region can be bought for from \$50 to \$100 and \$125 per acre with improvements. In 1900, the total number of farms in Maryland was 46,012. Of this number 29,313 were cultivated by the owners; 15,447 by tenants; 1,052 by managers. The total value of the farms with buildings was \$175,178,310. The average value of land per acre was \$23.28. The amount realized on the large crops in 1900, that is for wheat, corn, oats, rye, tobacco, etc., was \$20,814,371, and from fruit, vegetables, and truck farms was \$15,195,629, making a total value of farm products \$35,000,000. The estimated value of the buildings \$54,810,760, and the value of animal products, \$13,006,877.

The forest trees are principally pine, chestnut, oak (with three varieties, white, black, and red), hickory, and walnut. The staple fruit crops are peach and apple, which cover many thousands of acres. Maryland peaches, fresh and canned, are exported to all quarters of the country. Tomatoes, melons, small fruits, and all kinds of vegetables are cultivated on the Eastern Shore and sent to the markets of Baltimore, Philadelphia, and New York. The mountains still contain deer; and wild geese and swans are found in large numbers at the proper season on the Bay and its tributaries, as well as woodcock, grouse, partridge, and turkeys. Immense flocks of wild ducks of various species through the estuaries of the Chesapeake on the approach of cold weather.

Fisheries.—From the earliest period of her history, fisheries attracted the attention of the people of Maryland. Her waters swarm with fish of every variety and oysters and terrapin of superior flavor. The annual value of the sea food, fresh and canned, supplied by the Bay and its tributaries, amounts to \$10,020,000. Of this amount oysters alone contribute \$3,500,000.

Manufactures.—Maryland by reason of her proximity to the sources of production of the raw material, to the great coal fields, and of the great water-power she possesses in her swiftly flowing streams, her unequaled facilities in water carriage, and her complete railroad connections with every part of the country, engaged early and successfully in manufactures. They embraced nearly every species, textiles, iron and steel, lumber, paper and printing, chemicals, clay, glass and stone, metals, tobacco, clothing, vehicles, shipbuilding of wood, iron, and steel, and hand trades. The manufacturing plants are mostly established in Baltimore, and its vicinity, and the cities of Cumberland, Hagerstown, and Frederick, and the small towns of the central and northern parts of the State. In 1903, the number of manufacturing establishments in the State was 11,529; the capital invested in them was \$164,422,926; annual average number of employees, 108,325; value of the finished product, \$242,552,990; average annual wages, \$38,762,961. In Baltimore alone, there were in 1903, 6,717 manufacturing establishments with a capital of \$163,945,811, the annual value of whose product was \$164,945,811. In manufacturing industries, Baltimore ranks as seventh among the cities of the United States, being especially prominent in clothing, canning of fruit and vegetables, tobacco manufactures, and iron work.

Shipbuilding.—Living on the shores of the Bay and its estuaries, the ancient Marylander naturally took to boat and shipbuilding, and the

fast-sailing clipper ships of Baltimore were, before steam became the main motor power in propelling ships, famous for their swiftness, and carried the flag and commerce of the United States to every part of the world. In 1900, Maryland ranked as the fifth State in shipbuilding. The capital invested in this business was \$19,262,193, with a product valued at \$10,563,193. There are four large plants engaged in iron and steel shipbuilding in Baltimore and vicinity. A large one recently established at Sparrow's Point, 12 miles from Baltimore, is engaged as well in the manufacture of structural iron and steel. Its products in 1902 amounted in value to \$3,299,491, and it gives employment to 2,000 workmen.
